apply his whole power to drag the child from the mother In one case I have known this practice to result in the tearing away of part of the cervix, laceration of the vaginal wall, and permanent damage to the mother's local and general health style of forceps—and the Hodge pattern has always seemed to me the best—we had in each blade, used singly, a vectis, in one handle a blunt hook, an instrument often of great value, the other was a sharp hook, covered, when not in use, with a steel cap screwed on Such a combination of instruments, which is very convenient in a practice involving long distances, cannot be, or at least is great deal of interest to Dr Tilley's paper, and while not, offered in the forceps presented by Dr Stewart

While this instrument DR GFO E SHOEMAKER is, no doubt, safe in Dr Stewart's hands, it might not be so in those of others That toggle joint is a very powerful mechanical appliance, and the "shoulder" does not limit its action until the blades are A moderately large head quite close together would not let them get so near together, and a very violent and harmful compression would result from even moderate traction upon the handle

In reply to the first speaker, DR STEWART among the original forceps as represented in the older works were those with parallel blades, but I do not know of anything like this instrument course, I do not claim all the credit of this invention, but share it with the instrument maker, who carried out my ideas I was induced to have such an instrument made because of a number of complicated cases which came under my care, especially a difficult one in which I was called to assist a friend, who had been trying all night to get on the second blade of the forceps in a very narrow pelvis, where the child's head was jammed (in the right iliac re-I advised using the gion), and would not rotate second or female blade first, which we did with precaution in recrossing the handles, and the delivery I am not anxious to use was speedily effected My rule is not to forceps or to make lacerations apply instruments as long as there is any rebound to the labor

There need be no fear of the toggle-joint permitting the blades to approach too closely, as the shoulder can be adjusted to any desired distance new to me that a fœtus can be delivered without traction If a wedge is all that is wanted, the togglejoint is a better wedge than the cross-joint amount of compression is regulated by the necessities of the case If the mother is left alone, she compresses the head of her child in her labor the cases (eight) where I used this instrument, I could not find a trace of its mark twenty-four hours I would never use a handkerchief after delivery I believe that in cases of conto tie the handle tracted pelvis, where other instruments could not I had such an experience with deliver, this could a mannikin, in which the outlet was too narrow, failing with the cross-handles, I delivered with my instrument

CHICAGO MEDICAL SOCIETY

Stated Meeting, February 6, 1888

In the old THE PRESIDENT, W T BELFIELD, M D, IN THE CHAIR

DR ROBERT TILLEY read a paper on

MONOCUI AR DIPLOPIA WITHOUT MANIFEST LESION OF THE AFFECTED EYE

(See page 322)

DR HAROLD N. MOYER I have listened with a I should prefer to hear it discussed by some one more familiar with the subject, I do not feel like let ting a paper of this kind go without discussion The condition of unilocular diplopia as described by the doctor is certainly rare, one that will come under observation but once in a lifetime His conclusions regarding the pathology of the disease I think are fully justified We cannot but look upon a lesion of this kind as other than an affection of the brain, and I was struck with the similarity in some of the condi tions here described with the condition known as periodical ocular motor paralysis In those cases we have some of the symptoms which are described in In this condition, associated with other pen pheral disturbances, there is often distress in the stomach, pain in the eyes and even convulsions Of the 18 or 19 cases on record four have come to the autopsy table, but the autopsies have not established any definite pathology, whether the lesion was ba silar, cortical or nuclear, or the character of the lesion I fancy it is much the same in this condition, the few autopsies that have been obtained are confusing as to the nature of the basic pathology, the real lesion While I admire the doctor's in the nervous center exceptionally ingenious theory of an abscess con nected with the third ventricle rupturing, I think it was not clearly shown that was the exact condition It is ingenious, and in the absence of any other ex planation it might accepted provisionally

DR R TILLEY I have only one word to sav rela tive to my suggestion of the possibility of cerebral abscess, and it is founded simply on this fact that there are only two cases in which this phenomenon has been observed, on record as far as I can find, and I have searched as well as the means at my disposal would allow me I have sent to Washington for several volumes In the two cases where an autopsy has been made both have been associated with lesions in the cerebral hemispheres, one of them a blood clot and the other one an abscess in exactly the same With this peculiar lesion and these two previous cases with the lesion practically in the same location, we would be confined, as far as speculation is concerned, to some similar hypothesis In choosing between a blood-clot or hæmorrhage and a possi ble abscess, I accepted the possibility of an abscess simply on account of this fact that the child so sud denly got better I saw her, we will say it might be to-day, and had already prepared for an autopsy, the previous night, the Sister told me she had been burrowing her head in the pillow and complaining of severe pain in the top when she was delirous, and any medicine, without additional care, she became | August, 1831 slept well, got up and dressed and in a few days afterward went home on her holidays I cannot say how long, but about fourteen days, I imagine, from the time she began to get better, abscesses began to appear all at once, and it is the presence of these abscesses that made me suppose that the lesion corresponded to the abscess that was observed at the autopsy table, and by some means these abscesses were the expression of the previous abscesses that had existed

DR MOYER I would like to ask Dr Tilley if the reflexes and coordination were observed?

DR TILLEY There did not seem to be any difficulty in coordination, or anything of that kind There was quite a good deal of difficulty in examining the patient, just as there is when the patient is under the care of the Sisters, and I had to do the best I could, not as I would, so that the reflexes, etc., were not examined as accurately as I should have done under other circumstances

The Committee appointed to investigate the

PRIORITY OF THE DISCOVERY OF CHLOROFORM

made the following report

There are three claimants to the honor of the discovery, Liebig, of Germany, Soubeiran, of France, and Guthrie, of America

Liebig's Claim —Liebig claims to have published his discovery in November, 1831 (See Liebig's Annalen, vol 162, page 161)

Souberran's Claim - Souberran claims to have published his paper on ether bichlorique in October, 1831, in the Annales de Chimie et de Physique

Liebig shows (see Liebig's Annalen, vol 162, page 161) that the October number of the Annales de Chimie et de Physique was delayed in its publication, and that it did not appear until January, 1832 certainly is evident that it was not published in Octoentire month of October

Guthrie's Claim —In the January number, 1832, contents of the phial are as strong as I could con-I made not long ago "

(page 64, vol x1) we find an article by Dr Guthrie, without date, upon a "New Mode of preparing a Spirituous Solution of Chloric Ether," in which he says, "During the last six monts a great number of not only freely, but frequently to the point of intox-1cation

Dr Guthrie's paper on chloric ether must then still this vomiting continued, but suddenly, without have been in the hands of the printer in July or And if people had drunk of his better all at once Food staid on her stomach, she chloric ether for six months it would place the date of his discovery in the early part of 1831

We therefore conclude that Dr Samuel Guthrie is justly entitled to the honor of first discovering chloroform, and that the publication of his discovery antedates that of either Liebig or Soubeiran

Respectfully submitted,

F E WAXHAM, N S Davis, Jr, E WYLLYS ANDREWS

DOMESTIC CORRESPONDENCE

LETTER FROM NEW YORK

(FROM OUR OWN CORRESPONDENT)

PREVENTIVE TREATMENT OF SYPHILIS

Dr E B Bronson has presented before the Academy of Medicine an able argument, based on theoretical grounds rather than on any practical results as yet achieved, on preventive treatment during the primary stage of syphilis By preventive treatment, he wished it to be understood, was not necessarily meant abortive treatment, but the employment of such measures as tend in any degree to abridge or mitigate the subsequent course of the infection and its effects upon the constitution The scheme essentially consists in the local use of antisyphilities by a method designed to bring the remedy in direct communication with the whole of the affected region in primary syphilis, including more particularly the initial and the diseased inguinal glands As commonly practiced this regional treatment has been chiefly confined to the use of mercurial hypodermics beneath the initial lesion, unless this was first excised, and into the mass of indurated lymphatic glands It But the plan, Dr, Bronson said, might be easily ex-The field of operation might include all of tended ber, as it contains the meteorological report for the that district whose lymphatic vessels tend in their course towards the ganglia which are the seat of the When the initial lesion was situated upon of Silliman's American Journal of Science and Art, the genitals the area most available would consist of we find an article by Dr Samuel Guthrie, dated the external genitals, the perineum and the upper, September, 1831, in which he says, "A bottle and inner and anterior aspect of the thighs, together with phial contain alcoholic solution of chloric ether The the inguinal region and lower part of the abdomen By multiple small injections and by inunctions the veniently prepare them, but not equal to some which effort is made to introduce mercury little by little into the lymphatics, with the hope of its being con-In the October number, 1831, of the same journal, veyed to the diseased glands with the least amount of offense to the normal tissues, and yet in sufficient amount to destroy the infectious germs or to retard their multiplication

When hypodermics are used it is claimed that it is persons have drunk of the solution of chlonc ether not necessary that the agent should be injected in large quantity in any one spot nor in a concentrated form, so that $\frac{1}{20}$ of a grain, or less, of the bichloride, We find a notice to contributors in Prof Silliman's introduced in separate injections of not over 10 of journal, in which he says, "Communications to be in a grain each, would afford a more reasonable hope of hand six weeks, or when long, and especially with effectively reaching the seat of the disease than a drawings, two months before the publication day" much larger dose given by the mouth Dr Bronson uses a solution of 1 part in 400 or 500 of mucilage the syphilitic poison, we have to conclude that the and water, with a small quantity of common salt chancre is not positive evidence of constitutional added Of this several injections are made, of 4 or 5 minims each, distributed over different parts of the The discomfort caused cutaneous area mentioned is insignificant, especially if care be taken to avoid any escape of the fluid into the corium, and into the skin of the abdomen and thighs the injections may be repeated daily, or every second or third day gether with these, but more especially in situations where hypodermics are less admissible, as in the penneum and on the penis and scrotum, inunctions also may be employed, and for this purpose a mercurial It might soap is preferable to mercurial ointment be said that regional treatment is also constitutional treatment, but he contends that it is something more than this, and that it is at all events much better than doing nothing at all, as is advised by most authorities

It will be seen that this method of treatment is based on the supposition that syphilis is at first a local rather than a constitutional disease, and also that it is a parasitic disease, which, although the syphilitic germ has not as yet been positively determined, Dr Bronson considers explains the phenomena presented by it in a more satisfactory way than any other, and constitutes the best working hypothesis Dr Bronson believes that when for dealing with it first implanted in the tissues the syphilitic virus is, mainly at least, confined to the spot where the future chancre is to develop, that here finding a favorable soil, it grows and slowly increases until its intrusive presence becomes a source of offense to the tissue harboring it, and that gradually inflammatory action From this source of generation the virus contaminates sooner or later the nearest lymphatic glands, which in turn become other sources of supply, until finally, from these multiple foci, the whole According to this view organism becomes infected the main route to the general circulation is by way of the lymphatics and through the receptaculum chyli, though it is possible that an insignificant portion of the veins may pass into it immediately

According to the opinion generally current among syphilographers, Dr Bronson went on to say, directly upon its inoculation the syphilitic virus passes into the general circulation, and the incubation pertains, not to any materies morbs in the vicinity of the point of inoculation, but to something in the blood, while the initial lesion is the first tangible sign of the blood disease, reflected in some arbitrary and inexplicable manner to the spot where the virus effected its original entrance primary stage of syphilis upon which the symptomatic character of the initial lesion is based 1, that an individual who has been inoculated with syphilis has always acquired immunity from any subsequent inoculation of the syphilitic virus before the chancre develops, and 2, that extirpation of the chancre does not prevent the regular course of the disease it is true that, as a general rule, auto- and reinoculation in the primary stage fail to produce any perreported to show that the rule is not invariable, and instance there was no further trouble whatever about that, if immunity is the test of general saturation with the local lesion, and not the slightest enlargement of

disease, and hence cannot be its symptom

It can hardly be said, he continued, that the results of excision make conclusively either for or against the hypothesis of the local character of pn mary syphilis As a manifestation of the primary stage the chancre is hardly of more importance than the accompanying adenopathy That the indurated lymphatic glands in the vicinity of the initial lesion are contributory sources of infection there is little cause to doubt, and were the initial removed, they would doubtless still suffice to contaminate the sys While, then, it cannot be affirmed of any period in the course of the malady that the disease is strictly limited to the site of the initial lesion, the proposition that syphilis is at first essentially a local disease remains still uncontroverted An infection whose limits are circumscribed and more or less defi nite is a very different thing from one that has al ready taken possession of the entire organism

As to the value of medicinal antisyphilitic treat ment during the primary stage, he said, there is a While it is pretty generally diversity of opinion conceded that the employment of mercury in this stage tends to retard the appearance of constitu tional symptoms, the apprehension has been expressed by some that, in repressing the outward manifestations of infection, we are risking a more There is an serious implication of internal organs inconsistency, however, in the idea that for the month or so of primary syphilis the same remedy is to be shunned, because of dangerous after-effects, whose continued employment during the years of the con stitutional disease is accepted without demur

Even though mercury does act as an antiseptic in syphilis, Dr Bronson thought it very questionable whether it can have any effect upon germs circulating in the blood, and that it is much more probable that the effect would be exerted where both the germs and the mercurial would be apt to accumulate, as at such places of elimination as the skin, or where de That mercury does exert a posited in the tissues most decided influence upon the local manifestations of syphilis when topically applied there is undoubted evidence, then why should not this potent influence be brought to bear directly upon these local lesions which are also dangerous foci of infection in the pri-

mary period of the disease? In the discussion of the paper Dr E L Keyes said that he would have been glad if Dr Bronson Two facts are alleged concerning the had presented some practical results of the method disease becomes general from the time that it is acquired, and that the virus therefore gets beyond the lymphatic chain before the appearance of the initial lesion, which occurs only after a period of inocula He related a case in which, notwithstanding the complete excision, within twelve or fifteen hours after suspicious connection, of a small livid papule on the dorsum of the penis, the most marked consti tutional symptoms subsequently developed

The objection to local treatthe inguinal glands ment before the diagnosis of syphilis had been established with the only agent which was of any service during the subsequent course of the disease, consisted in the fact that it was likely to throw more or less discord into the life of the patient, while, if constitutional symptoms did occur, they were apt to run an uregular course He then related the case of a medical student who, contrary to his advice. commenced a mercurial course in consequence of a slight abrasion of the prepuce At the end of six months, no evidence of syphilis having in the meanwhile presented itself (if the enlargement of a single one of the post cervical glands were excepted), he gave up the treatment Within two years, however, he became the subject of hemiplegia, and eventually died of syphilitic brain disease As a rule, he believed it was much better to delay treatment until the diagnosis was confirmed by the appearance of secondary symptoms Otherwise a patient might be treated for syphilis who did not have the disease at all, and he referred to an instance in which a gentleman who never had the disease took bichloride of mercury for twelve years in consequence of a mistake of this kind

Dr R. W Taylor, while agreeing with Dr Bronson that syphilis is at first a local affection, was convinced that neither cauterization nor excision would prevent constitutional infection, and stated that there was already evidence enough to show that the disease cannot be exterminated at the radicals He thought, therefore, with Dr Keyes, that it was most rational to begin the treatment with the secondary stage, since by so doing a more orderly sequence was secured. and the moral effect upon the patient was also much In primary syphilis the circumstances were entirely different from what they were later on, as we had to deal with a nascent disease which exhibited marked activity, and hence the most powerful remedies were required to destroy the new growths so rapidly forming He believed it was impossible, however, to safely employ mercury, the only agent at our comthe desired effect As far as we could judge, mercury acted by causing fatty degeneration of the syphilitic cells, and as these cells did not become matured seemed to him irrational, as a rule, to use this remedy until the secondary stage of the disease was reached, especially since it had been shown that syphilis does not run the tractable course in those who are treated early as in those from whom mercury is withheld until after the primary stage

In concluding the discussion, Dr Bronson said that in the paper he had acknowledged that his views were based largely on theoretical grounds, and he had merely endeavored to point out the indications which called for early treatment If the disease was primarily constitutional, no such indications existed. while the fact that the disease was primarily local did not imply that excision of the initial lesion

advanced beyond the lymphatics In order to abort it, it would be necessary that all the foci of infection should be eliminated, and this had been proved to be impossible Believing, however, that the disease was still local, he thought it was philosophical to treat it regionally, and thus counteract the infection as far as possible in this early stage. The objections which had been urged to such a course seemed to him altogether trivial, and he felt confident that any patient would prefer to take the chances of this prompt treatment rather than do nothing until the fully developed symptoms of the secondary stage presented themselves Although he had no results to offer, he could abundantly testify from his personal experience that the method was entirely feasible, and he certainly thought it was worth a fair and systematic trial

CHARITY HOSPITAL OF NEW ORLEANS

Petition of Medical Students of Tulane University of Louisiana, with Reference to the Appointment of Resident Students-Reply of Joseph Jones, M. D., President of the Louisiana State Medical Society

MEDICAL DEPARTMENT OF TULANE UNIVERSITY OF Louisiana.

New Orleans, February 13, 1888 To Professor Joseph Jones, M.D., President of the Louisiana State Medical Society

Sir -It is with feelings of great pleasure and satisfaction that we, the undersigned, students of the Medical Department of Tulane University of Louis-1ana, acknowledge your efforts to have repealed the Legislative Act of 1886, whereby the selection of medical students for positions in the Charity Hospital was restricted to applicants then resident in the State of Louisiana

Believing, as we do, that a better selection can be made by choosing the most worthy, regardless of section or State, and furthermore, believing it to be of the greatest importance to have the ablest and most proficient students as sub medical attendants mand for this purpose, in sufficient quantity to have in immediate charge of the various wards of the institution, subservient to the orders of the attending physicians and surgeons, thereby securing the most careful and intelligent attention, medical and minisuntil the appearance of constitutional symptoms, it terial, to the thousands of suffering poor who seek the comfort and shelter of this noble institution to be cured of their diseases and healed of their wounds, and believing, furthermore, that the continued enforcement of said act will tend to impair the growth of the Medical Department of Tulane University, said Medical Department having been enabled to offer her most proficient students to the service of the Charity Hospital regardless of section or State, and at the same time offering, as an incentive to all students desirous of so doing, the opportunity to compete in examinations, necessary to appointment, to resident studentship

Whereas, the continued prosperity of the above mentioned University, and the interests of the Charshould abort it In his argument he had expressly ity Hospital, are matters of great importance to us, discarded excision as a means of abortion, because therefore we respectfully ask that you, in your offiby the time the chancre appeared the disease had cial position as President of the Louisiana State Medical Society, give this matter the attention it deserves, and use your efforts to have it brought before the next Legislative Assembly, urging its repeal

We, knowing your devotion to your chosen profession, to the State of Louisiana and to the city of New Orleans, to the Charity Hospital, to which you the hospital It is more important that we should have given so many years of valuable service, conferring benefits to suffering thousands, whom you have treated within its walls, whose testimony can be had from many portions of the civilized world, a knowledge of the above facts makes us feel that we can ask this of you with the confident assurance that your best efforts will be expended in its accomplishment

We know your kindly regard for ourselves, and your untiring efforts to place us in the possession of the most valuable practical and advanced ideas in medical science, and appreciating your disregard for self-interest and advancement, we hope to emulate those noble and elevated sentiments whereby we can rise superior to sectional thought, and render justice where merited We hope that your efforts may be strengthened to the accomplishment of the purpose as herein set forth, and again asking that you give this matter your attention, and use your best efforts to have it brought to the attention of the Legislature of Louisiana, we hereunto subscribe our names

A W Boren, (Signed) and by 160 other students of the Med Dep't of the Tulane University of Louisiana

> 156 Washington Avenue, 4th District, New Orleans, La, February 15, 1888

To A W Boren, and the medical students of the Med Dep't of Tulanc University of Louisiana

Gentlemen -I have the honor to acknowledge the receipt of your communication of February 13, 1888, and beg leave to submit the following act to which you refer, containing the proscriptive legislation regulating the mode of selecting the resident students of Charity Hospital of New Orleans, was passed by the General Assembly of the State of Louisiana at the regular session of 1886, Act No 47, "Making appropriations to defray the ordinary expenses of the State Government " "Approved July 3, 1886, by S D McEnery, Governor of the State of Louisiana" The following is the portion of Act 47 which relates to the subject referred to in your communication

"Charity Hospital in New Orleans To support of Charity Hospital in New Orleans for year ending June 30, 1887, forty thousand dollars For year ending June 30, 1888, forty thousand dollars Provided, that none but resident Louisianians be admitted as resident students. Act of the General As- from the following extracts from the proceedings of

sembly of Louisiana, 1886, p 72 " Will not discuss the question of the legality of act of the General Assembly of Louisiana, which cs an appropriation for the support of the destisick, contingent upon the performance of an by the Board of Administrators, of D McEnery, 18 llency,

nativity of

to be appointed, and not to the mode of expenditure of the funds devoted to such charitable purposes as the purchase of food and medical supplies, and the payment of the salaries of the house surgeon, assistant house surgeon, treasurer, and other employes of inquire into the official interpretation of the special and proscriptive legislation of Act 47

Through the courtesy of Edwin Marks, Esq, Secretary and Treasurer of the Charity Hospital, we have been able to make the following extract from the letter of Governor S D McEnery, of February 9, 1887, giving his official interpetration of that part of Act 47 which relates to the class of students to be

selected as resident students

EXECUTIVE DEP'T STATE OF LOUISIANA, BATON ROUGE, February 9, 1887

Edwin Marks, Esq, Sec'y Charity Hospital, N O Dear Str -My interpretation, in the Act of the General Assembly referred to, of the words "resident Louisianians," is that they mean citizen Any citizen of the State is a Louisianian, and the words do not imply or mean that the person should be native born I presume that your inquiry is made in order to ascertain whether the medical students at the Tulane University from other States can be admitted as resident students in the Hospital, from the fact of their residence in the State during the time they have been pursuing their studies This residence is not sufficient. If the student is under age, he of course cannot select his residence, but if he is of age and came to the State with the intention of acquiring a residence in the State, and of remaining permanently here, then he is entitled to admission

It is the intention the act of residence coupled with the intention of remaining permanently, which fixes the residence, and which will entitle the party to become a resident student of the hospital (Mc

Rowan vs McGwin, 15 and 637)

Respectfully yours, S D McEnery, Governor (Signed)

Regarding the action of the General Assembly of Louisiana of 1886, in Act 47, relative to the appointment of resident students in the Charity Hospital as unjust and unwise, and as injurious to the best interests of the students and patients, I embraced the earliest opportunity to obtain the sense of the high est medical authority in the State, to the end that the obnoxious clause might be repealed, or rather that such legislation might never again be repeated

To accomplish this end, I attended the meeting of the Louisiana State Medical Society held in the month of April, 1887, in Alexandria, as will be seen

Resident Students of the Charity Hospital of New

Orleans, La

Dr Joseph Jones offered the following WHEREAS, The Charity Hospital of New Orleans receives the distressed and destitute, sick and wound ed, of all the States of the Union, and all the nations the world Be it

Resolved, By the members of the Louisiana State Medical Society, that the position of resident students in the great and noble institution should be open to the competition of all honorable, intelligent and accomplished medical students Be it further

Resolved, That the General Assembly of the State of Louisiana be respectfully and earnestly requested by the Louisiana State Medical Society to rescind the law enacted by the General Assembly of 1885, excluding all medical students from competition for the position of resident students of the Charity Hospital except natives and residents of Louisiana

Resolved, That the action of the General Assembly of Louisiana of 1885 was in violation of those future true, generous and patriotic principles which have ever characterized the philanthropic citizens of

Louisiana

Resolved, That the President of the Louisiana State Medical Society be empowered to urge the abrogation of this law of 1885, establishing, for the first time in the history of Louisiana, the unwise and illiberal policy of excluding from the competitive examination of the medical service of the Charity Hospital the intelligent and enterprising medical students of other States

Dr Joseph Jones supported the preceding resolu-

tions by the following argument

(a) The object of this great and noble institution is the relief of suffering humanity, the healing of disease, the restoration of the sick to the performance of the active duties of life, and the advancement of the highest intellectual, moral, and physical welfare of the commonwealth

- (b) The generous citizens of Louisiana have not confined their benefits and ministrations to their own Upon a careful examination and classification of statistics of the Charity Hospital of New Orleans during the period of forty years (1836-1876), we find that 310,659 patients were admitted, and of this number 248,011 were foreigners, 54,403 natives of the United States outside of Louisiana, and only 11,761 were natives of Louisiana It is evident from these statistics that the noblest and broadest charity has actuated the citizens, and especially the medical profession, of Louisiana, in the charitable ministrations to the destitute sick of all States and countries
- (c) By again throwing open the field for honorable competition of all accomplished medical students, regardless of their nativity, the State of Louisiana will secure the most effective service and achieve the greatest good to suffering humanity

Duly seconded and carried

In conclusion, allow me to direct the attention of the students of the Medical Department of the Tulane University of Louisiana, and of our sister States, who may in future desire to compete for the position of resident students in the Charity Hospital of New Orleans, to the following important facts

1 That Act 47 is not a law of the State of Lou-

2 The operation of Act 47, as far as the appointconcerned, ceases absolutely on July 1st, 1888

3 Unless the General Assembly of Louisiana, at its subsequent meeting, is induced to repeal this unwise and proscriptive legislation, the Board of Administrators of the Charity Hospital of New Orleans will, after the 30th of June, 1888, be untrammeled in their appointment of resident students or let us hope that they will, act regardless of State lines, basing the appointments upon merit and merit

As your friend and professor, and as a representative of the medical profession, I shall cheerfully comply with your request, and exert any influence at my command to avert similar legislation in the

With thanks for the kind and courteous terms in which you have been pleased to couch your petition, and with kind regards, I remain as ever

Your friend, Joseph Jones, MD, Pres't Louisiana State Medical Society

MERCURY IN THE BONES

Dear Sir —In The Journal, Jan 21, page 95, column "Book Reviews," and in commendation of "600 Medical Don'ts," the review says "To the other 'don'ts' might be added Don't imagine that mercury can get into your bones," etc

What then shall we do with authority so high and so generally accepted as Bartholow? In his "Materia Medica," fifth edition, pp 248, 249, Bartholow says "Mercury is deposited in the textures, interferes with the normal nutritive processes, and is found in all the secretions and excretions A marked degree of anæmia, loss of flesh, loss of hair, eczema, a foul breath, diarrhœa, the stools being very fetid, are the characteristic symptoms of the action of mercury on the solids and fluids of the body

As a result of the changes in the composition of the blood, and of the direct action of the metal on the renal epithelium, albuminuria is one of the symptoms present in cases of Without the use of special means to mercurialism render it soluble, and despite the use of such means, sometimes mercury remains permanently in the organ-When extremely severe cases of salivation were not uncommon, permanent damage to the osseous structures often occurred, and globules of mercury could be shaken out of the dried bones of such subjects" The italics are all mine

The reading of proverbs and terse dogmas is generally pleasing though misleading, and the time has been when the writers had everything their own way The proverb writer of to-day is liable to be inquired of occasionally before his sayings are accepted as finalıtıes

Wishing the addendum to "Don't" above quoted to be correct, I beg leave to ask the writer for the Very truly,

INQUIRER.

["We have never seen any alceration of the skin or disease of the bones, or paralysis, in consequence ment of resident students of the Charity Hospital is of the therapeutic use of mercury, even in cases in which its misuse was carried to the extreme"

Von Zeissl, "Pathology and Treatment of Syphilis,"

p 376
"The attempt which has been repeatedly made by different authors to attach tertiary lesions, and especially lesions of the bones, to the mercury which was administered during the earlier stages of the disease (syphilis), is now shown to be groundless, by Persons who labor with abundant evidence mercury, and who are constantly exposed to its fumes, are by no means subject to affections of the bones Virchow, who has been quoted as supporting this error, strongly repudiates it in his recent work on syphilis" Bumstead and Taylor, "Venereal Diseases," 1883, p 734

The shaking of metallic mercury out of dry bones is about as good proof that it was deposited as mercury during life, as seeing a saddle under a bed is proof that the patient has eaten a horse When one finds mercury in a dry bone he may allay his excitement by the reflection that the subject from which the bone was obtained was injected with a mercurial dermitology. He will build a laboratory for histological and preparation after death. There is no contributions of the same than the subject from which the bone was obtained was injected with a mercurial dermitology. He will build a laboratory for histological and There is no earthly reason preparation after death why mercury should be deposited in bone as mercury causing bone lesions is concerned, do we know of any such thing as mercurial ostenis? We know that mercury is given for syphilitic affections And we know that of bone, and with good results mercury, given to ptyalism, is frequently valuable in non syphilitic osteitis

Are we to believe, then, that mercury can itself cause similar lesions? This is good similar similabus,

but very poor pathology

When chemists examine the dead bodies of persons supposed to have died from the effects of mercural preparations, they do not investigate the bones, They have no reason to investigate but the viscera In works on the chemistry of poisons the the bones And in such cases bones are not even mentioned of poisoning has anyone ever seen any bone lesion thought to have been caused by mercury? The deposition of mercury in the bones is a Thompsonian and old woman's myth Reviewer]

MISCELLANEOUS.

HEALTH IN MICHIGAN FOR JANUARY, 1888 -For the month of January, 1888, compared with the preceding month the re ports indicate that pneumonia increased, and that diarrhœa de-

Compared with the preceding month the temperature in the month of January, 1888, was much lower, the absolute humid ity, the relative humidity, and the night ozone were less, and

the day ozone was more

Compared with the average for the month of January in the nine years 1879 1887, diphtheria, intermittent fever, whoopingcough consumption of lungs, pneumonia, bronchitis, typo ma larial fever, and influenza were less prevalent in January, 1888

For the month of January, 1888, compared with the average of corresponding months in the nine years 1879 1887, the temperature was lower, the absolute humidity, the relative humidity, and the day and the might again uses less and the day and the night ozone were less

Including reports by regular observers and others, diphtheria was reported present in Michigan in the month of January, 1888, at 57 places, scarlet fever at 54 places, typhoid fever at 39 places, measles at 20 places, and small pox at 1 place

Reports from all sources show diphtheria reported at 19 places more, scarlet fever at 14 places more, typhoid fever at 19 places more, and small pot at i place more in January, 1888, than in the preceding month

A part of the increased prevalence of communicable diseases is doubtless only apparent, because a knowledge of a large num ber of outbreaks, not otherwise reported, was obtained from the annual reports of health officers during the month of January

THE MEDICAL ASSOCIATION OF THE STATE OF MISSOURI will hold its next annual meeting in Kansas City, Mo, April 17, 18 and 19, 1888, at Music Hall A large attendance is expected

STATE MUDICAL SOCIETY OF ARLANSAS -The Thrteenth Annual Session of this Society will be held at Fort Smith, April 25, 26 and 27, 1888, commencing on Wednesday, April 25, at IIAM President, W P Flint, M D, of Washington, Ark, Secretary, L P Gibson, M D, Little Rock, Chairman of the Committee of Arrangements, L L Saunders, M D, Fort Smith, Ark

PROFESSOR UNNA'S COURSE IN DERMATOLOGY —On April 1 Professor P G Unna, of Hamburg, will begin a series of half his clinic and polyclinic.

OFFICIAL LIST OF CHANGES IN THE STATIONS AND DUTIES OF OFFICERS SERVING IN THE MEDICAL DEPARTMENT U S ARMY, FROM MARCH 3, 1888, TO MARCH 9 1888

First Lieut W W Fisher, Asst Surgeon, sick leave extended one month on surgeon's certificate of disability S O 50,

A G O, March 2, 1888

First Lieut Paul Shillock, Asst Surgeon (recently appointed), ordered for duty at Ft Assimboine, Mont S O 50, A G O, March 2, 1888

OFFICIAL LIST OF CHANGES IN THE MEDICAL CORPS OF THE U S NAVY, DURING THE WEEK ENDING MARCH 10, 1888

Asst Surgeon E P Stone, detached from the Coast Survey
Str "Bache," and to hospital, New York, for treatment
Asst Surgeon James F Keeney, commissioned March I, 1888
Surgeon George R Brush, ordered to the "Omaha" when
"Pensacola" arrives at Aspinwall
P A Surgeon Victor C B Means, to the "Omaha" when
"Pensacola" arrives at Aspinwall

"Pensacola" arrives at Aspinwall

OFFICIAL LIST OF CHANGES OF STATIONS AND DUTIES
OF MEDICAL OFFICERS OF THE U S MARINE HOS
PITAL SERVICE FOR THE TWO WEEKS ENDING
MARCH 10 1888

Surgeon W H H Hutton, to proceed to Brunswick, Ga, on special duty, March 5, 1888 Detailed as President of Board to select site for Gulf Quarantine Station March 10, 1888. P A Surgeon H R Carter, detailed as recorder of Board to select site for Gulf Quarantine Station March 10, 1888

P, A Surgeon Eugene Wasdin, granted leave of absence for thirty days March 8, 1888

Asst Surgeon W D Bratton, ordered to examination for promotion March 7, 1888

Surgeon G W Stoner, detailed as chairman of Board for phy stcal examination of officers and candidates, Revenue Marine

Service February 28, 1888

A Surgeon F M Urquhart, detailed as recorder of Board

A Surgeon F M Urquhart, detailed as recorder of Board for physical examination of officers and candidates, Revenue

Marine Service February 28, 1888

A Surgeon P C Kalloch, relieved from duty at Pittsburgh, Pa, ordered to Marine Hospital, San Francisco, Cal March

Pa, ordered to Marine Hospital, 2, 1888

P. A. Surgeon P. M. Carrington, relieved from duty at Marine P. A. Surgeon P. M. Carrington, relieved from duty at Marine P. Hospital, San Francisco, Cal, ordered to assume charge of Hospital, San Francisco, Cal, ordered to assume charge of Service at Pittsburgh, Pa. March 2, 1888

Asst. Surgeon J. J. Kinyoun, granted leave of absence for twenty days. February 28, 1888

LECTURE

THE OPERATIVE TREATMENT OF RETROVERSION ALEXANDER'S OPERATION

A Clinical Lecture delivered at St Luke's Hospital, BY HENRY T BYFORD, M D, OF CHICAGO

GENTLEMEN -Until recently the treatment of retroversion of the uterus had been a standing reproach to gynecology An inspection of older hosa cure of chronic retroversion Retroversion pes sames of various kinds and modifications follow each other like the waves of an unquiet sea, and disappear without bringing any cure with them Now, however, since operative gynecology has taken the subject in hand, incurable cases are fast becoming the excep-

Operative procedures are of two kinds those for the purpose of restoring the uterus to a natural condition, and those for restoring the uterine supports to their natural functions It is to the latter class of operations that I wish to call your attention, suppospnate treatment

or retaining, and the perineum or supplementary the pelvic organs form, with these organs and their pressure to which it is liable surrounding connective tissue, the pelvic roof When speaking of them as uterine supports, we divide them across the pelvis from side to side and including the uterus in their embrace, the sacro uterine ligaments,

front of the axis of the superior strait, so that the abdominal pressure will bear upon the posterior surface of the uterus All of these tissues suspend the uterus in the center of the pelvis with the fundus in front of the axis of the superior straight, and the external os somewhat behind it When the body is in a state of rest these elastic supports easily sustain the weight of the uterus, and that of the superincumbent abdominal viscera which are also suspended and bear but slightly upon it During muscular action, however, the abdominal pressure bears upon the posterior surface of the uterus and forces the anterior wall of the whole uterus downward toward pital reports will show plenty of cures of almost the pelvic outlet. The resistance of the sacro-uterine every other non-malignant ailment, but scarcely ever ligaments tends to hold the cervix up from the coccyx and favors a rotation of the external os backward toward the sacrum as the fundus is pressed down Thus we see that even when the uterine ligaments are not strong enough to resist this abdominal pressure they normally direct the lower end of the uterus back upon the pelvic floor and the upper end forward upon the firm pubo-vesico-uterine septum

The pelvic floor or retaining support is made up of the lower end of the sacrum, the coccyx, and the coccygeo-anal ligament in the median line, by the ischial bones and obturator internus muscles laterally, between these points by the sacro sciatic ing that the uterus itself has already received appro- ligaments, pyriformis, coccygeus, levator ani and levator vagina muscles, the levator and recto-vesical The uterine supports may be divided into three fasciæ, and lower down by the connective tissue padclasses, the pelvic roof or sustaining, the pelvic floor ding of the ischio-rectal fossa, the gluteal muscles These structures form a firm floor capable of The expansion and duplicature of the perineum over supporting the uterus when borne against it by any

The perineum, supplementary uterine support occupies the space between the pubic rami in front into five portions, the broad ligaments extending of the anus and extends in the median line back along the coccygeo-anal ligament to the coccyx It is made up of the recto-vesical fascia and levator extending from the posterior surfaces of the broad vaginæ, or vaginal sphincter, supported by it, the ligaments and uterus near the junction of the body perineal septum or triangular ligament containing the and cervix, around the rectum to the upper and constrictor urethræ, the perineal fascia containing the middle sacral regions, and suspending the cervix a constrictor cumii or vulval sphincter and the transtrifle back of the axis of the superior straight, the versus perinei, and by the sphincter ani with its facial pubo vesico uterine ligament, extending from the coverings. The perineum forms a barrier across and pubes to and around the bladder and cervix, and just below the pelvic outlet or space between the holding the cervix away from the sacrum, and the levator and behind and the pubes in front. It is firm round ligaments extending from the uterine horns or enough to act as a support to the viscera which peneshoulders like long narrow curved arms, forward into trate it and terminate in it, and at the same time is the inguinal canals The function of the last men- sufficiently elastic to allow the visceral contents and tioned ligaments is to keep (or return) the fundus in fruits of parturition to pass through it It supports the uterus indirectly by supporting the parts in front the upper edge of Poupart's ligament, and near the of and below it

In every complete retroversion of a normal sized uterus the external os lies in front and the fundus behind the axis of the superior strait, in slighter forms the displacement is the same in kind but less in Hence our operations must either assist in holding the cervix back of the axis of the superior strait, or the fundus in front of it

For holding the fundus forward two operations have been performed, viz (1) stitching the fundus uteri or its appendages forward against or near the abdominal walls or bladder, and (2) shortening the round ligaments The former, first done by Kæberlé, requires that the abdominal cavity be opened, and is seldom justifiable except as secondary to a laparotomy We can usually employ other for another purpose equally efficient and less hazardous means The operation for shortening the round ligaments was conceived, successfully performed and established as a therapeutic measure by W Alexander, of Liverpool, in face of from the ring and can be recognized with ease for it almost universal opposition The most telling objections against the operation were that it was difficult to perform (an exceedingly puerile one), and that it was unscientific to operate upon the round ligaments because the sacro-uterine ligaments were the chief ones The latter objection is rendered untenable by the fact that when we draw the fundus forward we restore the normal direction of the uterine axis with reference to abdominal pressure although the whole uterus may be a trifle forward of its natural location, and by the fact that after the os is rotated backward the sacro-uterine ligaments tend to retract, and regain I would like to remind you here that the traction of the shortened round little shorter-meet with no arteries-and succeed as their supporting function ligaments are not antagonized by abdominal pressure, but turn the fundus so that abdominal pressure assists

This patient has a flexible uterus and a relaxed state of the sacro uterine and broad ligaments, allowing the cervix to turn forward and upward against the vesico-vaginal septum and the fundus to become fitting pessaries by myself, and afterwards by another loosely both edges of the ring to the ligament I now gynecologist, and a persistence of distress, inability to attend to her duties and hysterical symptoms, in spite of local and general treatment, have influenced public attachment me to perform Alexander's operation

As you see, she is a young, well developed, somewhat muscular woman, without any superabundance The ligaments should be of good size and spine and extend it for an inch and a half outward apt to be poured out freely during the first few hours along the upper edge of Poupart's ligament cut brings us through the skin, another through a ficial fascia I have struck the external pudic artery left side similarly we sprinkle a few grains of iodoform on the inner side of the incision and the superficial in each wound, the the external stitches and lay one epigastric on the other, both of which in this case of these pieces of lint dipped in a 10 per cent solu are so large as to require fine catgut ligatures Below tion of carbolized glycerine over each wound this deep layer of the superficial fascia we seldom fore removing the uterine probe I slip an Albert us down upon the external ring which is easily felt As the patient will now wear it with comfort I will by the force and are less than the force are less than the force are less than the force and are less than the force are less than the force are less than the force and are less than the force and are less than the force and the force are less than the force are less than the force and the force are less than the force are less by the finger end as a long narrow depression along leave it for six or eight months, or until a permanent

pubic spine With a probe-pointed fascia scissors I now cut all the tissues to the entire extent of the incision, introduce these small tracheotomy retractors, and have a clear bloodless field for work. An incision is now made from the pubic spine along the upper edge of Poupart's ligament right over the inguinal ring and as far as the depression is felt to extend A slight bulging of fatty tissue shows that the inguinal canal is I seek for the ligament at the junction of the pubic spine and Poupart's ligament, and by looking carefully can see a delicate white nerve filament running over some pinkish slightly striated tissue I cut the nerve, which is the genital branch of the genito crural, and take up the tissue under it with the forceps, being sure to keep near to the pubic spine and Pou The thin fascia connecting it with part's ligament the inferior external pillar is punctured by my broad hook and as the tissues are held up the fascia snipped toward the inguinal canal The ligament is now free By means of the hook I is a large muscular one pull gently upon the ligament, separate the surround ing connective tissue, which forms a very loose sheath containing here and there aponeurotic bands that require section with the scissors The ligament is strong, however, grows larger as it passes up the canal, and the connective tissue looser and more Pulled again, the ligament slips easily separated gradually out of the canal, drawing an inverted portion of the peritoneal covering with it The ligament may now be said to run I now drop it, introduce a small clean sponge into the incision, and cut for On this side I make the incision a the other easily as before in making the ligament run While Dr Hoag replaces the uterus with a sound, I strip the inverted peritoneal sheath back and, the uterus being replaced, I pull on both ligaments until the sound in the uterus is felt to move While Dr Foulks holds the left one I will take three sutures with fine silkworm-gut through each edge of the ring and the round ligament as thus pulled out, and approximate cut off the projecting loop of the ligament and fasten the free end to the connective tissue at its normal A few drachms of 1 per cent carbolized water, injected into the ring under the ligament cleanses the inguinal canal perforated rubber dramage tube, which I also slip under the ligament well into the canal, will pre vent an accumulation of the bloodly serum which is One Using silk-wormgut for the external stitches, I carry the one nearest the pubic end of the incision Having treated the through the round hgament Another cut brings Smith hard rubber pessary over it and into position

nurse will put a little absorbent cotton over and around the dressing and fix it all in place by a double She will change the dressings as often T bandage as saturated by the discharges

The after treatment is based upon ordinary surg-In from twelve to eighteen hours I the drainage tubes until it comes out clear twenty four to thirty hours I shall remove the tubes, wash out the drainage holes, sprinkle iodoform over all the stitches and then cover them with pads of so that I may not be able to recognize anything 10doform gauze In this way all bloody serum is removed and primary union under a dry dressing anterior surface of the pubes near the spine, and External sutures are removed in 8 days

tion will undoubtedly present more difficulties about the broad ligaments the cervix is one of the indications of such trouble, ligament a complete and unhampered replacement impossible as pessaries do not hold the uterus in good position, the other similar looking tissues I have operated in a few to relieve her in the end relief has finally occurred She is a little fleshier than the first patient, but is rather deficient in mus cular development, hence, I expect to find a smaller ligament and a greater abundance of connective ligament run

and, not reaching the arteries on either side, scarcely bleeds at all superficial fascia, and I will illustrate a mistake often of it is left made, that prevents the ligament being found may know it by the springing up of the fat make an incision over the ring about half an inch long, and the fat between the deep layer of the sup erficial fascia and the abdominal muscles, bulges up as if from the ring You may hunt about in this supposed ring for hours, as others have done, and not one half the diameter find any ligament We now cut through this deeper observed Feeling about again I at last find a de- condition of affairs on the other side

readjustment of the tissues will have taken place The hour-it is a depression filled with fat just below Poupart's ligament We must, therefore, in this case disregard depressions and cut down upon unmistakable unvariable landmarks I place my knife just external to the pubic spine and cut through the fascia along the upper edge of Poupart's ligament, for the ring must be here I am through, but I see no shall inject some more of the carbolized water into round ligament, only fat and connective tissue In from Picking away a little fat I cannot be certain what I If I now make the mistake of poking about in the inguinal canal, I will disorganize the tissues

Remembering that the ligament is attached to the also to the external ring, I carefully take up the tis-We have here another patient in whom the opera- sues that he against the upper edge of Poupart's She ligament near the spine, perforate the thin fascia had some pelvic inflammation after the birth of her stretched between the tissue raised and the external child about two and a half years ago, and, although pillar with my broad hook, and feel confident that I apparently cured, has some faintly palpable hold the round ligament I dissect off the fascia peritoneal and cellular indurations and contractions underneath, pull off the connective tissue fibers at A slightly bluish hue of the sides and above, but still cannot recognize the The tissue remaining on my hook is and is a condition that should lead us, before per- somewhat ragged, seemingly too small, and, although forming Alexander's operation, to examine the pa- I have separated this tissue quite deep into the ring, tient under ether, and determine whether the ad- it will not pull out nor run If I pull any harder it hesions and contractions might not be such as render | may break, in fact is already stretching | Now there are a few characteristics of the round ligament and In this case the fundus can be laid flat over the blad- its attachments that will enable me to determine der, but less easily than in the other case However, whether to go ahead with this or to take up one of If this is an and as there are no direct adhesions to prevent the aponeurotic edge its separation from its surroundshortened round ligaments acting, we will perform ings must be followed by hæmorrhage-but the sep-Alexander's operation as the most likely treatment aration of this is almost bloodless, the aponeuroses when put upon the stretch come to a sudden stop, such cases and have found that a readjustment and and, if pulled harder, break—while this gives an elastic resistance when pulled, and stretches before breaking, when an aponeurotic edge is pulled toward the inguinal canal, and from the pubes it shows its attachment to be at one of the pillars or under tissue, and to have some difficulty in making the them - while this, when thus pulled, shows its attachment to be out upon the pubic bone near My incision, as you see, is only about an inch long the spine I am therefore sure that I have the ligament, although it is so small and has so spread We are now upon the deep layer of itself before reaching the pubic bone that but little Introducing my finger deep into the We canal I boldly separate the ligament as far as the inare told that when the inguinal ring is opened we ternal ring, and have the satisfaction of seeing it pull out slightly, become a little larger and easily recog-But I cannot bring out the peritoneal sheath as in the other case, and must separate very slowly with my finger in the canal It now runs, as you see, but not so well as the other, and is about

The mistake that has often been made in such layer of fat by a free stroke, and come upon a coarse cases as this is that the ligament has been gradually fibred fascia that shows no trace of an inguinal ring stretched out instead of drawn out When there is either to the sight or touch, for the firmness of the difficulty it is better to enlarge the opening of the fascia prevents us from feeling any depression over ring, and get into the canal where the ligament the ring, and the relaxed empty condition of the grows larger instead of smaller, as it would if merely bowels takes away that soft fullness that is sometimes stretched You will notice that I have the same pression, and did I not know my landmarks well, I being replaced, I finally succeed in moving the would cut down into it, and perhaps search for an uterine probe by pulling on the ligaments. The

difficulties are over, and I proceed to attach the tion in the vital or visceral organs of the body, and ligaments and complete the operation as before We will leave the pessary for eight or ten months

A little reaction may be expected from the disturbance and stretching of peritoneal indurations and contractions, and possibly a dose of morphia be delphia in 1799, proved to be a weapon of destrucrequired when she recovers from the anæsthetic The pessary is left for the purpose of keeping the in 1814-15, and doubtless many valuable lives were cervix back of the pelvic axis until the round liga ments are healed in their new relationship, and until of the sangrados of that period Dr Gustavus B the sacro uterine ligaments will have time to contract Horner, a successful surgeon of the U S army, and as much as may be If, after two or three months there should be any tendency to a sagging forward the depletory treatment, and after a third venesec of the cervix toward the relaxed pelvic outlet, we tion, died in the vigor of manhood will raise the posterior vaginal wall by denuding and drawing up the tissues along the posterior sulci, somewhat after Freund's perincorrhaphy or Martin's elytrorrhaphia duplex lateralis Thus the fundus will not only be held forward but the cervix upward and backward, and the retroversion be permanently

EPIDEMIC TYPHO-MALARIAL FEVER BY FREDERICK HORNER, M D, OF MARSHALL, FAUQUIER CO, VA

Among the medical notes of the writer's grandfather, the late R H Little, M D, who practiced at Hay Market, Prince William county, Virginia, was found the following letter from his preceptor, Dr Benj Rush

"Sept 5, 1804 —I have only to advise, in your present contest with a powerful and insidious epidemic, to accommodate your remedies to the state of the system Try all modes of treatment There is certainly a right one, and I sincerely wish you Tell your farmers who complain of the plaster-of-paris as the cause of their sickness, that the potato was banished from France by an edict of had made a rapid trip from the United States to the government because a sickly season followed in a few years its cultivation in that country people after a while discovered their mistake, and death recalled the potato from its banishment Our city is unusually healthy, the heavy rains, by washing our though local causes favoring its development were streets and common sewers, have been in the hands supposed to exist on board of heaven of making it so "

Shenandoah, near Winchester, and his notes show that he encountered again in 1827 another epidemic report is quoted to show that naval surgeons admit then termed remittent bilious fever lies, including white and colored persons, and of all ages, were prostrated by the disease, which extended all along the river as far as Harper's Ferry, and to Though Dr Little the near villages and towns served as a surgeon in the U S army, strange his notes fail to record the occurrence of a previous epidemic of fever of widespread prevalence in the New England and Middle States in 1814-15, subsequent to the war with Great Britain, which the physicians considered to be a new form of disease, and The drinking water is obtained from wells and named "Typhus Pneumonia." failed to recognize that it was a low asthenic form receiving the debris from the atmosphere, the soil, of disease, with no visible signs of inflammatory ac- and occasionally putrid animal matter

in this aspect entirely differing from bilious remit-The "lost art" introduced by Dr Rush, tent fever of the Lancet, and claimed by him to have been so effective in the treatment of yellow fever in Philation when physicians were called to treat the fever sacrificed because of the blind adherence to theory physician of Warrenton, Virginia, was submitted to

Incidental to the massing together of large bodies of soldiers during the civil war in this country, and from local and climatic causes, this fever, which was then first properly designated Typho Malarial, again prevailed, and again occurred a repetition in 1886-The "Bulletin of Health" of Tennessee for the month of October, 1887, reported bilious fever to be epidemic in some localities In Lebanon county there were 48 cases, 29 white and 19 colored Out of this number were 6 deaths The reports from seventeen counties of Tennessee show that typho-malarial was the most prominent prevailing disease, and that the year has been one of greater fever prevalence than common all over the country Some of these cases of fever were of a very severe grade, and proved fatal Some lacked the bowel complications and rose spots, and other distinctive features, yielding after three weeks to a treatment of 10dine, carbolic acid and quinine The newspapers also confirmed the statement of the general prevalence of the disease in Missouri, Ohio, Maryland and It occurred, also, on board ship, as well as on land The official report of Surgeon-General Grinnell, U S navy, for 1886, mentions that "the commanding officer of the U S S Quinabaug, who Egypt in nineteen days, arrived, a fever of a violent The type set in, ending in perforation of the bowels and The crew of another vessel of the squadron contracted this fever in the port of Alexandria, At Constantinople, after the vessel had gone into dock, a case was de Dr Little afterward removed to the valley of the veloped that could be traced to a local cause suffi cient to generate the poison of typhoid fever " This Entire fami- the existence of a materies morbi and the infectio contagious character of the disease

A brief record of cases which occurred at Mar shall, Fauquier Co, Virginia, in 1886-87 may interest the reader Marshall has a population of about 200 inhabitants, and is located near the Blue Ridge mountains, in the midst of a section of the state famed for salubrity The houses have been long built, some a century ago, with no cellars, timbers partially rotten, and in contact with the ground Unluckily, they pumps long sunk and rarely cleaned out, the water

drought prevails in midsummer, the water is low and has a somewhat unpleasant taste of salts of magnesia, lime and iron During the winter and spring of 1886-87 the weather was very cold, with violent storms of wind, and the summers were extremely hot, with the thermometer in the 90's for days, night and day distinct hot waves were felt

Case 1 — S G, a farmer, æt 65 In the month of March, after great exposure buying cattle in Chicago, returned home and became ill with symptoms of typhoid fever The drinking water of his family was obtained from a pump located a few feet from a stable and a heap of manure He never rallied, and died comatose during the third week

Case 2 -M T, female, æt 40, lived at Marshall Dwelling house and water supply unsani-

This patient also died

Case 3 —Three females, two adults and a child, in one house, were taken simultaneously ill with fever -type, typho malarial—cerebral and nervous symptoms very violent Within a few yards of the dwelling was heaped up the earth from a well which had been dug and rock quarried with large quantities of powder and dynamite, and left exposed to the ex cessive heat and neavy rains which fell during the month of July One case of acute All recovered dysentery occurred in this family afterward During the month of May, 1887, Dr Copeland stated to the Fellows of the N E Medical Society that he had had in his practice lately several anomalous cases of fever, simulating, he considered, meningitis Shortly afterwards Dr Cochrane, of the Plains, near Marshall, had under treatment three cases of fever in a single family, one very ill The cellar and kitchen of the house was very unclean, and fouled by the débris of decayed vegetables and chicken offal thrown out near the dwelling All recovered. under the treatment by baths and the internal use of antipyrin The disease again invaded Marshall and the vicinity, and there were cases of fever in nearly every house, while the newspapers reported its prevalence all over the state

Case 4—M C, female, æt 40, occupied one of the old houses, with the flooring and timbers near She was very ill for weeks, unable to retain any food, and was nourished by enemata Recovered

Case 5 -P L, male, æt 45, kept a livery stable, and had also a distillery At first was not seriously ill, and worried a great deal His dwelling house was quite near the stables When recovering he was warned to avoid exertion and exposure to the sun He rebelled, however, and when about attending to his affairs, relapsed, became comatose, and died in this condition

Case 6 -H M, female, unmarried, lived in an overcrowded house, with inmates who had no special employment, and were perhaps poorly fed case presented all the worst symptoms of typho-malarıal fever She recovered after a long illness

Case 7 -M D, a colored woman, et 45, was ill

appeared in better health than for many years the month of October following, while undressing for bed, she dropped dead, from mitral disease and paralysis of the heart

Case 8 —G A, female, married, æt 30, has three children and has had three miscarriages, and for sev eral years symptoms of Albuminaria When taken ill with fever there was great body heat, high fever, and wasting of flesh After sponging with cold spring water, the skin would dry as if it were a heated metallic surface The drinking water was obtained from a spring near the stable, and was considered unwholesome At the end of five weeks she was delivered of a dead fœtus at the period of five months' gestation Afterward she made a good re-

Case 9 — B C, a married lady, æt 50, resident of Philadelphia, before coming to a country residence near Marshall to spend the summer She had lately moved into a house, the entire repairs of which had given her great worry, had for several years complained of constant dull pain in the right side, after exposure to malaria while visiting Europe summer she returned to the city for a few days, but again came to the country here, becoming ill with symptoms of incipient typhoid fever She went back to the city The report received of this case was that at the end of six weeks the patient became suddenly ill—great prostration, pallor, cold extremities, and collapse, with swelling, and all the signs of an hepatic abscess After consultation, her physicians, Profs Bartholow and Parvin, at first were inclined to operate, but waited, and finally left the cure to nature After three months' severe illness, the patient is making a good recovery

Case 10 -M W, the son of this lady, at 21, a druggist by profession, became ill with fever, acute pain, tenderness of the abdomen, temperature 104°, pulse 93°, and signs of collapse and peritonitis He had been allowed to visit his mother's chamber, after the free use of disinfectants on his face and hands It may be added that this patient's business was in a large manufactory of drugs and chemicals, and confined him during the entire day to a heated if not impure atmosphere For some weeks he complained of loss of appetite Resident in the house where his mother was ill for weeks with fever, it cannot be a matter of surprise that he contracted the disease, which developed the usual symptoms, with marked Both of these cases are now convalescent, and have been ordered to a health resort in the

That the brief narrative presented of these fever cases at and near Marshall suggests a clew to the etiology would appear to be self-evident dwellings were unsanitary, the drinking water impure, the isolation of patients was neglected, and the season was marked by excessive hot weather, with tne epidemic tendency to typho-malarial disease In Pepper's "System of Medicine," chapter "Typhoid Fever," by I H Hutchinson, M D, the author with the fever for several weeks in the month of Oc- mentions that a single case at Darwin, England, tober Had for several neeks symptoms of heart where the sewerage of a single house was defective disease She made a good recovery, and afterward the excreta of a typhoid fever patient was carelessly thrown into a well from which drinking water was though it may not suffice to prevent the develop obtained, and 1,500 cases occurred in that town In another instance it is proved that the excreta of a patient hving in a town near London gave origin to an epidemic fever affecting 62 families, who used the milk of diseased cows Indeed, the medical profession at present are agreed in the opinion that the stools and clothing of fever patients, and the putrefactive débris of wells and cellars, and impure water or milk, so long as they retain the specific germs, bacilli typhosi will prove sources of infection—the incubative period being usually three weeks. And as a final cause, it may be added that the Bible informs us that the Almighty smites man with fever as a judgment for punishment of sin

Treatment of Typho-Malarial Fever -Only the and by Bedford Brown, M.D., in a late article pub Divine Savior, who healeth all our diseases, has by a touch and word cured any form of fever The office of the physician would appear to be in his treatment of a case, to seek to avert harm to important vital and excretory organs and viscera, where lesions At Marshall and in the vicinity the three methods of treatment now recommended by standard authors were tried, viz first, baths, second, antipyrin, and third, iodine In the treatment of the fever at Marshall, each of these methods were given a fair trial, and with excellent results cold bath, begun with first in the morning, and afterwards repeated three or four times during the 24 hours, acted admirably in adynymic cases attended by high nervous excitement Antipyrin, five grains every three hours, administered internally bath there is marked reduction of temperature, and of the pulse rate, and when the full effects of antipyrin was obtained, profuse perspiration, followed by refreshing sleep and a desire for food, with no unpleasant effects, as sometimes follows the use of quinine

Professor Robert Bartholow was the first to suggest the use of 10dine, which, it is supposed, produces a condition of blood in which micro-organisms, The Staincluding the bacilli typhosi, cannot live tistics of Collective Investigation are as yet needed The distinguished author recto prove this theory ommends the following formula

R Tinct Iodid, f 313 f 31 Acid Carbolic Liq,

Of this, one, two or even three drops is given in a sherry glass full of ice water, after food, and repeated every two or three hours during the day and In addition to this treatment, Hydrarg Mumas, gr v, is prescribed, and repeated on alternate nights until three or four doses have been administered in the course of the first six or eight days Unless there is a high temperature, 104° F, it is stated the fever calls for no special treatment beyond cold sponging The single case treated after cal Congress this method near Marshall recovered

He should use boiled water, cooled by ice, as the vanced wonderfully in the past few years by the process of boiling tends to arrest fermentation, energy of enthusiastic practitioners

ment of bacıllı

Finally, it may be added that for many years prior to the discovery of remedies already enumerated. ol ferebinth, sulphate of quiniæ, and alcoholic stim ulants were esteemed as valuable medicines for the treatment of typho malarial fever In the "Medical and Surgical History of the War of the Rebellion," vol 11, 1t 15 stated by Cullen, Rush, Physic and Chap man that whenever the tongue became smooth, dry and red at the edges, and there was vomiting and diarrhœa, emulsio ol terebinth as a diffusible stim ulant and local alterative acts well, and is an incom parable remedy in low fevers. Antiseptic virtues are attributed to this remedy by the authors cited, lished in The Journal, July 2, 1887

IMPLANTATION OF HUMAN TEETH, THE LIMITS OF ITS SUCCESS

BY I P MILLER, MD, OF BUCKHANNON, WEST VIRGINIA

In reply to a considerable number of inquiries The made in person shortly after the operation, and later by letters, but all too early to warrant me in the ex pression of an opinion as to the good result in my case of an implanted tooth, I take this opportunity of writing particulars rather fully, and I hope satis factorily, for publication in The Journal, believing that this will be of interest to many more than those that have inquired

While attending the late International Medical Congress at Washington Dr Younger, of San Fran cisco, kindly and certainly skilfully did for me the operation of implantation, at the Franklin Building, in the presence of a number of dentists and the ubi The latter had a position in the quitous reporter hard-pressing crowd before all others, and rested his manuscript upon an arm of the chair in which I was The next day, September 10, the Evening Star devoted a column to "Dental Curiosities," from which I quote the following

"To the person who believes that the sphere of the dentist embraces only, or principally the operation commonly known as pulling teeth, but called in den tal vernacular 'extracting,' a visit to the clinical operations at the Franklin Building would have been a There, every morning throughout the revelation week, prominent dentists have performed som e of the most difficult and useful operations known to the pro Patients were treated in a highly scientific manner-filling, building, scraping were done on all This work has, perhaps, attracted more attention than that of any other Section of the Medi

"The human mouth, with its various uses and in cidents, presents to a dentist a world of possibilities regulated, and such should have complete physical Invention runs riot in cavities between roots, and through the gums Dental science has been adten years ago were considered the acme of perfec tion are now abandoned as musty and worthless

"But there is one operation which overshadows all others in its wonderful character and its important This is the 'implantation' process history of the operation is as follows hundred years ago Dr Hunter, of Edinburgh, Scotland, had a peculiar idea, and he followed it out by extracting a live tooth from a human jaw and implanting it in the comb of a rooster grew, much to the delight of the Scot, and, probably, to the disgust of the cock But Dr Hunter's difficulty now lay in the fact that he did not know why it grew, and consequently was unable, in his future operations, to select those peculiar conditions which were necessary for successful work Considerable experimentation has gone on since that time with varying success, but it is only within the past two years that practical results have been obtained W J Younger, of San Francisco, is the pioneer of the practical work in implantation, and has been carrying it on for about two years His first step was to discover that which Dr Hunter did not know, the cause of the growth of the tooth He has found, he says, that the human tooth is provided, like a grain of wheat, with a membranous outer lining, which serves to supply the material with nutriment through This is termed the peri-cementum tooth may be extracted, Dr Younger has discovered, and laid away for years, but if the membrane is not side of the mouth disturbed or injured it may be used with success in implanting

"YESTERDAY'S OPERATION

formed on Dr J P Miller, of Buckhannon, W Va, throughout the dental establishments of the city until | subject, and that no better result could be had place in Dr Miller's gum had yawned for nearly four an apple years, and the missing tooth was described as the right of the central tooth pared by removing with dental burrs all of the pulp, gum was cut open by two upward incisions, making day accident a 'flap' None of the flesh was removed The denforming a cavity there, working away until the hole of the meaning of the inquirer, viz was exactly the size and shape of the root of the This consumed about thirty minutes root, and the line of the edges of the teeth was exact A thread was next tied around the tooth and fastened to its two neighbors, in order to keep it from disturb-The flesh was pressed down into place and site side of the mouth

operation about 200 times, and in only twenty has partially masticated, yes

These failures he attributes to the absence he failed of the 'peri-cementum' In about two weeks the thread may be removed, and in another fortnight the tooth will be solid

"Surgeons recognize this operation as one of the most difficult and practical known to the dental profession, and it is claimed that in certain lines it is destined to revolutionize the science"

Immediately after the completion of what is described above, an impression of the back of the teeth next adjoining to and including the implanted one was taken, and a plate of vulcanized rubber made so as to fit closely all these Holes were drilled through this plate through which silk ligatures were passed, then between and over front of teeth to protect and stay, or "splint" the newly implanted tooth This I was told to leave in place for two weeks, and keep the gums carefully aseptic by frequently washing with a bichloride solution, 1-1,000 This solution I found too strong After weakening to about 1–5,000 I bore it well and it did well The first few days I washed—or rinsed—the gums by taking a mouthful of the solution and running it over the parts, including the newly made flaps and the entire extent of plate-covered gum, using several mouthfuls at a sit-This was done three and four times a day at first, then twice a day until I removed the plate, on October 3 All this time I avoided the mastication of solids, even beef and bread, in the "implanted"

About two months after the implantation A M Jarrett, DDS, of Grafton, W Va, a skilful dentist of twenty years' active and extensive experience, who was with me at the Franklin Building the morning of "The operation which Dr Younger yesterday per- the operation, and himself implants teeth, examined my tooth carefully and pronounced it a perfect suc-A search was made in the morning cess, explaining that I was an exceptionally good a suitable tooth was found, intact in its coating, per- to that time and still later I had never felt that the fectly sound, and of the proper size The vacant tooth would do to "take a bite" with, not even of

During the holiday season I accidentally placed right superior lateral, that is, in plainer language, under the tooth a piece of cold turkey which sprung one of the 'eye teeth' of the upper jaw, just to the it loose, and gave me a soreness and pain in the gum The tooth was first pre- for several days and the tooth feeling about as it did when it had been implanted a week, but decidedly and replacing it with 'hill-stopping,' a preparation of and easily movable. At the time of this writing it is gutta percha Then, when the tooth was ready, the less painful, possibly more solid, than before the holi-

To the inquiry, then, whether I regard implantation tist then bored up into the jaw-bone of his patient, as a success. I must qualify my answer by the extent

1 Does it restore the symmetry of the teeth, gums The and mouth? Yes, my tooth had been extracted prepared tooth was then inserted and so fitted that about four years and the gum was badly shrunken there was perfect contact between the bone and the This did not begin to fill up until about two months after the implantation, since which time it has filled out almost completely, and the tooth is same in size, color and general appearance as its fellow on oppo-

2 Can the tooth be used in mastication? Upon "Dr Younger stated that he had performed this food of medium hareness and when insalivated and

3 Is the tooth as good as the original one whose place it fills? No, and it will be remembered that I had it upon good dental authority that a better result than mine was at two months after the operation cannot be had

Buel hannon, W Va , March 17, 1888

THE NECESSITY FOR INSPECTION OF ANIMALS REQUIRED FOR FOOD

Read in the Section on State Medicine, at the Thirty Lighth Annual Meeting of the American Medical Association, June, 1887

BY CARL II HORSCH, MD, OF DOVER, H. R.

Among the number of persons who have made efforts to prevent the eating of diseased animal food, Moses was the first well known The commands in the Talmud are

"The animal shall be killed with a sharp knife and three cuts If the knife has a jagged edge, or the animal breaks a leg when falling at the time of butchering, the meat is condemed

"To eat no meat from a diseased animal,

"From an animal that has died suffering with tympanites,

"Animals which have Jaw worm,

"Lameness from any cause,

"No meat from calves under eight days old,

"From sheep suffering with tetter,

"Diseases of the lungs, abnormal formations, more lobes on one side than the other (on the right 3, 5, 7, on the left 4, 6, 8,) adhesions, indurations, patches, water-blisters, matter in the vessels, if the lungs are flabby, dry, black, yellow, whitish, fleshy, or coagulations of dark, stringy blood are found in the vessels

"No suppuration, or other diseases of the liver,

spleen, or kidneys

"No sharp things in the stomach, which perforated

the lining of the walls, and have pus on them

"Meat from healthy animals, and where the large vessels have been cut out is called Kausher"

Regarding eating pork and no fish without scales, this was most likely a dietetic regimen for the condition of the Israelites in tropical regions, and against prevailing diseases such as leprosy It would be well if the rational parts of these commands were obeyed

by all nations

Dr Most says "Only healthy animals should be butchered and their meat used for food The signs of health are The animal moves around and appears lively, by applying gentle pressure on the back it ing turkey to my house While preparing it for cook does not bend the ears or tail, the eyes look clear ing my wife found a very large liver, with white patches and bright, the body is well formed and nourished, rumination of the cud is carried on well, no saliva flowing from the mouth, no blisters or pustules on the mucous membrane, breath is normal no cough, groaning or gasping, the skin is not tightly grown to the body, is free from pustules, scurf, or scales, temperature normal, hair glossy After skinning the animal we should find no boils, tumors, pustules nor black spots, the meat should be firm and has the characteristic fresh smell

"Meat is not fit to eat from too old, too young, or from sick animals Such meat is hard, tough, or soft, pale, watery or greasy, and the fat is soft, green or yellow On opening the chest of healthy animals there is no putrid, bad-smelling exudations, no white patches or ulcers, no difference in color, and no dis ease in the surroundings of the lungs In the stom ach and bowels we find no red spots, soft, gray, black places, no dry, dark looking remains of food

"The best meat comes from healthy animals of middle age The appropriate age to fatten oxen is from 5 to 8 years old Calves should be at least 3 or 4 weeks old, dropped the umbilical cord, and have lost the milk teeth Veal and mutton should be kept from two to four days, beef and pork from four to eight, venison from four to ten, and fowls from two to four days Fish should be cooked soon after they are killed

"The meat of animals which have been driven fast before slaughtering is darker and heavier, contains more blood and decomposes sooner The meat of animals killed by lightning is not fit for food butchers inflate mutton to make it look plump, but such meat may contain the fetid breath of some person "

Dr Most cites the following cases

A man contracted a malignant fever and died, after salting meat from an ox which had been sick with murrain (Vich-seuche) A family died after eating the meat of a hog which had been sick with angina (Braune) In Marburg, Stiermark, several persons died of hydrophobia, who had been eating meat from cattle which had been bitten by a mad

dog 1

In 1869 I was called to see a patient in Dover, NH The gentleman was 70 years old, a man of regular habits, and had been the most of his life healthy and strong, until March, 1869, when two of the lymphatic glands on the neck and several of the inguinal glands became enlarged After examination and deduction of other diseases I diagnosed scrofulosis tient was a reliable, intelligent observer, and stated that he never before in his life had any signs of that disease and that there had been no case of scrofulosis I afterwards on either his father's or mother's side ascertained that the butcher of whom my friend bought his meat had slaughtered and sold the meat of an ox which had a large swelling near one of his ears, the person who saw the animal called it "a wolf" This was a case in which I could find no other cause than diseased meat

Two years ago a farmer brought a fat, good look of the size of a cent throughout the tissue On further examination I found fatty degeneration of the liver, and decided that the meat of that fowl would be better relished by the worms

Glanders, hydrophobia, malignant pustules, splenic fever, tuberculosis, trichinæ and other diseases are dangerous and communicable from animals to man

¹Ausführliche Encyklopiidia der gesammten Sizatsarzneikunde von George Friedrich Most Doctor der Philosophie, Medicin, Chiruf gie und Geburtshülfe, etc etc

The bare thought that we are liable to eat the meat of diseased animals causes the strongest aversion and there is certainly danger of contracting diseases to an uncommon extent Being naturally plethoric, thereby

Dr D S Salmon, Chief of the Bureau of Animal Industry, in answer to a letter from Mr J W Bartlett,

Dover, N H, wrote

Washington, D. C., Feb. 12, 1887. In reply to your communication of the 9th inst., I would state that so far as I know there is no systematic and complete inspection of the cattle killed for beef in any State of the Union Many states have beef inspectors, but as a rule they do not in spect all the beef, and in most cases do not see the animal before it is slaughtered or the internal organs when they are removed. They simply look at the beef after the carcass is dressed. Such an inspection is not sufficient to discover all cases of disease for which carcasses should be condemned.

Very respectfully, (Signed), D E Salmon, Chief of Bureau

In an interview with Dr S H Durgin, of the city Board of Health, Boston, Mass, Mr Bartlett ascertained that the city has had an inspection of cattle and meat three years "All the cattle are inspected two or three days before the slaughtering, and the Inspector sees the animals killed If he suspects any disease he inspects the heart, lungs, liver, etc, but does not make a general practice thereof In case the animal shows evident signs of disease before killing, it is slaughtered in the rendering-house away from all healthy animals All disputed cases are referred to the city Board of Health, whose decision is final

Dr Durgin stated that a large amount of tuberculosis in cattle, especially in cows, has been found "

In order to provide a better safeguard against the use and sale of diseased meat, every animal should she was taken with convulsions, which terming the inspected by competent persons before slaughtering, and the internal organs thoroughly examined afterward.

Labor commenced in about thirty days from the safe was taken with convulsions, which terming very pleasantly in every particular to both mo and child in about two hours from its beginning afterward.

Considering the case from first to last, and e

The members of the American Medical Association, Medical Societies, National Board of Heath, American Public Health Association, State and local Boards of Health, every well meaning medical practitioner and citizen ought to see the importance of such a sanitary measure, and make an effort to impress it on the minds of their Representatives to Congress, State Legislatures, County, City and Town officers, that it is for their own safety and for that of over 51,000,000 of inhabitants, and thousands of persons travelling in this country, to pass laws and make appropriations for such protection, and to give the able members of 85,671 physicians, and of the veterinary surgeons a chance to carry out that very much needed part of State Medicine

A CASE OF ECLAMPSIA, WITH ALBUMINURIA, TREATMENT

BY J H BENNETT, M D,

Mrs H, et 35, multipara, was taken with convulsions at end of eighth month of pregnancy At 4 o'clock in the morning of September 28 her husband was aroused from sleep by the convulsive action and labored breathing of his wife I was called immedi-

ately and found patient in a comatose state, face and hands and, in fact, the whole body, cedematous to an uncommon extent Being naturally plethoric, 16 ounces of blood were taken from the arm, followed by 10 grs of calomel combined with 1/4 gr of elaterium This procedure and treatment had a very happy effect in controlling the alarming symptoms Elaterium was continued in 1/5 gr doses administered every three hours, with 60 grs of cream of tartar, until thorough watery stools were secured, which reduced the cedematous condition almost entirely

Believing that urea decomposing in the blood causes the phenomena of eclampsia, benzoic acid was administered (after the thorough watery evacuations were brought about), in 8-gr doses every three hours until the patient became conscious, after which the same treatment was continued, with the addition

of wine of colchicum and guaiacum

As soon as the patient was able to do so, the knee and chest position was adopted and maintained at times when her strength would allow of its use, thereby relieving in a mechanical way the pressure caused by the weight of the gravid uterus upon the renal circulation. The urine was frequently tested for albumin, and for the first few days the quantity was enormous, the test-tube showing that two-thirds to three-fourths of its contents was albuminous on reaching the boiling point.

The bowels were kept well open with occasional doses of cream of tartar and elaterium, with a view of reducing the work of the kidneys. Her diet during this time was a generous and nourishing one Labor commenced in about thirty days from the time she was taken with convulsions, which terminated very pleasantly in every particular to both mother and child in about two hours from its beginning

Considering the case from first to last, and especially the unfavorable circumstance of not being able to see my patient until taken with convulsions, and the happy results of treatment adopted, and finally the short and easy labor, leaving mother and child in excellent condition, impressed me as being worthy of more than ordinary consideration. The only addition to the treatment mentioned was an occasional dose of bromide of potash and hydrate of chloral to secure rest at night.

After an experience of nearly forty years in the practice of medicine, and in the successful treatment of puerperal convulsions when this method was followed, varying, of course, according to condition of patient and indications observed, leads me to firmly believe in its efficacy and importance

There are five important indications to meet, as a general rule First, to relieve the congested brain and venous system by bloodletting, second, to relieve the cedematous condition usually present, by administering drastic cathartics, third, to neutralize the carbonate of ammonia present in the blood by use of benzoic acid, fourth, to eliminate from the system urea, by the use of colchicum and guaiacum, thereby preventing its decomposition, fifth, knee and chest position, where it can be done, to relieve in a mechanical way the renal circulation

Wauseon, Ohio

MEDICAL PROGRESS.

BOUNGIT ON THE PTOMAINFS -DR LOUIS BOUR-GFT, in his thesis on the ptomaines (abridged in Le Piegrès, No 21, November 20, 1887), writes as fol-

The ptomaines, which form in great abundance during the decomposition of animal matter, belong, according to Gautier, to the series of the pyrides and They represent oily, very viscid, colhy dropyrides orless, highly alkaline liquids, and form, when saturated in equal proportion with strong acids, crystalizable, easily disintegrating salts They possess a very penetrating odor, and readily oxidize in the air

Para oline, C, H,, N, 1 is obtained from the putrefying flesh of the mackerel and the horse. It is an only base, of amber color, and smells like hawthorne, it is but little soluble in water, but very much so in alcohol, ether and chloroform Its boiling point is at 188° C (370 2° F)

Hydrocollidine, C,H,,N, an oily liquid, produced

by the putrefaction of meat

Colledine, C, H, N, is one of the most abundant bases, has a strong smell of syringa, and is extracted by chloroform According to Nencki, this base is identical with the collidine, first discovered by him Guareschi and Mosso, following the method of Gauthier, repeatedly found a base of the formula C, H, N Brieger asserts that ptomaines only form during the first stage of putrefaction, and that afterwards they But the fact that it has been possible to extract them from a body eighteen years after death seems to invalidate this opinion Brieger has investigated and isolated the following ptomaines

Peptatorine is obtained from fibrine peptonized by the gastric juice, without decomposition having taken place It is a very permanent substance, and gives with strong reagents the same reactions as the vege-It dissolves in amylic alcohol, and table alkaloids very readily in water, but is insoluble in ether, ben-Millon's reagent (nitrate of zine and chloroform mercury) forms with this base a white precipitate which, by boiling, turns into deep red This base is

extremely poisonous

Neuridine, C, H, N, is a diamine forming long needles like urea Chlorohydrate of neuridine is very soluble in water, but, when pure, insoluble in absolute alcohol, ether and chloroform It is the It is found in most frequent base in animal tissues rotten cheese and in decomposing gelatine, which is very rich in this base Neuridine occurs also in the It is most abundant on the fifth fresh human brain and sixth days, and disappears after the eighth day It forms precipitates with several strong reagents Its picrate is almost insoluble

Neuridine is perfectly innocuous, and is only poisonous as long as it is alloyed with impurities of putri-

The putrefactive neurine is Neurine, C.H., NO extracted from the lees after the elimination of the

neuridine It is excessively poisonous, and resem bles muscarine in its effects It appears in the form of very deliquescent needles, and is an oxyhydrate of trimethyl-vinyl-ammonia, a very soluble base It is obtained by boiling cerebral matter (lecithine, pro tagon) with baryta-water, and derives itself from cho line (bilineurine or sincoline), C6H15NO2, by losing one molecule of water The choline is found in the brain and in the yolk of eggs, in combination with phosphoro-glycerylic acid and can also be obtained from trimethyl-amine and from oxy-ethyl in aqueous solution It is an oxyhydrate of trimethyl-oxyethyl ammonia By treating this choline with hydro iodic acid and oxide of silver, one molecule of water is abstracted, and a neurine is produced which possesses the same properties as the neurine extracted from putrefying meat

Animal ethylene diamine, which is extracted from decomposing codfish, is highly poisonous There is, besides these, in the lees a substance of the same physiological properties as muscarine, and another which Brieger calls gadamine, but which does not

seem to be toxic

The cadaverine, C, H16N2, appears already on the third day, rapidly increases, and abounds proportional to the duration of the putrefaction the following reactions with iodized iodide of potas sium and with bi-iodide of bismuth and potassium, a brown precipitate, with picnic acid yellow needles, with ferrocyanide of potassium and perchloride of iron a blue color It is a thick transparent fluid, which greedily absorbs the carbonic acid of the air, forming in conjunction with it crystals It likewise forms with strong acids beautiful crystals, which are soluble in water and absolute alcohol Its chlorohy drate is very hygroscopic

Putrescine, C, H, N, (bimethyl of ethylene dia mine), is not found in perceptible quantity before the eleventh day of putrefaction It is a clear liquid of sperma-like odor, boils at a temperature of 135° (255° F), and distils without disintegration in It forms with acids presence of caustic potash beautiful crystalline salts, which are not affected by It is very soluble in water exposure to the air

Saprine, C, H, N, is a centesimal compound analo gous to the former, from which it only differs by some chemical and physiological properties of its salts

The last three compounds do not possess any ap

preciable toxic action

The mydaleine forms as early as on the seventh day of putrefaction, but no sufficient quantities for exam mation of its properties can be extracted before the The definite formula of this base has fourth week not yet been discovered, owing to the difficulty of The investigation of obtaining it in pure condition its salts, nevertheless, shows that it is a diamine pto maine, much resembling the preceding Like these, it possesses a great reducing power, and gives with salts of iron and ferrocyanide of potassium anim mediate and very copious precipitate of Berlin-blue color

It produces increase of temperature and of the secretions, especially of the intestinal discharges It dilates the pupils, respiration and circulation be

¹ Brieger refuses to admit the correctness of Gautier's formulæ for parvoline and hydrocollidine. He even maintains that their existence is only due to the analytical method of the chemist.

was not too large, the functions gradually and slowly of the anterior and posterior extremities (in animals) Death is ushered in by a rapid fall of takes place the temperature, and the heart stops during diastole proves fatal to cats

Poehl found in damaged flour, containing ergot of rye, a toxic base, to which he ascribes the convulsive and gangrenous symptoms which characterize poison-

ing by this fungus

the medium in which they develop, different pto-The bacilli which permeate horse-meat produce neurine, those in the flesh of fish, animal muscarine or ethylene diamine

Nencki has demonstrated that the presence of free oxygen considerably assists the process of putrefaction

The various stages of cadaveric putrefaction are marked by the formation of different basic com-Thus, eg, the choline disappears, to be replaced by trimethyl-amine In one of Brieger's experiments it required seven days of putrefaction before the disappearance of the choline was completed, whilst the neuridine could be discovered until the fourteenth day, after which no trace of it was left The formation of an extremely poisonous base is coincident with the disappearance of choline, which seems to confirm the theory that neurine is a derivative of choline -London Medical Recorder, January 20, 1888

PROGNOSIS AND TREATMENT OF CANCER OF THE LARYNY -DR DAVID NEWMAN, of Glasgow, at the close of an article in which seven cases are reported,

Malignant disease of the larynx, if unchecked by operation, is always rapidly fatal, but the course it follows depends chiefly upon two circumstances the site of the primary growth, and 2, its histological The most rapidly fatal cases are those of extrinsic soft carcinomata, the most favorable are intrinsic sarcomata, while intrinsic hard carcinomata may be said to occupy an intermediate position The individual characters of the neoplasm must also

In extrinsic cancer the disease is incurable, the growth spreads rapidly, the lymphatic glands become involved at an early date, and the patient is liable to die either from suffocation, from asthema, from hemorrhage, from sudden collapse or from pyemia, or the fatal termination may be induced by perforation of the œsophagus, by the formation of abscesses, or by pulmonary disease If tracheotomy has been performed at the proper time, life may be prolonged, and suffering for the time be mitigated, but more heroic surgical interference in cases of extrinsic carcinomata offers little or no hope of success Although the prognosis is very unfavorable in all cases of cancer, it is much less so in intrinsic than in extrinsic

come accelerated, after which, provided that the dose volved, the hope of rescuing the patient from impending death is considerable If, however, the disease become normal again, in the contrary case paresis has spread beyond the limits of the laryngeal cavity, or if the glands have become affected, then a tumor which at first may have been intrinsic becomes quite as hopeless, as far as operative interference is con-An injection of 0 005 of a gram $(\frac{1}{12})$ of a grain cerned, as if the growth had been extrinsic from the beginning Total or partial laryngectomy is only to be thought of where the disease is intrinsic, and if the operation is to be performed, it should be done as soon as the diagnosis of cancer has been estab-I am firmly of opinion that cancer is prima-The germs of putrefaction produce, according to rily a local disease, and so long as the system of lymphatics has not been involved in the new formation, I think it is quite possible that the patient may be rescued from death by the early performance of a radical operation

When surgeons make up their minds to operate upon cancer of the larynx at the earliest possible stage of the disease, the statistics of laryngectomies will be greatly improved, and there will be some hope of curing the patient But so long as members of the profession encourage the belief that cancer is a constitutional disease, their patients will seek to hide the fact of the existence of a tumor, in the fear that it may be pronounced to be "cancer" On the other hand, the fault is not always with the patient, it is not uncommon for the family medical attendant to postpone a consultation till he has satisfied himself of the nature of the disease, when this has been done the growth is often so far advanced as practically to place the patient beyond cure I have frequently had painful experience of the evil effects of delay both in hospital and private practice, and I here desire to insist upon the importance of medical men prevailing upon patients who may suffer from intrinsic carcinoma to submit to operation as early My experience in the treatment of canas possible cer has been almost limited to the larynx, mouth, and nose, where you see the disease at an early stage, and the diagnosis is comparatively easy ynx the growth usually exists within the cavity for a considerable time before secondary manifestations show themselves But while this is so it is no reason for delay-quite the contrary If laryngectomies are justifiable, it is only on the belief that cancer is primarily a local disease, which may be eradicated if the operation be performed at a sufficiently early

Laryngectomy as an operation for cancer is still on its trial, and the question now sub judice isshould partial or total laryngectomy be undertaken as soon as the diagnosis has been established, or should simple tracheotomy be performed at a time when the growth has so increased as to cause dangerous dyspnœa? In order that a correct opinion may be formed it is the duty of all surgeons to fully record their experience I have, therefore, brought these cases under your notice, and I hope at a future date to publish a few others which have occurred in private practice

It is, I think, admitted by all that the only cases When the tumor is small in size, and none suitable for extirpation are those in which the disease of the tissues external to the larynx have become in is intrinsic, in other cases life may be considerably prolonged by trachcotomy, which should be performed as low down as possible, in order that the tube may not be obstructed or displaced by the in crease of the growth

Without referring to statistics of laryngectomies in detail, I feel justified in saying that, until within the last few years, sufficient care has not been given to the selection of suitable cases for operation results of most recent experience tend to show that ferer from migraine for the last six years Hypermea careful selection of subjects for the operation greatly reduces the immediate mortality, and delays the extension of the disease, but while this is so, if tacks have entirely ceased time is lost by want of decision, recurrence must be looked for sooner or later

Partial laryngectomy is indicated, and in late years has been performed frequently for unilateral intralaryngeal cancer It is a less serious operation than total excision, recurrence is not more rapid or more frequent Again, another advantage which is claimed for unilateral lary ngectomy is, that the voice is almost perfectly retuned without the use of a tracheal canula, and deglutition also may be completely preserved -Glasgow Medical Journal, February, 1888

IMPAIRED VISION AS AN EXCITING CAUSE OF MI-GRAINS -MR PERCY JAKINS SAYS

For some time past my attention has been directed to the treatment of migraine by correcting any defect of vision which may exist by suitable lenses Most writers on the subject advise medicinal and dieting Dr Liveing, in his work on "Megrim treatment and Allied Disorders," has advanced the hypothesis that "the paroxysms of migraine are due to nerve storms traversing more or less of the sensory tract from the optic thalami to the ganglia of the vagus, or else radiating in the same tract from a focus in the neighborhood of the quadrigeminal bodies "

The first case that came under my observation was in a married lady, at 34, who had suffered from periodical attacks of migraine every ten days for the last She had taken all kinds of medicine, four years which gave but temporary relief On testing her vision I found there was + 1 50 D of hypermetro-The patient was persuaded to wear corresponding glasses, much against her will, for a month the end of the time, when I again saw her, she said there had been no return of the migraine, and she "felt a different woman" I saw this patient a third time at the end of eighteen months and found that

she continued free from her complaint The second case was that of a woman of 37 years who had suffered from attacks of migraine for the last three years, coming on every sixteen days examining her eyes I found hypermetropia which I was able to correct by + 1 25 D glasses tacks of migraine in this case have entirely ceased

The third case, a woman of 45 years, had been subject to attacks of migraine every fourteen days for seven or eight years, and had tried all kinds of I discovered that she was treatment without benefit suffering from hypermetropia to the extent of + 1 D The fourth case occurred in one of the nurses, æt | 10bservations on Prognosis | By P H Pye Smith, M D, Guy's | Hospital Reports, vol xliv, p 59 The patient wore the proper lenses and has never been troubled with her attacks of migraine since

36, at the Central London Throat and Ear Hospital This woman was a martyr to migraine, having two attacks a week, which made her life a perfect misery On examination I found hypermetropia to the extent For the last six months, during which of + 1 50 D time she has been wearing the lenses, she has not had a single attack of her complaint

The fifth case, a man of 42 years, has been a suf tropia was discovered which was corrected by +2 Since he has been wearing these lenses the at

The sixth case occurred in a child of 10 years, who had complained of symptoms of migraine for the last three years On testing his vision I discovered myopia, which was corrected by - 2 25 D There has been no return of the attacks since he began to wear the proper glasses

From the above cases one feels justified in concluding that in all cases of migraine the sight should be carefully tested and suitable lenses ordered These cases have an additional value in the fact that no medicine was prescribed, and no alteration in diet ordered -The Practitioner, March, 1888

Pye Smith on Prognosis 1-Dr Pye-Smith sums up the conclusions arrived at in his paper in the Epidemic diseases following prognostic aphorisms Acute diseases, are most fatal when first introduced following upon chronic, are the most dangerous A degree of pyremia, which is of slight importance in a child, is grave in an adult, and imminently perilous

Typhus fever is most dangerous to persons who have passed their 60th or 50th year, less so to in fants and those between 30 and 55, and least dangerous to children about 5 and to young adults

Small-pox in these particulars closely resembles Whooping cough is dangerous during in typhus fancy, and benign after 5 years of age fever seldom takes on a malignant form when it at-Acute lobar pneumonia has usually a tacks adults favorable issue in youth, and is usually fatal in ad In young adults pneumonia is rarely vanced years fatal unless the patient has disease of the kidneys or of the heart, or is of intemperate habits monia is also a dangerous complication of fevers or Acute lobar pneumonia, when acute rheumatism not fatal, leaves the lung uninjured after recovery, and the patient in good health. It is seldom or never followed by phthisis even when it attacks the apex Primary acute pleurisy is not fatal, unless it is accompanied by pericarditis Pleurisy, if under treatment it ends in death, is secondary to tubercle or to cancer, or to disease of the kidneys Œdema of the larynx is very seldom dangerous, cedema of the lungs is usually so Acute bronchitis is a frequent cause of death in young children and old Fatal bronchitis, in persons between 10 and 60 years of age is either capillary or sec-Phthisis is most perniciondary to tubercle Consumptive patients, ous when it is hereditary

the stomach to be immediately fatal, except it pro-Chronic valvular disease of ceed from aneurism the heart, when it complicates phthisis, does not aggravate the latter—rather it checks its progress mitral lesions, in regurgitant than in obstructive kin dilatation of the mitral orifice In apoplectic atgravescent, is commonly fatal tacks, the ultimate prognosis depends chiefly upon the degree and continuance of unconsciousness, the immediate prognosis upon the degree in which res piration is afflicted Chronic diseases of the spinal manipulating the uterus -British Medical Journal cord are more likely to end favorably in women than Chorea is only fatal when the patient canin the young than in the old posite is true of stone in the bladder curable in middle life, and of little danger in later Diarrhœa is dangerous only in infants and in persons above 60 years of age —London Medical Recorder, Feb 20, 1888

ERGOT AND ACETIC ACID IN POST-PARTUM HÆM-ORRHACE -MR JOHN A FRANCIS says It must have occurred to everyone with a few years' experience in practical midwifery to have encountered cases of inertia uteri after delivery The labor may have been normally rapid and strong, and the placenta and membranes discharged entire after the usual interval, leaving a firmly contracted uterus, but presently, notwithstanding the continued pressure of the hand, the uterus elongates and acquires a feather-bed feel, and, refusing again to contract, hæmorrhage re sults, or the uterus may have been mert from the first, barely effecting delivery, or requiring instrumental interference, and all this notwithstanding the previous administration of large doses of ergot cases where the uterus does contract firmly at first, I take it to be but a continuation of the routine of labor contraction I should like to insist on the value of a pasty, or of a hectic complexion as a warning, and almost certain forerunner of hæmorrhage

instances I have been equally pleased at the quick ing facts action of vinegar, given after ergot has failed, espe cially when followed by brandy or ether Having ously slowed by strophanthus times, without ergot, I have found little benefit result | been accelerated by atropine

who lose flesh and color and appetite, with but little | Arguing by analogy, I made the following mixture signs of disease in the lungs, are in a worse case R Liq ergotæ, acid acetic concent aa 31, æther than those who have marked local symptoms, but sulph (s g 735) 31v This should be put into a whose appetite and nutrition are good Hæmopty three ounce bottle, well corked, and shaken thoroughly I administer of this mixture three teaspoon-It is rare for hæmorrhage from either the lungs or fuls in a wineglassful of water, and having used it now for a considerable time I am delighted with its efficacy in causing contraction and giving a refreshing sleep after a short interval, with little or no complaint of after-pains I combine this with the good old-Sudden death is more frequent from aortic than from fashioned pincushion pad wrapped round with a nap-I look upon the ordinary binder, with or withdisease of the aortic valves, and in stenosis than in out the two or three napkins usually offered by the Apoplexy, when in- nurse when a pad is asked for, as a delusion and a With the lower edge well below the hips snare (where it ought to be to prevent slipping up), the direct pressure on the uterus is almost nil, and it serves merely to hinder the pressure of the hand in

ACTION OF STROPHANTHUS —Dr A KAZEM BEK, not sleep Malignant tumors are more rapidly fatal of Kasan, reports seven severe cases in which he Cancers in the aged used tincture of strophanthus—the tincture being are exceedingly slow in their process, and may even made of 1 part of strophanthus seed to ten parts of in rare cases atrophy Stone in the kidney may alcohol—in doses of gtt 5 every three hours, four frequently be cured without operation. The op-Diabetes is after that The cases treated were chronic myorapidly fatal when it occurs in young men, more carditis, with consecutive dilatation of the heart, and with chalky deposits in the aortic valves and walls, two cases of mitral stenosis, regurgitation, alone or complicated with parenchymatous nephritis, two cases of bronchial asthma with emphysema, aortic stenosis with regurgitation, and cardiac neurosis in a woman with hystero-epilepsy failure was met with in one case only, that of a woman, æt 37, who had rheumatic mitral disease and chronic nephritis, and in this case it was far better than succinate of caffeine and sodium, digitalis with valerian, grindelia robusta, or convallaria, with which the case had been previously treated In the other six cases the drug caused marked improvement, usually in a short time The dyspnœa was arrested, the paroxysms of bronchial or cardiac asthma, and the œdema gradually disappeared, cardiac action became slower and more regular, the pulse stronger and fuller, and the daily amount of urine was markedly increased The patients slept well when they were taking the drug, and this Kazem-Bek thinks was due partly to an improvement of the general condition, and partly also to a direct cereand the uterus finding no opposition and nothing to bral sedative action of strophanthus, since he obexpel, relaxes instead of passing into a state of tonic served that dogs became drowsy after intravenous injections of the drug (tincture) From experiments made on frogs, turtles and dogs, with a view that an accelerated pulse, be it strong or weak, is an of determining whether strophanthus acts solely on the muscular tissue or not, Kazem-Bek concludes The liquid extract of ergot is very unreliable in that it acts both on the heart-muscle itself and on these cases, and I have been grieviously disappointed the cardiac ganglia and the peripheral ends of the with preparations of ergot and ammonia in several vagi, a conclusion that is supported by the follow-1 Atropine causes marked acceleration of the cardiac contractions that have been previ-2 Strophanthus experimentally given a wineglassful of vinegar several does not slow cardiac contractions when they have Strophanthus, he

finds, also, increases blood-pressure, but the increase of the cuboid bone, all the external cuneiform, seems to be independent of the cardiac contractions At any rate the arterial tension continues to rise, but the number of beats is not affected - Pratch, Nos 10 and 11, 1887

UNITED FRACTURE OF TOOTH-FANCS -DR WII-HAMSON, the President of the Odonto Chirurgical Society of Scotland, exhibited recently an interesting case of fracture of the root of a central meisor, which hore evidence of having been united There was a history of a blow in childhood, from which the right incisor received so much injury that its pulp died, as shown by its discolored appearance both teeth had done good service until the patient ing the sphineters untouched reached the age of 45, when the left central became so loose that it was removed with the fingers part of the fang, however, was lest behind, but gers, which can readily be introduced, and its fascial being loose, was easily extracted it was found that the two fragments fitted accurately It is cut through well above the disease limits, its when placed in apposition, except when there was anterior attachments gently separated and it is then a little chipping at one edge dentine was at a higher level than that of the cementum, so that the latter formed a sort of collar for There was some thickening in the lower fragment parts of the cementum, and the whole of the pulp in the coronal fragment was calcified, and also the part close to the line of fracture in the other piece Whether there was any cemental tissue coating over the fractured surfaces, as in one of Weld's cases, was uncertain, since the specimen was not subjected Hohl, Tomes, Hyrtl, to microscopical examination and others have altogether collected only about a dozen cases of united fractures in human teeth, and several have been met with in the tusks of animals There seems no physiological reason why these cases should be so rare for new cementum is capable of being formed at any period of life, and it is no uncommon occurrence for the pulp to resume its formative functions long after the cessation of regular Tomes points out that probably the calcification difficulty of diagnosing fracture of the root leads to improper treatment, which does not give nature a Moreover a blow sufficiently violent to cause fracture would generally injure the pulp, and bring about its destruction -Lancet, Feb 25, 1888

TREATMENT OF ADVANCED CONDITIONS OF EQUI-NO-VARUS -At the meeting of the Royal Academy of Medicine in Ireland, on January 20, 1888, MR Swan read a paper on the treatment of advanced conditions of equino-varus, which he maintained to be curable by proper treatment, carried out before the expiration of the first year of life, or before After three or four years walking had commenced had elapsed a modified result might be obtained, but the treatment would be prolonged and difficult When the patient had reached the age of 10 the tarsal bones were thickened, the large adventitious bursa was dense, and included in its base the cuboid and the tarsal end of the fifth metatarsal In such a case ablation of a portion of The portion removed should consist of the anterior three fourths nasal passages are obstructed

except its posterior part, the proximal extremi ties of the third, fourth, and fifth metatarsal bones, and the apex of the wedge would consist of a portion of the middle cuneiform The mobility of the foot would remain almost unimpaired, and as the metatarsal bones had their epiphyses at the distal end, it was probable the development of the foot would not be interfered with He had per formed this operation in thirty-four cases since 1876 -British Medical Journal, Feb 11, 1888

RESECTION OF THE RECTUM -BARDENHEUER de But scribes an operation for removing the rectum, leav The sacral ligaments and the sacrum itself are cut through, the rectum is A brought into the wound by means of the index fin On examination, connections are stripped from it in the same manner The two remaining The fracture of the severed about the sphincter portions are carefully stitched together through the sphincter with which the operation begins is left unsewed Bleeding is stopped by direct The operation pressure with carbolized sponges can be performed in fifteen or, at the most, thirty minutes, and from two to four ligatures are now em ployed, when formerly, in similar operations, from fifty to sixty were necessary - Volkmann's Sammlung klinische Vorträge, No 298

> USES OF BORACIC ACID -It is well known that boracic acid is practically harmless GAUCHER has found it useful in impetigo, and the more so because The scabs should be reit is without color or odor moved by means of poultices, and a solution of bo racic acid in glycerite of starch, 1 10, 18 then applied Gaucher has cured a case of tuberculosis of the skin in the same way, and has given the acid in gr 10 doses in pulmonary tuberculosis, with advantage The urine eliminates the acid readily and rapidly, and, as would be supposed, boracic acid is useful in ternally in cystitis, especially of old men -L'Union Médicale, Jan 31, 1888

ANTISEPTIC AND ANTIPYRETIC TREATMENT OF PHTHISIS

It is not our purpose now to go over the field of the antiseptic and antipyretic treatment of phthisis, but only to notice a paper read before the Bath and Bristol Branch of the British Medical Association. by DR W H SPENCER, of Bristol, in which he gives the records of two cases of phthisis treated by antiseptics and antipyretics, which may be found in the British Medical Journal, of January 28, 1888 And while it may be said that two cases, however complete the records and successful the treatment. can scarcely be admitted as positive proof of the value of any particular mode of treatment, it may be said of the cases recorded by Dr Spencer that they are valuable as showing how and what antiseptics and antipyretics may be used

The two cases were, in brief One case of acute pneumonia of the left lung in a girl 20 years old, the pneumonia passed rapidly into acute tubercular phthisis, which was almost completely repaired by fibroid substitution, and the bacilli, that were abundant during the acute stages, disappeared as recovery progressed, complete recovery was almost assured, when sudden profuse hæmoptysis caused death the case was ten months in duration The second case was one of acute double pneumonia in a young woman of 22 years, which passed into acute tubercular phthisis, there was complete recovery, which was maintained at the end of twelve months, the duration of the case was five months

of the cases, as set forth in the clinical histories may An acute pneumonic condibe recapitulated thus tion of the lower lobes of the lungs at first-both lobes in one case—with concomitant general and special symptoms, showing the disease to be acute croupous pneumonia A transition from the pneumonic condition into an acute tubercular and phthisical condition, begining in the lower lobes invasion of the apices, after the phthisical condition of the bases was well assured Rapid breaking down and formation of vomicæ at both base and Then, the discovery of the tubercle bacillus in the sputa confirmed the diagnosis, and indicated the general and local treatment After this there was repair of the lung tissue by fibroid substitution This repair proceeded simultaneously both at base and apex, and was traced by physical signs distinctly during its progress The profuse hæmoptysis in the first case left no doubt as to the nature of the lesion, and was doubtless caused by the contraction of the lung-tissue, whose building up brought death before healing was completed

It will be of interest to recapitulate the treatment of these cases, applying the term "local treatment" to the means adopted with the special object of influencing the local mischief of the lungs-the anti-In the first case, along with other remedies. a mixture of sulphuric acid, bark, and ether was used pretty continuously throughout the case, cod-liver oil being used at intervals for short periods, as it was not well borne Kairin and quinine were the antipyretics used, the former always reducing the temperature, and quickly, but the fall of temperature was transient, and the resulting depression marked intervals and for a short time quinine was used in large doses, but without any effect on the general progress of the case Throughout the second case a mixture of sulphuric acid and quinine (4 grains), or one of tincture of perchloride of iron and quinine was used, and cod-liver oil, which was well borne, was taken for a considerable time The antipyretics used were salicylic acid and quinine, the former with good results as regards a steady and continuous reduction of temperature, but, though combined with ether, the depressing effects were sometimes bad The quinine given in this case was used in moderate doses, and with unqualified success

The local treatment consisted, in the first place, of iodoform, which was given in 1-grain doses in pill form, 6 grains in 24 hours, in both cases it was given for long periods Attempts were made to increase the dose to 2 grains, but this dose always caused The pathological conditions and clinical features pain and gastric disturbance. In the first case the drug was taken for nine months continuously, with the exception of two weeks The second part of the local treatment consisted in the inhalation of the vapor of the oil of eucalyptus, though this was used only in the first case, and here along with the iodo-It was inhaled by means of a celluloid respirator inhaler, worn continuously except when taking From this there was no nausea or food or sleeping other unpleasant effect

The diet throughout the cases was most liberal As soon as the patients began to feel the effects of the iodoform the appetite improved remarkably, and good food was supplied in liberal quantities, some stout being allowed with the dinner after the return of the appetite

The conclusions drawn by Dr Spencer as regards the special methods of the treatment by iodoform and cucalyptol are

- I He sees no reason to doubt that, when iodoform is given in doses that the stomach will bear well, and given frequently and continuously for long periods, it is absorbed into the circulation, and in the lungs, in whatever form it be, manifests its antiseptic (or antibacillary) action and properties effects of 10doform so administered, in phthisical conditions, are too unequivocal to be gainsaid, however they may be produced
- 2 He sees no reason to doubt that when the vapor of eucalyptol (or other antiseptic vapor that can be tolerated equally well) is inhaled continuously and for long periods, it reaches the residual air in the lungs, and so externally, as it were, bathes the affected tissues or suppurating cavities that may be open to the ingress of the air
- 3 Thus, he thinks, we may have antiseptic remedies, not antagonistic, brought up on two sides to the sites of the inflammatory lung lesion, or the sites of bacillary activity, and these antiseptics, mutually cooperative, do affect for good both the inflammatory process and the bacillary activity, and bring about repair by the mode of organization after suppuration or fibroid substitution
- 4 He thinks it both desirable and correct to treat pyrexia of acute phthisical processes, whether the by the interests involved temperature be high or moderate, by and for itself He thinks that quinine, used as in the second case, promises great things for the future in this respect He thinks that no other special antipyretic than quinine should be used in phthisis, and quinine serves other purposes as well when used as an antipyretic It succeeded three times in sucın moderate doses cession in the second case in controlling the pyrexia -not the temperature merely

In the treatment of these cases it is the object to bring about healing of the damaged lung-tissue, and this by means of fibroid substitution "In order to attain this end, we must secure the same conditions and adopt similar measures, if we can by any means compass it, to those we find successful in dealing with suppurations, ulcerations, and the like lesions, in To secure these conditions parts exposed to view we should adopt measures for supplying adequate nutrition-that is, adequate anabolism of tissue and the storing of energy—in the body generally, and in We should deal the damaged part in particular with pyrevia on its own account, as a general and constitutional state, apart from the local suppuration or ulceration (as by quinine) We should bring the lesion under the influence of antiseptic remedies, both by internal medication (as by iodoform), and by external applications (as by inhalations of euca lyptol), and the application and influence of the antiseptic should be complete, continuous, and pro longed

THE BILL (H R 1526) TO PREVENT THE INTRO DUCTION OF CONTAGIOUS AND INFEC TIOUS DISEASES AND TO ESTAB LISH A BUREAU OF HEALTH

This is the title of a Bill now before the House of Representatives in Washington, and from some par agraphs in both the secular and medical press, we supposed it had been prepared for the purpose of covering the important recommendations made by the committee of the Philadelphia College of Physi cians, several months since, and which we concisely stated in the leading article of this Journal for Feb ruary 4, 1888 Those recommendations directly and strongly urged the establishment of a uniform system of maritime quarantine and health protection for the whole country under the National Government, in stead of the present separate State quarantine ar Without expressing any opinion of our rangements own, we simply placed the several propositions of the committee before the readers of THE JOURNAL, and asked for them the careful attention demanded

After examining the provisions of the Bill now before Congress, however, we find that it covers none of the important recommendations of the com mittee to which we have referred, but simply estab lishes a "Bureau of Health" in the Department of the Interior in addition to the U S Marine Hospital Service, already in the Treasury Department, and provides for the appointment of a Commissioner of Health, some of whose most important duties are the same as are now imposed by existing laws upon the Supervising Surgeon General of the Marine Hospital Service, and still does not go far enough in its provisions to supersede or render unnecessary the latter Service

The adoption of the bill now before Congress would, therefore, bring into existence under these Departments of the Government two distinct medical organizations, one called the Bureau of Health, the other the United States Marine Hospital Service, each under a chief officer appointed by the President of the United States, and both subordinate to a Department Secretary If it were desirable to convert these Departments into laboratories for the special cultivation and perpetuation of intrigues, jealousies, and divided councils, concerning all medical and health matters legitimately belonging to the General Government, no better plan could be devised than the one now before Congress We have no special medical favorites whom we are anxious to keep in office, and no medical friends we desire to nominate for a new office, but we do think that all the medical, sanitary and quarantine interest belonging properly to the General Government, outside of the Army and Navy Departments, should be under one organization with a single intelligent and efficient head Whether that *head* is called a Supervising Surgeon General or a Commissioner of Health, is of no possible importance to the people whose health interests he is to promote

SWINE PLAGUE OR HOG CHOLERA IN FRANCE -In the "weekly abstract of sanitary reports," issued from the office of the Supervising Surgeon General of the U S Marine Hospital service March 16, 1888, is an interesting report of a formidable epidemic among the swine in the vicinity of Marseilles, which on investigation appear to be identical with the disease known in this country as "log cholera" It is estimated that more than 30,000 swine have died of the disease between June, 1887, and February 1, 1888, in the department of Marseilles Though actively contagious, its origin can be traced to no foreign source, as there have been no importations of either swine or pork into the South of France for several years

DIPLOMA ENRAORDINARY -At Albany, N Y, a man calling himself Dr Richard M Dayton, was arrested on the 19th inst on a charge of malpractice in causing the death of Mary Willett He claimed

Cincinnati," for teaching and practicing the "vitapathic" system, including cures for all diseases of The diploma sets forth that the body and soul Dayton has been fully instructed and is amply qual-It authorizes him to legally practice the system anywhere in the treatment of all physical and mental diseases and to lawfully receive compensation therefor, and "in virtue of our religious crganization and second incorporation, we also constitute and ordain him minister of the gospel of life and authorize him to preach and to solemnize marriage according to law, to attend funerals, and to lawfully perform all ministerial offices, and by these presents we do fully constitute him doctor of health and minister of life, this 27th day of November, 1886"

THE PRIZES OFFERED BY THE NEW YORK MEDI-CO-LEGAL SOCIETY, of \$100, \$75, and \$50, for the best, second best, and third best original essay on "any subject within the domain of medical jurisprudence," are by recent action of the Society, extended to June 1, 1888, on or before which time all essays, designed for that purpose, should be in the hands of Clark Bell, 57 Broadway, N Y, President of the Society

DEATH OF DR EDWARD G NEWHALL -Dr E G Newhall, a prominent physician of Galena, Ill, died in that city on March 20 He was born in Galena in 1844, and was graduated from the medical department of H Ivard in 1869. He was Mayor of Galena for two terms, and was for many years a member of the Board of Education

ASSOCIATION ITEMS

PARTIAL PROGRAMME OF THE SECTION OF OBSTETRICS AND DISEASES OF WOMEN

The following papers have been offered to the Section on Obstetrics and Diseases of Women

The Address of the Chairman, "How Gynecology is Taught," by Ely Van de Warker, M D, Syracuse,

"Separation of the Symphysis Pubis in Labor and its Treatment," by R. B Bontecou, M D, Troy, N Y

"A Plea for Early Operative Interference in Cases of obscure Pelvic Pain, and recurrent attacks of Pelvic Inflammation in Women," by Rufus B Hall, M D, Cincinnati, O

"Exploratory Laparotomy," by Henry O Marcy, M D, Boston, Mass

Any other members desirous of contributing papers to be a graduate of the "American Health College, to this Section are requested to send the titles at once

to the Churman, Ely Van de Warker, M D, Syracuse, N Y

PARTIAL PROGRAMMI OF THE SECTION OF STATE MI DICINI

Any members desirous of reading papers before this Section are desired to notify its officers at once

At the coming meeting of the American Medical Association at Cincinnati, Ohio, May 8, 9, 10 and 11, papers are expected before the Section on State Medicine, as follows

"The Malatial Germ," by Prof William Osler,

M D, Philadelphia, Pa

"The Causation of the Essential Fevers," by Prof Victor C Vaughan, M D, Ann Arbor, Mich

"The Internal Origin of Fevers," by J A Larra-

bee, M D, Louisville, Ky

"Atmospheric Temperature and Intermittent Fever," by Henry B Baker, M D Lansing, Mich -By J N McCormack, M D, Bowling Green,

"Report of Committee on Form of Law for Regulation of Practice of Medicine," Perry H Millard,

M D, Chairman

in the title as here given, they will confer a favor by notifying the Secretary of the Section, S T Armstrong, M D, Marine Hospital Service, New York vocal cords City, or the undersigned

HENRY B BAKER, M D,

Chairman of Section on State Medicine, American Medical Association

Stated Meeting, February 20, 1888

THE PRESIDENT, W T BELFIELD, M D, IN THE CHAIR

DR F E WAXHAM exhibited an

IMPROVED LARYNGEAL TUBE

(See Department of New Instruments)

DR F O STOCKTON It seems to me that there are two or three features in these tubes which are radically wrong In the first place, the hinge ex poses a roughened surface on the inner side of the tube which might afford a lodgment to any membrane which may be loosened and worked into the only that, but in this hinged opening there is a glottis has a very important function. The fact that chance for the lodgment of septic matter, so that all it may be removed and a person swallow well is tubes must be very carefully disinfected, and every one does not believe in such thorough antiseptic measures as some of us do

Another point is the action of the epiglottis Those who have read the abstracts of the Internaber the paper by Carmalt Jones, of London, upon the action of the epiglottis in swallowing. While I the action of the epiglottis in swallowing While I they experience from partial paralysis of the de

do not agree entirely with Dr Jones, of London, I believe its ordinary action is the true one. We are taught that it acts like a trap-door, that it closes over the entrance to the larynx I do not believe it has any such action, the muscles attached to it are not sufficient to cause such an action, the base of the tongue does not expand back and downwards suffi ciently to cause such action While it may, to a limited extent, be pressed backward by the base of the tongue, I believe there is another action of the epiglottis than guarding the entrance to the laryny from foods and liquids We have ascertained this We have taken birds and much from experiments animals and removed the epiglottis and found that liquid and food does not enter the larynx when they We have seen it in man, when from ulcer ation the epiglottis is destroyed, they are still able to swallow food and liquids with impunity, so it seems to me the hid on this tube is of very little ben It seems to me that the fault in intubation is that we do not intube deep enough, making the shoulders thinner and introducing them below the false vocal cords so that they rest upon the true vo cal cords, and then the false vocal cords can close If those who are to contribute papers see any error up against themselves and close the entrance to the glottis I think the mistake in intubing is that we have let the tube rest on the false instead of the true

I am much interested in this DR E F INGALS device of Dr Waxham's, it seems to me an excel lent idea, and I fail to see the many objections that I apprehend that the Dr Stockton has mentioned amount of mucous, or false membrane, or septic ma terial, that would catch about that little hinge would be a trifling matter considering the large amount It would seem from the re already in the throat port that this tube has acted favorably in some cases I do not think the administration of liquids is as im portant as is commonly supposed In this disease we like patients to have food, but for the four or five days that they wear this tube I believe it of little consequence whether they take either liquid or solid food, there is no danger of starvation

In the past week I have seen a case of colitis in a child, who was sick three days without taking a particle of food, not even a drop of milk, and I never saw a patient do as well as that child did, with such a disease I think we often make a mistake in attempting to feed our patients so much, thinking we are building them up when we are really retard ing their recovery, because the foods taken are not

digested

I do not fully coincide with Dr Stockton about the action of the epiglottis, I believe that the epi glottis has a very important function The fact that It certainly covers the laryn in ordinary deglutition, and I think that is its function. The elevation of the larynx and pressing backward of the tongue during deglutition is sufficient in the majority of cases to cause the epiglottis to hold accurately over the laryna, though I confess it is not always

pressor muscles reference to seating the tube low down do not seem to me borne out by the experience of those who have had the greatest experience in intubation danger of tubes passing into the trachea I think has been very much underestimated by the profession, dinarily hear nothing about it Not long since I heard of a case which seemed authentic, at the autopsy of which the tube was found in the bronchus I had myself an unfortunate case this winter tube introduced was an ordinary O'Dwyer tube with The child did well and seemed a good sized head to have recovered, when on the fifth day I attempted to extract the tube As I had the tube nearly out the extractor slipped, I tried repeatedly, and the extractor slipped again and again, until finally the tube slipped into the trachea, and I had to do tracheotomy to remove it About two hours afterwards, during the absence of the attending physician, the child died The friends insist that it died from the shock of the operation Any one who has talked with Dr O'Dwyer must think his experiments in this matter have been very thorough, I certainly am willing to accept his conclusions as to the tube and the mode of using it

Dr Moreau R Brown I think the tube shows a great deal of ingenuity on the part of Dr Waxham, and looks like something in the right direction The tubes generally used are by no means perfect, and we are anxious for an improvement This appears to be a great advancement on what we have already seen, and I shall look with interest for further reports from its use I agree with Dr Ingals in his statement that the valve is not apt to catch much septic material, as it is very smooth in all its parts, and so well made there is not much chance

for anything to lodge on it DR WAXHAM, in closing the discussion, said The first speaker raised an objection to the tubes on ac count of the danger from septic poisoning from collection of septic matter around the spring ways my custom, after using a tube, to soak it in 95 per cent carbolic acid, and I am quite positive there would be no danger from sepsis after such a treatment I think there is no danger from accumulation of mucous about the hinge

In regard to deep tubing I have passed through that experience, and I can see no advantage in that method over the high tubage Indeed, during the early history of intubation, for a long time I used tubes with the small heads, so small they would rest below the false vocal cords on the true vocal cords, and yet there was the same difficulty in swallowing Dr O'Dwyer's experience has been the same, he claims that a child will swallow food better with the larger heads than with the smaller ones first used

These instruments were made for me by Mr Truax, and I think the instruments should be made only by the most reliable firms, and should be thoroughly part of the upper jaw, but it was not done inspected by an expert before they are sent out

The gentleman's remarks with I shall suggest that an opening be drilled through the pivot and a wire passed through it instead o around it, and I think there will be still less risk of The impairment of the spring This, together with the gold spring, I think will overcome all difficulties

DR STOCKTON I think Dr Ingals misunderstood it is probable that when this accident occurs we or- me in regard to the head of this tube. I did not mean a smaller head, but thin from above downward, not laterally small

> DISCUSSION ON DR INGALS' EXHIBITION OF INHAL-ERS, ALREADY PUBLISHED IN THE JOURNAL

See Journal of Feb 18, p 213)

Dr Moreau R Brown The tubes are very sat isfactory, I have a set of them in use at my office The Davidson No 25 I have previously used for general work and found it to be a better spray than we had before the introduction of these by Dr In-The objection to most atomizing tubes is the air pressure required to create a spray is so great that, when thrown into the nose, the force will undoubtedly prove a source of irritation and cause a swelling of the turbinated bodies With the exception of their use in atrophic catarrh, I have entirely abandoned the Sass tubes and substituted the Davidson, and find the spray made by the latter desirable in almost all the forms of nasal catarrh, superior to This spray is thrown in with cotton or the brush little force, lightly deposited upon the mucous membrane without creating irritation

DR C S Bacon exhibited a patient with SARCOMA OF THE NOSE

The patient I have to show to night is 21 years of His family history is good, none of his relatives have had tumors of any kind Some time in December, two years ago, he noticed a swelling in the right nostril About a week after he first noticed the tumor in the nose he went to Dr Gunn at the Presbyterian Hospital, and the tumor was removed Shortly after the tumor was removed the nose was swollen on the outside, nothing further was done, however, until the following August (1886), at that time the tumor had grown to about the size of a half walnut and caused some discomfort He again went to Dr Gunn at the Presbyterian Hospital and the tumor was removed by cutting through from the out-No microscopic examination was made of either of these growths The recurrence of the growth was gradual afterwards, and nothing further was done until the spring of 1887 About April, 1887, the patient went to Dr Fenger at the Emergency Hospital At that time the tumor was considerably larger than it was at the time of its last re-By the kindness of Dr Fenger I am able to moval show you photographs of the patient as he appeared when he was under Dr Fenger's care The tumor was removed by Dr Fenger four or five times recurrence was very rapid, in about two weeks it reached its original size. At that time there was some talk about a radical operation, removing a large I the fourth or fifth removal the patient passed from am about to suggest a further change This wire is the hands of Dr Fenger and another surgeon, Dr twisted about a pix of which controls the epiglottis Owens, was called in He made a diagnosis of malignant tumor and said he did not think the patient's the Policlinic Hospital five or six weeks ago by Dr life would be materially prolonged by an operation | Hoechsler and referred to me for operation. The his Three or four weeks after the last removal of the tory was that the man had had removed at vanous tumor, in the latter part of July, the patient came times, from the right nasal cavity, some six or eight under the care of Dr Baxter at the Alexian Brothers' Hospital At that time the tumor was much larger | nary gelatinous polyp or myoma of the nose Within than is shown by the photographs, it covered a large the next three or four days after the last operation for part of the right side of the face, extending from the removal of these polypi, which was last summer, above the eyebrow to below the mouth, closing the the right nostril became suddenly occluded and re right eye and extending to the left, partially closing | mained so up to the time of the operation presently the left eye. It was an angry looking mass had been some bleeding, which had been checked this sudden occlusion, but during the fall, about No by a styptic solution. The growth had not been vember, the patient went East, and while there con cleansed on account of the bleeding, and it was very sulted a physician who discovered and attempted to a serious condition on account of blood and septic but as the hemorrhage produced was so severe he The tumor was removed, causing consid- gave up the operation erable bleeding, the active cautery was applied, and cago with the blood oozing from the tumor Next, also a styptic solution had returned I his time the patient was chloro- produced further hæmorrhage, to remove the tumor formed and the right common carotid artery tied, by the snare When the man was presented at the and the growth again removed the tumor was considerable, it was partly on that of age and of a healthy appearance On looking account, but mainly on account of the hope of in- into the right nostril there was seen a somewhat pale fluencing the growth, that the artery was tied benefit of the ligation was apparent, the recurrence ular and bled very readily on being touched It was was not as rapid as before However, there was a only the surface which was exposed to view that af recurrence, it began to grow shortly after the liga- terwards proved to be irregular, and which irregular tion of the artery, but not as rapidly, and from that ity I attributed due to the operations which had been time the tumor was removed four times at intervals attempted The growth reached perhaps the size shown in the photographs in the course the roof of the nostril inside, and broke up a small of four weeks, not being nearly as rapid in recurrence attachment to the middle turbinated body, the main as before the ligation of the carotid moval was in the latter part of October, and from nose that time to this there has been no recurrence of the around the growth and removed it by the galvano-Two or three weeks after the last operation | cautery the surface had granulated over, and for the last ten there was no further hæmorrhage. The tumor was or twelve weeks there has been no change in the apabout the size of a hen's egg, exceedingly soft, of a with the exception that the cautery was not applied, texture, the lower part or base being harder and more it was simply that of gouging out the tumor, it was dense and firm in texture necessary to remove it as rapidly as possible on ac- growths in the man's nose, either polypoid or sarco count of the bleeding In the course of the operations, the cavity seemed perfectly clear and the tion a part of the septum was removed, almost all of man was able to breathe through it with ease Some the middle turbinated bone and a part of the supe- three or four days after I did a second operation, sent a section of the tumor, but none were saved binated body, which had been the superior attachment because the diagnosis seemed plain enough, and it of the tumor was hardly expected the patient would recover of sarcoma was the same as made at the Emergency across the septum and the floor of the nose on account of the fact that it has now gone about tissues down to the bone and cartilage with the gal four months without any recurrence We all know how hopeless sarcomata of the nose are generally considered, especially cases like this, where the all who wish will have an opportunity of looking at return or indication of it. It is known that these the face as it now appears I shall be interested in sarcomata, when removed repeatedly, will sometimes heaving the opinion of any who have had appeared to the opinion of a point of the opinion of the opinion of a point of the opinion of the opin on the subject as to the probable effect of ligation of great malignancy Whythis is so is impossible to say the artery in diminishing the rapidity of the great the great malignancy. hearing the opinion of any who have had experience the artery in diminishing the rapidity of the growth DR MOREAU R BROWN

polypi which presented the appearance of the ordi I was unable to learn the cause of There to be described The patient had some fever and was in quite remove a growth which filled the right nasal cavity, The man came back to Ch One week later the growth three or four unsuccessful attempts were made, which The bleeding from Policlinic it was marked that he was about 45 years The tumor blocking up the cavity, the surface was irreg

A case was brought to plar to this, though with one exception not so bad,

perhaps three or four, in which I have found within at Bedford Springs the nasal cavity what seemed to me at first simply a fibrous tumor, but upon microscopic examination the sarcomatous appearance was so marked that the microscopist gave me a very unfavorable prognosis One of the cases I did nothing whatever with, as it had gone too far It was very malignant and the patient only lived a few months, but in two other cases I have removed the growth repeatedly, perhaps five or six times, and eventually the patients disappeared Whether the growths returned or not I do I heard from one of the young men a not know week or two ago and he had gone six or eight months without a recurrence The other had gone three or four months without recurrence when I last heard of In one case, after repeated removals, the growth took on rapid growth which speedily caused the patient's death

BALTIMORE ACADEMY OF MEDICINE

Stated Meeting, February 21, 1888 DR JAMES CAREY THOMAS IN THE CHAIR Dr Thomas F Murdoch reported a case of DOUBLE ANEURISM OF THE ASCENDING AORTA

On February 13, at 8 PM, he was summoned to see Mr B, and found him complaining of nausea, great pain in the epigastric region, very sensitive to pressure, eructating great quantities of wind and his heart beating tumultuously, so that it was impossible to hear the sounds of the heart to determine if there was any disease of the valves The patient informed him that he had dinner at 3 o'clock at a restaurant, consisting of a beefsteak and a potato, and shortly afterwards was seized with nausea, pain in the stomach, and tumultuous action of his heart, which obliged him to go home, but did not send for Dr Murdoch until the hour above named scribed an antispasmodic mixture, and after taking two doses, he left the patient somewhat relieved and ordered a dose of castor oil to be taken in the morn-Would have given him an emetic, but he informed Dr Murdoch that he was never able to Called at 1 AM, the 14th, still suffering, ordered an enema, and at his own suggestion gave him half a tumbler of hunyadi water. The enema brought away some hardened fœces, and, at the same time, he did vomit some fluid, but nothing that he He expressed himself as feeling much better than he had done since he was first taken Remained with him until 4 AM, and left him comfortable, although his heart was acting tumultuously

Called again at 7 30 A M Prescribed

Tr digitalis Morphin sulph Aqua camphora Teaspoonful every two hours.

Of this he took one dose

Dr Salzer had attended Mr B last summer tion of the heart

He agreed with Dr Murdoch that the action of his heart was sympathetic, and informed him that he had frequently examined his heart, and also his urine, and he was certain there was no disease of either heart or kidneys treated him for gastric trouble. After much consideration they determined to give him 20 grs of ipeca in compressed pills, this instead of vomiting him, had the most soothing effect, and he got some sleep. the first he had had After fifteen minutes, repeated the specac and he slept for nearly two hours, waking occasionally Dr 5 left at 11 30, considering him much better Dr Murdoch remained until 12 30, thinking he could leave him for an hour or so, but had not been away more than thirty minutes when the patient expired suddenly

Report of autopsy made on the body of Mr B

by Dr W T Councilman

February 15, 10 AM, twenty hours after death Body of medium size, slightly built Rigor mortis well marked On the right upper arm, about one and one-half inches below the head of the humerus was depressed stellate cicatrix, and on the anterior aspect of the body between the cartilages of the second and third ribs and one-half inch to the right of the sternum was a similar cicatrix lung free from adhesions Its tissue œdematous The right lung firmly united to the chest-wall by old Its tissue cedematous pleural cavity about one ounce of clear serum entire heart was enlarged, both ventricles, especially the left, somewhat dilated The wall of left ventricle slightly thickened The muscular tissue of heart All the valves of the heart were normal The aorta atheromatous in its entire extent aorta just above the aortic valves were two aneurisms, one opening in the sinus of Valsalva behind the right anterior valve, and one behind the posterior The one to the right was the size of a black walnut, its opening into the aorta about three-fourths of an inch in diameter The aneurism opening behind the posterior valve was not larger than a small In the wall of the right auricle there was hazelnut an area about one inch in diameter where the wall was thin, anæmic, and in the middle of this a ragged opening the size of a No 14 catheter which passed directly into the larger aneurism Both aneurisms contained red coagula Liver, kidneys and spleen In the abdominal cavity about 3 per congested cent of clear serum

Dr. T A Ashby said, that through the courtesy of the attending physicians, he had witnessed the autopsy in the case reported by Dr Murdoch had known this gentleman for a number of years, and was as much surprised as were his medical attendants at his sudden death He had never attended the gentleman professionally, and therefore, had never examined his heart, but was aware of the fact that he was a frequent sufferer from attacks of indigestion which gave him much uneasiness and dis-At times he complained to his family of thoracic pains and of dyspnæa after exercise Dr Salzer met Dr Murdoch in consultation at 9 also complained of palpitation and of frequent ac-The valves of the heart were

normal, and there were no physical signs present after the aneurism had broken pointing to cardiac trouble. His medical attendants were therefore correct in assuming that illness was not referable to circulatory changes The cause of sudden death was explained by the rupture of the was hoarseness and stridulous breathing, and the In his judgment the disturbance of pupil was also affected the circulation was primarily induced by the retch- under the use of the iodides, the worst symptoms ing and vomiting, which induced sufficient pressure disappearing, but the patient passed out of his sight, upon the alrady weakened aortic sac as to occasion rupture and sudden death It is probable that rup- autopsy ture was in this wise hastened, but it would in all the case, and had pronounced it an aneurism of the probability have occurred at an early date from mere attenuation, or physical exercise, had not the attack of indigestion occurred Changes in the aorta had evidently been going on for some time, though no means of determining this fact were presented to his medical attendants In the light of present circumstances it was easy enough to construct a theory and establish a chain of evidence which would explain a result, but in dealing with conditions we were guided by facts in view and not by suppositions which only became clear after they are obtained from positive information enough now to account for the presence of a con- He would suddenly fall down and get up again, and dition since it had been discovered by post-mortem evidence, but this information was not possible be-The treatment of the case was rational fore death and not open to criticism Who could have done better? This is a practical question to which each difficult to say whether he did or not Patients with one must give a candid answer

DR JAMES CARFI THOMAS asked if atheroma could be diagnosticated when not far advanced also spoke of venous engorgement which occurred in such cases

DR JOHN R UHLFR thought that if the physics of he could get no knee jerk out of him auscultation were better understood and more thoroughly studied, we might be better able to understand obscure cases He referred to a similar case He was called to see a man in his own practice one morning at nine, and found him with a pain in the chest, and unable to lie down died at 9 P M the same day with a sharp pain at the A diagnosis during life had centre of the sternum The autopsy showed an aneurism not been made which had burst in the mediastinum The aneurism had probably been open for twelve hours, and the blood was leaking out all that time

DR F T MILES said, the history of this case helped to show that it was not necessary for the chambers of the heart to empty themselves to carry The right auricle in this case was on its function probably always distended with blood He recalled the case of a man who had attacks of spasm of the glottis, and whose circulation and breathing were No one had made a diagnosis impeded autopsy showed an aneurism pressing on the trachea, and probably carrying on its effects through the recurrent laryngeal nerve It was not easy to see why such attacks were paroxysmal, and not continuous He thought that when an aneurism once burst, nothing could be more sudden than death

DR WILLIAM B CANFIELD said he thought many for twenty-four or forty-eight hours, or even longer in London

He had reported a case last year in which the symptoms, produced by pressure on the pneumogastric and recurrent laryn geal nerves were well marked In this case there and the diagnosis had never been confirmed by an Several other physicians had also seen The 10dides, and particularly the 10dide of aorta sodium, had been much used of late in these cases He had under observation at present a man who suffered with violent palpitation, cough, contraction of the left pupil, and he suspected an aneurism, but none could be found The man had worked in lead, and had had lead colic The iodides had done him good

DR F T MILES reported a case of LABYRINTHINE VERTIGO

It was easy in a boy 16 years old, who had attacks like epilepsy when asked would say nothing was the matter His eyes would roll The important point was the loss of consciousness The boy said he did not lose consciousness, and his friends said he did It was petit mal often lose their consciousness without knowing it This patient had fallen at times He could walk a straigt line without hesitation or devia tion, but when he stood with closed eyes he went over to the left side It was not locomotor ataxia, He thought He had had it was a case of labyrinthine vertigo otorrhæa and loss of the drum membrane This case was as interesting as some of Mr Gowers He laid much stress on the way in which he fell to the He thought tinnitus aurium was not sufficient The patient to cause it It was much like epilepsy

DR WILLIAM B CANFIELD, in referring to this vertigo and falling to the left with closed eyes, asked Dr Miles if a perfectly healthy individual, with one ear artificially stopped, would be apt to fall over on closing the eyes The sense of hearing has much to do with preserving the equilibrium in total darkness, as any one might notice It would be interesting to know if one totally deaf suffered any less from sea-sickness than others

IDIOSYNCRASY TO IRON

DR THOS E MURDOCH, in treating a child with double lobular pneumonia, had used beef, wine and iron, and noticed that the child put its hand to its head, and on stopping this preparation the child He thought it was not the alcohol, as grew better he had continued that He attributed it to the iron, as the grandmother had always been unable to take It was a remarkable case of heredity

THE VOLCANIC ORIGIN OF EPIDEMICS is the title cases were on record in which the patient had lived of a new book, by Dr John Parkin, recently issued

GYNECOLOGICAL SOCIETY OF CHICAGO

Regular Meeting, Friday, December 16, 1887 THE PRESIDENT, HENRY T BYTORD, M D, IN THE CHAIR

THE PRESIDENT exhibited

A NEW UTERINE ELEVATOR,

and said I have been in the habit, for a long time, of introducing an ordinary straight, hard rubberintrauterine stem into the retroflexed uterus before replacing it, in order to stiffen or straighten it, and to serve as an indicator of the position of the fundus after it has ascended out of reach Last summer a cutler showed me a uterine elevator, invented by Dr Miller, of San Francisco, which consisted of a straight steel stem, fastened upon the end of a thimble, with the end in view of making the stem a continuation of the finger end I was unable to use this one, because in bending my finger so as to push the cervix back in place my knuckle would catch against the posterior vaginal wall or pelvic floor therefore constructed this instrument There are three stems a jointed steel stem, like that upon the end of Emmet's elevator, and two copper ones of different sizes, slightly flexible Any of these may be attached to a shovel-shaped piece in which the finger end hes at right angles to the stem vix may thus be pushed backward or sideways, and the fundus pried forward With the finger thus against the end of the stem, and practically against the cervix, we can calculate the position of the fundus, the amount of resistance to replacement, and avoid all violence and danger

The Secretary read for Dr F W Mercer, Chicago, a

REPORT OF A CASE OF TUMOR OF THE ILEUM, DEATH FROM INTESTINAL HÆMORRHAGE, EXTENSIVE COMPLICATING LESIONS

The following history was communicated to me by Dr Converse, the attending physician

Annie W, single, æt 34 years, was always considered in good health Had menstruated regularly Had menstruated regularly without undue pain till within the past year, when it was observed that the flow was not quite as copious All the other bodily functions had been regularly performed so far as the friends knew Miss W was of cheerful disposition, vivacious, and physically strong, being able to toss her sister's child, weighing about twenty pounds, up at arms length above her head

About one year ago, she consulted a leading physician of this city to whom she complained of a throbbing sensation in the left inguinal region, and also of some slight digestive disorder The doctor informed her that he considered the throbbing due to the presence of gas in the intestine, and prescribed some digestive After this, the patient went along as usual, not making any special complaint, till the tired, rechning upon the bed in her room About ing of fibroid tumors II AM she had a movement of the bowels, consist-

ing almost entirely of blood, but not large in amount Dr C, who examined the stool, concluded it was due to "bleeding piles" Absolute rest was ordered At 12 30 PM, the patient left her bed and entered the bath room, where she fainted while passing another bloody stool She was carried back to bed, where she soon revived Dr C saw her again, and ordered pyrogallic acid and ergot, with brandy at short intervals From this time till 9 P M, she grew very restless, having involuntary discharges of blood which were received upon cloths, making any accurate estimate of quantity impossible At about the last named hour, I was called in consultation, and found the patient tossing from side to side of the bed, groaning, and complaining of pain in the The features looked shrunken and umbilicus pinched, the surface blanched and clammy, the face very cold to the touch, and the pulse barely per-In fact, the patient appeared moribund ceptible from hæmorrhage

An examination of the abdomen was made, and the presence of a tumor, quite symmetrical, of globular form, was discovered in the median line, just above the pubes, an enlarged uterus was suspected as the source of the hæmorrhage, and an examination per vaginam was made, with the result that the os was found to be of pin-point character, cervix elongated, and giving no indications of hæmorrhage

Hot-water bags and bottles were applied to the surface, warm blankets packed about the body, and brandy given subcutaneously with aromatic spirits of ammonium by the mouth Transfusion was thought of, but, the means not being at hand, it was not tried Dr E W Sawyer was called, but little could be done, as the patient was now in articulo

Section, fourteen hours after death, Dr E D Converse, Dr E W Sawyer, Dr W Barry, Dr Frank Andrews, and your reporter being present The section was made by Dr Frank Andrews The hody appeared well nourished, the rigor well marked Upon reflecting the abdominal parietes, the intestines appeared rather pale, and not unduly dis-At the lower hypogastrium a tumor was found resting in the median line It was globular, ten centimetres in diameter, and weighed 454 grams, was moderately firm in consistence, and attached by a slender pedicle to the small intestine (ileum), about fifteen inches above the cæcum Upon section of the ileum, an oval opening was discovered upon its mucous surface, about four millimetres by This opening corresponded to three millimetres the attached pedicle, and communicated directly with an artery of about four millimetre calibre was undoubtedly from this that the fatal hæmorrhage There were old and extensive adhesions occurred of the intestines to the pentoneum Both the right and left kidney showed a greatly reduced cortex, and the tubuli and pelves were found filled with pus The liver was very fatty and friable, breaking under pressure like old granular tallow morning of October 16, 1887, when she said she felt converted into an irregular lobulated mass, consist-The uterus was The thorax was not opened

Dr. F W Mercer I very much regret that I

have not the stained specimens to show you to-night ether, the operation previously performed by Dr I have, however, examined the tissues, and the Sibree was repeated, and a soft, friable mass, weigh tumors of the uterus are intramural myomata. The ing not less than two pounds, was removed. The tumor of the intestine is also a myoma very vascular structure. I have been unable to de- fourths of an inch in diameter, to the left side of the velop the literature on this subject, few, if any, such uterus, about on a level with the os internum. The cases have been reported and I have not been able specimen was examined by Dr Wing, who pro to find a parallel case to the intestinal tumor, as re- nounced it to be a sarcoma, I therefore determined gards the peculiarity of its attachment and the open- to remove the uterus per vaginam, which was done ness of the blood-vessels Myomata are often very three weeks ago to-day vascular

DK IS W SAWLER the condition of this patient, I want to say that she rare disease, the number of cases on record being filled a difficult clerical position, involving a good less than one hundred deal of labor, up to the day previous to her death I have seen her in life for the last ten years, and tofore not been very much used—the method of knew her to be industrious and a healthy appearing Péan, i.e., hæmostasis was secured entirely by means

It might be proper to sug-DR C T PARKES gest the idea that this was an angioma The partial description that has been given would call my attention to growths of that character, its extreme vascu- lips This was done in order to prevent any of the larity, the size of the vessels entering into it, its contents of the uterus from coming in contact with position, differing in this respect from myoma tissue about the walls might be connective tissue, the cervix into the pelvic cavity The cervix, seized showing some evidence of muscular fibre I speak with strong lock vulsellum forceps, was drawn to merely from my experience I have seen quite a the vulva, and an incision was made with scissors number of myomata, but never saw any that showed entirely around the cervix at the utero-vaginal atthe pecularities of this specimen developed, as suggested by Dr Dudley, in some were torn away from the cervix, keeping close to the other place, this being a foreign position 'As to its uterus until the cul-de-sac of Douglas was reached, attachment, I think it would be in reason to say that with two fingers in the cul-de-sac of Douglas, it was it might show muscular fibre, if it was an outgrowth from the intestine it is not a myoma

DR A REEVES JACKSON that this should be a myomatous tumor when so little muscular structure can be found as a basis in the The case, too, is interesting and remarkable in its history, from which we learn that the woman had degeneration of long standing of a portion of the liver, that there were adhesions of the bladder intestines to the abdominal wall, indicating the de-sac, but, taking a pressure-forceps with long blade former existence of peritonitis, that there was a in the right hand, I passed the index finger of the fibroma of the uterus, and yet, despite all these dis- left through the posterior opening, and hooked the eases, the patient was in good health up to a recent point of the finger around the left broad ligament, women can live and seem fairly healthy with a good terior opening I punched through to the finger tip deal of disease present, but such an amount as was present in this instance seems quite inconsistent with Ît is exceedingly ima condition of good health portant that this specimen should be examined microscopically, because its nature must be of very great interest to the pathologist

DR E C DUDLEY reported a case of

VAGINAL HYSTERECTOMY FOR SARCOMA UTERI

The patient, a multipara, 62 years of age, came to me from Dr Sibree, of Sturgeon Bay, Wis Sibree, several months before, had removed a soft, friable mass, filling the uterus and vagina two months ago, the tumor, which had returned, morly to the small intestine At least twenty min enormously distended the uterus and vagina Under utes were consumed in carefully breaking up these

It is a tumor was attached by a short pedicle, about three

The case is remarkable and interesting Remarka As a still further emphasis of ble because sarcoma of the uterus is a somewhat Interesting because a method of operation was employed which has here of pressure-forceps, no sutures or ligatures having The cervical canal was first stuffed with been used absorbent cotton, and closed with a single suture, which was passed through the anterior and posterior The the perineum, in case it was found necessary to turn It might have tachment, with the finger the post-cervical structures easy to enlarge this opening by tearing, until I had I would not say, of course, that reached the region of the broad ligament on either side, I then attempted to divide anteriorly in the It seems remarkable same way, but, being solicitous about invading the bladder, I kept so close to the uterus as actually to tear up a layer of the muscular structures I had carried this process beyond the vesico uterine at tachments, indeed almost to the fundus, before I discovered that I must be beyond the region of the I did not at once enter the anterior cul All this is very remarkable I know that then, with the lower blade of the forceps in the pos with the other blade, and locked the forceps, thus The right broad securing the left broad ligament ligament was secured in the same way, and the utero vesical attachment severed with the scissors and the Upon putting the forceps upon the right broad ligament, and finding that the dis ease had extended through the uterine wall on that side and involved the uterine end of the right broad ligament, I pulled the ligament out and put on an other pair of forceps back of those originally used These forceps included the ovary and Fallopian tube on that side, and I hope all the disease

The only difficulty in this operation was in conse quence of extensive adhesions of the uterus poste

The right ovary and tube came down patient having passed the menopause, the left were not removed. Several bleeding points anterior and posterior to the uterus were secured by means of ordinary pressure-forceps, all of which were left in

the vagina

Instead of closing the abdominal wound with sutures, the peritoneal edges anteriorly and posteriorly were caught at two points with lock-forceps, so that in reality the peritoneal wound was closed at these points, leaving space enough between the forceps for dramage All the forceps except those on the broad ligaments were removed in twenty-four hours, these were removed at the end of forty-eight hours It would possibly be safe to remove even the forceps leaving them forty-eight hours is an additional safeguard and insures more prompt separation of the necrosed tissues within their grasp

The patient had no bad symptom until the fourth day after the operation, when she developed a slightly elevated temperature and a pulse of 140, very weak and almost like the pulse of collapse, but with a moderate amount of stimulation, circulation greatly improved and was normal again in twentyfour hours It is now three weeks since the operation, she has had no further trouble, and is sitting up I learned after this trouble with the circulation what I had not recognized before, and what would have deterred me from operating had I known it, that the patient had a fatty heart

I think this method of removing the uterus will be generally adopted The operation in this case lasted forty minutes If it had not been for the adhesions it could have been done in twenty minutes

without difficulty

This operation may have a wider field than vaginal hysterectomy, I have determined that the next case I have of uterine myoma, in which supra-vaginal hysterectomy would ordinarily be performed, to serre nœud, to secure the broad ligaments by means of lock-forceps in the vagina. It would probably be easy, by having the index and middle fingers in ligament as a guide, to force the blades of the forceps through close to the uterus on either side of toneal cavity the ligament to the finger tips, and then, having sellost cured both ligaments, sever the anterior and postenor uterme attachments The peritoneal edges of the vaginal wound might then be closed with a continuous catgut suture, or seized with lock-forceps in the vagina, as already described This method of performing hysterectomy for myoma when the tumor is too large to be delivered through the vagina, is worth trying, it would enable the operator to dispense with all extra-peritoneal methods of hæmostasis, and might afford all the advantages which belong to intra peritoneal hemostasis for ovariotomy

THE PRESIDENT reported

A CASE OF VAGINAL HISTERECTOMI, and exhibited specimen

Miss P, is a virgin, 57 years of age, ceased menand were secured in the grasp of the forceps, but the struating over ten years ago. About eight months ago she had a slight hæmorrhage from the uterus, and for five months before the operation had been bleeding (sometimes profusely) most of the time had been bedridden for five weeks, suffered frequently with severe pain in the lower part of the abdomen, and was the most waxy, anæmic looking person I remember to have seen Her pulse ranged from 100 Her evening temperature, from the normal in the morning, ran up to 101° F, and sometimes higher upon the few evenings before the operation When not bleeding she had an offensive vaginal discharge She was subject to oaily hysterical attacks in which she and her friends feared she might die A loud, cardiac murmur could be heard Vaginal from the broad ligaments in twenty-four hours, but indagation revealed a friable vascular mass about the size of a hen's egg, projecting from the cervix into the vagina, and continuous with the posterior lip A piece taken from the lower end was examined and pronounced papilloma I had considered it cancer and had contemplated hysterectomy, but felt relieved at the diagnosis, because the operation would have been long and difficult on account of the virgin and senile condition of the vagina and perineum, and the success would have been doubtful by reason of the extreme anæmia and nervous prostration I also feared she would not bear anæsthesia well for the

necessary length of time

She was anæsthenzed at 9 AM, Dec 7, for the purpose of curetting, but the posterior wall of the cervix as far as the internal os was found so degenerated that a complete removal was considered impossible without breaking into the cul-de-sac of Douglas The posterior vaginal wall was also infil-trated behind the cervix Therefore I resolved to take out the uterus, and did so at I 30 PM method I employed proved so successful and seemed so well adapted to her case that I think it worth while to mention it and advise it for cases presenting simılar difficulties After a thorough disinfection of the open the abdomen, lift the tumor out through the parts, I introduced suture of juniper catgut around abdominal wound, and then, instead of using the the vaginal fornices so as to make a circle of ligatures I made a bloodless incision inside of the circle, commencing in front and separating the bladder and the broad ligaments for a short distance at the sides bethe pelvic cavity, one on either side of the broad fore introducing the posterior sutures, completing the circular incision posteriorly, and opening the peri-Scarcely half an ounce of blood was After opening the cul-de sac its entire width, a pair of hemostatic forceps was placed on the left sacro uterine and base of the left broad ligament, and the uterus cut loose on that side as far as the forceps The maneuvre was then repeated on the reached other side Then another pair of forceps was placed on each side just above the first, and the tissue severed as high as they extended A third pair on each side included the Fallopian tubes, and enabled me to cut out the uterus with the loss of less than an ounce of blood except that which had oozed from the diseased cervix. Some iodoform gauze was stuffed in between the forceps The forceps were removed at the end of twenty-eight hours, with great distress to the patient and followed by a temporary

rise of temperature from 99 4° to 100 4° F The temperature went down, however, and did not rise have quite disappeared in some parts, in others they that high again until the beginning of the fifth day, when it again went up to 100 4 F, but subsided upon | being irregular, ovoid, or spindle-shaped removal of the tampon, which had become offensive She turned on her side at the beginning of the fourth day The bowels were moved on the fifth day by a After the removal of the iodoform Seidlitz powder gauze on the beginning of the fifth day, vaginal douches with a tube for the return flow were used After the sixth day they were carboltwice a day

Hung performed the operation both ways, viz, with and without hemostatic forceps, I feel justified in asserting that ligatures are better for cases in which loma, and is now in the stage of transition to sar the size of the vagina and mobility of the uterus allow of their application without too much loss of time, for there is less bruising of the broad ligaments They may be left and less sloughing afterwards long and used instead of sutures to draw the stumps For cases in together over the vaginal opening which time is an important element, and the broad ligaments cannot be rapidly ligated, the forceps are In the hands of the beginner they are preferable safer because they may be applied with less handling and exposure of the peritoneum, and are not liable to be followed by hæmorrhage Ligation of the vaginal walls before cutting can be done so quickly and easily that it is a desirable procedure in all cases

The growth, as you see, has extended as high as the internal os, with the main part of it taken off it looks like an epithelioma of the cervix. The uterus Sarcoma, originating in the cervix, is small in size would seem to be a rare occurrence, and this one case is, as far as I can determine, the thirteenth one One has been recorded by G Veit ("Handbuch der Speciellen Pathologie," etc ,von Virchow), one by Scanzoni ("Lehrbuch der weiblichen Sexualorgane"), one by Kunert (Archiv für Gyna-kologie Bd VI, p 113), one by Leopold (Archiv f Gyn, Bd VI, p 493), one by Grenser (Archiv f Gyn, Bd VI, p 501), two by Spiegelberg (Archiv f Gyn, Bd XIV, p 178, and Bd XV, p 437), one by Rein (Archiv f Gyn Bd XV, p 187), one by Winckler (Archiv f Gyn, Bd XXI, p 309), by Winckler (Archiv f Gyn, Bd XXI, p 309), ment a gone by Schwartz (Reerman, Inches Gottingen) one by Schwartz (Beerman, Inaug Diss, Gottingen, 1876), one by Zweisel (Centralblat fur Gyn, 1884), Hunter (Am Journal of Obstetrics, Vol XVII, p 523), and this one Some of these were not primary sarcomas, but were developed secondary to other growths, such as papilloma, fibroma, etc

Report of Pathologist - Microscopical Examination of the Cervix -On the surface the growth presents the structure of papilloma, t e, villous projections consisting of a connective-tissue stroma covered over completely by several layers of ovoid cells Upon the surface of these there is a single layer of columnar epithelium In the specimen this has been stripped off on part of the surface The columnar epithelium is not as tall and less delicate than that of

of granulation cells The normal glandular elements are greatly modified, the cells lining the folicles

Many of the glands are quite replaced by sarcoma

corpuscles

In some points of the specimen there occurs a deli cate network of branching cells, presenting the char acteristic appearance of myxoma These portions are considerably softer than the surrounding struc

Diagnosis — Papilloma at surface Myxo sarcoma

The disease was probably primarily simple papil MARIE J MERGLER

DR J H ETHERIDGE I understood Dr Byford to say that a portion of the growth involved the vagina also, and I would like to ask him if he could follow up the broad ligament well enough to find if there was any involvement of that structure

DR BYFORD I did follow it up and put on the

forceps

DR ETHERIDGE I saw a case about two weeks ago that was very interesting and instructive to me It was the removal of the uterus for cancer of the Upon examination, at first we thought we cervix could not take it out, but as the whole cervix was involved and it had spread over the sides of the vagina, the left side a very little and considerably upon the right side, it was concluded to go on and The operator freed the cervix do the operation from the vagina and then commenced the peeling up process, the broad ligaments were exposed, and the forceps put on, and the uterus cut away In the left broad ligament, throughout its whole extent to the pelvic wall, there were nodular enlargements, show ing that the broad ligament itself was involved, and that, too, upon the side in which there was the least encroachment of the vagina, on the right side there was no involvement of the broad ligament. There were eight or nine forceps left in the vagina, which were removed at the end of forty-eight hours without any trouble She has recovered from the operation I have often wondered how the broad liga ment appeared when infiltrated with cancerous ma terial, and I think now that I know

If the case Dr Dudley reported is the one I saw, and he did not speak of one thing, I would like to speak of it, and that was a clever bit of ingenuity on the part of a clever operator in retroflexing the uterus If I remember rightly, he attempted to push it down and draw it down from beneath without avail, and then, by taking a pair of vulsellum forceps, he grasped the uterus just above the vaginal attachment and drew it down, then took another forceps and drew it down a little more, then another, and so on, and in that way got the uterus down easily, which impresses one who has had trouble in getting the uterus down

Since the October meeting, at which a paper of within reach mine on this subject was read by title, another case Normal Mucosa —At the base of these villi the has passed through my hands which I have not ressues are considerably altered. They consist largely ported to this Society. It was a case in which there tissues are considerably altered They consist largely ported to this Society It was a case in which there

All attempts at retroflexing posterior uterine wall or retroverting the uterus were unavailing, and it had to be removed by detaching the broad ligaments The patient has which the uterus turned upward gone along without trouble and has made a complete The uterus was removed for incoercible Everything else had been tried, scrap operation which was expected to be performed was But as I had had the experemoval of the ovaries mence of removing two pairs of ovaries for bleeding fibroids, and they kept on bleeding, I explained to her the difference between removal of the uterus and the ovaries, and she finally accepted removal of the uterus

forceps over the ligature is the superior facility for free drainage All fluids will run down through the manner, and there is no danger of the fluids remaining in the peritoneal cavity by the closing of the top of the vagina which is speedily brought about After the patient is put to bed, it is but a few hours decompose and septic peritonitis ensue, unless effective drainage, such as the forceps afford, be used to induce every operator to use the forceps

DR JACKSON the entire uterus

have lessened the danger to the patient

I want to refer to a point in Dr Dudley's remarks sues the uterus by a pedicle I desire to ask whether that is a usual method of attachment of a sarcoma? In the cases of uterine sarcoma that I have seen the disease commenced on a flat surface—the attachment was sessile I once saw a case which I at first supposed was one of sarcoma, but subsequent examination with the microscope determined that it was not a sarcoma, but a degenerated fibrous polypus,

These microscopic examinations of malignant diseases, by the way, are not always reliable, in my own experience I have received three widely differing reconfidence in the microscope as a diagnostic instrument than I formerly had I regret this very much operation, three or four weeks before the second because, in many cases, we depend almost entirely

DR PARKES I was exceedingly interested in Dr Dudley's case, and especially in the manner of securing the broad ligaments by means of forceps by the person who first invented them, Péan, of Paris In 1883 I did the first operation that has come under my care for removal of the uterus per vaginam by this method

was a development of a small fibroid tumor in the been described this evening, the use of the snap forceps in controlling the broad ligaments, instead of After listening to a report of similar cases ligatures by Dr Etheridge, I remarked that I did not see why, in this method, the uterus should be retroverted, that so far as my experience went, I found no difficulty, after the division was made in the cul-de-sac of Douglas, in reaching the top of the broad ligaments with ing, stimulating applications, ergot, etc., and the my finger, and found no difficulty in severing the attachment, and had no subsequent difficulty from I can very well see that occasional hæmorrhage cases will be met with where it will be difficult, if not impossible, to reach the top of the broad ligament so as to be sure that every portion is included in the grasp of the forceps, as in Dr Byford's case, and in another case I saw where the uterus had in its poste-I believe one of the greatest advantages of the rior wall a large tumor, and where it was with great difficulty removed In these instances it may be necessary to reverse the uterus The objection to opening in the vagina left by the forceps, in a perfect reversal is, that it twists the broad ligaments, and we know that any instrument used for pressure acts better the thinner the tissue that is engaged in the for-

It is only lately that very much has been said in before we have a closed cavity in which fluids may the journals about the use of forceps instead of liga-Within the last two years an article has appeared in the journals by a French gentleman who think that one advantage over the ligature is enough has reported some forty cases operated upon in this The objection that comes to my mind, in the It occurred to me, in examining use of these forceps in operation for myomata of the this specimen, that it was not necessary to remove uterus and large size is that, in the cases I have seen, High amputation of the cervix the broad ligament has been carried up with the utewould have removed all of the disease and would rus to such heights above the top of the vaginal wall that no forceps I have seen would embrace all the tis-Still the plan would be good, abdominal secwith reference to the attachment of the sarcoma to tion would enable one to tie the broad ligaments half way down to the uterine arteries, and then the forceps could be used

DR E C DUDLEY, in closing the discussion, said Dr Jackson has asked for my experience relative to the question whether sarcoma is apt to be attached to the uterine wall by a pedicle Sarcoma of the uterus is too rare to permit any one operator to speak from experience It is, however, true that sarcoma may be attached to the uterine wall by a broad or narrow pedicle, on the other hand, as Dr Jackson says, it may be intramural This tumor had ports, all made by competent persons, and from the a very short pedicle, the growth filled and distended same specimen, so that I must confess I have less the entire uterus, there was perhaps a pound of sarcomatous tumor in the uterus at the time of my first

I have more confidence in the accuracy of pathoon investigations to determine our diagnosis and logical observations through the microscope than Dr Jackson, never having had occasion to question the diagnosis of a pathologist, although, like Dr Jackson, I have frequently employed two or three micro-I had scopists to examine the same specimen independthe pleasure of witnessing the use of these forceps ently, but I have always taken care to employ good pathologists, of whom Dr Wing is one

The objection of Dr Parkes against the operation which I have indicated for removing myomata and In 1886 I did it again, and during the securing the broad ligaments by means of lock forearly part of this year I removed three uters, and in ceps in the vagina would not render the procedure in each of them I employed the method that has impracticable. The broad ligaments could easily be stripped from the uterus until it became possible to include them in the grasp of the forceps For this operation it would be well to have, in addition to the ordinary forceps, four pairs of forceps with very long blades, two of which could be fastened on either speaker that iodoform gauze interferes with drainage broad ligament close to the uterus, and the ligaments could be divided between them, then the ordinary forceps might be passed through the vagina with their blades on either side of the remaining portions of the After removing the uterus, the enbroad ligaments tire broad ligament on either side could then be grasped in a single pair of vaginal forceps, which should have longer and stronger blades than for ordinary vaginal hysterectomy, on account of the great

hypertrophy of the ligaments

Dr Byford considers the method of Péan inferior to that of the ligature for certain cases in vaginal hysterectomy Péan's method seems to me better and safer for all cases. The hæmostasis can be more quickly secured by the forceps than by the ligature A single pair of forceps will secure a mass which The hæmostasis is would require several ligatures almost absolute when secured by the forceps, but is uncertain with the ligature After the forceps have been left on for forty eight hours there is necrosis of that portion of the ligaments within their grasp, and we thereby get rid of it Not so with the ligature mass, it must remain as a slough, sometimes for Moreover, after a ligament is found to many days be involved in the disease for which the uterus is being removed, it may be easily drawn out by means of the forceps first applied, the surrounding tissues stripped off, and another forceps applied back of the This would be very difficult, sometimes with the ligature The mortality of this impossible, with the ligature operation may perhaps be reduced as low or lower It is certainly an than that of ordinary ovariotomy easier operation than ovariotomy with adhesions The hæmostatic forceps have indeed changed a very formidable operation to a very simple one

Retroverting or inverting the uterus through the opening posterior or anterior to the uterus and bringing the fundus into the vagina is objectionable First, some of the contents of the uterus may get into the peritoneal cavity and make trouble ond, the body of the uterus in the vagina fills it so full as to leave very little space in which to complete It will always be well, however, as a the operation precaution against infection of the abdomen from the malignant disease, to tampon the uterine canal with cotton and close the os externum with a suture, so that if it become necessary to retrovert or antevert Iodoform gauze was the uterus nothing can get out used as a vaginal tampon in this case, when removed in twenty-four hours, it was found to be fetid, and therefore seemed rather an element of danger than It also interfered with drainage at all, it should be placed between the forceps and the vesico-vaginal septum, where it would not be so liable to obstruct drainage as if placed between the It would always forceps and the recto-vaginal wall seem desirable to close the peritoneal edges of the They did not close the wound enough to prevent pulled out several joints of the tænia from his anus

drainage and they do protect the patient against the danger of protrusion of abdominal viscera in case of

severe retching, vomiting, or coughing

I cannot agree with the last DR H T BYFORD As the vagina cannot and favors decomposition well be douched during the first few days, the secre tions must accumulate until forced or drawn up through the vaginal entrance, which, in the dorsal decubitus, is the highest end of the vaginal canal By placing a small roll of iodoform gauze well up against the stumps (drawn down by the ligatures), and then stuffing in a long narrow strip so as to fill the vaginal canal loosely, and extend out to a dry piece of gauze between the labia, we can drain off the fluid portionof the exudations by capillary drain age, promote hæmostasis, prevent prolapse of the in testines, support the base of the bladder, and keep the stumps stationary until an exudate has fixed them and closed the peritoneal cavity

As to the advantage of the forceps in enabling us to remove more of the broad ligaments, I think that the less of the broad ligament removed the better If the disease has extended into the ligament, the I think that the operation should not be performed proposed combination of the abdominal and vaginal methods by the application of the hæmostatic forceps from the vagina is more complicated, more difficult, and more dangerous than supra-vaginal amputation or Hæmostasis can be se abdominal hysterectomy cured without it In case the cervix must, on account of the disease, be removed with the uterus through the abdomen, then the forceps might be applied from below, but the mortality would, in the nature of the case, be greater than that of vaginal hysterectomy or

supra-vaginal amputation

In answer to the criticism that a high amputation of the cervix would have been preferable, I will say that the cervical wall was so deeply invaded that the cul-de sac would have necessarily been opened Had it not been opened, there was not enough vaginal wall to cover the raw surfaces, and the hæmorrhage that would have occurred, and the suppuration after ward, whether the cautery had been applied or not, would have been much more liable to kill this feeble The septicæmic symp patient than hysterectomy toms disappeared in a day, and the anæmia is daily In some cases, vaginal hysterectomy diminishing is the safer operation

DOMESTIC CORRESPONDENCE

A REMEDY FOR TÆNIA

Dear Sir —It occasionally happers that one rem edy after another fails to expel a tapeworm, even though the patient is placed under proper and re stricted diet before the medicine is given A case of this kind came under my observation—a boy, aged 13 years. The diagnosis, as is usually the case, was very readily made, from the fact that the boy

as proof of his ability to make the diagnosis Turpentine, pomegranate bark, pumpkin seed, extract of male fern, and chloroform were given at different times, with the effect of expelling the greater portion of the worm, but they failed to bring away the head Some of these drugs were given the second, and even the third time

After failing with the anthelmintics that had been hitherto successful in my hands, I concluded to give salicylic acid (as mentioned in Bartholow's "Materia Medica," 6th ed) The boy was given 8 gr doses every hour, until five doses were taken, a dose of castor oil preceding, and one after the last dose of The result was that the worm was expelled entire with the operation of the oil

I F JENLINS, M D Tecumseh, Mich, March 2, 1888

NEW INSTRUMENTS

AN IMPROVED LARYNGEAL TUBE Exhibited and Described to the Chicago Medical Society,

February 20, 1888

BY F E WAXHAM, M D, OF CHICAGO

Unexpectedly I found my name upon the programme to-night I regret it because I did not intend to present these instruments until I had some further experience My experience with these modified tubes is limited to four cases, which of course are too few to allow me to speak with authority in regard to them The most earnest advocates of intubation have never claimed that the operation has been fully developed, and it will undoubtedly be This new years before the instruments are perfect device is the outgrowth of the rubber epiglottis that I have used considerably The rubber attachment in many cases worked admirably but would often fail, partly due to the disarrangement of the epiglottis on

Largest size tube shown full size

introduction, or more frequently, perhaps, to disarrangement afterwards from frequent coughing, so I have long been at work trying to find some way by which we could close the upper opening of the tube without danger of any disarrangement upon introduction or later by the coughing I have devised this metal epiglottis, that acts by means of a spring made of piano wire, which is embedded in the upper part of the tube This epiglottis works very lightly indeed As the child swallows the epiglottis falls and the larynx rises, and this metal attachment covers completely the upper opening of the tube and when the swallowing ceases the spring forces it upward The only danger I see from this instrument is from the rusting of the wire and its breaking if used too long without non-corrosive spring

being changed If made of gold it will not be necessarv to change the spring so frequently 1

My first case was seen in consultation with Dr The patient was a little child 4 years old Several months previously the child had suffered a severe attack of nephritis and had never fully recovered Four or five weeks ago the child had an attack of scarlet fever, the nephritis was aggravated and the amount of albumin in the urine greatly increased Following scarlet fever came diphtheria, and the larynx becoming involved it seemed a hopeless case, To relieve the on account of the complications urgent dyspnœa, the O'Dwyer tube was inserted, but scarcely with the expectation of recovery the first thirty-six hours there was almost entire suppression of urine The child was frantic for water and as every attempt at drinking caused violent coughing it was thought best to remove the tube hoping the child could breathe without it The tube was removed and a membranous cast about two inches in length was expelled, but it was impossible for the child to breathe without the tube and this modified one was introduced There was a great contrast between the ability to swallow with this tube and the The child died, however, about eight hours later from uræmic poisoning

The next case was seen in company with Dr Parsons This was almost a malignant case of diphtheria There was albumin in this case also, and it seemed. if possible, more hopeless than the other There was repugnance to food of any kind, the child would not take nourishment before the tube was introduced, and of course there was the same difficulty afterwards When she would make the effort she could swallow This child died about thirty-six without difficulty

hours after the operation

The next case was seen through the courtesy of Dr Roberts, of Lemont There was some diphtheritic infection, several children in the family had had sore throats and there had been small spots seen on The child had been suffering urgent the tonsils dyspnœa for forty-eight hours, I never have seen more urgent dyspnœa than in this case, there was very deep sinking in of the thorax with every inspiration, the pulse was rapid and feeble, and the child could have lived but a few hours longer was introduced and the child was able to take nourishment very nicely and without coughing, and took liquids comfortably The child wore the tube fortyeight hours and expelled it, and has made a good recovery

The next case was seen at Blue Island, through the courtesy of Dr Kaufman The child still wears The child was 5 years old and suffered the tube from urgent dyspnœa, this form of tube was introduced and he was able to swallow water without coughing, but after the tube had been in about half an hour he rejected it, it was reintroduced and he rejected it again A larger tube was introduced which has been retained ever since The report is favorable, and as the child has worn the tube this long we shall hope for a recovery in this case

¹ Since reporting the above Truax & Co have constructed for me a

I think if we are able to allow a child to take fluids a larger proportion of them will recover. Many children object to semi solid food and it is difficult to feed them, while they would more readily take liquids which would often agree with them much better. While these tubes may still need some changes I confidently expect that they will answer the purpose.

NECROLOGY.

LEVI HOWARD, MD

Levi Howard, M D, was the son of Deacon Levi Howard and Mary Howard, nec Houghton, and was born in Bolton, Mass, in May, 1820, being at his decease nearly 65 years old His father was a farmer in comfortable circumstances, and the son passed his boyhood and youth upon the firm, receiving a common-school education in his native town, continuing his studies at Worcester and at Bridgton Academy, Me He then taught school a few terms "on the cape" and in Bolton, afterwards beginning the study of medicine under the direction of his uncle, Dr Lewis W Houghton, of Waterford, He attended one course of medical lectures at Bowdom College, and then entered Dartmouth Medical College, graduating at the latter in 1845

After graduation he practiced with his uncle, Dr Houghton, in Waterford for three months. While here he married Miss Lydia J. Hapgood, and soon moved to Still River, Mass, a village of Bolton, and here practiced his profession two years. In 1848, learning that Dr. Francis Kittredge, of Chelmsford, wished to resign his lucrative practice to take up his residence in California, Dr. Howard went to Lowell, where he has ever since resided, enjoying in a marked degree the confidence and esteem of the community, as evidenced by the constant and ever increasing demands for his professional services.

Dr Howard was a member of the Massachusetts Medical Society, of the North Middlesex Medical Society, was at one time president of the latter, and held all the various offices in its gift, and of the American Medical Association from 1865 During Gov Talbot's administration he was appointed a trustee of the Blind Asylum at South Boston Never taking an active part in politics, he yet consented several years ago, yielding to the earnest solicitation of friends, to become a candidate for the office of representative in the State legislature In so doing, he was in part influenced by the behef that the change would afford him the rest which he needed from the exacting duties of his profession He was, however, unsuccessful, and, paradoxical as it may seem, his personal popularity and professional ability contributed to his defeat. Many of his personal and political friends neglected to go to the polls, feeling that his election was sure, while others voted against him, fearing that his medical services could not be had when wanted, so that, through the over-confidence of his friends, rather than the strength of the opposition, he failed to

Many his religious views he was a Baptist, and while a member of the church, and a firm believer in the doctrines of this denomination, he was never narrow For several years he was a deacon of ly sectarian the Central Baptist Church, gave largely to the erec tion of its meeting-house, and always contributed liberally to the support of public worship Two of his sons adopted their father's profession, the elder, George L, a young man of much promise, died be fore he had completed his studies, the other, Dr Amasa Howard, has been associated with his father the past two years, meriting and receiving the favor of the community Besides these, Dr Howard's only students have been the brothers Dr Samuel L Dutton, of Boston, and Dr Charles Dutton, of Tyngsborough, for both of whom their preceptor always cherished the warmest friendship, and whose success in their chosen profession is most creditable alike to instructor and pupil

In June, 1884, Dr Howard, knowing well the nature of the malady fastened upon him, left his practice in charge of his son, and in company with his devoted wife, sailed for Europe, where he spent several months, but it now seems evident that it was too late to secure even a temporary benefit from change of chimate and occupation

Not fluent in speech, his thoughts were always expressed in terse, well chosen language. He never jumped to conclusions, and the diagnosis of every case entrusted to his care was the result of a most minute and careful examination Before age and disease had impaired his bodily vigor, his very ap pearance at the bedside of the sick fairly rivalled the efficacy of the contents of the medicine chest, causing many a patient to feel if not to say that his presence "doeth good like a medicine" Another, and by no means the least prominent trait of his character, was his kindness to the poor, and many are they who, without money and without price, have received the benefit of his skill and advice, and when his body shall have been laid in the grave, not they alone but the more fortunate, all classes will join in the benediction contained in the poet's lines

> "How many a poor one's blessing went With thee beneath the low, green tent Whose curtain never outward swings"

Dr Howard leaves a widow, three sons and two daughters One son, associated with his father, has already been named, one is in his senior year in Harvard College, and the third is studying for the profession of architect Of the daughters, one is the wife of Prof J H Willoughby, principal of the Middleborough High School, and the other a teacher in London, England

The death of Dr Howard makes a void in this community not easy to fill Fortunate, indeed, will be his successor if he shall win the respect, esteem and confidence bestowed in so large measure upon the honored physician who has gone to his final

rest

GARRETT R BALDWIN, M D

Dr Garrett R Baldwin died at his home in the city of Ft Scott, Kansas, on March 4, 1888, after a prolonged illness, at the age of 47 years He was born at Saugerties, Ulster Co, New York, on May 13, 1840, his boyhood days being spent in his native village where he attended the common schools When he was quite young his father moved to Michigan, where Garrett attended the Academy at Tecumysset, and afterwards the literary department of the University of Michigan In 1857 he commenced the study of medicine with Dr Wood, of Monroe, Mich, as preceptor, matriculating at the Medical Department University of Michigan, in 1850, and again in 1860. In the fall of 1861 he entered the army, enlisting in the 18th Mich Vol. served a time as hospital steward until commissioned as assistant surgeon, remaining with his regiment until the war closed In the fall of 1865 he matriculated at Bellevue Hospital Medical College, graduating the following spring, 1866 During that summer he located at Ft Scott, Kansas, and commenced the practice of medicine, continuing without intermission until stricken down with his fatal illness He was noted for faithfulness to his chosen profession, and honored by all who knew him, beloved by his patrons and patients for his kindness and sympathetic nature He held the position of city physician in 1867 and 1868, county physician in 1868 and 1869, in 1870 he was appointed surgeon for the examination of pensions, president of the board for the same purpose from its organization in 1880, until the present administration made a change an active member of the State, South-East Kansas, and Vice President of the Bourbon County Medical He represented the State Medical Society at the session of the American Medical Association, held in New Orleans, in 1885, and again at Chicago in 1887 He made several contributions to medical literature, notably a paper on "Continued Fever," read before the Kansas State Medical Society in 1883 In 1867 he was married to Anna E Johnson, an estimable lady, who, with two sons, survives him Mankind was beautified by his labors, and the world seemed better because such a man lived

JOHN HOMER DIX, MD

John Homer Dix, M D, was the son of John Dix, Surgeon in the U S Navy He was born in Boston, 1813, graduated from Harvard College in the class of 1833. He began the study of medicine with Dr John Jeffries, receiving his degree of medicine from Jefferson Medical College in Philadelphia, 1836 He became a member of the Massachusetts Society in 1837, making the diseases of the eye and ear a specialty, he commenced practicing in Boston about In 1846 he visited Europe to avail himself of the hospital advantages and became one of Professor von Graefe's pupils He was a man of laborlous study and great self confidence, strict integrity,

lover of music Among his writings (although not numerous) I find a (Boylston) Prize Essay on "Morbid Sensibility of the Retina" He joined the American Medical Association in 1849, and attended meetings in 1864 and 1865 He contributed some valuable works to the literature of his profession After a successful practice for nearly fifty years, he died at the Isle of Shoals, August 25, 1884, bequeathing in his will a large portion of his estate to charitable institutions His widow survives him

H C HOWARD, MD

Dr H C Howard, of Akron, O, died April 23, 1887, at his residence, at 45 years of age Dr Howard was born in Akron and received his literary education in the city schools He studied medicine with his father, Dr E W Howard, after which he attended two courses of lectures in Cleveland, O, and then completed his medical education in Bellevue Hospital Medical College, New York City, in 1871, after which he entered into partnership with his father, which continued until the time of his His cheerful, happy disposition robbed the No call was ever made for sick-room of its gloom his services which did not receive his prompt atten-His untiring devotion to his patients was rewarded by a large and lucrative practice

Dr Howard was always an earnest student, keeping his library filled with the latest works on surgery and medicine His judgment was remarkably good, and his convictions firm As a physician he ranked high among his professional brethren He was kind, good hearted and genial, and never forgot the calls His genial, social and good-natured of charity disposition made him many friends All deeply mourn the loss of a warm friend, a good neighbor, an honorable citizen, and a devoted physician

MISCELLANEOUS.

AMERICAN PUBLIC HEALTH ASSOCIATION

THE LOMB PRIZE ESSAYS FOR 1888 -Mr Henry Lomb, of Rochester, N Y, offers through the American Public Health Association, two prizes for the current year, on the following subject "Practical Sanitary and Leonomic Cooking Adapted to Persons of Moderate and Small Means" First Prize, \$500, Second Prize, \$200, Judges, Prof Charles A Lindsley, New Haven, Conn, Prof George H Rohé, Baltimore, Md, Prof Victor C Vaughan, Ann Arbor, Mich, Mrs. B H Richards, Boston, Mass, Miss Emma C G Polson, New Haven, Conn Conditions—The arrangement of the essay will be left to the discretion of the author They are, however, expected to cover, in the broadest and most specific manner, methods of cooking as well as carefully prepared receipts for three classes.—(1) those Association, two prizes for the current year, on the following

as well as carefully prepared receipts for three classes, -(1) those of moderate means, (2) those of small means, (3) those who may be called poor For each of these classes, receipts for three meals a day for several days in succession should be given, each meals a day for several days in succession should be given, each meal to meet the requirements of the body, and to vary as much as possible from day to day. Formulas for at least twelve din ners, to be carried to the place of work, and mostly eaten cold, to be given. Heathfulness, practical arrangement, low cost, and palatableness should be combined considerations. The object of this work is for the information of the beautiful. genial in disposition, kind to the poor, and a great whose requirements the average cook book is ill adapted, as well

All essays written for the above prizes must be in the hands of the Secretary, Dr Irving A Watson, Concord, N II, on or before Sept 15, 1888 Lich essay must bear a motto, and have accompanying it a securely scaled envelope containing the author's name and address, with the same motto upon the outside of the envelope

After the prize essays have been determined upon, the envelopes bearing the mottoes corresponding to the prize essays will be opened, and the awards made to the persons whose names are found within them. The remaining envelopes, unless the corresponding essays are reclaimed by authors or their representatives within thirty days after publication of the awards, will be destroyed, unopened, by the Secretary

None of the judges will be allowed to compete for a prize The judges will announce the awards at the Annual Meeting of the American Public Health Association, 1888

It is intended that the above essays shall be essentially Ameri can in their character and application, and this will be considered by the judges as an especial merit

Competition is open to authors of any nationality, but all the

papers must be in the English language

The subjects selected and successful competitors in the past three years are as follows 1 "Healthy Homes and Food for the Working Classes," 62 pages, by Prof V C Vaughan, of the University of Michigan, 2 "The Sanitary Conditions and Necessities of School Houses and School Life," 38 pages, by Dr D F Lincoln, of Boston, 3 "Disinfection and Individual Prophylaxis against Infectious Diseases," 40 pages, by Major G M Sternberg, Surgeon U S Army, and 4 "The Preventable Causes of Disease, Injury, and Death in American Manufactories and Workshops, and the Best Means and Appliances for Precenting and Avoiding Them," 19 pages, by Mr George H Ireland, of Springfield, Mass

These may be obtained at the book stores, or of Dr Irving A Watson, Secretary, Concord, N. H., at the following rates Single copies, No 1, 10 cents, Nos 2, 3, and 4, 5 cents each The entire four essays in pamphlet form 25 cents, or in cloth binding at 50 cents or 75 cents, according to style of binding and paper. The desire is to distribute these as widely as possi ble among the poorer and middle classes

THE NEXT MEETING OF THE ASSOCIATION OF AMERICAN MEDICAL EDITORS —The following programme has been ar ranged for the meeting at Cincinnati, Monday evening preceding the meeting of the American Medical Association, May, 1858

Meeting called at 8 P M

Reading of minutes

President's Address, William Porter, M D, of St Louis Report of Committee on Organization, Dr McMurtry, Chairman, Danville, Ky

Flection of officers for ensuing year

Extraordinary business Questions for consideration

I Is the multiplicity of medical journals an advantage to the profession? To be discussed by Drs Crothers, Hartford, Sine, Memphis, Wile, Conn, I ove, St Louis, Culbertson, Cincinnati, Cushing, Boston, Coomes, Louisville, and Gray, Chicago 2 How far do medical journals distributed by drug houses

and manufacturers interfere with regular medical journalism?
To be discussed by Drs Reynolds, Louisville, Davis, Chicago,
Shoemaker, Philadelphia, Bond, St. Louis, Connor, Detroit,
Kiernan, Chicago, Thacker, Cincinnati, and Fulton, St. Paul
Members are requested to limit their remarks to fifteen min

utes, and if possible to ten, The place of meeting will be posted in all the hotels by the local committee Arrangements can be made at this meeting for a "press dinner" for another evening during the week, but it will be impossible to conclude the business of the Association and have the dinner the same

HEALTH IN MICHIGAN, FEBRUARY, 1888 -For the month of February, 1888, compared with the preceding month the re ports indicate that bronchitis, influenza, and measles increased in Compared with the preceding month, the temperature in the prevalence

as to bring her attention to healthful and economic methods month of February, 1888, was higher, the absolute humidity, the relative humidity, and the night ozone were more, and the day ozone was less

Compared with the average for the month of February in the nine years, 1879-1887, measles increased, and diphtheria, con sumption of lungs, pneumonia, intermittent fever, and scarlet fever were less prevalent in February, 1888

For the month of February, 1888, compared with the average of corresponding months for the nine years, 1879 1887, the tem perature was slightly lower, the absolute humidity was slightly less, the relative humidity was the same, the day and night ozone were considerably less

Including reports by regular observers and others diphtheria u as reported present in Michigan in the month of February, 1888, at 40 places, scarlet fever at 45 places, typhoid fever at 17 places,

mensles at 39 places, and small pox at 1 place
During February 1 disease variously named as a "common cold," and "epidemic influenza," has been very prevalent. It has affected to an unusual extent the root of the tongue It has run through families, neighborhoods, and schools Physicians have sometimes been called, especially when the cold threatened to "settle on the lungs"

AN ERGOT-MILL FOR OBSTETRIC BAGS -Dr Loviot, in describing Professor Pajot's obstetric bag in the Annales de Gynecologie, notes that it contains an ergot mill This instrument resembles a small coffee mill, bearing, like that familiar domestic instrument, a handle, but in size it is not larger than a pepper mill, and might work by the same simple mechanism. It may readily be packed in the bag, as it takes up very little The practitioner can only rely on freshly pulverized rye This mill enables him to powder the ergot on the ergot of rye spot, so that in the hour of need a strong preparation of the drug may be made in the patient's chamber, even in the most In this manner perilous delays caused remote country districts either by mert liquid preparations of ergot, or by waiting till some fresh tincture or fluid extract is brought to the lying in room from some distant druggist's shop, are avoided, to the great advantage of the patient and the practitioner—British Medical Journal, March 10, 1888

SIR HENRY ACKLAND has recently had an eye removed for hæmorrhagie glaucoma At last accounts he was doing well

MR T B CURLING, a well-known English surgeon, died at Cannes on March 4, of pulmonary congestion

OFFICIAL LIST OF CHANGES IN THE STATIONS AND DUTIES OF OFFICERS SERVING IN THE MEDICAL DEPARTMENT U S ARMY, FROM MARCH 10, 1888, TO MARCH 16 1888

Major G M Sternberg, Surgeon, ordered to proceed to Bruns wick, Ga, on official business, and upon completion of same will return to his proper station S O 57, A G O, March 10, 1888

First Lieut Jefferson R Kean, Asst Surgeon, reheved from duty at Ft Sill, Ind Ter, and ordered for duty at Ft Robinson, Neb S O 56, A G O, March 9, 1888

OFFICIAL LIST OF CHANGES IN THE MEDICAL CORPS OF THE U S NAVY, DURING THE WEEK ENDING MARCH 17 1888

A Surgeon W H Rush, detached from Navy Yard, New York, and to Naval Hospital, Philadelphia, Pa

A Surgeon J M Steele, detached from Naval Hospital, Philadelphia, and to Coast Survey Str "Bache"

Medical Inspector A S Oberly, detached from Navy Yard,

Portsmouth, N H, and wait orders
Surgeon F L Dubois, ordered to the Navy Yard, Portsmouth,
N H

Asst Surgeon, James Keeney, ordered to the receiving ship

P A Surgeon C W Deane, detached from Marine Rendez vous, San Francisco, and to Coast Survey Str "McArthur" Asst Surgeon E W Auzal, detached from Coast Survey Str "McArthur," and to Marine Rendezvous, San Francisco

P A Surgeon Clement Biddle, ordered to Naval Academy, An napolis, Ad

METHODS OF EXAMINATION OF BACTERIA FOR LABORATORY PURPOSES,

Based upon Notes taken in Prof Koch's Laboratory

ın Berlin BY S N NELSON, M D, OF BOSTON MASS FUNGI

Bacteria are a species of fungi coming under the division of the fission fungi besides the fission there are two other varieties, the mould and budding fungi

The mould fungi are divided into Penecilium, Aspergillus and Mucor, being distinguished by the The base or difference in growth of the seed stalk extending in every direction, forming a mycelium from this extends the seed stalk

Penecilium The seed stalk extends upward like a pencil It has no male or female members The oldout by the younger members The distinguishing characteristic is that the spores grow on branches

Aspergillus When the spores of penecilium are joined together closely it forms the second variety aspergillus—the spores here growing in masses on a head

Mucor Here the spores are enclosed in a capsule, which has a brown or yellow color. If the capsule is shaken it bursts and the spores fall out. The characteristic of this variety is that the spores grow in a head or capsule

2 Budding fungus This is the fungus of fermentation, although all do not cause it. It has no mywith budding processes cells are fat cells and vacuoles

budding fungi-the "ordium" This is the fungus of this variety of bacteria is not well known Favus, and is pathogenic of this disease and buds, but it grows as a my celium, a number motile organs of longish cells lying on one another

of the cell and subsequent separation of the parts | scope

They are different also from the budding fungi, in that the cells are immeasurably smaller

The most elementary form is the coccus, having a bullet shape, all axes being alike When lying with no regular arrangement they are simply spoken of as micrococcus, if they occur in pairs they are called diplococci, as that of gonorrhæa, if they are found four together, they may or may not be enclosed in a capsule, they are called tetracoccus, if found in the shape of a cube, four on each face, they are termed sarcinæ, if they occur in strings or chains, they are spoken of as streptococcus, as of erysipelas, and if in bunches, like grapes, staphylococcus The substance binding the cocci together is called the The spore formation of cocci has not yet been studied up, fat globules may be mistaken for spores

The bacilli are rod like forms with a difference in substratum of all is a mass of anastomosing threads, the two dimensions. A characteristic element is their development. One way is by fission is noticed in the middle of the cell, forming a constriction, and finally the two sections fall apart forming two plants The other way is by spore formaest spore is always the terminal one, being pushed tion, to be spoken of further on These bacilli form strings, being joined end to end, and it often happens that we cannot distinguish the different members of the long threads These threads may run in straight lines or breed upon themselves in any direction There are many varieties of bacilli, some resemble cocci, but among them will always be found enough rods to fix the variety This is especially noticed during rapid growth. When the growth is slow one

The Spirillium, or third variety of bacteria, is characterized by being curved on its long axis, in different combinations There is the plain curve or breed, as seen in the comma bacillus of cholera, the true celium or spore formation, but consists of ovid cells spiral form, more or less resembling a screw, as that The spaces seen in the of relapsing fever, called an elementary form, and finally a complex form, where the spiral is bent upon There is a transition form between the mould and itself in different directions. Spore formation in

dimension is always longer than the other

Many bacilli have cilia at the ends which in many logically it resembles the budding fungi, having cells cases are hard to distinguish. These cilia are the

Examination of the Mould and Budding Fungi -3 Fission fungi These are all true spirochete, or A small bit of the fungus is placed in alcohol, to bacteria—the latter being a general name for the which a drop or two of ammonia has been added, whole class Like the other fungi, they belong to until it sinks. It is then placed in glycerine and can the vegetable kingdom, and increase by the division be easily torn apart and examined under the micro-

Colors and Staining -The difference of refraction between an object and the air makes a colorless ob ject visible. When the medium approaches the refractive powers of the object then the object cannot be seen, as is shown when a glass rod is placed in oil are to be first thoroughly sterilized. Test tubes are The experiment is best shown when a row of dishes is taken, the first being empty, the other dishes being filled respectively with water, oil of cedar, and Canada balsam If now a glass rod or a lot of glass beads is placed in each of these successively it will be seen to grow less and less perceptible to the sight With a colorless rod we simply ally sufficient when the cotton plugs are slightly get a structure picture, while with a colored rod we tinged jellow have in addition, the color

Following out the principles here involved we make use of the following stains or dyes to render the bacteria more visible

Methyl violet or gentian violet. This acts quickly and deeply, but may overstain

A red stain, not acting as quickly as gentian violet, but not as likely to overstain

does not overstain

Bismark brown, used mostly for contrast staining Heat is not needed with this dye and it acts well in water and glycerine

To prepare the staining solutions. First make a concentrated alcoholic solution, using absolute alco hol, then to some of this alcoholic solution add distilled water until the resulting solution is no longer transparent, generally about six parts of water are needed to one part of the alcoholic solution, filter, and the solution is ready for use Bismarck brown cannot be used in alcoholic solution, a concentrated watery solution must be made

Cover-glass Preparations — A platinum needle must be held in the flame of a Bunsen burner or alcohol lamp, in order that it may be thoroughly sterilized, and after it has cooled we remove with it a small quantity of the material to be examined and make as thin a layer as possible on a carefully cleaned coverglass—the less material used the better If a second cover-glass is rubbed on the first the layer will be made thinner The specimens are then to be dried in the air, under cover, and when dry are to be drawn three times through the flame, with the surface containing the specimen uppermost This serves to coagulate the albumen and thus to fix the bacteria Care must be taken not to overheat the specimen They are then ready for the staining, which may be repeat the heating If filtrate is clear and slightly done by dropping some of the watery solution of alkaline, then filter the whole amount through a the stain upon the preparation and allowing it to stand, perhaps using a little heat, or by allowing the specimen to float, specimen side downward, in a dish containing the staining solution—from one to twenty minutes may be required The preparations are washed in distilled water and if overstained, decolorized For this purpose alcohol, acetic or the mineral acids are used, generally water and alcohol are sufdried and the specimen ready to examine It may be laid on a slide with a drop of distilled water and desired to keep the preparation, the specimen is time fluid and at another temperature solid, and is

allowed to dry by allowing the water on the specimen to evaporate, and by means of Canada balsam the cover glass may be fixed on the slide

Cultivation of Bacteria -All utensils to be used to be first thoroughly washed and dried, they are then closed up with plugs of cotton wool, so made that they may be easily removed when necessary The tubes are then to be sterilized under a dry heat, under a temperature of 150° C,—302° F—twenty minutes will be long enough The heating is gener They are then allowed to cool and are ready for use We have found that this could be done in the oven of a kitchen stove or range. In the same way flasks and other utensils may be made sterile

Peptone Gelatine — Take a pound of fresh, lean meat, containing little or no fat, mince it finely, add a little water and allow the mixture to stand over The following day the liquid is thoroughly Methyl blue This shows the finer structures and strained and pressed from the meat, water being added to bring the amount up to a litre. Then the following is added

> Peptone sicca, 10 grams Common salt, Gelatine,

[Instead of the above 10 grams of Liebig's extract may be used with a litre of water]

The mixture is then allowed to stand in a flask a quarter of an hour, or until the gelatine is thoroughly Flask is then placed on a water bath and softened heated to 60° C -140° F -until the gelatine is en At the temperature above named tirely dissolved coagulation of albumen does not occur a solution of sodio-carbonate with a pipette till a test shows no acid reaction, and the solution is neutral or perhaps slightly alkaline, many bacteria preferring an alkaline medium, then lightly plug up the neck of the flask with cotton and heat for an hour in a steam kettle at a temperature of 100° C -212°F Being heated and sterilized in constantly rising steam is much better than ordinary boiling, as we can ob tain a higher temperature, while in common boiling cold air comes in contact with the flask, thus lower ing the temperature Next test a little of the liquid by filtering If the filtrate is still cloudy, boil longer, if it is clear, test to see if it still remains alkaline, If not, add more of the sodic carbonate solution and double layer of filter paper and pour into the alread) The tubes are filled about a sterilized test tubes This can be easily done by quarter of their depth attaching a piece of rubber on the end of the funnel, to which is attached a stop arrangement by which The tubes are plugged the flow can be controlled immediately after the filling and are then sterilized for three successive days, fifteen minutes at a time The clean surface of the cover-glass is then By these repeated sterilizings at this high tempera ture the germs and spore that are hard to destroj by

ordinary heat are killed The advantages of gelatine are that it is at one Pasteur uses germs may get to all parts of the sub- tube tube upside down in the left hand and loosen the end cotton plug, with the platinum needle which has ond tube. I terial to be examined, remove the plug with fingers that of tube I by the fingers of the right hand must not be placed in the sun or in a hot place, generally the number taken otherwise they will melt and culture be destroyed. the germs being diffused in the mass

The different manifestations in growth are to be porcelain, made by A W Faber) noticed as the distinguishing points of different germs, such as, superficial and deep growths, lique-faction and non liquefaction of the gelatine What relation the growth bears to the inoculation line a germ needs much acid from the air the growth is mainly on the surface of the gelatine It may he here flat or in a raised clump The inoculation line may be thickened or have little prominences here With germs that liquefy the gelatine it happens usually that the gelatine is liquefied to an equal depth It may be slow and evaporation take place and an air space result It may even occur at the bottom of the gelatine, while the upper part remains solid, or it may occur at different places along the line

The inoculation streak, "Stitch Culture" The tubes when cooling are so laid that there is a slanting surface and the streak is made by drawing the platinum needle lightly over the surface This method is not suitable for bacteria that liquefy gelatine

Slide cultures are made by pouring liquid gelatine on sterilized slides and then allowing them to cool This is an excellent method for cultures over the surface cultures it is best to melt it at as low a temperature as possible, just sufficiently to pour it out of the test way a culture of but one germ is obtained

Plate Cultures —All utensils to be used must be sterilized before using Glass plates by dry heat Glass jars are to be carefully washed and then rinsed out with a solution of corrosive sublimate, 1 1000 good formula being about 7 grains to pint of water) When ready a piece of blotting paper moistened with same solution of sublimate is laid on the bottom and another piece, also moistened, on the inside of the and hold it upside down till it is placed on the levelcover Gelatine tubes are then heated at about 32° litre of water, instead of the minced meat)

The germs will remain at the spot and plunge into the liquid gelatine Repeat this five where they fall, while with the fluid stratum which or six times and thoroughly mix the material in the This is best done not by shaking so that bub-To inoculate a tube of gelatine, hold the bles may form, but rather allow it to flow from end to From this tube, labeled O, we inoculate a sec-The two tubes are taken in the left been sterilized in the flame take up a bit of the ma- hand, the plug of tube O being also held in this hand, of same hand, and plunge the needle into the gela- previously sterilized platinum needle is first plunged tine, keeping in the middle line as nearly as possible into O and immediately carried into the gelatine of I and not going to the bottom of the tube After Four or five times will be enough, and in the same withdrawing the needle, replace the plug, label the way inoculate from tube I into tube II, and if O is tube and watch developments This is the so called to be thrown away, if thought to contain too many inoculation line-"Stitch-Culture" Gelatine tubes germs, from tube II to tube III, three plates being

> (Instead of paper labels for numbering the tubes pencils may be obtained that will mark glass and

When the contents of the tube are thoroughly mixed, the gelatine is then poured upon the plate under cover, commencing with tube O, or tube I, according as it is desired to retain O or not gelatine is spread evenly on the plate by means of a sterilized rod or with the edge or lip of the test tube, which has been previously heated, leaving a margin between the edge of the gelatine and that of the glass plate The plate is then allowed to cool, under cover, and hastened if necessary by resting on ice On the bottom of a jar already prepared, place a glass bench and on this the plate containing the gela-A second bench is placed over this to receive the next plate I or II as the case may be, prepared with the same precautions as the previous plate, the plates being labeled to correspond with the tubes, and so on Any accidental germs that may get in will grow on the surface, while the others will grow in the depths of the gelatine. When all the plates are in the jar, cover and place away for observation, noting progress from day to day

If the moculation has been made from a material The specimen is taken up by the platinum needle where probably more than one germ may be found, which has been heated by the flame and drawn lightly we can make our pure culture from the above plate When the growths on the plate are disexamining growths, as it can be placed under a micro-tinct and have not run together the last plate is the scope In liquefying gelatine preparatory to making best one for this purpose, we make an inoculation from the growth desired to a gelatine tube, in which

The different characteristics of the growth on the plate are to be noticed as distinguishing different

germs, just as in the tube cultures

Agar-Agar —This has many advantages over gelatine, the principal one being that it does not liquefy at ordinary temperatures It is prepared in the same way as gelatine A pound of fresh, lean meat being minced and allowed to stand over night in a litre of water, pressed and strained on the following day, cover, if a hole is cut out of this the contents of the and brought up to a litre by adding water. It is then jar may be partially seen Now take a glass plate placed in a clean flask with 10 grams of peptone and 5 grams of common salt and filtered (As with gelaing apparatus, and cover immediately with a glass tine, 10 grams Liebig's extract may be used with a C,-86-90° F,-just sufficiently to allow the gelatine filtrate add 15 grams finely cut agar-agar, and allow to pour but not enough to kill germs Then remove whole mass to soak over a water or sand bath at a with sterilized platinum needle the substance desired temperature of 50-60° C -112-140° F -and lastly,

galf data of the man of the state gall bending an affect of the state heated directly over the flame and must be heated till it is thoroughly divided. It finger, turned over and placed in the jar. In this is then neutralized with solution of carbonate of soda way the cut surfaces of the potato has had nothing in the same way as gelatine, and then filtered This in contact with them but the sterilized knife Do is the hardest part and is best done at a temperature the same with the other potatoes till enough are cut of 100° C -212° F -in a steam Lettle made high to fill the jar. The jar is covered after each potato enough to hold the flask and funnel. It is then run is placed in it till the next is ready into test tubes and sterilized for three successive days, lifteen minutes at a time. It is used for moc. ulations and cultures in same way as gelatine and is especially suitable for bacteria that liquely gelatine It is also good for germs that require high temperature, as in a culture oven or incubator

Blood Serum - Some germs, notably the tubercle must be taken to expose the potato to the air as little bacillus, will not grow on either gelatine or agar-agar, and for these blood serum serves excellently for a cleansed and sterilized, it will show for itself by the stratum Beef or sheep's blood is used, being caught growth of the potato bacillus from the animal in sterilized vessels and immediately placed away in the cold to quietly settle for 24-36 Up till lately, the examination of water was a chem hours in order that the serum may form If shaken ical one, but it was not reliable, as it could not deor moved the serum becomes tinged with the blood | teet the organic elements, which have no relation to coloring matter. When the serum has formed it is the chemical constituents. Distilled water contains removed by means of a sterized pipette and poured | plenty of germs | A good drinking-water should coninto test tubes, previously sterilized, which are filled tain as few bacteria as possible, still, many geims about one-third their length sterilized like gelatine tubes and is best done in an apparatus where they lie in a slanting position at a temperature of 58°-70°C -131°-158° F —the former being the better, if possible, for one hour, for five or six days. When firm place the serum tubes with their plugs in a culture oven or incubator to see if they are sterile or not. The serum forms an opaque mass and the inoculations are made as streaks along the surface of the serum with a sterilized platinum needle, as with gelatine

Bread Substratum —This is used for cultivation of the mould and budding fungi Small flasks are washed and dried, then plugged with cotton and They are then partly filled sterilized with dry heat with powdered bread and just enough water added They are then with a pipette to be soaked up sterilized by dry heat and are ready for use inoculations are made from the desired material to the surface of the bread

Potato Cultures — The potatoes must be as fresh and perfect as possible in every respect. Bits of earth adhering to the eyes must be cut out and the growths develop they may be counted, if the plate potatoes carefully cleaned with a brush then to stand an hour in a 1 1000 solution of corrosive sublimate, by which the skin is made sterile They are then placed in a pot and thoroughly steamed | made on agar-agar in a steam kettle at 100° C, being allowed to remain here from a half to three-quarters of an hour is sufficient for new potatoes, old ones requiring a When taken out they are allowed to longer time cool and are then ready to be handled Before handling, knives are to be heated in the flame and cooled, edge up, under cover, glass jars to be cleaned than the ends which are colored intensively, this is and rinsed out with a solution of sublimate, I 1000, hands to be brushed and bathed in same solution Potato is to be picked up between the thumb and this is the spore forefinger of the left hand and cut through the mid- leads an independent existence They vary in shape dle with a sterilized knife which is not to be removed and position may be round, oval, and may have until the potato is placed in the jar, when the upper their long axis across the bacillus, some bacilli have

Agar melts slowly half is to be removed by means of the knife and the

Inoculations are made by taking a bit of material to be examined on the tip of a sterilized knife and spreading it on the surface of the potato, leaving a clear margin around the border From this a bit is taken out of the centre and spread on the second, from the second to the third, and so on Precaution as possible. It the potatoes have not been thoroughly

Examination of Water and Counting Bacteria -The tubes cannot be are found in the air, which are perfectly harmless On the whole, one may say that a sample of water containing 100 germs is better than one containing 1,000 germs, still, it may not be, as the 100 may con tain pathogenic forms, though of course the possibil ities naturally increase with the increase in number of the bacteria in a certain quantity of water Water should always be examined immediately after re-The circumstances surrounding any specimoval fied water should also be examined When a well is pumped dry and allowed to fill again, there will always be found a number of bacteria in the water If there are but 100 germs in a cubic centimetre of water, then we say that water is comparatively pure, In counting absolute purity is almost impossible germs, a certain definite amount of material is taken with a sterilized pipette and inoculated in a gelatine The tube, generally i cubic centimetre of water or other substance is taken to ro cubic centimetres of the gelatine, and a plate culture made with all the pre cautions mentioned, the jar containing the-culture placed away and noted from time to time When They are has been marked off in squares and subdivisions the counting is rendered easier. If any of the germs liquefy the gelatine, then a new culture must be

Spore Formation -Asspores have not been studied This up in the case of cocci, the knowledge of spore form ation is connected with the study of bacilli Spores are a special growth in the life of the germ In staining germs it is will not stain like bacteria often four d that the middle part stains less deeply not the real spore stage, but the one preceding it First an oval body appears, which will not take color, Then the spore frees itself and

the spore in the end, forming a club of bacilli from spores occurs in different ways. It lize with absolute alcohol and acetic acid may grow out from the ends, from the side, or may trast color use methyl blue For spore formation there bulge out broadside must be a higher temperature than is necessary for staining solution more intense, aniline oil has same Anthrax spores the growth of ordinary bacteria will grow at 30°-32° Cent, 86°-90° Fah, and in a Ehrlich's method is a solution of fuchsine or gensolid stratum. For staining see under "Double tian violet and aniline water. It is made exactly as Staining"

Hanging Drop - Special slides are made for this purpose, they being thicker than usual and the cen tre being hollowed out about the circumference of a three-cent piece Slides and cover-glasses are thor oughly cleansed and sterilized The bouillon used is the same as that used in making peptone gelatine, without the addition of the gelatine, same formula and process used in making it. A drop of this is with a trace of a pure culture by means of a sterilized The cover glass is then carefully platinum needle turned over and laid over the spore in the slide and the edges covered with vaseline, to prevent evapora The preparation can then be examined under the microscope and the growth observed It is es pecially suitable for spore growth

on the fact that aniline colors do not react the same entirely washed out Bacteria are stained more tion should be made fresh, gentian violet added and the preparation stained in the ordinary manner. It is then brought into a solution of iodine and iodide of potassium (1 part 10dine, 2 parts of K I and 100) parts of water), this decolorizes everything but the bacteria. To make the aniline water solution pour aniline oil into a test-tube till it fills the concavity, then add distilled water to two thirds or three-fourths the length of the tube, then filter, the filtrate will be clear Add gentian violet till you have a light cloudiness, and shake the test-tube thoroughly

Let the preparation remain in this solution five to ten minutes, when it is to be brushed through the iodine solution, generally twice will be enough, in time perhaps half a minute, then bring into alcohol, out, the bacteria being stained violet For contrast color color use Bismarck brown

Staining Spores - The prettiest results are obtained by using double staining, the spores being the other hand, they are hard to decolorize stained red and the bacilli blue or six times through the flame, by which the spores little round clumps of material are made more prominent by the bacilli being more fuchsine or violet solution, using a little heat if on the blood serum that has been described hence ordinary staining will not suffice this solution use the following formula

The growth violet, 11 ccm, absolute alcohol, 10 ccm Decolor-As a con-

Tubercle Bacilli - An alkaline solution makes the

effect also

the solution for staining spores, using the same for-A preparation of the suspected sputum is made on a cover-glass in the ordinary way, dried in the air and then drawn three times through the flame, care being taken not to overheat the specimen The preparation then is placed in the above fuchsine or violet aniline solution for twelve hours, it is then brought into a solution of nitric acid and water, 1 to 10, for some seconds, where it is decolorized, it replaced in the middle of a cover-glass and inoculated mains so long as clouds come off the preparation, ordinarily inside a minute being long enough, it must show no yellow shimmer It is then brought into not less than 60 per cent alcohol and washed, and for contrast color into methyl blue, is then washed with distilled water. The tubercle bacilli will be stained red, the other germ cells and elements will be stained blue If violet has been used instead of Double Staining, Gram's Method —This depends fuchsine use Bismarch brown for contrast color Use oil immersion lens and Abbé condenser The prowith all bacteria, from some germs the color can be cess may be shortened by heating the fuchsine solu-A more rapid and as certain a method is thoroughly with an aniline water solution in addition Liehl's modification, the whole process not requiring to the ordinary coloring matter The aniline water over ten or fifteen minutes Instead of aniline water, which must be often renewed, he uses phenol in a 4 per cent solution Phenol, 4 grams, absolute alcohol, 5 ccm, water, up to 100 ccm Then add fuchsine or methyl violet 1 gram, dissolved in absolute alcohol, 10 ccm -31155 Allow the specimen to remain in this solution five minutes Heating will have same result quicker, heat till bubbles come off, may add the solution to the cover-glass preparation of the sputum, which has been made in the ordinary way, and then heat the cover-glass over the flame It is then brought into a r to 10 solution of sulphuric acid and water to be decolorized Next come in absolute alcohol, rapidly drawn through till the coverglass has a dirty-yellow color, is then washed with distilled water and stained with methyl blue, or Bisthe brown color due to the iodine is then washed marck brown if violet has been used, for contrast Here, as by the preceding method, the tubercle bacilli are red, remaining elements blue bercle bacilli react very slowly to aniline colors, on The best results must be taken not to allow the specimen to remain are obtained with the spores of the anthrax and hay too long in the decolorizing solution, else the tuber-bacilli. Make an ordinary cover-glass preparation, cle bacilli will be decolorized. In a suspected sputum using the material from the hanging drop, draw five the parts most likely to contain the bacilli are the

Pure Culture of Tubercle Bacilli —With a platinum or less destroyed, then stain with the aniline water, needle make an inoculation of the suspected sputa Spores have a firmer capsule than bacteria, germs grow, if pure, have a grayish-white layer on the dinary staining will not suffice. To make serum, the bacilli grow slowly. To prevent the en-Of the sat- trance of other germs, heat the end of the tube, tourated aniline water solution mentioned under Gram's gether with the cotton plug, may also place a drop method, 100 ccm, conc alcoholic sol fuchsine or of sublimate on the cap to prevent evaporation

Place in culture oven or incubator, at a temp of 35° keeping the remaining fingers on the gauze to keep Cent, 95° Falt It may be ten days before a growth the animal in the jar Then the hair is clipped away is noticed

Staining Cuts of Tissues -Small pieces of material to be examined are hardened in alcohol, remain- duced to make a pocket, and the inoculation made ing here twenty-four to forty-eight hours at least, when in this pocket. Of course all utensils are thoroughly they will have the consistency of soft cork then stuck on pieces of cork by means of glycerin jar and watched from day to day gelatine, made by a part gelatine being placed in water till it has swollen to double its volume, it is then placed in a part of glycerin and heated over the flame, thus making a mucilage. It is then glued on a cork by this mucilage and again placed in alcohol for further hardening Cut with a micistome

Cut is then placed in the ordinary solution, where it spreads and in a few minutes has absorbed the dye, it may be overstained and may sink a little From five to ten minutes is long enough to leave the cut in the staining solution. It is then washed off mother of several children, first noticed an enlargewith alcohol, clouds come off and cut looks pale and shrunken The germs and cell nuclei remain stained, the remaining elements being decolorized. It stays in absolute alcohol one or two minutes to remove water, is then cleared up with cedar oil and mounted in Canada balsam

Cuts may be double stained according to Gram's They are placed in a solution of the fuchsine aniline water solution, next in the iodine solution for from one-half to one minute, this renders the It is then placed in alcohol while clouds come off, and next in absolute alcohol to remove the patient's home, however, was at Rappahannock Stawater one or two minutes, place again in absolute alcohol, cedar oil and mounted in Canada balsam

Germs are found in different parts of the tissues Anthrax bacilli are found in the liver and lungs, often her taken at once to a private room in the Proviin clumps

Tubercle Bacilli in Cuts of Tissue —Fiehl's method is the best for this purpose The cuts are placed in the carbol-fuchsine solution for ten minutes, then rapidly in the 1 to 10 sulphuric acid solution, and next in alcohol till clouds have all passed off For contrast color let it stand in methyl blue for five to ten min-Is next placed in absolute alcohol to remove the water, cleared up in cedar oil or bergamot oil and mounted in Canada balsam They cannot be stained by Gram's method The bacıllı are red, while all else The bacilli are found in the cells, especially in the giant cells, and are generally in that part of the cell farthest removed from the nucleus, may be found irregularly in the tissues When cells break down the bacılli are set free

All sorts of animals are susceptible to the tubercle If inoculated in a cutaneous vein, tuberculous affection will develop in fourteen days lution containing the bacilli may be injected into the peritoneum, localizing the process there

Inoculation Experiments - Use ordinary house The animal is held by an asmice or white mice sistant or is hung in a glass jar which is about six inches deep, covered by a piece of wire gauze gauze is raised enough to admit a pair of forceps to responsibility with me hanging inside, and held by the thumb and forefinger, an exploratory incision was recommended and Mon

at the base of the tail and a V-like cut made into the skin with a pair of scissors. A lancet is then intro-They are sterilized. The animal is then dropped back in the

THREE BAD CASES OF OVARIOTOMY, TWO DOUBLE, ONE SINGLE

Read before the Medical Society of the District of Columbia, November 23, 1887

BY JOSEPH TABER JOHNSON, MD, OF WASHINGTON, D C

Case 1 -Mrs M, white, æt 51, married and the ment in the left side of her abdomen four years ago It grew rapidly and gave her considerable pain She became an invalid and for the past year was unable to leave her house, and for the last six months was compelled to stop in bed, partly on account of failing strength, and partly on account of the large size of the tumor

She had been treated to the materia medica mostly, and the entire surface of the abdomen bore evidence of the vigorous and lavish use of iodine sent to me by Dr Khpstine, of Alexandria The For contrast color use Bismarck brown for tion, Va, and she was brought to Washington by her son-ın-law, Dr Quackenbosh, of Florida As she was not able to sit up, a section was taken for her in a sleeper, and she bore the journey very well I had dence Hospital, where she was put to bed and al lowed to rest

Upon examination I found an enormously enlarged abdomen which gave the impression of containing a unilocular cystic tumor, so clear was the wave of I thought it would weigh at least fifty fluctuation The weight was so great that the patient pounds found it impossible to lie for any length of time on her back, but rested for the most of the time on her left side in such a position that the bed supported the weight of her burden

For several weeks the patient had been voiding less urine than normal, some days less than a pint, and that contained albumin She suffered from nausea, constipation, indigestion, and got little sleep She was certainly in a bad way, and was rapidly growing worse Her pulse was rapid, weak and intermittent, and her temperature 99° in the morning and 101°+ in the evening I did not think her case a favorable one and was loth to operate I had had a series of eighteen ovarian operations without a death, and I was reluctant to spoil my record, but the patient and her son-in-law were anxious to take the chances-if she had any chance, and I agreed to operate if the Consulting Board of the hospital would divide the

After examination three days later by the Board

day, November 7, fixed as the time We feared she choice between chloroform and ether, as both her

kidneys and heart seemed equally affected

Ether was administered by Clover's inhaler, and although she was on the operating table nearly an tumor above the umbilicus only, was fluid The remainder of the mass was composed of a great numthe patient upon her side and actually bale her ab-The sac, fortunately, domen out with both hands I transfixed its stem, fied it on both sides and cut it contact found enlarged, flattened and very hard, above the and covered with warm carbolized towels navel, and imbedded in the folds of thinned out broad

ligament and parietal peritoneum While I was lifting this out Dr Bulkley, who was standing by the patient's head, reported that she was I heard several other physicians agree with him that it was useless to proceed, but I did proceed deliberately in the removal of the second reddened ovary I remembered Dr Gill Wylie's suggestion that hot water in the cavity overcame shock, and several pitcherfuls of distilled hot water into the abdomen, and she promptly rallied, her tongue was pulled forward and she had no more trouble baled out her abdomen again, closed the wound, aptaken no opium, as she has had no pain some stimulants and quinine and one purge bowels moved naturally on the seventh day delighted at this, as I had injured an intestine slightly she was first tapped she was much prostrated by compressing a fold of it in a pressure forceps applied to a bleeding point in the omentum I discov- months bruised No harm has resulted temperature are now normal Tumor weighed 54 lbs

children and has had several miscarriages, first noat Providence Hospital by Dr Frederick, of this Board of the hospital advised me to make an "excity Dr Lincoln saw the case in consultation with Dr F, and a diagnosis of ovarian tumor was made

Upon admission to the Hospital I found the abdowould die from the an esthetic, we had not much men very tender She was compelled to stay in bed three days from the effects of my examination and took morphine to allay pain. Her pulse ran from 94 to 112, and her temperature remained constantly above 100° After treating her for about ten days I hour she only took about 2 ounces That part of saw that she was getting no better and determined to Accordoperate as the best way of affording relief ingly, on Monday last I opened the abdomen, and ber of cysts containing fluid too thick to run through | found a general peritonitis everywhere throughout a large trocar, and it became necessary to turn the cavity. It was impossible to separate the peritoneum from the cyst, therefore, after making a slight puncture with the point of a scalpel, I pushed a large had few adhesions When the running mass was trocar through to the peritoneum and cyst wall and turned out of the abdomen and the pedicle reached let out about a gallon of dirty brownish-black fluid it was at once compressed by strong forceps and the With my finger-tips I finally succeeded in separating tumor cut away The uterus had projected from it a little of the peritoneum, and gradually the whole of a fibroid growth with a long pedicle about the size it was peeled off The omentum and intestines were of a hen's egg, this was too tempting to leave, and also glued to every portion of it where they had The omental adhesions were so general I then searched for the other ovary, which I that a large mass of it was withdrawn from the cavity this had finally to be cut off to arrest the bleeding Numerous other points were ligated There was a general oozing from everywhere in the cavity, and after the removal of the other ovary, which I found to be cystic, I poured into the cavity a number of pitcherfuls of hot water until it came out but slightly I then put in a drainage-tube and sewed

Her pulse is now 70, and temp 99 40, being less as this cavity was sadly in need of the cleansing as to-day than before the operation, and I believe the well as the heating effects of water, I at once poured patient will recover No more fluid coming through

the tube, it was removed this morning

up the wound

Case 3 -Mrs H, æt 67, widow, mother of sev-I eral children, came to the charity ward of the Providence Hospital about ten days ago Her abdomen plied the dressings and put her to bed The doctors was very large and she had sprung a leak on her way all looked sorry for me and said of course she would up to the hospital. She had been tapped a week die-but she hasn't died and is doing very well to day, before coming The puncture had opened, and for which is the eighteenth since the operation. She has three days she kept the nurses busy changing cloths Has had and beds She stated that the tumor began to en-Her large and to trouble her about two years ago, but I was thought it had been growing at least six years When was tapped again in two months, and again in two For the past year the tapping has been reered this when I removed the forceps, and had Dr | peated every two weeks, so that in all she has been Cuthbert hold it at least five minutes in his fingers to tapped thirty-seven times Neverless than a bucketdetermine the extent of injury When everything ful was drawn away, and frequently more, and countelse was finished I again examined it and decided to ing a bucket at 10 quarts, we would have 370 quarts, drop it back without doing anything, as it was only or 740 pints, so that I could say that she has lost Her pulse and about 800 pounds of fluid within two years

She applied to a distinguished obstetrician a year Case 2 - Mrs Q, et 35, Irish, mother of five ago for a diagnosis and desired an operation, but was told that she had enlargement of the liver and dropsy, ticed a tumor five months ago She was sent to me and that nothing could be done The Consulting

ploratory laparotomy with power to act "

Immediately after the operation on case No 2 just Mrs Q had been attended by Dr F for an attack reported, I had her etherized with Clover's inhaler of pelvic inflammation quite recently, and the last and put on the operating table. The usual incision two months the patient had been suffering from was made as for ovariotomy, and a cystic growth dispersionitis

he multilocular and colloid. Many cysts were opened stones very strong in my mind. As the severe prun and a bucketful of fluid finally drained away. The tus cutaneus drove the patient almost to distraction, opening had to be enlarged up to the navel, and after and as she had lost all faith in medicine, she asked much manipulation and traction an immense semi- me whether an operation might not afford some re solid mass was delivered which was estimated to lief, or at least end her misery in some other way I weigh at least 20 lbs inches broad, and had to be ligated in four places under the forceps, which had been applied to enable stones me to cut away the great mass which was so difficult The cavity was then thoroughly cleansed, the wound was closed with a dozen silk sutures, and the old lady put into bed She rallied well, and this evening was very bright and feels perfectly certain that she will get well, and is passing wind and water Pulse and temp under 1001 normally

OPERATION FOR GALL-STONES CONGENITAL ABSENCE OF GALL-BLADDER DEATH

BY M STAMM, M D, סו ווו וס וד, מוווס

I he following case, although it terminated fatally, still. I think, presents some interest from a pathological as well as surgical standpoint. Congenital absence of the gall-bladder has been found in a few postmortem cases, no mention, however, has been made. to my knowledge, of the presence of gall-stones in the bile ducts under such circumstances. I also think that no such a case has been operated upon, at least not reported

Mrs L, age 63 years, has for the last eight years been suffering from severe paroxysmal pain in the epigastric region, coming on almost regularly after few drops of a milky fluid escaped and then I struck About two years ago she called at my office and, as she located the pain over the gall-bladder, and told me that it was at times followed by slight icterus, I made a diagnosis of the presence of gall stones I prescribed for her with a view to such a condition but, as all medication at the hands of other physicians had hitherto proved without effect, she gave my medicine only a very short trial and, of course, with similar dissatisfaction About the end of October, 1887, she fell from a chair, striking against her stomach and causing very severe pain over that region, which, however, lessened consider ably in a few days An intense icterus meanwhile four silver sutures broke during the abdominal closure, made its appearance, combined with severe itching, especially at night, so that it deprived her very much the peritoneum, I became rather partial to braided of her sleep Her appetite was very poor, bowels moved once a day or every other day, stools were grayish-white, resembling putty in color and consistency Her urine was free from albumen, but rich in biliary (Chloroform test) Her liver was coloring matter enlarged, especially the left lobe, but no enlarged gall-bladder could be felt Her history, however, before the accident, the intense icterus, and a pinch ing sensation in the region of the gall-bladder made the suspicion of mechanical obstruction by gall-

The pedicle was about 4 told her that we might make an exploratory incision and if feasible we would attempt to remove the gall Though aware of the dangers of such an operation, the patient eagerly accepted this proposi The evening before the operation her temper ature was 991/2, in the morning it was normal

Operation, Thursday, January 19, 1888 - Patient vomited repeatedly during the administration of ether, also during the operation I made a T-shaped in cision, the transverse cut parallel to and 11/2 in be low the ribs, the longitudinal cut externally along the rectus abdominis muscle to a little below the umbilicus Owing to the large amount of adipose tissue the incision had to be made of such a length The liver was found enlarged, principally its left lobe A careful search made for the gall-bladder, it, how ever, was conspicuous by its absence, and in its place was found a projection of the liver substance, but harder than the surrounding tissue On pressure I thought I could hear a grating sound Dr Caldwell, who was my nearest assistant, independently noticed the same fact On further examination I also found that this projection contained three solid nodules which suggested the idea of their being either gall The introduction of a needle stones or cancer even did not settle the question fully in our minds, and for a moment closure of the abdomen was sug After a moment's reflexion, however, we determined to cut down upon these nodules After I made an incision through about 5 cm of tissue a a stone 1 5 ccm in size and the shape of a die, after its removal two more were found, of equal size and shape I succeeded from this place in introducing a steel sound into the common bile duct and found no The stomach and duodenum further obstruction were adherent to the liver near the venous duct, but I made no attempt to separate the adhesions Under considerable difficulty the incision was closed by four silk sutures, and, as I was afraid of some oozing of bile or blood, I left some iodoform gauze at the place, after Miculicz's method (tobacco-pouch), as it perhaps might serve to indicate such an event As not at the place of twisting but where they pierced silk, and think I will use it altogether in the future

The patient rallied well from the operation, and for the first twenty-four hours did very well, with the exception that she did not pass over two ounces of On the second day, however, vomiting set urine in which gradually increased in frequency, so that on the third day it became incessant Although she swallowed nothing but ice pills she vomited up con siderable quantities of greenish-black material Her temperature never exceeded 100°, pulse and heartaction remained very feeble after the operation, the jaundiced condition of her skin and eyes seemed to Death ensued about sixty hours after the

¹ March 26, 1888—These three bad cases made good recoveries, action reand are alive and happy to day. I have now had a series of 24 ovarian operations without a death, the last being done in my private hospital clear up seven weeks ago

During the whole time the quantity of operation urine, voided through catheter, did not reach 3 ozs

Post-mortem examination was performed under Read before the Medical Society of the District of Columbia, protest, which made me resort to the pretence that I would remove the iodoform gauze left in for drainage and secure better closure of the wound, it therefore had to be done in a hurried manner The abplaces was already well adherent The bowels were streaked with a little bloody serum but no coagulation was found, except in the transverse cut between the muscles, it had no connection with the peritoneal cavity since the peritoneum under it was well closed The liver was considerably enlarged, somewhat pale and yellowish, and the wound made for the removal of the gall-stones was in a very good condition, well agglutinated There were no signs of bile or blood visible The adhesions between liver, stomach and duodenum could be easily separated There was absolutely not a vestige of the gall bladder to be The cavity where streaked with some biliary fluid the gall stones were located seemed to empty right seemed overlaid with a thick stratum of liver sub-The stomach and duodenum were filled was normal but somewhat pale small and quite brittle, of a grayish-red color kidney of normal size, very pale and showed signs of fatty degeneration. The heart was covered with the valves were intact but otherwise normal

REMARKS - From the clinical course and the conviction that the death of the patient could not directly be charged to the operation The fatty conthink had the case been operated upon a little earlier, abdominal wall and covered with plastic lymph or could the real condition have been foreseen, the shock to a patient whose blood had been poisoned with bile for nearly ten weeks, and the degenerated allow her to rally from it fully, Had I known of a similar case in about half the time, which would certainly influence the result very much As the wound iodoform gauze can be done away with in future

SARCOMA OF THE SUPRA-RENAL CAPSULES

November 23, 1887

BY I W BLACKBURN, M D,

GOVERNMENT HOSPITAL FOR THE INSANE, WASHINGTON, D C

The specimen of tumor that I exhibit was redominal wound looked fresh, peritoneum in some moved, post mortem, from the body of a patient at the Government Hospital for the Insane tient was a male, aged 48 years, nativity, Germany, occupation, soldier, mental disease, chronic mania of thirteen years duration He was at one time violent, but for many years was quiet and did light work in the tin shop of the institution

He had for some time suffered from hæmorrhoids, and had lost much blood from this source and he frequently complained of pain in his right side, attributed by himself to "liver complaint," on account of this pain he wore his clothing very loose was anæmic and his skin was yellowish, but not dis-The bile ducts were dilated and patent, also tinctly jaundiced Death resulted from exhaustion and anæmia

The body was in a fair state of nutrition, the skin into the common duct, its walls were thick, and yellowish, slight prominence of the right hypochondriac region

The brain and its membranes were first examined, with about half a pint of greenish-black fluid Spleen but nothing of interest was revealed except slight Right Lidney was internal pachymeningitis, and extreme pallor of Left leptomeninges and brain

On thoracic and abdominal section the organs were found to be much displaced by a large oval a layer of fat, its walls were thin and very flabby, tumor, situated in the right hypochondriac region The lungs were very pale, beneath the right lobe of the liver The right lung was pushed upward, and the heart and left lung upward and toward the left, and the liver extended post mortem appearances of the case I gained the downward five inches below the ensiform cartilage, and across into the left hypochondrium

The tumor was adherent to the liver and to other dition of the heart and kidneys, with consecutive structures in the vicinity, except a small portion of suppression of urine, were more responsible for it I the anterior surface which was in contact with the

By careful dissection the tumor was removed with result would have been much better The operation the liver, and the specimen was photographed to lasted over two hours, and the bowels were eventrated show the relative size. The tumor when removed and kept in disinfected cloth during most of this from the liver weighed 97 1/4 oz, and measured in its time, this was certainly sufficient to produce a severe long axis, 85% inches, in its short axis 57% inches. It was completely encapsuled, regular in contour; soft, and fluctuated slightly It was cut through the condition of her heart and kidneys would hardly middle, and 91/2 oz of blood-tinged fluid escaped. The cut surface showed three concentrically arsimilar case that might have served me as a guide ranged nodules, which bulged slightly from the surthere would have been much less delay in the opera- face, and were mottled and streaked with blood The novelty of the condition made the diag. They appeared to be more recent than the other nosis between gall stones and cancer also somewhat parts of the tumor and probably were centres of The greater portion of the tumor was In other words, I could perform the operation in a brownish in color and very friable, the result of degrowth generative change

in the liver was well agglutinated and no signs of bile about 1/8 inch in thickness. The growth of the The capsule was tough and fibrous, and averaged or blood oozing were present, I think the strip of tumor had caused great atrophy of the right lobe of the liver, and the right border, where stretched over This case further teaches that we should not abstain the tumor, was thinned and fibrous The left lobe from an operation even if we cannot detect any seemed relatively enlarged. The weight of the liver was 651/2 oz, the tissue was bile stained, but

otherwise normal calculi of various sizes Some were imbedded in mains the walls, and to be cut out, and one of the larger granulations is impossible, and the patient slowly was firmly grown into the mouth of the duct, completely obstructing it The common duct was pervious

toward the left, and was firmly adherent to the and it should be restricted to such cases, and not capsuli of the tumor, by a fibrous band of the supra-renal body could be found, its place the natural cure of the empyema to be accomplished having been taken by the tumor The other organs, including the supra-renal capsuli of the left side, drainage operation. It is important to emphasize presented nothing worthy of note No secondary this point, lest the success attending it should tempt growth was found in any organ

The macroscopical as well as the microscopical save time appearances show the tumor to be a sarcoma mary sarcoma of the supra-renal body is more common than primary carcinoma, the latter is very rare, but secondary carcinoma is not uncommon comata of the supra renal bodies occasionally reach shall have reference to but three or four points great size Wilks and Movon record a case of sarcoma of both supra-renal capsules, in which the the cavity to be treated either before the operation tumors were the size of a feetal head at full term, and a primary melanotic sarcoma the size of an adult the fact that the operation must be specially planned head, was seen by Kussmaul. The tumor I exhibit for each case, for its success depends upon the was fully as large as an adult's head

Microscopical examination shows the tumor to be being removed. It is not a matter of removing a of the large celled round celled type, with a slight tendency toward alveolar arrangement in some parts I hough the large round cells are most numerous, all shapes and sizes may be seen, and a distinct intercellular reticulum is present Small bands of spindleshaped cells and delicate connective tissue run through and divide the cells into imperfect alveoli Blood-vessels are numerous in the recent portions, and are seen to have imperfect walls The brownish portion shows degeneration of the cells, but the same general structure Though no proper glandular structure can be found, the sarcomatous cells have wonderfully preserved the shape and general character of the cells of the supra-renal body Fields may be found which admirably show this curious tendency of sarcomata, to reproduce the characteristics of the mother-tissue

MEDICAL PROGRESS.

ESTLANDER'S OPERATION, ON THORACOPLASTY-MR A PEARCE GOULD, in a paper in which he Thoracoplasty must be records four cases, says clearly distinguished from the much simpler procedure of removal of a small portion of one rib for It is, as its name signifies, a purposes of drainage plastic" operation of empyema which refuse to heal in spite of long-The comcontinued free drainage of their cavities pressed lung has expanded to the full extent possible to it, the mediastinum has been displaced, the diaphragm has risen, and the chest wall has fallen in

International Encyclopædia of Surgery, vol v, page 1087

2 Cornil and Ranvier, page 601

The gall bladder contained 155 until the ribs are in contact, and yet a cavity re-To occlude such a cavity by a growth of advances to the grave, worn out by the continued suppuration, or is more suddenly carried off by acute tuberculosis or cerebral abscess It is to save The right kidney was displaced downward and these lives that Estlander devised this operation, No trace undertaken until ample time has been allowed for -a cure that most often results from a well devised the surgeon to perform the operation merely to The severity of the operation is such that it is only justifiable when it is plain that it is demanded to save life

As to the operation itself, I need add but few Sar- words to the descriptions already given, and these And the first is the necessity for carefully exploring or as a first step in it. This necessity arises from whole of the unyielding bony boundary of the cavity certain length of a certain number of ribs, but all the ribs lying in the wall of the empyema must be The surgeon should therefore first of all excised determine the vertical and the antero-posterior extent of the cavity The best way of doing this is by the finger, and I prefer, first of all, to enlarge the fistulous opening until the finger can be freely passed in to explore the cavity, but of course much information can be obtained by intelligent probing The ribs to be removed have generally been exposed by raising a flap of the soft parts over them, and Mr Godlee in his valuable Brompton Lectures advo cates that plan I have not found this necessary, a single vertical incision is all that is required Raising a flap makes a more extensive wound, but another and perhaps more grave objection to it is that it is often impossible to decide before hand ex actly how far the cavity extends in all directions, and therefore how large the flap should be I strongly recommend a single vertical excision through the skin and muscles in preference to raising a flap To excise a rib, the periosteum should be separated all round by a respatory, and if a long length has to be removed, it is best to cut it away in two or If the cavity extends far back even three pieces toward the spine, it will be found convenient, after removing the front portion of the rib in the usual way, to remove the posterior part from the inside, peeling the thickened pleura off the bone, and apply-We are all familiar with cases ing the cutting forceps from within the chest, this simplifies the operation, and disturbs the soft parts less than the other plan Should the cavity reach high up, the second rib may be safely removed, but of course the first rib must not be touched owing to its close relation with the subclavian vessels I would here again lay stress upon the necessity of carefully removing all the bone in the outer wall of

the empyemic cavity, so that only a soft and easily severe cases a drain or two was inserted must the bone be fully removed Lining the ribs, in applied an inch in thickness, is found, which is almost as un- with large scalp flaps, two healed primarily eration may be considerable cut, and they bleed freely If any arteries spurt, they should be sized in compression forceps with a weak corrosive sublimate solution Thoracoplasty is a much more sespecial incision vere operation than the mere drainage of an empyema, the shock produced is considerable, and great cases of chronic fistulous empyema are to be treated by thoracoplasty, for its danger to life must negative at when there is serious visceral disease and the vital powers are at a very low ebb

The results of the operation may be either partial or complete success In some cases a sinus remains behind, but this is a much smaller surface than previously suppurated, and the condition of the patient is to that extent improved Such a result, however, cannot be called very satisfactory, it is, I believe, due to the operation not having been sufficiently complete, some part of the bounding wall of the cavity having been left rigid and unyielding I believe full success is only to be anticipated where all physical obstacles to the entire obliteration of the cavity have been removed The cases of com plete success will become more frequent as the op eration is more completely executed Such patients have a great deformity of the chest, but the cessation of all discharge is quickly followed by great improvement in the general health It is to be hoped that the cases requiring thoracoplasty will beefficiently carried out But for a small residue of very chronic and otherwise incurable cases of fistuthoroughly carried out, offers a good chance of cure When once the necessity for operation is recognized, the sooner it is carried out the better, for marked severity of the injury exhaustion or serious visceral disease renders the operation too dangerous to be recommended -Lancet, Feb 11, 1888

Wounds of the Head -S Ginger discusses the cases of traumatism of the head treated in the clinic of Czerny from 1877 to 1884, inclusive were ninety cases of wounds of the soft parts ing with alcohol or turpentine, followed by washing but not the motor centres were affected

Iodoform collapsing wall of soft tissues is left And not only was then dusted on the wound and a Lister dressing It is noted of forty-eight incised wounds these cases, dense cicatricial tissue, half an inch or thirty-three united by primary union Of six wounds yielding as bone, it, too, must entirely be cut away favorable cases recovery from these wounds was The hæmorrhage attending the op-| completed in four to eight days If the secretions If care is taken in of the wound were profuse the Lister dressing was peeling off the pericostal membrane, the intercostal discarded and open treatment with salicylic solution vessels should escape injury, but many branches are or 2 per cent acetate of aluminum was adopted Erysipelas delayed recovery in six cases, proving For fatal in one In twenty-three cases of fractures of the rest, it is best to complete the operation as the bones of the cranium, the parietal, frontal, and quickly as possible, and then thoroughly irrigate temporal regions in the order named were the seat The of traumatism The patients were brought to the skin wound should be closed with sutures, and, if hospital in a state of unconsciousness which lasted necessary, drainage may be secured by means of a a variable length of time. In lesions of the brain substance an approximate localization is possible in most cases

The brain and meninges are favorable seats for care is necessary in the after-treatment. Not all the development of various forms of inflammation (meningitis, encephalitis, pyemia), and after years an apparent recovery may be complicated by the development of a series of symptoms due to brain abscess Such abscesses are fatal in the majority of Neuroses and psychoses may develop and the more so if the local lesion in the brain takes the form of trauma of a centre with formation of a cicatricial tissue Frequent congestions, intolerance of alcoholics, localized headaches, dizziness, paræsthesias, functional disturbance of the senses, all forebode such complication of a beginning psychosis In extensive disturbance of the brain substance and large extravasation, deep coma and complete absence of reaction was present There was also a reactionless pupil, irregular frequent pulse, increased temperature, shallow frequent respiration, in some cases of Cheyne Stokes' character, death occurred in these cases from cardiac failure of cedema of the lung The treatment was a strictly antiseptic one and narcotics, etc, were used symptomatically, but it is to be remarked that where trephining was necessary this was carried out with the mallet, chisel, knife and come fewer and fewer as the surgical treatment of scissors, seldom with the trephine. In addition to empyema is resorted to more early and is more trephining for splintered fractures, abscess and depressions, the indications laid down by von Bergmann and Wiesmann are recognized in this clinic dous empyema, Estlander's operation, when very fourteen cases of trephining recovery resulted in In those cases which proved fatal after nine cases trephining the fatal issue was due rather to the The operation rather retarded the fatal issue Most favorable and rapid was the recovery of those fractures where the brain substance remained uncompromised The less the extent of the bony lesion the more rapid and complete the recovery Where the motor centres were affected by the traumatism, functional nervous dis-There turbances resulted which may, after a period, have retrogressed The prognosis is best in the first class The treatment consisted in shaving the head, cleans of cases, and reserved where the brain substance, with 2 per cent to 5 per cent solution of carbolic especially a certain reserve in prognosis should be acid, or a r per cent solution of sublimate The the rule, for here, though extensive lesions may end wound was then sutured with silk or catgut. In in immediate recovery, yet the statistics show that such patients in later life form a prominent quota of reference is made to seven previously recorded those suffering psychoses. In compound fractures cases of permeal incision of deep perirectal abscess. of the skull, therefore, lesions of the absolute cortical and reports are given of three recent instances of centres give a more unfavorable prognosis than similar treatment in the practice of Professor Bruns lesions of the relative cortical centres has not improved after five or six months after com- four cases urethro perineal fistula had formed in pound fractures of the skull, they may be considered consequence of rupture of the abscess into the possibility of abscess must be considered. In not a single case was the incision intosubsequently Strict antisepsis should be followed in the perineum followed by rupture of the abscess in all these cases tures at the base of the skull, three proved fatal The collected cases in which the deep abscess was prognosis is favorable in those cases where the brain symptoms are slight and short in duration most frequent disturbances of hearing and vision improve if the tympanum alone has been ruptured in the middle line of the perineum or in a line and the labyrinth in the one case and the optic nerve in the other have not been compromised Paralyses are permanent which do not recur to the should correspond with that of the abecess. After normal condition or show signs of improvement within a few months quent brain abscess or psychoses must be concars with antiseptic solutions is imperative The antiseptic tamponade of the ear is advocated obscure concussions of the brain (Beck) where the lesion of the brain substance is slight capillary apoplexia and absorbable exudate, the prognosis is good as regards the immediate recovery of the pa-It is a guarded prognosis, however, when future psychical complications are in question-Deutsch Leitsch f Chir , Bd xxvi, Hft 3 and 4

SURGICAL TREATMENT OF DEEP-SEATED PERI-RICTAL ABSCESS - In Professor Bruns' Butrage zur Klin Chir, Band III, Hest 2, DR HEINRICH Zeller, of Tubingen, argues that perineal incision is the most rational and the proper method of opening a perirectal abscess situated above the levatores ani and coccygei muscles, and presenting a prominence and fluctuation within the rectum without forming any appreciable projection on the surface of the perineum. The perineal has, it is urged, many advantages over the rectal incision The former permits a strict application of the antiseptic method, which, if the abscess be opened by the rectum, must be practiced under very unfavorable conditions the perineal incision the abscess is opened at its deepest part, and so a free and ready discharge of the pus is favored The opening in the perineum can always be made to a sufficient extent, whilst when made in the rectum it will necessarily be limited on account of the risk of bleeding, and therefore is liable to be insufficient for the purpose The permeal incision of draining the abscess guards against further rupture of the abscess in other directions, and should an urethro perineal fistula be formed, this can be more easily dealt with Moreover, the perithan an urethro rectal fistula venting a communication between the abscess and main consideration being the frequent irrigation the interior of the interior the interior of the intestine

If paralysis In those ten cases the patients all recovered In In all extensive compound fractures the urethra before the perineal incision had been made Author records twelve cases of frac- any other direction Of the subjects of thirteen opened by the rectum two died-one from purulent The infection, the other from perforative peritonitis. The perineal incision has been made in some cases. parallel to this, in others, in the line of the incision for lateral lithotomy, but, as a rule, its situation the skin has been divided, the surgeon should make The possibilities of subsc- his way to the abscess more by the use of blunt instruments than of the knife, and every bleeding ves The frequent douching of the nose and sel must be secured The depth of the wound, when the abscess has been reached, varies very In much in different cases In each of the three cases reported by the author it was about four inches, in some cases, especially when the abscess has de-pelvis formed by the levatores ani and the coccygei has not been perforated, the surgeon must work to a depth of at least one inch and a quarter If the abscess be large, it will usually be opened without any difficulty If the incision be made at an early stage, and when the collection is small, the operation may be facilitated by the introduction of the forefinger of the surgeon's left hand into the rectum, so as to press down the abscess towards the surface of the perineum, care being taken not to carry the The relative position of knife too near to the gut the urethra to the abscess may be indicated by pass-After the discharge of the purulent ing a catheter contents, the surgeon should pass his finger into the cavity of the abscess, in order to search for any secondary cavities or prolongations should then be washed out with some antiseptic fluid, and, after the introduction of a drain-tube, the seat of the operation should be carefully covered by a dressing of iodoform gauze - London Medical Recorder, Feb 20, 1888

TREAMENT OF DIPHTHERIA —An elaborate paper on the management of diphtheria by DR G GUELPA, is concluded in the issue of October 30, of Bulletin, Gén de Thérap The special point brought forward by the author 15 "irrigation, the most frequent possible" He has employed a solution of the perchloride of iron for this purpose, chiefly from habit, but other solutions—of lime, carbolic acid, and boric acid may, he admits, be quite as efficient-may be more efficient—for the agent used is quite secondary, the In this contribution Dr. Guelpa advocates the early and persistent, and almost continuous application to the parts threatened with an extension of the diphtheritic process.

Cauterizations are negatived Perchloride of iron solutions, 5 to 10 per 1000 in strength, have proved most successful in a long series of cases of different periods The irrigations are practiced every quarter of an hour during the day, and every half hour at night, in the milder cases with moderate force through the fauces and nares, as is done with the nasal douche, but when the resistance to the passage of the fluid requires it, the hand-ball should be used to pump the fluid through When irrigation is practiced early and efficiently, it is comparatively rare to find the disease spreading to neighboring parts It is relatively easy to bear by the patient, and to apply by the attendants

There are no difficulties in the way medicament that determines the result, the practitioner has a wide choice of materials, and, hence, recommending them those objecting to the disagreeable iron chloride, can employ other medicaments Probably, those agents having a solvent action, as papain, lactic acid, lime, etc, can be used with the expectation of the best results It is the early, frequent, and copious irrigation that accomplishes the important curative results obtained by Dr Guelpa's method -American Journal of the Medical Sciences, January, 1888

INFLUENCE OF OPESITY IN YOUNG WOMEN UPON THE MENSTRUAL AND REPRODUCTIVE FUNCTIONS -In a paper on this subject DR ANDREW F CURRIER says It is somewhat surprising that the law which evidently obtains in this matter has been so gener- News, Feb 18, 1888 ally overlooked by modern and contemporary observers at least I have found very little reference to it in recent literature in the following terms

I A woman under 30 years of age who bears and suckles them, prematurely reaches the limit of stronger than that of cocaine phenomena of the climacteric supervening who become obese after so frequent pregnancies

2 A woman under 30 years of age who becomes obese, from whatever cause, will, as a result, be subwhich I have proposed as a synonym for scanty menstruation may previously have been nearly or twenty minutes (or half an hour) If such patients be married sterility flection during a not inconsiderable experience have convinced me of its existence

tem of treatment could change it It is the order For the others a properly regulated diet is of primary importance, hydrocarbons being eschewed in favor of albuminoids Alcohol in any form is contraindicated. Suitable exercise must be insisted upon, either by the performance of the active outies of household life or a suitably arranged course of gymnastics, including massage Worthington recommends the systematic use of the waters of Vichy, Marienbad, Carlsbad, or Ems I am profoundly impressed with the value of electricity for this condition both in the form of general faradization and the intrauterine use of the faradic current Not only will the muscular tone of the uterus be improved by this means, but the entire pelvic circulation will be favorably affected I have seen come As Dr Guelpa submits many cases illustrating the cases which seemed to be benefited by the use of utility of the method, there can be little doubt of its astringents and stimulants to the interior of the As it luterus, also by moderate dilatation, but the same is the irrigation rather than the character of the means have also been successful in exciting violent inflammation, which leads me to be cautious in

The systematic use of laxatives will be required in almost every case, and we should look well to the condition of the heart, using suitable tonics as they are indicated The internal use of iodide and its compounds has not been attended with the success which its early advocates would lead one to expect Worthington approves highly of hydrotherapy, especially sea-bathing Warm baths are, of course, As Worthington has suggested, it is to be avoided not improbable that one who succeeds in relieving a patient of her obesity will, at the same time, cure her sterility, even without intrauterine medication, and this opinion is shared by Roubaud -Medical

ERYTHROPHLŒIN —This African product has been That law may be formulated the subject of a lively debate in the Berliner Medicinische Gesellschaft (Berliner Klin Wochenschrift, 1888, March 5, also February 27) DR LEWIN asfour, five, six, or more children in rapid succession serted that it possessed a local anæsthetic action far Professor Liebreich her physical powers as a reproductive animal, the replied that the sample examined by Dr Lewin was This ap- in reality a snake poison, and that the rosy red colplies to the average woman under present conditions oration produced by evaporation with sulphuric acid of civilization, and, in a marked degree, to those is shown also by snake poison, and even by dried egg or serum albumen Dr Scholer read a paper at the last meeting of the above Society, in which he confirms Lewin's results ject to amenorrhœa, or oligomenorrhœa (a term tion of 1/5 per cent strength, when dropped into the An erythrophlæin solueye gave rise to a good deal of irritation at first, but menstruation) and usually to dysmenorrhoa, though perfect insensibility of the cornea ensued in about The pupil was not affected and intra-ocular pressure was lowered, will be the rule This law, like most other laws, has but a slight degree of hyperæmia of the conjunctiva more or fewer exceptions, but observation and re- persisted for a long time, and the subject of experiment complained of a feeling of weight in the upper The prognosis in many of these cases may be interference phenomena—for example, colored rings considered exceedingly good, excluding, of course, On the other hand, Dr Loewenhardt, of Breslau, lid, a sensation as of a veil before the eyes, and of those in which the climacteric has followed extraor- writes in the Berliner Klin Hochenschrift, (March 5), dinary fruitfulness For the latter the condition of to the effect that he obtained no an esthesia, but a consterility is permanent, and I doubt whether any sys-Isiderable degree of hyperæsthesia, after subcutaneous injection in animals, and found that he could recently performed laparotomy in a case of m-Dr Epstein, of Nurneasily produce sloughing berg, in an original communication to the Centralb f Kim Med (March 3), finds that erythrophicum the ileo-caecal valve. The stone was removed by a has only a slight local an esthetic action when subcutaneously injected, and that a good deal of pain is the wound closed with a double row of fine silk caused by it. So far then this last observer is opposed to Dr Lewin, who said in his communications to the Berliner Med Gesellschaft that erythrophlæin had a marvellous power of producing anæsthesia The difference of opinion evolved by this statement has had the effect of bringing a number of experi ments upon the field of action and no doubt precise results will soon be afforded from uniform samples of erythrophicum - British Medical Journal, March 10, 1888

ACUTE IDIOPATHIC MYOSIFIS -DR E WAITHER, gives a collection of cases of acute suppurative myositis (idiopathic) and a consideration of the He classes it among the pathology of the affection severer inflammatory affections, peritonitis, osteomyelitis acuta spontanea, pseudo erysipel It is a disease of my cotic origin, and, as investigations of Rosenbach show, is due to the agency of the staphy- Recorder, Feb 20, 1888 lococcus aureus and albus, and streptococci pyo-The avenue of penetration of the infectious genes element into the muscle is not clear in all cases, but there are conditions as severe muscular exertion, contusions, etc , which predispose these structures to the reception of these micro-organisms Dull, severe, increasing pain, inability to use the affected muscle, swelling of the muscle and extreme tension One or many are among the principal symptoms The prognosis differs, in some abscesses may form cases threatening the life of the patient Of nineteen cases collated eight ended fatally If the pa tient recovers and the abscess has not been large the use of the affected muscle is gradually recovered The most frequent complications were erysipelas The author brings forand tuberculous of the lung ward nothing new as to pathology of the affection, quoting largely from Rosenbach The treatment is quoting largely from Rosenbach an antiseptic treatment of suppurating areas -Zentschr f Chn , Bd xxv, Hit 3 - Annals of Surgery, March, 1888

COLD OF THE HEART —LUTON says that a gorged condition of the heart is the salient symptom of an impression a frigore, which is manifested anatomically by inflammatory and plastic lesions clinical symptoms are painful spots over the chest, precordial anxiety, a sense of constriction, and a The sequel of this condition dry, fatiguing cough is a muco-purulent catarrh of the bronchial tubes, which corresponds to the crisis of this indefinite ailment, which is then called a "cold" The effect of digitalis in aborting these attacks before they have reached this stage, shows clearly that the cardiac muscle is at fault -London Medical Recorder, Feb 20, 1888

LAPAROTOMY FOR INTESTINAL OBSTRUCTION DUE TO GALL-STONE - MR CHARLES STONHAM has

testinal obstruction, and found a gall-stone firmly impacted in the ileum, about twenty inches above longitudinal incision about one inch in length, and There was recent peritonitis of the gut sutures above the stone, but none below The patient, a lady aged 66, who was very prostrate at the time of the operation, died fifteen hours later Symptoms. of obstruction had lasted forty eight hours -Lancet, Feb 11, 1888

Perchloride of Iron —To prepare a reliablesoluble saccharide of iron M TRAUB recommends Dissolve 100 grammes of the following process perchloride of iron in 500 grammes of water. In another vessel dissolve 85 grammes of bicarbonate of sodium in 500 grammes of water Mix the solutions, collect and dry the precipitate which is then ground down with 100 grammes of powdered sugar, previously mixed with 11/2 grammes of caustic soda. dissolved in three grammes of water The mixture is dried in a stove and powdered -London Medical

ACTION OF BOILING WATER ON TYPHOID BACILLE. -WILCHUR, of St Petersburg, has found that when a volume of boiling water equal to that of a gelatine culture of typhoid bacilli is used on the culture the bacilli are only partly destroyed, and that when the volume of water is double that of the culture all Experiments on the dejecta the bacilli are killed of typhoid patients showed that when four times the volume of water was added to the dejecta, the ba-It seems, then, that cilli were invariably destroyed this is an easy and certain method of disinfecting typhoid stools

SALICYLATE OF MAGNESIUM IN TYPHOID FEVER HUCHARD says that this salt is easily prepared by dissolving salicylic acid in distilled water, and saturating the boiling solution with carbonate of magnesium, when the salt forms in colorless and odorless crystalline needles, readily soluble in water and alcohol Huchard gives the salt in doses of gr 40 to 80 a day-It is not contraindicated by diarrhœa, since even in It seems to large doses it is but slightly lavative act as an antipyretic and as as intestinal antiseptic. -Rev Gen de Clin et de Thérap, Jan 26, 1888

MARSON'S NEW TEST FOR SUGAR IN URINE, Dissolve to centigrammes of pure ferrous sulphate in 8 cubic centimetres of urine by the aid of warmth, add 25 centigrammes of caustic potash, A dark green precipitate forms if sugar be present, and the supernatant liquid is reddish brown or black, according to the amount of sugar-When sugar is absent, the precipitate is greenishbrown in color, and the liquid is colorless -London Medical Recorder, Feb 20, 1888

THE

Journal of the American Medical Association PUBLISHED WEEKLY

THE EDITOR OF THIS JOURNAL would be glad to receive any items of general interest in regard to local events, or matters that it is desirable to call to the attention of the profession Letters written for publication of containing items of information should be accompanied by the writer's full name and address, although not necessarily to be published All com munications in regard to editorial work should be addressed to the Editor

SUBSCRIPTION PRICE INCLUDING POSTAGE \$5 ∞ PRE ANNUM IN ADVANCE TO CENTS SINGLE COPIES

Subscriptions may begin at any time The safest mode of remittance is by bank check or postal money order drawn to the order of the under signed. When neither is accessible remittances may be made at the risk of the publishers, by forwarding in REGISTERED letters

OPERATION FOR ABSCESS OF THE SPLEEN

It is seldom that affections of the spleen comeinto the hands of the surgeon, and on this account, as well as its somewhat remarkable character, a case of abscess of the spleen, operated on by DR CARL LAUENSTEIN, of Hamburg, and reported in the Deutsche medicinische Wochenschrift, No 51, 1887, is very interesting, and so far as we can ascertain no similar case has been reported in medical literature

The patient operated on was a coppersmith, 23 years of age, who was admitted to the medical wards of the Seaman's Hospital of Hamburg on September 17, with a diagnosis of typhoid fever, after he had been sick 14 days He was in a febrile condition, pulse 96, tongue red at the edges and white in the middle, had been suffering with diarrhœa, and the abdomen was somewhat tympanitic Splenic dulness was much increased, extending in the axillary line from the lower border of the fifth rib forwards and downwards to the free border of the ribs, and backwards to within a finger's breadth of the spinal col-From the middle line forwards it encroached upon the region of normal cardiac dulness, and over the somewhat enlarged dull region of the left lobe of The spleen was not palpable through the abdominal wall, since the patient did not use the diaphragm in respiration, and during inspiration there was some retraction of the epigastric region instead of abdominal expansion The patient complained of pain in the splenic region, though there was no sensitiveness on pressure There was no pul-

tion of the diaphragm on the left side, and some friction sounds at the boundary of the base of the left lung

Under a fluid diet, wine and hydrochloric acid internally, and the pack externally the patient's condi-The temperature tion was not materially changed fell in the morning, and in the evening rose to 39°C Three days after entering the hospital the patient had a severe chill, with a rise in temperature to 40° C, very small pulse, 128, and cyanotic lips He then complained of increased pain in the splenic region, the dulness of which was not increased forwards and downwards, but above and behind was markedly in-The dulness reached two fingers' breadth above the angle of the scapula, and had an extent of 35 by 18 cm With the exception of the fixed condition of the diaphragm, and the marked friction sound at the lower border of the left lung, there was no abnormal condition of the thorax On the day after the chill there was severe collapse, with a fall of temperature to 35 4°, small pulse of 72, and coldness of the extremities, from which the patient was aroused only by the use of stimulants and heat. As the pain in the splenic region continued after the chill, Lauenstein concluded that there was a purulent collection in the spleen, and on the fifth day after the patient entered the hospital he operated

After the patient was anæsthetized the needle of the Dieulafoy's aspirator was inserted in the eighth interspace in the axillary line, at the point of spontaneous pain, and about the middle of the anterior portion of splenic dulness The needle was pushed perpendicularly downwards about two fingers' breadth, but no fluid was obtained till it was carefully withdrawn about 2 cm, when a small quantity of chocolate-colored fluid escaped, which had a penetrating fœtid odor The needle was kept in place and, in order to empty the abscess thoroughly, about 10 cm of the ninth rib were resected, this rib being selected in order to avoid wounding the pleura order to avoid hæmorrhage the there o-cautery was used to cut down under the resected rib, and parallel Though the spleen was lying close to the diaphragm it was not adherent to it at the point of in-After the cautery was carried down about 2 cm into the spleen a chocolate-colored fluid welled up by the side of the cautery The incision in the spleen was now widened to the extent of the resection of the rib, and the borders of this incision brought up against and fixed to the wall of the thorax by means of hooks

The finger introduced into the wound showed the monary abnormality, except an unusually high posi- presence of a cavity, about as large as a goose egg,

the walls of which were friable, and in which several canula in the abscess until the opening was comloose fragments of tissue were found, that were removed with forceps The cavity was washed out with cold salicylic acid solution, and then tamponed with iodoform gauze, the whole wound was then covered with an antiseptic dressing scopic examination of the pus showed that it was composed of pus cells mixed with some red corpus cles, fatty acid crystals, and hæmatoidin crystals was impossible to find either pus cocci or typhoid breilli in dried preparations of the pus The dressing was renewed on the fifth day after the operation, when it was seen that the spleen was adherent to the thoracic wall and to the diaphragm Splenic dulness was at this time much lessened For several days after the operation the temperature was about normal, but then rose, and the subsequent course of the illness was that of a case of typhoid fever On October 11 the patient was entirely free of fever, but had the characteristic paleness and emaciation of typhoid fever, as well as the ravenous appetite of the convalescent At the middle of October the cavity in the spleen had granulated well, and the wound in the thorax was almost cicatrized When the patient left the hospital on November 5 the area of splenic dulness was about 16×11 cm

It is likely that this abscess was embolic, and it is known that embolic abscesses are most frequent in the course of the infectious diseases Without operation the course of such an abscess could scarcely be otherwise than to a fatal termination from rupture and purulent peritonitis, or rupture into the Lauenstein thinks it probable that pleural cavity in his case the abscess was one arising in the course Clearly the most rational and of typhoid fever best surgical treatment was that adopted by Lauen-For the treatment of such abscesses we must draw conclusions from the results of treatment of abscesses in other internal organs, especially in The best results in abscess of the liver have been obtained, not by punction, but by free antiseptic incision, according to Lauenstein, who gives the mortality of the Lindermann-Landau and Volkmann operations as 47 per cent It is true that Barbieri and Parzewski cured two cases of abscess of the spleen by puncture and aspiration, but in both these cases the splenic enlargement and the abscess was accessible through the abdominal wall, which was not the case in Lauenstein's case important steps in the operation reported must be 1 Puncture before the incision, by which the danger of an escape of the putrid contents from the over full cavity was avoided, 2 Leaving the

pleted, so that it served as a guide for the farther Finally, it must be regarded as a wise opening provision of nature that fixed the diaphragm so completely during the progress of the case, and before the operation Had the diaphragm continued its work nothing is more likely than that the abscess would have been ruptured, and the contents ex travasated So also, the circumscribed pleuritis at the base of the left lung was of no small considera tion, since it caused adhesion between the costal pleura and diaphragm, without which the operation, by opening the left pleural cavity, would have much complicated matters

I aunstein gives the following points in the diagnosis of abscess of the spleen, besides the presence of an infectious disease, the changes in temperature, rigors, etc 1 Enlargement of the area of dulness 2 Spontaneous painful sensations Inflammatory phenomena in the region of the spleen (basal pleuritis and fixed position of the diaphragm) As for fluctuation, this could be detected only in cases in which the enlargement was apparent below the free border of the ribs

COMMEMORATIVE MEDAL OF THE NINTH IN TERNATIONAL MEDICAL CONGRESS

We are pleased to announce to the subscribers interested that the dies for the "Commemorative Medal of the Ninth International Congress," have A beautiful specimen, in bronze, been completed struck from one of them is now before us It is fin ished in the best style known to the medalic art, and is also creditable to the Congress and the artist

The medal represents a group of five figures draped in classic costume, as shown in the seal of the Con gress, the chief figure of which is Æsculapius, the Greek physician, who is seated and prescribing for The mother of the child, who holds it in an infant The two other figures are men lap, is also seated standing, the one supporting himself upon a crutch, the other with a bandaged head, resting upon a staff The inscrip awaiting the advice of the physician tion or legend upon the face and around the medal is as follows. In a straight line beneath the group of figures just described, 15 "Washington, 1887" Above and surrounding the figures, reading from left to right around the margin, "International Medical Congress," reading from left to right and around the margin, "N S Davis, Pres, J B Hamilton, Sec Gen, E S F Arnold, Treas, J M Toner, Reg" On the obverse is a noble head of Washington,

encircling above it the words, "United States of America," and beneath it, "Founder of the Republic"

We take the liberty of stating on our own responsibility that the money subscribed for the medals has been entirely exhausted in their preparation, leaving nothing to pay postage on their delivery We would therefore respectfully suggest that each subscriber for a medal send to Dr J M Toner, 615 Louisiana Av, Washington, D C, 15 cents, in stamps, to pay the postage on his medal, and not allow Dr Toner, who has already spent so much time on the work, to advance the amount from his own pocket

PREVENTION OF DIPHTHERIA

Dear Sir - In your editorial of March 17, 1888, "Public Wealth vs Public Health," page 334, you refer to diphtheria as "a preventable disease" Will you not kindly publish the formulæ for preventing diphtheria in your next issue, and oblige A MEMBER

The writer of the editorial referred to in the above paragraph from our correspondent, used the word "preventable," as applied to diphtheria, in the same sense as it is used by nearly all writers on vital statistics and contagious and infectious diseases, i e, by assuming the practicability of preventing the development and diffusion of the specific infection from which the disease is supposed to originate sufficiently obvious from the tenor of the article itself Any disease is preventable in direct proportion to the correctness of our knowledge concerning its essential causes and of our ability to either prevent the development of those causes or to render the human system insensible to their effects Thus, small-pox as preventable either by avoiding contact with its contagion or by rendering the system insensible to its action by previous vaccination But diphtheria, erysipelas, cholera, yellow fever, and some other diseases, evidently depend upon specific infections developed outside of the human body, and capable of being introduced into it in connection with the air we inhale or the food and drink we take our formula for the prevention of diphtheria does not consist of drugs to be obtained at the apothecaries', but of an abundance of pure air, good water, wholesome food, clean soil, and a clean personality

Inhalations of CO2 in Dispnea -Dr Edward Weil, says La Semaine Medicale, of March 7, 1888, has used inhalations of carbonic acid gas to relieve and prevent paroxysms of dyspnœa and with favora-He thinks that the good effect is due ble results to the abolition of reflex sensibility of the pharynx

for from two to five minutes, once or twice a day, in quantities of from two to four litres When the inhalations are made during an attack the dyspnœa is cut short, and the patient breathes easily and com-When the gas is given between the atfortably tacks, inspiration becomes more free, and the attacks are prevented, or else diminished in frequency, intensity and duration

SMALL POY DECLINING AT SAN FRANCISCO —The weekly abstract of Sanitary Reports, from the office of the Supervising Surgeon-General of the U S Marine Hospital Service, for March 23, 1888, states that only 16 cases of small-pox, and one death, had been reported as occurring in San Francisco from the 1st to the 15th of March

The medical officers in charge of the Marine Hospital Service at Key West, reports no more cases of small-pox on that Island, under date of Mach 15, The disease is also reported as having disappeared entirely from Santiago de Cuba But it still lingers in Havanna, 29 deaths having taken place during the week ending March 10, 1888

THE CARTWRIGHT LECTURES of the Alumni Association of the College of Physicians and Surgeons, of New York, will be given on Thursday evenings, March 29, April 5, and April 12, at 8 30 P M, by Prof William H Welch, of the Johns Hopkins University on "The General Pathology of Fevers"

EXECUTION OF CRIMINALS -At a meeting of the New York Medico-Legal Society, on March 16, 1888, a committee reported on the best methods of executing criminals, giving preference to "death by the electric current" The report was adopted by the Society

THE DISTRICT MEDICAL SOCIETY OF CENTRAL ILLINOIS will hold its next regular meeting at Pana, Ill , April 24, 1888 An interesting programme of work is promised F B Haller, M D, Vandalia, President, J H Miller, M D, Oconee, Secretary

ASSOCIATION ITEMS

A Section of Rhinology and Laringology PROPOSED — To the members of the American Medical Association who are interested in Rhinology and Laryngology, I desire to give notice that it is and laryn. The patient is made to inhale the gas my intention to offer an amendment to the Constitution of the Association at the next annual meeting, To establish a separate Section of Rhinology and Laryngology in the Association, in other words to separate Rhinology and Laryngology from Ophthalmology and Otology Yours, etc,

CARI H VON KITIN

SOCIETY PROCEEDINGS.

CLINICAL SOCIETY OF MARYLAND

Stated Meeting, February 3, 1888 Dk WM H Wilch described the PATHOLOGICAL ANATOMY OF INFECTIOUS PLURO PNEUMONIA OF CATTLE

He said the subject was an interesting one aside from its pathology on account of the economic interest it bore to stock raisers and dairymen vails in this country extensively and large sums of money have been appropriated to stamp it out If it is not checked it is bound to cause greater loss It has doubtless existed from reas time goes on mote times but only in the last two centuries has its description been accurately carried on It prevails in this country chiefly in localities east of the Alle New York and Brooklyn representing one center and Baltimore another So far it has never gained a firm foothold west of the Alleghanies disease is a contagious one, not spontaneous so far as is known, and always due to infection The period of incubation varies from three weeks to three months The onset is and it may be as long as six months The animal begins to cough, its temperature becomes elevated, with loss of appetite, etc Often much can be determined by physical signs when practiced by experienced hands Sometimes these acute symptoms subside and the disease passes Again it may run a latent into a chronic state course and it is then not easily recognized disease is a fatal one with an average mortality vary The distining from 30 per cent to 50 per cent guishing feature in the normal anatomy of the lungs of cattle is the connective tissue around the lobules It is not abundant, but characterized by the looseness If the animal dies in the early stage of its meshes of the disease we find in the lung one or more foci of inflammation Sometimes the whole lung becomes affected The affected portion is consolidated, more or less of its elasticity is lost and it is friable pleura is always affected and in some cases a well-A cut section shows a marked pleurisy is observed Not only are the lobules variety of appearances affected, but the interstitial tissue also Some lobules may be red, some gray, others dark, etc, and moving The early stage through this are bands of tissue of the disease is marked by cedema, later it is red, The interand still later the appearance is gray lobular tissue appears as broad bands due to its infilare inflamed in the immediate vicinity of the inflamed tention to a method of suturing designed to be used

area and contain muco-pus and fibrin The microscope shows that the air cells are filled with the ordinary products of inflammation. In the interlobular tissue the lymph spaces are filled with large blocks of Emigration of white corpsucles fibrillated fibrin does not penetrate deep into the interior They are found to undergo coagulation-necrosis

As regards the termination of the disease there is no proof that the lung ever reaches again its normal Sequestra form in the areas of inflammation and fresh pleuro-pneumonia may set up from these The formation of these sequestra always takes place in the interlobular tissue and bands of tissue run into these which correspond to the bronchi and bloodvessels The sequestrum may disappear by invasion of granulation tissue from the outside and the exterior becomes peculiarly worm eaten in appearance There is no proof that the disease affects other organs than the lungs

The disease is infectious beyond all doubts A great many have described organisms and this is the most sensible hypothesis It has never been produced artificially The materie morbi as yet is open to investigation

During the course of his remarks Dr Welchillustrated the points he made with some very beautiful specimens of the disease in its different stages

DR PATTERSON, in response to an invitation from the members of the Society, said that he was unable to go into discussion very deeply because Prof Welch had brought out all of the points of interest pertaining to the disease in question He did not believe there was any way to eradicate it except by destroy The subject is such an important ing the animals one that National legislation should be directed to aid in its suppression

DR L McLane Tiffaney asked if the droppings from an infected herd would cause infection in other herds should they come in contact with it

DR WELCH said the disease may be transmitted without contact There is a singular insusceptibility to the disease in some cattle. An animal may be carried to a place and no disease develop He thinks too that it is necessary to have a National law to eradicate it National and State laws sometimes cooperate to that end, as in Maryland, for example Destruction of the animal is the only way to destroy

DR PATTERSON, in reply to a question, said that he had not experimented with the milk of animals affected with pleuro pneumonia and therefore he could not say whether the disease could be transmitted in that way or not One thing, however the milk does not secrete in the acute stages and therefore it does not get into the market Meat in the acute stage is dangerous

Stated Meeting, February 17, 1888

DR W P CHUNN, of Baltimore, read a paper on

A NEW SUTURE IN CÆSAREAN SECTION

The very short paper here presented is to call at-

to close the incisions made during Cesarean section details of the operation I have a suggestion to make inch and a half during seven days We know that many complete prove of great advantage The escape of fluid is found any stitches having been inserted whatever into the peritoneum to occur by reason of shrinkage of the uterine tissue of the uterine wound I offer then as a suggestion and for what it may be worth, the following method of using the same row of sutures for both abdominal and uterine wounds, and thus lessening the chances of shock and septicæmia

The uterus having been evacuated I would if necessary sew up the upper angle of the abdominal wound in the ordinary way until the abdominal wound and the uterine wound were both of the same length, then by introducing the ordinary suture urine escaping into the peritoneal cavity through one lip of the abdominal wound, then through the corresponding lip of the uterine wound and crossing over and passing the sutures out through the other lip of the uterine wound, and then out through the corresponding side or lip of the abdominal wound we would obtain a single row of sutures which it seems would close both wounds effectually The sutures should be entered one half to three fourths of an inch from the margin of each wound. In this way the suture being secured a strip of parietal peritoneum comes in contact with a strip of uterine peritoneum along the whole length of the uterine wound, on both sides of the incision, and then the peritoneal cavity is shut off from the uterine discharges In addition to the adhesive inflammation surrounding the uterine wound we would have parietal peritoneum pressing directly upon the closed uterine incision

That there are some advantages in this method cannot be denied The question remains for decision, however, whether the disadvantages will not counterbalance the advantages a great saving of time and labor as one row of sutures | jaundice from the obstruction in the gall-bladder can be put in much more quickly than three rows If any fistula resulted the discharge would occur out side of the peritoneal cavity

of bringing in contact opposing surfaces of peritoneum would be avoided Surgical shock would be diminished and the operation greatly simplified The ends of the sutures being outside the abdomen could be lightened as occasion might require Let us now consider the disadvantages

1 Would there be sufficient traction exerted to cut out the sutures? I think not We know that a retroverted uterus may be dragged up out of the continue in position The abdominal walls admit of toms, and there is an absence of pain sufficient depression to form firm adhesions about the is also absent cervix after an extra peritoneal stump is left behind This fact shows how depressible the abdominal walls shin Immediately after labor the uterus is at least

six and a half inches in length, so that we can So far as I know it is original and it is left to the see the relaxed abdominal walls about the upper Society to judge of its usefulness. In regard to the angle of the wound would only have to sink in an which I think might shorten the time required and should remain in contact so long union would be If a fistula should occur in all probability patients die of shock on account of length of time, the discharge would flow outside of the abdomen etc, some of septicæmia, etc, septic trouble being We know many cases of cattle-horn laceration have produced by escape of fluid from the uterine wound gotten well not only without any fistula, but without

The uterus would not remain permanently elevated and consequent loosening of the sutures and gaping any more than a supra-vaginal cervix after an extraperitoneal hysterectomy The writer was induced to make these suggestions by watching the results of a similar operation on the bladder where the whole length of that organ was cut open during an exploratory laparotomy for a fibroid tumor of the uterus The bladder and abdominal walls were stitched together with one row of sutures as already described in such a manner that the two layers of peritoneum stuck fast together, thus preventing a single drop of retically there would seem to be no objection to the operation as described To be demonstrated or practical it will have to be tried

MEDICAL SOCIETY OF THE DISTRICT OF COLUMBIA

Stated Meeting, November 23, 1887

THE PRESIDENT, JOS TABER JOHNSON, M D, IN THE CHAIR

DR I W BLACKBURN presented a case and specimen of

SARCOMA OF THE SUPRA-RENAL CAPSULE

(See p 389)

DR SCHÆFFER asked Dr Blackburn if there was any pigmentation of the skin?

Dr Blackburn There was only a slight yellow-There would certainly be ish tint of the skin, which he thought was due to the

> THE PRESIDENT Could the tumor have been removed during life?

DR BLACKBURN saw nothing to prevent it except Any resection of muscular tissue for the purpose the adhesions The blood supply of the tumor was through very small vessels

DR SCHÆFFER would call attention to the weight of the tumor, which is one and one half times as great as that of the liver It would be interesting to know whether the mental disease was merely coincident or based on the origin of the tumor thought there was some connection between the mental state and the growth

His own experience with such tumors DR LAMB pelvis and stitched to the abdominal peritoneum and is that they do not give rise to any well-marked symp-Pigmentation Where the capsule has undergone cheesy degeneration we find pigmentations of the

Dr Schæffer It is not rare to find cancer of eight inches in length. At the end of a week it is the capsules coexisting with Addison's disease

As to the matter of pigmentation, he had occasion several years ago to look up the sub-A young man consulted him after a distinguished English physician had diagnosticated Addison's disease, and he accepted the diagnosis did not have the characteristic bronze pigmentation His skin was dark, but he was of a dark complexioned family, and was also said to have been sunburnt He thought the man had Addison's disease up to the last, but there were no decided symptoms mortem showed that every organ in the chest was Both capsules were also diseased cancerous thought the absence of pigmentation in Dr Blackburn's case was not due to the character of the disease, but to the fact that it was confined to one capsule

DR BIACKBURN thought the hæmorrhoids were due to the disturbance of the portal circulation

DR D S LAMB presented a case and specimen of

BONF SYPHILIS

Had been sick for years Colored man, act 42 Was in Freedman's Hospital several times for long Had enlargement of liver and dropsy, cough, vomiting and diarrhoa, jaundice, severe, persistent headache Died November 1, 1887

Emaciation extreme Necropsy by Dr Lamb Right inguinal glands enlarged and indurated, ex-

ternal genitals normal

Vault of skull thick and showed many small gummata, which had caused absorption and exostosis Scalp and dura mater both closely attached to calva-Brain 50 —, normal

Lower incisor teeth irregular, but no "syphilitic" Mouth, throat and larynx normal, except several minute abrasions on under side of epiglottis

Tonsils atrophied

Heart 8 ozs, irregular patch of old pericarditis on right ventricle, slight atheroma of ascending aorta Several anterior mediastinal glands enlarged, hard, pigmented and contained grayish foci not softened Firm old pleuritic adhesions on both sides lung 29 ozs, upper lobe ædematous Left lung 14 ozs lower lobe contained grayish nodules indefinitely outlined

Stomach small, mucous membrane smooth Liver 34 ozs, aptestines also appeared atrophied Spleen 31/2 ozs, pale, thickening of peared normal Right kidney 5 ozs, lest 7 ozs capsule Iliac, lumbar and lesser omenand prostate normal tal glands enlarged, firm, and with grayish foci

Sections of lung and kidney and pericranium have been set aside for microscopical examination, but I do not think there is any doubt of the case being The nodules in the lung may prove The enlarged liver had been resyphilitic to be tubercular duced, I presume, by the iodide treatment enlargement of glands in the right inguinal region began while the patient was confined to his bed in hospital, and a careful examination then failed to find any venereal sore, nor was the post-mortem examtheless, quite an extensive chain of glands in the iliac sequences of a criminal seduction Dr Kiernan and lumbar regions was found diseased as also as the and lumbar regions was found diseased, as also in the pointed out that attendants guilty of perjury at the

anterior mediastinum All of this suggests syphilitic infection acquired except the apparent absence of the primary sore It may be that the bone disease was from the congenital transmission, though I be lieve such cases are rare And it is said that a per son already showing evidence of syphilis cannot acquire the disease Altogether the case has been interesting to me, as well as puzzling

DR Jos Taber Johnson reported

THREE CASES OF OVARIOTOMY, TWO DOUBLE AND ONE SINGLE

(See p 386)

DR LAMB would like Dr Blackburn to give his experience in examining skulls with reference to

syphilis

DR BLACKBURN has seen very few well marked syphilitic cases In 225 skulls examined he had not seen one with the characters shown by the specimen He had frequently seen syphi presented to-night litic nodules of bones

In reply to a question by DR King as to what doses of potassium iodide were given in the case presented? DR LAMB said that 20 grains were given

three times daily

DR King believed in very large doses He began with 10 grains and increased the dose daily until it reached 300 grains, if necessary

DR FRIEDRICH had followed the plan mentioned by Dr King until his patient took i Troy ounce a

DR KING had heard Dr Hammond say, in a lec ture on anatomy delivered at the University of Ver mont that a man with syphilitic epilepsy was 50 accustomed to the potassium iodide that he bought 12 pounds a week

DR CALDWELL had treated a man for syphilis who finally went to the Hot Springs Upon his return he stated that he had been taking I ounce of the potas sium iodide daily, and he was apparently cured

CHICAGO MEDICAL SOCIETY

Stated Meeting, December 16, 1887

THE PRESIDENT, W T BELFIELD, M D, IN THE

DR J G KIERNAN read a paper entitled CAN A SANE MAN BE CONFINED IN AN ILLINOIS IN SANE HOSPITAL?

He discussed the self-contradictory character of the Illinois insane commitment law, and pointed out that under it the brother-in-law of one of the bood lers, without having been legally committed, had been placed, while sane, in the Cook County Insane Hospital, whereupon the Warden, H H Varnell, and the Superintendent, Dr J C Spray, had certi fied to his insanity and presence as a patient of the Such certificates were subsequently used to defend the aforesaid individual from the con

1885 investigation were retained in the Insane Hosthe hands of unscrupulous people to prove sane peo He urged the Society to assist the State ple insane Society in securing the abrogation of the present ab surd and brutal law, and to assist in securing State supervision of all places where the insane were kept

DR N S Davis So far as the paper is concerned, I have no knowledge of the facts the Illinois law for the commitment of the insane, I have had but one opinion since it was enacted has seemed to me one of the most unnecessary laws, unjust, and injudicious for the accomplishment of its The object being to prevent the commit ment of sane persons to insane asylums and keeping them there. I think it would puzzle any intelligent physician conversant with the insane and with the ordinary proceedings of courts and juries to tell wherein there is the least degree greater security with this law than there is with the ordinary laws that exist in almost all other civilized countries in regard to the commit-There are a large number of the ment of the insane insane that are totally unfit to be taken before a jury or in a public court and confronted as the law requires, and in order to avoid it the judge must evade the childbed insanity to a public court, under intense excitement and in a physical condition where the most humane thing that could be done would be to secure for her quiet and seclusion, is revolting to every sane mind The process the law requires is so utterly repugnant to their sense of justice that some judges have evaded it by instituting private exlaw should not be drawn in such a way that human-

ity requires it to be evaded my care not many months ago, who was brought the street, with but one physician among them relieved by taking her away from home But in stead of being benefited she became more decidedly moved selves in a dilemma look about to see how they could secure her and re-street corners wanted to know if there was not some private insti were certainly institutions and, so far as I knew, perfectly reliable ones, as well as State institutions but her go through the form of a trial and be recorded in court as convicted of insanity That idea stands directly in the way of a great many of our best citizens who unfortunately have a member of the family be It is regarded, whether rightly or not, come insane as put upon record for the inspection of the world and all future time, and such a verdict of insanity is regarded by a large class of intelligent people as a bar or hindrance to perhaps the most desirable prosand ask us, What else can we do?

I said to these people There is no other way pital, and such persons would be excellent tools in known to me but to take her out of the State just as you brought her in, you will have to take the risk and take her away or leave her where she is made preparations to take her to an institution near Cincinnati, to avoid our law And I have known of not a few cases taken out of the city quietly because people will not submit to that procedure which increases insanity sometimes to a dangerous extent think if that delicate girl had been taken to the court room and confronted by a jury, in accordance with the terms of that law, with the incipient indications of meningitis that she was laboring under, it would probably have increased it into complete meningeal inflammation and probable death within a week But, fortunately, the case terminated more favorably The family kindly consented to have her remain where she was and each to do what they could A reliable nurse was obtained, and the mother was to take the place of the nurse only long enough for her to sleep And the nurse and I agreed to do what we could to get the patient well and, having her thus secluded, the young lady in time got well, went home, and is as well to day as any other girl in her native State

I give this instance to show that there is absolute The idea of taking a woman in puerperal or harm worked to the insane by this law, which secures no greater certainty of preventing those who are not insane being placed in an asylum, not one whit more than the law of New York or Wisconsin, or a dozen other States, or the laws of almost any other civilized country

Talking about medical men—three medical men in succession separately examining a case personally and aminations of the parties at their homes. But the acquainting themselves with it, and going before a magistrate and making oath to the correctness of their statements should certainly be not less reliable I had the misfortune to have a young lady under than a jury of non-professional men summoned from here from another State in hopes that she would be not think the profession of this State ought to rest contented until the bad features of that law are re-If they need a jury law in any case, let it and excitedly insane Her friends here found them- be retained only for such accused parties as may ask Her mother brought her here for a jury, or whose friends may ask it for them to the house of relatives, and instead of getting bet- And then make it a real jury, just the same as any ter she had become decidedly worse, requiring the other jury that is deemed competent in a court of most vigilant care day and night, so they began to record, and not a halfway jury summoned from the But in all cases where the parties lieve themselves, and they came to me for advice and accused or their responsible friends do not ask for a jury, let the same testimony that the rest of the civiltution that she could be taken to? I told them there | ized world accepts be considered satisfactory for the State of Illinois, and I think we will have better credit, exercise greater humanity, and secure better they would be obliged to go before a court and have results to the insane as well as to those who are not

DR G C PAOLI Sofar as Chicago is concerned, I have several times had an opportunity of shaming the injustice of trials for insanity before the courts I remember the case of a lady whose family physician I had been She was, though a woman of strong common sense, of an extremely nervous temperament Herhusband wanted her to sign over to him not only their joint property, but also property that belonged pects and chances in life, and they rebel against it to her individually. This she refused to do. The husband then came to my office and said that he wanted

me to go into court to testify to his wife's insanity I told him that if either of them was insanc it was himself and not she. He was displeased at this and told me of a physician who at first decided that she was not insane, but finally, through undue influence, his judgment was reversed and he pronounced the poor woman insanc I gave a history of the case and the woman was adjudged same. She afterward studied law and has, I understand, been admitted to newspaper friends say, the result of her dissipation, who afterwards became infatuated with another woman and wanted to marry her, and in order to get rid of his wife he paid a great deal of money to prove preme Court If a person committed to the asylum that she was insane Meanwhile friends who were should appeal to the Supreme Court he would be set interested in her case, not receiving notice of her free trial, procured another trial and the woman was an indefinite something is to come but never comes This shows the loose way in which the business is done These trials are conducted in a way that is a shame to the State of Illinois These two women would no doubt be in the lunatic asylum to day if somebody had not taken an interest in them The jury that decides these important questions! should be composed of physicians, and not of men from the various walks of life, who are not competent to decide on this subject, and sometimes, though surd that the judge set it aside there be one physician amongst the jurors, he may not be competent to diagnose a case of insanity

Dr. Frank Billings I cannot discuss the subject, but I should like to ask a question of Dr Kiernan that pertains to the subject. About two years ago, and within the last six months, I have had patients whom it was necessary to send to an asylum The people were so situated that they did not care to go before a jury, and they were both put in a board for boodlers to pocket. This is frequently I have been told that should these done private asylum patients awake to the fact that they had been put in an asylum, those who put them there would be hable read are all on file in that court, and they can be

for damages

DR J G KIERNAN The point raised by Dr Billings is covered by the Section I have read, that says the person shall be liable to civil and criminal damages, to one year's imprisonment in the county pail and to fine or both, and to suit for civil damages Another state of things is even more curious supposing the patient be a case of melancholia who, as frequently happens, recognizes the importance of certain suicidal impulses and desires to place himself Supposing that patient should be under control put under control at his own request, without a jury trial, and taken to an institution For doing that thing at the request of the patient any one would be The law, it liable to criminal and civil prosecution is almost unnecessary to state, was passed at the instance of a paranoia named Mrs Packard, who had One of those been in the Jacksonville institution enterprising humbugs who run newspapers went there, was touched by the woman's story, wrote up the case, and there was a great liberation epidemic, yet this woman was rightfully placed under humane laws in that institution With regard to the case in France of which Dr Paoli has spoken, I am acquainted with its history I must confess that I think the man was placed rightfully in an insane asy- cles that are abstracted from the body of a patient The newspapers have stated the other way, just before, during or after the chill characteristic of

but the newspaper medicine is always absurd The man was placed there under the authority of one of the most able alienists this age has produced, Legrand du Saulle, one whose dictum has almost as much weight as a law

Another patient was liberated under almost the same circumstances from an English insane hospital She has just been sent back to the asylum as, so her In another case a woman married a man but really this resulted from her insanity She was previously reputable

The law here would not stand the test of the Su-The finding of the jury is merely an inquest,

In regard to how the juries are consultated I may be permitted to cite one instance In 1884 there was a man on trial who was clearly insane A man got himself put on the jury to spite the brother of the patient, and declared a man sane who believed that his brother, while on the witness stand in open court, was forcing compressed air into him with a patent electric apparatus The verdict was so ab

Another harshness results under this law Sup pose a man in moderate circumstances has an insane relative, but he cannot afford to pay his board at an insane asylum, that friend must be decided a pauper On the other hand, the judge may decide that the insane man is not a pauper because the insane man's brother gets \$12 a week, although he may have five children to support, and the latter has to pay his

In regard to the case I have stated, the certificates procured at any time The case was one in which there was no doubt of the object While the man was at the institution he was going on the bail bond of two other people, and his mental condition was not questioned, the point did not he in the fact of his being sent there Here is an institution that is not visited for years by the supervisors of our State This institution is under the control, to all intents and purposes, of a set of politicians Under this, the law, and by aid of the art of "jury-fixing" so commonly used, a sane man, obnoxious to the "bood lers," could be adjudged insane The vile attendants would swear to his violence and the Superintendent would, judging from the certificates quoted, do the same The law should be amended to secure privacy in commitment and proper State supervision afterwards

DR W T BELFIELD exhibited a specimen of the

BACILLI OF INTERMITTENT FEVER,

This specimen is exhibited through the and said kindness of Dr William T Councilman, associate professor of pathology in the Johns Hopkins Um It presents the organisms first described by versity They are contained in the blood corpus Lavaran

They are always present at that intermittent fever time, being contained in numerous corpuscles, and are not found except at that period-about the time Nor are they found in the blood of inof the chill dividuals who are not suffering from intermittent fever That, so far as I am aware, is the extent of the invesacteristic organisms found in the blood corpuscles artery this does not prove any causal relation of the organisms to the disease, that requires cultivation outside now of the body and inoculations with pure cultures these organisms are the cause of intermittent fever But observations are sufficiently numerous to warrant the assertion that these organisms are characteristic of the blood of patients suffering from that of Obermeier, which was one of the earliest of the organisms observed in the blood

Did I understand that they DR N S DAVIS are found only in the blood at the stage of the chill -after the chill disappears, during the febrile stage?

DR BELFIELD That is the universal statement of observers They are present for a short time before and after the chill

DR R H BABCOCK Has the effect of the solution of quinine been tried on these organisms?

DR BELFIELD Not to my knowledge, in the The administration of blood outside of the body quinine to the patient, however, causes a rapid and complete disappearance of these bodies from the blood corpuscles

ST LOUIS MEDICAL SOCIETY

Stated Meeting, February 4, 1888 THE PRESIDENT, Y H BOND, M D IN THE CHAIR DR H H MUDD read the history of a case of FRACTURE OF THE FEMUR, WITH RUPTURE OF THE LEFT FEMORAL VEIN AND ARTERY

The patient entered the City Hospital at 3 30 PM, Monday, January 23 Two hours before he fell four stories through the hatchway of an elevator When brought to the hospital he was suffering from shock the pulse was weak-130 per minute-respiration shallow—30 per minute, skin covered with perspiration, the extremities, especially the lower, cold, the left thigh was deformed, there being a sharp bend at the junction of the lower and middle third, the thigh was increased in circumference scarcely be indented with the finger There was a the parts were discolored, and there was a slight fore proceeding to operate with the knife" abrasion Crepitus was felt at the point of deform-

far up as the knee, and was entirely absent over the foot The specimen presented shows a complete rupture of the semoral artery about the junction of the lower with the middle third of the bone and near the lower extremity of the femoral artery, just below the point of the complete rupture is a second, tigation that has been made They are merely char-lextending through one third of the calibre of the The vein shows a longitudinal, irregular during the chill of intermittent fever Of course laceration, extending across perhaps one-half of its circumference I think it is a little exaggerated It will be seen that the vein and artery were both involved I find in the International Encyclo-These have not been made, therefore it would not pedia of Surgery-Ashhurst's, from an article written be justifiable to say—and observers do not say—that | by Liddell, this quotation I quote it to show something of the status of the treatment in 1883 and 1886, because I think there is a change in the feeling of the profession concerning the proper treatment

"Ligation of artery and vein simultaneously for disease In that respect they rank with the spirillium venous hæmorrhage When a large vein is wounded and bleeding, Professor Langenbeck recommends that, as an hæmostatic measure, the accompanying artery should be tied as well as the injured vein He believes that when both artery and vein are tied, not only does gangrene not follow, but there is less disturbance to the capillary circulation than when the vein or artery alone is tied " He states that, by simultaneous ligation of both artery and vein equilibrium is maintained between the arteries and veins until the collateral circulation is established Two observations which I have already presented strongly support these views One of them was a case related by the late Dr George McClellan, in which, the femoral vein being lacerated, the femoral artery was ligatured, the hæmorrhage was easily restrained by compression, and the result was success-The other occurred to Professor Agnew, in it the hæmorrhage from a punctured femoral vein ceased on applying a ligature to the accompanying femoral artery, and did not recur That gangrene is not an inevitable result, and is but rarely to be expected in such instances, is well shown by the cases of Professor Grillo, of Naples, who included the femoral artery and vein in the same ligature in fifteen cases of aneurism of the ham or lower part of These were all successful, while in fourteen other cases, in which the artery was isolated and tied alone, there were two deaths from secondary hæmorrhage"

Again, "The main artery of the lower extremities is rent asunder without external wound much oftener than many suppose "

The indications for treatment in such injuries as that may be summed up under perhaps four heads, and under those four heads I find this statement

"Compression of the femoral artery at the pubes, Above the bend it was exceedingly tense, and could from its innocuousness, and the remarkable success which has attended its use, is far preferable to any tumor eight centimeters in diameter on the outer other plan of treatment, and the surgeon should surface of the knee, and over the external condyle always make faithful trial of it, when practicable be-

2 "The old operation, that is, the ligation of the ity, no pulsation could be felt in any artery below torn artery itself in the wound, above and below the the point of fracture, the patient's temperature was rent in its tunic, although J L Petit performed it 37 4 C General sensation was much diminished as with success, is not admissible in cases of simple geon can justify himself in voluntarily converting a it is at two Every thing favors this plan of treatsubcutaneous into an open fracture"

3 "Ligation of the superficial femoral artery, at ture instead of a simple one or above the middle of the thigh, as originally recommended and practiced by Dupuytren, is the operation which must be performed in cases of diffuse ancurism, resulting from fractures of the leg that are simple or unattended with external wounds, whenever compression of the femoral artery is impracticable or proven meffectual "

"Amputation at the knee should be performed, without delay, as soon as gangrene appears in the toes or foot belonging to a limb where this accident because of the interference with the circulation by had occurred, and there is but one circumstance besides gangrene which makes this operation admissible for the lesion in question, and that circumstance is the failure of all other plans of treatment"

From these quotations it would seem that the simultaneous ligation of the artery and vein does not materially increase the gravity of the case, but is rather a mitigating circumstance, and that gangrene is not so likely to follow as if only the artery If the vein itself is injured and that were ligated alone ligated, the danger is still further increased, from secondary hamorrhage, and from giving way of for controlling inflammatory affections about wounds, Gangrene had already supervened when I saw the case, forty-eight hours after the accident, I thought possibly we might have the artery in such a condition that it would carry on the circulation and enable us to save the limb even below the site When I made an incision into the of the fracture part I found a large coagulum of venous blood, and when that was detached arterial blood flowed After finding the condition of the parts, with injury both to the artery and vein with gangrene already present, we amputated the thigh above the site of injury, and the patient is in a way to recovery Now what are the dangers to such an injury? First, the danger of primary hæmorrhage, which our patient had already passed Second, the danger of This we should pretty secondary hæmorrhage certainly have had in this case, if we had simply waited, as the coagulum, which was a large one, was For when it softened, we diffused in the tissues should have had the clot in the vessel itself breaking down, and secondary hæmorrhage would have been Now the question comes up, and pertinently I think, whether gangrene is less likely the result to occur if we depend upon compression, or ligature at a proximal point or a point of election, or when we cut down upon the part and free the tissues and ligature directly at the point of injury immediately Shall we cut down upon a fracture? With a rupture of the artery, with such symptoms as we had here, I think we are justified in converting a simple fracture unto a compound fracture, that our proper surgical procedure is not to depend upon compression, but to cut directly down upon the injured part and free it from the coagulum to lessen the tension of the part, cleanse it, and ligate not only the artery, but if necessary the vein, thus giving an opportunity for collateral circulation is more likely to be reestab- were both perforated, and ligature placed on the

There is no pretext under which a sur-lished from an injury at one point in the artery than ment, if we are safe in making it a compound frac-We have in the original injury conditions which favor sepsis, we have a large coagulum, we have the sheath of the artery itself dissected away from the coat of the artery by the coagulum which pushes back into the connective tissue and interferes with the nutrition of the artery itself, the tissues of the leg are disturbed in their nutrition, because we have loose connective tissue infiltrated by a dense firm coagulum which prevents free circulation and gangrene supervenes the coagulum and the tension of the parts The injury, if promptly met and treated gives no more reason for gangrene than would the sample ligation of the artery or but little more, it certainly would not if the wound can be maintained in an aseptic condi-Once more I quote

"In gun-shot severance of the femoral artery with fracture of the femur I believe it is always best to amputate without delay, because gangrene is almost certain to ensue if the limb be not cut off"

It seems to me that with our improved facilities that we are justified in cases of fracture of the femur with injury to the femoral artery, or any of its large branches, in seeking at once the site of the injury and placing a ligature about it The collateral circulation is more readily developed than in would be if the ligature had been placed at the site of election Danger of secondary hæmorrhage is above injury much less than if we trust to compression Gangrene is much less likely to supervene for, cleaning out the clots, freeing the vessels from pressure ne limit the inflammation which is sure to follow such extravasation of blood as we get from the rupture of The increased difficulty of ligation a large artery at the point of injury should be no bar to the early Rendering a simple adoption of this proceeding fracture compound is now the lesser of the two evils presented Compound fractures under present management are very much more innocent of harm than is a ruptured artery treated under the old rules and

methods I might cite several cases which have come under my personal observation I once saw a policeman who was shot and the femoral artery severed about The artery was ligated at the same point as this the site of election above, gangrene supervened and the patient died on the fourth day a patient whose axillary artery and vein were both perforated by a bullet, and an aneurism developed, when I saw the patient some days afterwards, I ligated the subclavian artery, a secondary hæmorrhage occurred several days later I think it was the second or third day after the ligature was placed in position that the patient suddenly suffered a severe sense of oppression with hæmorrhage hæmorrhage occurred later associated with severe oppression of the chest, and the patient died Mak-The ing a post-mortem, we found that the vein and artery

blood-air mixed with the blood, and there was quite an extensive coagulum extending through the ture heart

DR MEISENBACH There is not a man practicing surgery who may not at some time be brought face to face with the condition which has been described by Dr Mudd I have met with only one case that I now recollect in which there was probably a rup ture of the femoral artery This case occurred in a man who was working under a railroad car, a bar- tive practice of surgery, and would like to have seen rel, which had been placed under one end to prop it up gave way, and struck the man on the thigh When I saw the patient he presented very much the appearance that Dr Mudd has described, the leg was shortened, out of line, and there was a bend in the thigh, the thigh was very thick and tense There to those principles I know just how difficult it is was a wound into which I could introduce my finger, and through which a portion of the thigh bone proof the tibial artery, and whether the femoral artery was not ruptured I could not positively determine I treated the case conservatively, put on a long Lister splint, and applied ice and watched results small beat in the posterior tibial artery days I was enabled to put on a Hodgen splint, and rhage at the time of the operation had the satisfaction of getting a very good union of the principle to which I have just referred the thigh bone, without shortening good condition and has never suffered any evil concompound fracture as he is in cutting down upon very careful and cautious at all events than there is in the other the placing of a ligament around both vessels at the case proximal end, the difference of course being in favor man fell out of a window direction in which the force which causes the injuries across the bone into the artery, or rub it across the artery tate without further delay

after, was in proper position, and the secondary any injury which has a tendency to bend the limb hemorrhage occurred from the avillary vein and not at an acute angle would have a greater tendency to from the artery The death of the patient was prob- drive the bone against the artery in such a way as to ably from insufflation of air, for the left auricle and rupture it, entirely or partially, and to be followed a portion of the vena cava were filled with grumous by rupture in the course of time producing an aneurism or some other condition which involves rup

> Dr D V Dean I wish to say only that in such cases as Dr Mudd has cited, in my opinion, the impropriety would consist in not making the wound an open one, even for explorative purposes, and afterward adopting such procedures as might be found necessary

Dr Broome I rather incline to the conservaconservative principles applied in this case know it was said of the father of American surgery that he never spilled a drop of blood uselessly And I think now when occasionally I hear reports read before this Society, that perhaps we ought to return to determine what to do under circumstances like those stated by Dr Mudd Here is a large, stout At the time I examined him I was very man who has fallen and has received a very severe much in doubt as to whether there was any pulsation injury, he finds that the skin is immensely tense and everything points to an abundant hæmorrhage underneath the skin, the circulation in the extremity is very feeble, if there is any at all But I under-Af-| stand that in this case there was some circulation, ter a number of hours I found a distinct but very and I think the circulation was growing stronger But the Furthermore, I infer from Dr Mudd's statement circulation became stronger and after a number of that there was a clot, and that there was no hæmortreating the wound as aseptically as I knew how is, what would have been the results had he clung to The man is in like to know what he thinks about it himself case of the policeman to which Dr Mudd referred, I think Dr Mudd struck the key note the patient was seen immediately after he was shot, in saying that where the artery is involved, where of course there was hæmorrhage at that time, but the fracture is such as to leave no doubt as to the in the case which he saw after three or four days rupture of the artery, the simple fracture should be standing, blood-clot had formed and no hæmorrhage, converted into a compound one Why should the and the bleeding did not occur again until after he surgeon hesitate to make a simple fracture compound cut down upon the part I would have liked to in this case? He is just as much justified in cutting have seen compression applied in this case, and a down and making a simple fracture of the thigh a conservative course adopted I think we should be the humerus and wiring the ends of the bones to- probably have done just what Dr Mudd did, had it There is no greater danger in the one case been my case, still I would like to have the doctor The compression at the tell us what he thinks would have been the result pubes acts, it seems to me, in the same way that does had a conservative practice been followed in the

The artery at the point of its rup-Dr Mudd of opening the wound and ligating the vessels at the ture is included in pretty firm tissue which forms site of injury I think Dr Mudd stated that the Hunter's canal, and it is pretty closely fixed to the I think that ruptures and bone The artery could not readily elude the bone, injuries of arteries are very often determined by the and it was cut by the sharp end of the bone fairly The conservative surgery of the old to the artery is applied Thus an injury which has authors, of recent authors and of all other aua tendency to produce an acute bending of the limb thorities, so far as I know, would have suggested, at at the time of the reception of the injury would be the time that we saw this case on Wednesday last, much more liable to injure an artery, that is, drive and at the time Dr Broome saw it, that we ampuin such a way as to cause a rupture, than in a case present, and the foot showed no evidence of a rewhere the artery would not come into line Thus turn of circulation The return of the circulation

was evident on the skin of the shin perhaps onethird of the way up, but the gangrenous process was already established, and my belief is that it was proceeding up the limb, and the question which presented itself to me was not whether we could save the whole of the leg, but any portion of it below the knee, and the effort to accomplish this determined I was satisfied that the first exploratory incision with the circulation in the condition which we found it, with a large clot present in the soft tissues, with the decomposition which was sure to occur, with the gangrene already established and sepsis already present, that we should have the gangrene extending rapidly unless that wound was cleaned out other words, this patient would have died if we had not amputated the leg, unless we could restore the circulation more perfectly than it was at that time, or more perfectly than nature could have reestablished it under the circumstances I hesitate to make a suggestion enlarging the field of operative It has extended so rapidly, has involved so many new questions, that even the oldest heads are puzzled to know where to stop and what to do, and it was only after considering the danger which would follow the conservative method of temporizing with such an injury, and thinking of the fatal results which have followed in the past, that I was led to adopt this method of direct and immediate interference, and I believe it to be a conservative plan, because, although primary hamorrhage was arrested here, the very conditions that we found showed that the hæmorrhage would have recurred if the man had survived the gangrene The point that I endeavored to make plain, I believe is a good one, to-wit that the gangrene is much more likely to supervene when we have an injury to the artery with such a tense condition of tissues as we had here, with the artery compressed, the venous circulation disturbed, because of the pressure and with the sheath of the artery, which supplies the blood, which gives nourishment to the coats of the vessels detached, than if we open up and cleanse the part, free it from this pressure, ligate the artery and vein if necessary, and put the part in a condition to develop the collateral If you will take the five hundred or circulation more cases of fracture reported by Dr Dennis a year ago, and the cases that have come under the observation of other men who practice surgery today, and see the good results that follow the practice of aseptic surgery in the treatment of compound fractures, you will readily conceive and concede that it is conservative surgery to ligate the artery and make the simple fracture compound is anything that brings to the surgeon an uneasy pillow, it is watching these cases of injury of the arteries and temporizing with them, depending upon pressure, waiting for secondary hæmorrhage to come to demand the interference that he ought to have made at first

THE GOVERNOR OF BUENOS AYRES has authorized Mr Neild to practice preventive vaccination for charbon, by the Pasteur method

LETTER FROM NEW YORK

(FROM OUR OWN CORRESPONDENT)

Late Hereditary Syphilis—Commencement of the University Medical School, of Bellevue Hospital Medical College—The New York Quarantine Station—Salary of the Health Officer

At the last meeting of the Academy of Medicine in March, Dr Frederick R Sturgis read a paper on "Some Questions in Connection with Syphilis Hered itaria Tarda," at the conclusion of which he expressed the opinion that late lesions never appear in hereditary syphilis, any more than in the acquired disease, without being preceded by earlier and minor syphilitic symptoms. In the discussion which followed the paper, while most of the speakers referred to cases in which no record or trace of this early history could be found, there seemed to be a unanimous concurrence in this view.

The subject, Dr Sturgis said, was one of special interest to the general practitioner as well as the syphilographer, on account of its relations to the etiology of many cases met with It had formerly been involved in much obscurity, and although great advances had been made during the last twenty years, many points still remained unelicidated. The question was still asked, Can hereditary syphilis remain latent for years? Until recently this was supposed to be a fact in certain exceptional cases of acquired syphilis, but the weight of evidence now showed beyond question that such a thing never occurred in the latter. It was the generally accepted opinion at the present day that, in cases apparently of this kind, other and lighter manifestations of syph

ilis invariably preceded the so-called tertiary symptoms. There was always an initial lesion, although no trace of it might afterwards remain

It was at one time supposed that in all cases of hereditary syphilis the disease showed itself at birth, but the fact was now recognized that many cases oc curred in which the child was apparently perfectly healthy when born Statistics showed, however, that in a large proportion of cases syphilitic lesions made their appearance before the end of the third month Of 249 cases collected by Diday and other author ties, the disease showed itself in 118 by the end of the first month, in 117 between this time and the end of the third month, and in 14 later than the third Of Diday's own cases, in two the lesions did not appear until after the first year In in stances in which the disease first showed itself at a very late period the question of acquired syphilis always had to be taken into consideration

The usual history of inherited syphilis, exclusive of those cases in which the child was born syphilitic, was that after a few weeks or months the earlier man ifestations of the disease made their appearance, such as a macular eruption or mucous patches of the mouth and tongue. At this early stage there was usually no eye or ear lesion, or affection of the bones or joints. These lesions soon passed away, and there

,1

or joints, or deep ulcerations in the buccal or nasal manifestations cavities Unless the early history of the patient that these late manifestations constituted the first appearance of the disease, as in an interesting case occurring in a man of 30, related by Fournier, in which the missing links in the history were supplied by the patient's family physician Even the diagnostic sign of Hutchinson's teeth was often absent in these cases

In the discussion on the paper Dr Edward L it had not been his experience to see any cases of what could be properly called late hereditary syphihereditary syphilis, and found that, after various pe- we might expect the later manifestations age of 25, however, when crystallization of the system had taken place, the trouble had been pretty the tenth or twelfth year well gotten through with, and he did not recall a single instance in which a new symptom of hereditary syphilis had appeared after this latter age The charin a virulent or a benign type of syphilis per se, the toms senousness of the symptoms depending to a great brothers, all of whom had syphilis at different times. central nervous system, which in one of them proved really seemed to thrive on the disease form Incidentally Dr Keyes spoke of a method of This consisted in the administration of the 100 part really syphilitic or not of a grain of bichloride of mercury every hour or, if He had never known this course of treatment to produce mercurialization and, in fact, it had often seemed to have a salutary effect upon the diarrhoea from which the infants at the Foundling Asylum were so apt to suffer

Dr P A Morron said that he could see no reason

might be no further syphilitic trouble for years, or ative evidence, and it was contrary to his general until the age of puberty was reached, when there knowledge of the disease to suppose that in any inmight develop keratitis, otitis, disease of the bones stance the patient had really escaped these earlier

Dr Roland W Taylor said that it was his firm could be accurately learned, it might be supposed conviction that there were always some manifestations in early infancy, though these might be so ephemeral or so unaccompanied by destructive action that they left no permanent trace We might expect the later lessons to appear at almost any time up to about the twenty-first year In the section on inherited syphilis in Bumstead and Taylor's work, he said, he had placed the usual limit at 12 years (although, as was well known, manifestations of hered-Keyes said that he could state with positiveness that itary syphilis occasionally showed themselves at a considerably later period), for the reason that he found that other affections would be likely to be con-He had, indeed, met with alleged cases of this founded with inherited syphilis, which was so comcharacter, but in all of them he was able to detect paratively rate at these later ages Dr Taylor said some scar or deformity which convinced him that that in his work published in 1876 he was the first the late lessons present were not the first manifesta- American to call attention to the bone lessons of tions of syphilis in the patient He had followed up syphilis, and to bring them out of the slough of soa number of individuals who were known to have had called scrofula. All the way up to the age of puberty riods of latency, the disease sometimes broke out got beyond the twenty first year it was pretty hard again before the age of 21 Before they reached the to say whether one was dealing with syphilis or not As a rule, the activity of the lesions occurred before

Dr L Bolton Bangs said that he was in accord with the other speakers in regard to the question at issue, and his own observation had been that almost acter of the disease in any particular case was also invariably, by careful inquiry and investigation, he largely a matter of soil, so that he did not believe had been able to find some history of previous symp-

Dr Chapin said that he agreed with Dr Keyes as extent on the constitutional characteristics of the to the importance of the kind of soil into which the subject In this connection he referred to three syphilitic infection was introduced, and said that he had known of many syphilitic infants with snuffles and in all of whom it produced grave lesions of the and mucous patches who were fat and robust, and fatal, yet the third of the brothers gave the disease later lesions occurring in individuals beyond the age to a young woman who had it in an extremely light of 10 or 12 years, he thought they might as well be called scrofula as syphilis If there were no typical treatment in congenital syphilis which he had worked lesions of syphilis present, it was his practice to put out some years ago at the New York Foundling Asy- patient on cod-liver oil and other tonic treatment, as lum, and which he had always found very satisfactory he was unable to decide whether the trouble was

Dr L Emmett Holt said that it seemed to him that was not practicable, of the 30 of a grain every to be the easiest thing in the world that the eartwo hours, night and day, the medicine being given her manifestations of hereditary syphilis should be in water or in the child's food Later, the intervals overlooked. In the course of his remarks he called between the doses could be extended to four hours attention to the importance, as a diagnostic sign of the disease, of enlargement of the epitrochlear glands, and said that although this condition might be due to other causes, in his experience very few cases of syphilis occurred without such enlargement

Dr A Jacobi said that when syphilis occurred at birth it was not always easy to recognize positively why hereditary syphilis should not continue through There was sometimes great difficulty in distinguish a lifetime, just as the acquired disease was often ing between a syphilitic and a rachitical bone, or known to do It was essentially the same affection rather cartilage, and particularly when the ribs were So far as his experience went, there was absolutely affected If the difficulty, then, was great at this no history of the early manifestations of the disease early period, it was still greater later on. It was a in many cases, but this was, of course, merely neg-lfact that where a number of children were born in a

syphilitic family the manifestations were apt to be- removed only for evacuation of the bowels and blad come less and less marked in each successive child, and the disease might at last be indistinguishable from so called rachitis or so called scrofula

In closing the discussion Dr Sturgis said that what he meant by the late lesions of hereditary syphilis was those occurring after the age of 5 years, and he believed that such late manifestations did not occur without previous symptoms The children in which these late lesions were found were apt to be born ap parently healthy, and when the earlier manifestations come shriveled and folded like a washerwoman's did occur, they might escape notice and remain untreated. It was in the untreated cases that the later lesions were most liable to make their appearance At the age of 5 or 6 years they were apt to have punctate interstitial keratitis and disease of the ears, joints, etc., and nothing would be found to do any 675 litres of water good until the iodide of potassium was resorted to Under this treatment the child would probably get which seems warm to him well rapidly outbreak of trouble, and about the age of puberty kept constant by a simple arrangement by means of the most serious explosion usually occurred. After a kerosene lamp the age of 25 the disease would generally be found to be acquired If a patient over this age presented for Tubercular Peritonitis," reporting a case in which himself with the earlier symptoms of syphilis we he had operated on a girl 16 years of age. She had could almost universally suspect that the disease was acquired, since the early manifestations of the inherited disease were most likely to show themselves incision in the median line between the umbilicus within three months from birth, and always did so within the first year

At the Commencement of the University Medical collapse on removal of the fluid School, which occurred at the Metropolitan Opera House March 6, there were 164 graduates, and at that feeling as if the finger had been thrust among small of Bellevue Hospital Medical College, which occurred lead shot at the Carnegie Laboratory March 12, the day of the great blizzard, 144 graduates

on a more business-like basis by reducing the salary of the Health Officer to \$10,000, cutting down the fees, etc, which was introduced into the State Senate in January has now passed both branches of the Legislature

The Surgical Use of Hebra's Continual Bath or Water-bed-Laparotomy for Tubercular Perstonetis -Treatment of Fractures of the External Condyle of the Humerus-A New Method for the Removal of Powder Grains from the Face

At the meeting of the Surgical Section of the Suffolk District Medical Society, on March 7th, Dr Otis K Newell read a paper on "The Surgical Use of Hebra's Continual Bath or Water-bed," of which he had had personal observation In addition to its use in the treatment of eczema and other cutaneous diseases, the continual bath has been used with success in the treatment of gangrene, bedsores, etc., and more especially severe burns, where its beneficial Patients are effects are particularly noticeable sometimes kept in the water for a very long time One patient was in the bath 385 days

der and they take their meals and sleep when in the The danger of drowning is much less than water seems apparent at first thought If a patient is very weak the precaution may be taken to support him by a bandage passing around the body under the arms, which is secured at the head of the bath to prevent his slipping down the inclined portion that raises the head out of water Only the palms and soles suffer and these only during the first few days They be hands and the condition is much alleviated by appli cations of substances of a greasy nature A papular eruption occurs on the parts which are both in and out of the water, as the arms and thorax This, however, heals spontaneously Hebra's beds contain When a patient first enters the bath the temperature of the water is 30° C (86°F), The heat is gradually At 10 there was likely to be another raised to 35° or 37° C (95° or 98 6° F), which is

Dr A T Cabot read a paper on "Laparotom, been previously tapped and 3 pints and 6 ounces of In operating he made an ascitic fluid withdrawn and the pubes He found a localized encysted pen tonitis containing ascitic fluid and the walls did not The peritoneum was so studded with miliary tubercles that it gave a A drainage tube was inserted and there was gradual recovery He also reported a case of general tuberculous peritonitis in a girl 3 years old The bill placing the New York Quarantine Station for which he had operated with good results and the In this case the wound was at patient was shown once closed, and Dr C prefers this method to drain This treatment for tuberculous peritonitis was accidentally discovered by Sir Spencer Welles over 20 years ago when he was operating for something else, and this patient is now alive Hirschfield has reported an autopsy where no tubercles could be found although they had existed previous to the oper Dr Cabot suggested as cause of the disap pearance of the tubercles, adhesions between the walls of the collapsed sac after the removal of the fluid and the encysting of the tubercles by connective tissue cells

Dr Elliot reported a case of successful operation for general tuberculous peritonitis in a girl 16 years old, and Dr John Homans reported two cases of laparotomy and one by tapping for tuberculous per

Dr G W Gay has treated external condyle of the humerus with the right angle splint He has seen follow dislocation of the radius forward, and also of both radius and ulva outward and backward To prevent the first dislocation he likes the acute angle splint and he also thinks side splints useful

Dr S J Mixter showed a new device for the re It consicts moval of powder grains from the face These are They are of small steel tubes of different sizes

similar to trocar tubes and are partially sharpened One of proper size is selected and placed on the skin over the site of the powder grain and then it is pressed down so that on removal the skin together with the powder grain is elevated above the surrounding skin It can then be snipped off with a pair of fine curved scissors and a suture of fine black skin allows the wound to heal by first intention without leaving any I ASNN scar

CINCINNATTI LETTER (FROM OUR OWN CORRESPONDENT)

The Association Meeting in May-More Positions for Internes in the Cincinnati Hospital-The Hospi tal, the Staff-Coalescence of Medical Societies-Fire in the Cincinnati Hospital-Medical College Com mencements

The absorbing topic in medical circles here is the meeting of the American Medical Association in our city in May of this year We confidently prophecy a very successful meeting, at least so far as the efforts years since we were honored by having the Associa- fession as a whole session a grand success The various committees are busily engaged pushing forward the work allotted schism is about at an end Music Hall and the adjoining rooms have This building is adbeen secured for the meetings the meetings of the various Sections

There will be a banquet tendered the members at our magnificent new Art Museum, at which place the delights of the stomach may be readily combined with those works of art that are so delightful to the Thus we may be enabled to obtain a feast of vision and a flow of gastric juice The following evening will be devoted to a concert given by the Apollo Club, at Music Hall We can guarantee a hearty and cordial welcome to all, and trust that we may be honored by an unusually large attendance

The hospital authorities have increased the chances for men to obtain hospital training, by appointing seven externes in addition to the internes already on duty The applicants for the positions are subjected to a competitive examination The seven presenting the best papers in all branches are chosen to fill the positions These examinations are strictly impartial, the Staff not knowing whose paper they examine nor in whose favor they vote The externes are chosen about the first of October each year, becoming internes upon the 10th of the following April during the winter months there are fifteen men on duty, seven internes, one senior interne, and seven The new system of appointing externes was maugurated last Fall, and must still be considered in the nature of an experiment

The City Hospital is a public institution, capable berg, the apothecary of the institution of holding about 400 patients The government is vested in a Board of Trustees appointed by the Governor of the State and by the Superior Court tics have never had any influence in the distribution had a better opportunity for distinction of positions, either medical or executive, conse-

quently the institution has always been well con ducted and prosperous

The Medical Staff of the Hospital consists of four surgeons, four medical men, four obstretricians, two oculists, two pathologists, and four curators and mi-The last named are not official posicroscopists The Staff changes every four months, half of the men being on duty at all times Such men as the following constitute the Staff Drs N P Dandridge, P S Conner, E W Walker, Jos Ransohoff, surgeons, Drs J A Murphy, F Farcheheimer, J C Mackenzie and Wm Carson, are the medical staff The obstetricians are Drs W H Taylor, Thad Reamy, C D The oculists are Drs Jos Palmer, and G M Allen Aub and Rob't Sattler Pathologists, Drs Kebler Drs Marsh, Cameron, Holmes and and Eichberg Caldwell occupy positions as curators

Several years ago an agitation arose that resulted in a division in the Academy of Medicine and a new Society was organized The consequence of the division was that the medical profession of our city has been seriously hampered and crippled by a lack There has been no assembly that authoriof unity of the local men are concerned It has been twenty tatively represented the opinions of the medical pro-Two comparatively weak Soci tion meet here, and we therefore wish to make the eties have been holding forth in place of one large, powerful and united brotherhood Happily, the The propriety and feasi bility of the amalgamation of the two Societies has been freely discussed, and the general tenor of mirably fitted for the general meeting, and also for opinion is decidedly in favor of an early coalescence The advantages that will arise from such a course are very obvious We shall be a united, harmonious and truly powerful association, we can speedily ob tain a permanent home for ourselves, we can be influential in securing legislation for the good of the public and for our own advancement, and better work can be done

There has been quite a serious conflagration at the Cincinnati Hospital The fire originated in a very peculiar manner, but one that it would be well to detail, as other institutions may have similar deathtraps for their patients. An elevator formerly run up through a shaft at the south end of the burned pavilion, after the elevator was removed the shaft was divided into compartments through which the dirty clothes, dust, etc, were carried to the basement Just alongside of this chute, in the first story of the building, was a gas-stove There had been a leak in the gas-pipe and the gas escaped up this chute to the ventilating space between the ceiling and the roof A match was applied to the gas-stove, with the effect of igniting the gas which had accumulated in the shaft, an explosion followed, setting fire to the woodwork and largely destroying the entire third floor of The patients all escaped without inthe payilion jury, but their safety was largely due to the efforts of Dr H T Gaylord, an interne, and Mr Julius Eich-Others deserve great credit for their efforts in rescuing the badly frightened patients, but the above named were Poli- on hand at the time of the explosion and therefore

The burned pavilion is the only one that is not

possessed of exits at both ends As the fire originated near the staircase, the patients were somewhat panic-The damage to the institution will be imstricken mediately repaired, and the previous defects in architecture will be remedied. Five thousand dollars suggestions made in our address to the medical so will about cover the amount of damage done

The medical colleges have had their commence ment exercises An interesting feature of the graduation exercises of the Ohio College was an address! delivered by Dr J S Billings, of Washington, D C, on "A History of the Ono Medical College before the War " It was a very interesting and pleasant talk, quite out of the line of the ordinary set speeches we are so apt to have inflicted upon us at Commencements He spoke in eloquent terms of Drs Graham and Blackman, recently deceased

J C O

ENORMOUS ENLARGEMENT OF THE HEAD

Dear Sir - The following case may be of interest to the readers of 1111 JOURNAL

Isham Harris, colored, at 17 Has been under my observation for 5 years. At the age of 3 months he had an eruption of the scalp lasting 6 months, during which the occiput, parietal and occipitofrontalis bones began to enlarge and have gained the enormous size of 33 inches above the ears, 171/2 inches each side right and left from chin to top of He is of average intelligence, sews, knits and crochets, has the physical development and face of a 5 years' old child, has not walked any in 7 years, previously having walked on crutches and getting a fall has since refused to make the attempt His general health is good and has been from infancy slight headache and dizziness when his liver is torpid, otherwise never complains of weight, pain or any unnatural feeling about the head, and weighs 85 I made a fruitless attempt to get his photograph to present at the International Medical Con gress, and have not succeeded at this writing, his mother refusing, stating that she is afraid someone will kidnap him for public exhibition

Hogansville, Ga

NATIONAL CONTROL OF QUARANTINE

Dear Sir - The editorial in your issue of the 24th inst entitled "The Bill (H R 1526) to Prevent the Introduction of Contagious and Infectious Diseases and to Establish a Bureau of Health," causes me to understand that you have the impression that this is a bill which was introduced through the agency of the committee of the College of Physicians of Phil I write this, as a member of that committee, for the purpose of removing that impression The bill you speak of is doubtless one which has been proposed and introduced in accordance with the action of the American Public Health Association, at their last meeting, in advocacy of the estab-Philadelphia committee have had no connection November, 1856 Previous to his graduation he lishment of a National Bureau of Health, and the

with it in any way The report and the recommen dation of our committee were strictly limited to the question of the necessity of National Control of the Maritime Quarantine, and the bill embodying the cieties of the country has not yet been introduced May I request that you publish this letter, in order to correct a similar impression which may have been received by others? Very respectfully,

E O SHAKESPEARE 1336 Spruce St , Philadelphia, March 26, 1888

A CASE OF POST-PARTUM PUERPERAL CONVULSIONS

Dear Sir —On February 22, 1888, I was called by her husband to see Mrs B, at 24, multipara, whom I found in labor The labor had advanced to the second stage, and she was delivered in about thirty minutes after my arrival of a well developed The labor was normal in every respect, male fœtus and there was no hæmorrhage nor laceration of cer vix or perineum She had been in good health prior to labor, with the exception of the last three days, during which she had suffered from a very severe throbbing headache After delivery this headache continued, and about thirty minutes after delivery was completed she suddenly passed into general con vulsions In the course of an hour and a half she had seven very severe convulsive attacks I sent for counsel at once, which, however, did not reach me until after the convulsions had ceased ately after the first attack passed off I injected hy podermically ½ gr morphia with 50 gr atropia, which producing no visible effect, in thirty minutes ! injected 38 gr morphia with 230 gr atropia, and bled her from the arm to about 12 ozs After the second injection and the venesection the convulsions were less violent and the intervals longer, but as they had not ceased one hour after the second injection of morphia and atropia, I made an injection of ¼ gr morphia alone In a few minutes the convulsions The patient remained in ceased and did not recur an unconscious state about nine hours after the last convulsion, when she gradually regained conscious ness, and has made a good recovery

The patient is a stout, plethoric woman, and before the venesection the pulse was full, hard and bound C J MARCH, M D

Whelm Springs, Ark, Maich S, 1888

NECROLOGY.

on July 30, 1887, aged 57 years

Dr Stuart was born at Williamsburg, Pa, on August 27, 1830 He was educated at Lewisburg University, Pa, and entered upon the study of med icine at Berkshire Medical College, Pittsfield, Mass, from which institution he was graduated MD in filled the position of demonstrator of anatomy in that

He located in practice in Westhampton, Mass, but in 1858 removed to Macomb, Ill, where he engaged in the duties of his profession until August, 1861, when he entered the army as assistant-surgeon of the 10th regiment Missouri infantry volunteers In the autumn of 1861, while assisting in the hasty timbers and sustained an injury producing partial paralysis, from which he never fully recovered Corinth and the spring campaign of 1862, but owing to severe illness he was sent North in July, 1862 In the month of September he returned to his command and was present at the battles of Iuka and mourns the loss of a most devoted son Corinth in September and October of that year After those battles the Confederate wounded, numbering over 3000, were placed in hospital at Iuka, Miss. under the immediate case of their own surgeons, and Dr Stuart was put in charge of the whole, by direction of General Rosecrans He filled the position of medical superintendent of the Iuka hospital until March, 1863, when arrangements were made for the care of the inmates elsewhere

In April, 1863, he was commissioned Surgeon of the 1st regiment Alabama cavalry volunteers, U S (white), and continued in active service with that regiment until January, 1864, when, owing to continued ill health, he resigned his commission, returned North, and some months later resumed practice in Macomb, Ill In the winter of 1865-6 he attended the regular session of the Bellevue Hospital Medical College, New York, receiving an adenudum degree

in March, 1866, from that college

In June, 1866, he removed to Minnesota, established an office in Winona, and engaged in general) practice until July 1, 1876, when he determined to seek a climate better adapted to his impaired health With this end in view he visited California, and for some years was located at Santa Barbara he removed to Santa Rosa, in that State, which point he selected as a permanent residence He soon acquired a lucrative practice in his new field, to which he gave his attention to the last day of his life

During the spring and early summer of 1887 he suffered from occasional seizures of partial paralysis, the effects of which, to some extent, disappeared On the 30th day of July, 1887, he was stricken with a severe attack of paralysis, from which he never rallied, death occurring on the evening of that day

Dr Stuart aided in the formation of the Winona County Medical Society in 1869, and was President of the same in 1872 He was a member of the Mass achusetts Medical Society, of the Minnesota State Medical Society from its organization-holding the position of vice president in 1874 and 1876-of the California Medical Society, and of the American Association, serving, in 1873, as secretary of the section on State Medicine and Hygiene He served as He served as a delegate from Minnesota to the International Medical Congress which met in Philadelphia in 1876 He was largely instrumental in securing the estab lishment of the Minnesota State Board of Health,

and was elected president of that body at its first

meeting in 1872

Dr Stuart, notwithstanding a feeble physical constitution and the vicissitudes attendant upon almost constant ill health, succeeded in accomplishing a large nork in his professional career, solely by the aid of that earnest effort and indomitable energy which were manifested in all his undertakings construction of a fort, he was caught between some later years of his life were saddened by the great affliction arising from the loss of his children He last bereavement, the death of his daughter Marv. was on duty with his regiment during the seige of a lovely child of 12 years, which occurred in 1883, was to him a sorrow unrelieved by the lapse of time

Of his immediate family his widow alone remains, but near the scenes of his childhood an aged father

MISCELLANEOUS.

INSTRUCTIONS TO THE MEMBERS OF THE ILLINOIS STATE Through the courtesy of MEDICAL SOCIETI -Dear Doctor the different Railway Passenger Associations all persons attending the Thirty Eighth Annual Meeting of the Illinois State Medical Society to be held at Rock Island, Ills, commencing Tuesday, May 15, 1888, will be granted a reduction of a fare and one third for the round trip, only under the following

First Each person must purchase (not more than three days prior to the date of the meeting), a first class ticket (either unlimited or limited) to the place of meeting, for which he will pay the regular tariff fare, and upon request the ticket agent will issue to him a certificate of such purchase properly filled up and

signed by said ticket agent
Second If through tickets cannot be procured at the starting point, the person will purchase to the most convenient point where such through tickets can be obtained, and there purchase through to the place of meeting, requesting a certificate properly filled out by the agent at the point where purchase is made

Tickets for the return journey will be sold by the ticket agents at the place of meeting, at one third the highest limited fare, only to those holding certificate, signed by the ticket agent at point where through ticket to the place of meeting was purchased, and countersigned by the secretary or clerk of the convention, certifying that the holder has been in attendance upon the convention

It is absolutely necessary that a certificate be pro cured, as it indicates that full fare has been paid for the going journey, and that the person is therefore entitled to the ex cursion fare returning It will also determine the route via which the ticket for the return journey should be sold, and without it no reduction will be made, as the rule of the associa tion is that "No refund of fare will be made, on any account whatever, because of failure of the parties to obtain certificates "

Tickets for return journey will be furnished only on certificates procured not more than three days before the meetmg assembles, and will be available for continuous passage only, no stop over privileges being allowed on tickets sold at less than full fares Certificates will not be honored unless pre sented within three days after the date of adjournment of the

convention

Ticket agents will be instructed that excursion fares will not be available unless the holders of certificates are properly identified, as above described by the secretary or clerk, on the certificate, which identification includes the statement that one hundred or more persons, who have purchased full fare tickets for the going passage, and hold properly receipted certificates, have been in attendance at the meeting

The certificates are not transferable and the signature affixed at the starting point, compared with the signature to the receipt, will enable the ticket agent to detect any attempted transfer

N B -Please read carefully the above instructions, be par

ticular to have the certificates properly filled and certified by the rulroad agent from whom you purchase your going ticket to the place of meeting, as the reduction on return will apply only to the point at which such through ticket was purchased Yours truly, G L Lister, M D

Assistant Secretary

Rock Island, Ill., March 20, 1888

SUCCESSILE DISTOSAL OF GARBAGE AT MILWAURFE Martin, Commissioner of Health, for Milwaukee, writes to the Saritary Arts of March 10, 1888, reporting the success of the

disposal of Larbage by cremation, as follows

Perhaps Milwaukee is not so favorably situated as some of our sister cities for the safe disposal of our refuse material, and that may be one reason why we have been forced to take vigorous measures to consume ours. Other municipalities have entered on a course of experiments involving large sums of mones, and will at the end of these experiments, be no nearer the solution of the problem than when they were first under With us it is quite different. Last summer we found that fully one half of our garbage was water that could be, and 1 as extracted by a powerful pre s and as we know of no better or charper method of getting rid of this water, than by evapora tion, and as we do not expect that garbage like ours will burn without fuel, so our furnice was erected, and every day, for more than five months, our garbage has been consumed to a Association in 1887. Dr. J. H. Quinn, Blue Springs, Neb., dry, modorous ash, with us, it is no longer an experiment, but became a member in 1886. These names were accidentally dry, modorous ash, with us, it is no longer an experiment, but the first state of the formal an accomplished fact, that we claim to be the first city that is omitted from the trienmal list of members as published in The to day destroying her refuse material by fire I test of the cost of consuming the garbage was made on December 27, with the following result. The amount received and consumed was, 40,215 pounds, and the fuel required was 5,000 pounds, being its twenty first annual session at Huntingdon, W Va, on May 43 cents per hundred pounds of garbage consumed, a result 16, 17 and 18, 1888. A full meeting is expected. For further highly gratifying when we consider that on that date there was information apply to J. L. Fullerton, M. D., Secretary, Charles a large quantity of such and her mixed with the garbage. large quantity of snow and ice mixed with the garbage This department entered into an agreement for three years with the contractor to hurn all garbage delivered at the furnace by order of this office, being that collected by men employed for The wholesale houses, grocers, commission houses, and others of that class, take their refuse to the same place The contractor is also required to burn all small dead animals, and the furnace is in actual operation during this season, the worst of the whole year, only from eight to ten hours daily

ANNAI ES DE I AHORA POIPF DI L'HOSTICE DES QUINZE VINCES is the name of a new and important periodical for ophthalmologists and pathologist, edited by Drs Pienzal and Hensell, and published by Delahage and Lecrosnier, of Paris The editors will issue a series of studies of the pathological material in the Hospice Quinze Vingt, which includes 1,700 enucleated bulbs

THEKAPFULICS WITHOUT ALCOHOL - The Temperance Hospital has been in existence now about twelve years, and the annual report for 1886-7 may be studied with advantage in order to compare the results with those of other hospitals not be supposed that the hospital only receives abstainers, though these are in the majority, probably due to the large proportion of infants and children. In the surgical department the results have been very satisfactory, so far as one is enabled to judge from mere figures, but turning to the medical cases, we may restrict examination to one or two groups of disease with Out of the thirteen cases of acute pneumonia four (abstainers) died, one of them on the fifty fourth day from ex Only four cases of typhoid fever were admitted in all, and although the cases were of young people—15, 7, 14 and 35, respectively—and comprised three abstainers, they all proved fatal. The treatment was the same as elsewhere, and the only difference consisted in the non exhibition of alcohol again, simple exhaustion, eighty seven days after the onset of the d sease, proved fatal in one instance. The average stay of the d sease, proved fatal in one instance. The average stay of patients in the hospital would seem to show that convalescence is unduly prolonged, and this notwithstanding the fact that the list of cases comprises several of "nasal catarrh" and other trivial complaints. The only occasion on which alcohol was administered was in a case of operation for strangulated hernia, in which death resulted from an unreduced constriction credit is due to the registrar, Mr Leopold Hudson, for the clear and practical manner in which he has tabulated and arranged his

We shall look forward with interest to future reports figures drawn upon the same excellent plan, as it is only by comparing results that medical men will be enabled to judge the ments of treatment without alcohol Thanks to the impartial summary with which the report opens, it is easy to grasp its general tenor It constitutes an innovation which other hospitals would do well to copy -British Medical Journal, March 10, 1888

Anatomical Science in the District of Columbia -On Monday, March 26, House Bill No 5040, for the promotion of anatomical science and to prevent the desecration of graves in the District of Columbia, came up for discussion in the House of Representatives While the discussion on the Bill and amend ments to it cover ten pages of the Congressional Record, there is nothing remarlable, in one way or the other, about the Bill It is simply one providing that the unclaimed dead in public in stitutions, and the bodies of such persons as, unclaimed, did not request burial, should be turned over to the medical colleges of the District of Columbia for dissection, and providing for the punishment of body snatching. The Bill and the objections punishment of body snatching The Bill and the objections made to it by members of the House will be considered next

ROLL OF PERMANENT MEMBERS -Dr D W Harrington, JOURNAL of December 31, 1887

THE WEST VIRGINIA STATE MEDICAL SOCIETY will hold ton, W Va

LA SEMANA MEDICA is the title of a new journal published in Havanna on the 7, 14, 21, and 28 of each month, and edited by Dr T Garcia

DONA DR MATILDE MONTOLA is the first woman to receive the degree of M D in the Mexican Republic

DR GARRE, of Basle, has been appointed Professor at Tur bingen

OFFICIAL LIST OF CHANGES IN THE STATIONS AND DUTTIES OF OFFICERS SERVING IN THE MEDICAL DEPARTMENT U S ARMY FROM MARCH 17, 1°55 TO MARCH 17, 1°55 TO MARCH 23 1888

Col J H Bayter, Chief Medical Purveyor, will proceed to Augusta Arsenal, Ga, on public business SO 62, AGO, March 16, 1888

Major Chas R Greenleaf, Surgeon, will proceed to Cambridge, Mass, on official business 5 O 62, A G O, March 16,

Major W H Forwood, Surgeon, granted one month's leave S O 20, Dept Dak, March 10, 1888

Myor H E Brown, Surgeon, assigned to temporary duty at Ft Barraneas, Fla, during the absence on leave of Asst Surgeon M C Wyeth On the return to duty of Capt Wyeth March Brown by Track has been station. S O 65. eth, Myor Brown will rejoin his proper station 5 0 65, A G O, March 20, 1888

Major R M O'Reilly, Surgeon, will proceed to York, Pa, and make an examination of Capt Edw B Rhum, Twent; first Inf S O 62, A G O, March 16, 1888

Capt J C Worthington, Asst Surgeon, granted leave of ab sence for four months, to take effect May 15, or as soon there after as his services can be spared S O 65, A G O,

Capt M C Wyeth, Asst Surgeon, granted leave of absence for two months, to take effect about April 1 S O 65, A

First Lieut Wm D Crosby, Asst Surgeon, granted leave of absence for two months, with permission to apply for an extension of one month to talk effect after home ordered to a tension of one month, to take effect after heing ordered to a new station S O 60, A G O, March 14, 1888

AND A FULL DESCRIPTION OF THE "SÆNGER OPERATION"

Read before the Circinnati Academy of Medicine, January 30, 1888

BY GUSTAV ZINKŁ, M D,

OF CINCINNATI, OHIO

ASSISTANT TO THE CHAIR OF OBSTETRICS AND DISEASES OF WOMEN IN THE MEDICAL COLLEGE OF OHIO PRESIDENT OF THE CIN CINNATI OBSTETRICAL SOCIETY ETC

Austrian by birth, aged 23, primipara She had Mutilation of the child, or Cæsarean Section at delivery with the forceps, but without success

of which are well known to every practitioner of exjoined the lumbar vertebræ almost at right angles, she was tolerably well nourished pale, and wore an anxious expression, her skin was cold and clammy, the abdomen tympanitic, and severe pain in the pelvis, and supra-pubic region, which became almost intolerable during the contraction of the uterus Temp 100°, pulse 110 Fœtal above the superior straight Deformity of the pelvis sistants were cleansed thoroughly was at once apparent from the position of the

against the promontory of the sacrum, a distance of about three inches (see Plate xvi, Fig c) Thus, according to ordinary calculation, the conjugate di-CÆSAREAN SECTION, WITH REPORT OF A CASE ameter at the brim could not be more than two and one fourth inches The oblique and transverse diameters of the inlet could not be exactly determined, though at the time it seemed possible that delivery might be effected per vias naturales The forceps were again applied, and an effort made to fix the blades to the sides of the child's head, but failing in this, the head was grasped over the face and occiput With each pain, steady and firm traction was made A few minutes served to convince me that it was March 17, 1887, at 8 30 AM, I was called in cor- impossible to deliver the child alive through the sultation by Dr Adolph Grimm to see Mrs G, an natural channel One of two things had to be done been in labor thirty six hours, under the care of a former would have been resorted to had the child Dr Grimm had been summoned about been dead To destroy the infant and effect detwo hours prior to my arrival He found the pelvis livery, with the soft parts of the mother in an alcontracted, the os dilated, the head in first position ready swollen and tender condition, did not seem and above the brim He had made several attempts Justifiable to us, because, it might have resulted in the laceration of the organs, to a greater or less de-The patient occupied a small room in one of the gree Circumstances called for immediate action crowded tenement districts, the usual surroundings Whatever was to be done, had to be done at once To resort to craniotomy was to sacrifice the life of perience The patient was a dwarfed, pale brunette, the infant, while it would not have materially enfifty one and three-fourth inches tall, thirty inches hanced the mother's chances of life Hysterotomy, from vertex to tip of coccy. The lower limbs were I felt reasonably certain, would save the infant at abnormally small and knock-kneed, the sacrum least, while at the same time it did not deprive the mother of all hope of recovery Therefore it was Her face was determined to resort to Cæsarean Section

The operation was performed at 10 AM of the same day, Drs A Grimm and B Zinke assisting, tender to the touch She complained of constant the husband and midnife were also present. The patient was placed upon a table opposite a window The temperature of the room was kept at about 90° F throughout the operation Dr B Zinke adminheart was distinctly heard to the left of the median istered the chloroform, after 1/4 gr morph sulph had line, on a level with the umbilicus Digital examina- been given subcutaneously - Abdomen, vulva and tion revealed a swollen, hvid vulva and vagina, a upper portions of both thighs were then washed with fully dilated, but thick and flabby cervix The head soap and hot water, instruments and sponges were of the child rested (occiput to the left) transversely treated antiseptically Hands of operator and as-

The woman being anæsthetized, I made a five and sacrum, the coccy's being buried in the bed clothes, one half inch incision in the median line of the body, and the hand of the examiner being allowed to pass midway between the umbilicus and mons veneris easily under the back of the patient The promon-Before opening the womb all hæmorrhage was tory could be felt without difficulty. The middle of stopped Dr Grimm then placed his hands upon the first phalana of my right indea finger being the abdomen, surrounding as much as possible the firmly fixed against the lower border of the symphy-opening made, and gently, but firmly, pressed the sis pubis, permitted the tip of the same finger to rest abdominal parieties against the uterus. The point

selected for the incision in the womb was also in the | I median line. The position of the child could be easily outlined by running the tip of the finger over the exposed portion of the womb, and from this palpation I was satisfied that the placenta was not ittiched thereto Membranes had ruptured many hours previously, the uterine walls, when not con tracted, were fluccid The point chosen for the incision was the median line of the uterus about midway between the fundus and neck of the uterus small opening was at first made into the womb (in the upper portion) with an ordinary scalpel I brough this, a curved, blunt-pointed bistoury was introduced and the opening carefully but rapidly enlarged to about four and one half inches. There was profuse, but not excessive hiemorrhage, Dr Grimm destrously preventing it, and the remaining amniotic fluid from entering the abdominal cavity

The extraction of the child was the work of a few The right arm from elbow to shoulder was presented in the cut of the womb Taking hold of the arm gentle traction at once assured me that pain delivery could not be effected in this manner without running the risk of tearing the uterus. In attempting to deliver it by the feet, the same difficulty | pain presented itself (standing to the left of the patient) through the lower angle of the wound, and pushed it downward between the anterior wall of the womb, and the right | side of the head over the vertex. Then tilting the sulph gr 1/4 hypodermically head of the child upward and forward, it was easily guided through the opening and delivered proved to be a full grown, healthy child

The nomb contracted immediately and hæmor- Slight spasmodic pains over the loner portion of rhage amounted to but little thereafter time the patient was pale, the pulse perceptible, but No tympanitis Tr ver vir discontinued and 4gr very weak, her breathing was unembarrassed The cord, after being tied and severed, was carried through the incision in the uterine cavity through fortable, tr ver vir was again ordered to be given the cervix, brought out at the vulva, and the pla- hourly, in 2 drop doses on account of increased centa delivered per os and vaginam While thus pulse rate exposed, the uterus was observed to pass through several regular contractions I intended to close supra-pubic region Lochia somewhat offensive and the opening in the womb with a continued carbolized irritating in character Vaginal irrigations with car catgut suture, but when this was nearly finished, the suture broke in several places and consequently had to be abandoned I then resorted to the interrupted carbolized silk suture, eight stitches being introduced

Inspection and Cleansing of the Peritoneal Cavity | fering slight pain -The intestines had not been exposed Although, morphia several small, soft and thoroughly prepared sponges were dipped down deeply all around the uterus, Increased pain, slight distension of abdomen Gen nothing but the merest trace of blood could be ital tract irrigated and morph sulph 1/4 gr hypo found When satisfied that the abdominal and pel-|dermically vic cavities were clean, and that there was no oozing

anywhere, the

Abdominal Wound was closed by eight heavy silk A strip of lint, dipped in carbolized oil comfortable, no pain, abdomen not distended The rest of the dresswas placed over the wound ing consisted of a layer of absorbent cotton and a moderately tight abdominal bandage elapsed, from the giving of the anæsthetic to this point was one and one-half hours This may be divided as follows

l'or	anasthetic, about abdominal incision and stopping of hemorrhage, about	20	min
	uterine incision, delivery of child, and tying cord,	7	"
"	guiding the cord through the cervix, vagina, and out of the vulva sewing up the uterrie would	3	"
"	and the delivery of the placenta, about eleansing the abdominal and pelvic cavities respectively, sewing up the abdominal incisions and dressing the wound and the patient		

COURSE AND TREATMENT

Ist D y - 2 P MTwo hours after the operation patient suffered slight pain in the wound Pulse 120 Temp 10134° Resp normal 4 gr morph sulph subcutaneously Ice bag placed over the dressing

5 PM Temp 1013/4 Pulse 120, strong and full, patient felt comfortable Two drops of tr ver vir were given every 2 hours and morphine in 1/4 gr doses per os every 2-3 hours when required

7 PM Pulse and temperature the same No

12 PM Pulse 132 Temp 102° No pain 2d Day - 9 A 11 Pulse 132 Temp 100 1/4 No Patient vomited several times during the I then inserted my left hand night Morphia per os discontinued

morph 1/4 gr

5 PM Pulse 160 Temp 10250 The patient had become semi conscious, while her strength was ally, using xxx m every two hours

Pulse 160 much increased, delirious, no pain, but very rest-- less, whiskey, xxx m every hour, hypodermically

7th Day -8 AM Severity of all symptoms aug-Temp 1041/20 Pulse 160 Abdomen mented greatly distended but wound still intact Patient semi-conscious No pain, but much depressed and exhausted During the last few hours she suffered intensely from dyspnœa, which caused great restlessness and tossing about

She died from the combined effects of 2 P M peritonitis, dyspnœa and asthenia (See Plate xvii)

The ice bag was kept on the abdomen for nearly source of discomfort, and therefore it was discontinued and warm flannel substituted In the beginning the diet was mild, later, more nourishing and with the patient's stomach

The following diet was maintained Milk, mutton, beef and chicken broths, toast, the juice of broiled beef, port wine, and at one time a little beer was given to satisfy a strong craving for it. In the absence of any desire for food and the repeated attacks of vomiting the nourishment she received in the aggregate

amounted to very little

Post mortem Examination was held the following morning in the presence of Drs C D Palmer, Ed Walker, Adolph Grimm, Bruno Zinke and Thomas

Hays

Rigidity not very well marked, body in good state of preservation, features pinched and sunken, integument not discolored, abdominal walls enormously distended, wound gaping in the central portion to the extent of two and a half inches, a condi-

ness and throwing herself from side to side during the final struggle

The abdominal contents were held in place by a firm thick band of adhesion which had formed along the inner surface of the abdominal wall for more than an inch on each side and beyond the extremities of the incision, matting the omentum, uterus and irritation, all the sutures were removed and the abdo- bowels to the inner surface of the anterior abdominal

The cut was then enlarged to the sternum above placed over it as before, and the vagina again irri- and symphisis below. The intestines, distended with gas, showed a diffuse peritonitis, adhering universally to each other, to all the adjoining viscera and abdominal parieties, with the exception of the lower two thirds of the uterus, the bladder, and the true Pulse 156 Temp 102/2° The patient pelvic cavity Having removed the intestines, the stless, slightly delirious Increased tympanites liver, spleen and kidneys were found to be normal Having removed the intestines, the The body of the womb, high up above the brim, was bent upon the lower lumber vertebræ, over the promontory of the sacrum, and measured about seven inches in its vertical, and five inches in its greatest transverse diameter The walls at the upper third, where its transverse diameter was greatest, showed an rapidly failing Whiskey administered hypodermic-linch thickness, except in the proximity of the incision Here they tapered off from the inner to the outer Temp 1035° Tympanites surface, which was apparently due to sloughing All along this wound from the peritoneal surface, half way through the parenchyma of the womb, the union seemed to be perfect. On examining this wound with great care, it was found that the union had not been effected along the entire tract of the incision A space of about a quarter of an inch, corresponding to the upper suture, had failed to unite There was no communication, however, between the uterine and peritoneal cavity, this being rendered impossible by the adhesion of this section of the womb to the abdominal wall in front The remainder of the surface of the uterus and its appendages were smooth, but three days, during which time it seemed to have a marked with indentations by surrounding structures favorable effect upon the patient, after that it was a It was also greatly discolored, almost black, especially so at the inferior half, and both the ovaries

The pelvic pentoneum had the same appearance The upper half of the body of the uterus had a yelconcentrated food was given, in so far as it agreed low, greenish tint. There was no fluid pus present anywhere, nor adhesions between the pelvic viscera and pelvic peritoneum But there was to be seen a peculiar curdled, cream like, non adhesive pus, distributed in spots, or islands, upon the pelvic viscera and the peritoneal lining of the pelvic cavity uterus and appendages having been removed the following were the

Diameters of the pelvis at the superior strait convenience of comparison, I have placed them alongside of the average normal diameter

In this Patien	Natural Average Diameter				
Conjugate diameter Transverse " R oblique "	2½ m 4½ "	Conjugate Transverse R oblique		4½ 5¼	ın
L. "" " (See Plate vii, Fig	336 **	I. "	**	5	"

The diameters of the inferior strait and of those tion discovered only post mortem, and which must within the pelvis could not be taken with any degree have occurred shortly before or after death, and was of accuracy, though I believe that could the head no doubt caused by the patient's extreme restless have been made to pass the brim the rest of the cavity

would have offered no very great obstruction to the but the mother died on the seventh day. That she delivery of the child

RIMARKS

Was Casarean Section indicated in this case?

2 Was an operation justifiable at the time and place and under the culcumstances under which it was

performed l

In this country 2 inches, in Germany, France, and other European countries 2 73 inches and less, of the conjugate diameter, at the brim, is considered the limit at which hysterotomy may be resorted with perfect propriety, provided the infant still lives, and that the pelvis is not so distorted as to permit the passage of the head to one or the other side of the conjugate In other words, contraction of the anteroposterior diameter alone, is not to be considered a sufficient cause for the performance of the operation I must confess that in this case I believed, prior to the operation, that the conjugate at the upper strait The transverse was not more than 2 or 21/4 inches and oblique diameters at the brim, though likewise only approximately determined, were recognized as less than normal in size Notwithstanding, I believed myself justified in making another attempt to deliver the child with forceps, for it still seemed to me possible that a small child might be made to traverse this The introduction of the forceps contracted pelvis was not attended by any great difficulty Locking the instruments was not so easily accomplished The blades grasped the head over the face and occiput It was impossible to apply them over the sides, and hence was not persisted in Then gentle, later firm, and finally severe traction was made with each pain, but not the least progress effected

IVhat was then to be done? I believe with the majointy that it is wiser and more humane to spare the life of the mother though the child is sacrificed, if by so doing her life can be saved with any degree of certainty This, however, was not possible in the instance just cited All things being well considered, hysterotomy was determined upon, and performed in the presence of the gentlemen mentioned have abandoned the case entirely, or to have had her removed to more sanitary quarters would have been cowardly, to say the least, and would have resulted in the immediate death of both the parent and

child

For these reasons, with Dr Grimms' consent, I

assumed all the responsibility of the case

To what may the fatal issue in this case be attributed? The causes operative in the result obtained may be summed up as follows

Long delayed and exhaustive labor 2 Repeated unsuccessful attempts to deliver with

3 Bad hygienic surroundings of patient forceps

Shock of operation

Vomiting and inability to retain sufficient nour-

the carbolized catgut suture

lived so long is undoubtedly due to the great care and unremitting attention which Dr Grimm bestowed upon her

In this connection it may be proper to state that in this operation, as well as in any other so called capital surgical procedure, a certain amount of practical ex perience in the performance of the operation itself is absolutely necessary to success. But where, it may be asked, is a practical experience in Cæsarean section to be acquired? It would seem that this country offers very limited opportunity for this special This is true also of all other obstetric practice The fearful death-rate attending hyster operations otomy in this country, as manifested by the follow ing statistics of R B Harris, may be directly traced to the meagre obstetrical resources that this country furnishes, as well as to the consequent inadequate teaching of midwifery by its medical schools Where the teaching of obstetrics is most thorough, practi cally, Cæsarean section has been oftenest success fully performed "Germany," as Harris says, "takes the premium," while America shows the lowest per cent of recoveries This fact will remain so long as the teaching of practical midwifery remains more or less a strange one to the profession of this broad land

THE IMPROVED CÆSAREAN SECTION

Considerable improvement has been made by San ger in the operative technique of hysterotomy, when compared with the so called classical operation Not that he himself has discovered the various pic cedures of the different and successive steps in his new method of operating—he makes no such claim but by careful study, painstaking observation, re search and experiments, he has been able to formu late a method that bids fair to create a revolution in Strange as it may seem, prior operative obstetrics to 1887 English and American medical literature was almost silent on this subject, and Sanger's book, published in 1882, has received little or almost no attention from the English speaking profession Parvin (Science and Art of Obstetrics, '86) quotes an account derived chiefly from Potacki (Annales de Gynécologie f, 1886) It is a faithful description of the Sanger operation, but contains no drawing show ing the manner of introducing the uterine suture Lusk (Science and Art of Midwifery) is the only recent author who makes an attempt to illustrate the manner of undermining the peritoneum and of re We find a full though secting the muscular tissue not altogether very clear description of this opera tion in Charpentier (Grandin Encyclopedia of Ob But I know of stetrics and Gynecology, 1887) nothing that brought the suggestions of Sanger more thoroughly before the profession of this country than the rich and spicy "Sanger-Garrigues controversy concerning the claims and ments of the former, whose name the operation now bears, and which re 6 Development of general peritonitis

The operation was executed carefully and antiseptically with no mishaps, excepting the tearing of the carbolized catgut suture. The child was saved pold Crede Gussaron and others cannot fail to challenge attention wherever they are known view of the fact that the subject of

The New Casarean Section, or Sanger Operation, terrally has received no attention from this Academy, and least should, become a more frequent and successful, lying-in and her off-pring, I have concluded to furnish a detailed description of the same

I translate from an essay by Sanger, delivered at gauze Munich, 1886, besore Der Deutschen Gesellschaft

fuer Gynacologie

than those which every physician should have in his They may be disinfected possession, are necessary with carbolic solution, while both patient and operator employ bichloride for this purpose Thorough | disinfection of the shaved abdomen, of the external genitalia, vagina, even of the neck, are essential to Sponges are not absolutely necessary Cotton-nads dipped in solution of sublimate, carbolic acid, or chlorine water, as well as napkins of ine wound is the close (enge) double suture sublimate gauze, mull, etc., may be substituted persons are requisite for assistance may, in case of necessity, be trusted to a layman

the anterior median section of the uterus bilicus need not be avoided is not advisable, because it necessitates enlargement strong aseptic silk may be employed of the abdominal incision and renders intestinal pro- "6" The final acts in the operation consist in the the uterine contents escape into the abdominal cavity

3 Uterine incision, in situ, is made in the median of the uterus, the latter, especially, should be avoided, and may be recognized by the loose attachment of its peritoneum By placenta prævia Cæsaria, the pla centa should be either quickly cut through or detached on one side Delivery of the child is accomplished in the best and quickest manner by the feet If the head be retained, wait a short time only if this be due to contraction of the uterus, if relaxation does not occur soon, or if the incision be too small, elongate the same with button pointed scissors

the extraction of the child, it being bent forward and the abdominal wall quickly pressed together behind If the assistant has kept the latter all this time intimately in contact with the womb, neither blood nor uterine contents can find their way into the ab

dominal cavity

"The bowels may now be protected with an anti septic cloth, the uterus then rests upon another and is partly covered thereby. For the purpose of ar- form, without omissions, restrictions or criticisms resting hamorrhage from the womb, compression by

Temperature chart of case reported

- When infection of the corpus uters is evident "
- After repeated classical sectio Cæsaria"
- By serious general osteo malacia (?) Thus, from what we have learned by a careful study of the "Improved Cæsarean Section," it car-

not be denied that the Porro-operation has been severely, yet properly restricted, and will be resorted to only in very rare instances

In conclusion, it may be proper to state, that no one regrets more fully than I do, that the case here reported was not a Sanger operation, per se

My principal reason for not following Sanger was, that up to the time of the operation, indeed up to my correspondence with Dr Sanger, I had failed to fully comprehend his method I have given you a faithful description of the new operation and have attempted to explain the same by the subjoined drawings 1

THE SWEDISH MOVEMENT AND MASSAGE TREATMENT

Abstract of a paper read before the Clinical Society of Mary land, February 17 1888

BY HARTWIG NISSEN,

DIRECTOR OF THE SWEDISH HEALTH INSTITUTION WASHINGTON, D C INSTRUCTOR IN GUMNASTICS AT JOHAS HOPKINS UNIVER SITY BALTIMORE

I am here to-night to tell you a little of what I know about "The Swedish Movement and Massage Treatment," and if some things should seem strange, or you should think that I have claimed rather much for it, I beg you to remember that all that I have to say is based upon facts, and that I am here not as a special agent for myself, but as one who wants to lay before you a clear and true representation of what has been done

As Herodotus observed the curative effects of gymnastics on his own delicate health and thereby was brought to use movements in therapy, so did the Swede, Pehr Henrik Ling, in the beginning of this century, study the movement treatment, because he had cured himself of rheumatism in the arm by gentle percussions Ling had been a fencing master and instructor of gymnastics, but now he studied anatomy and physiology, and the influence of the different movements and manipulations in different chronic diseases He brought gymnastics into a system corresponding with the knowledge of physiology, and this is the reason why it is called "the Ling System," or the "Swedish Movement Treatment" By ardent study and labor, Ling succeeded at last in making his new ideas recognized, and in 1813 the first "College for Pedagogical, Military and Medical Gymnastics," called the "Kongl Gymnastiska Central Institutet," was established in Stockholm at the expense of the Swedish Government The principal studies for graduation are anatomy, physiology, pathology, hygiene, diagnosis, principles of the moveand local development Ling died in 1839 pupils, Brandting, Georgii, Liedback and G Inde beton, published Ling's theories Hereby, and on account of the many foreigners who studied at the Central Institute of Stockholm, Ling's art soon became known in a great part of the world

Mr Joseph Schreiber, of Vienna, in his "Manual

Plates VI VII And VII my own the rest taken from being thus set up in both

of Massage and Muscle Exercise," p 21, says most powerful impetus, however, given to the revival of mechano-therapy, originated with a Swede, the originator of the modern "movement cure," whose doctrines, spreading to England and to Germany, have after many decades, and in spite of being marked by some extravagancies, gained universal recognition "

Endowed with depth of thought as well as creative genius, fortified by scientific information, and sustained by an untiring devotion to his task, Ling was early led from result to result by a careful classification of movements, and by a scientific examination of their different results Ling distinguished in the first instance between Active and Passive movements, Active Movements being such as the subject performs entirely by voluntary muscular contractions, and Passive Movements such as the subject takes no part in, beyond allowing the operator to move the whole or any portion of his body-as flexion, extension and rotation-and to manipulate it, as in stroking, kneading, pressing, percussion, etc These simple movements Ling combines into Resistive, or Dupler Movements, VIZ Active passive, or "concentric duplex" movements, such as the operator resists, and Passive active, or "excentric duplea" movements, such as the operator overcomes when the patient resists Dupley, because two individuals engage in it, concentric, because the patient's muscles have to overcome a resistance which prevents flexion—a movement toward the trunk, excentric, because the force acts in a direction away from the body

These movements cause an increased flow of blood to the muscles and soft parts, increasing thereby the circulation and removing accumulation of tissue They cause resorption of exudations, transuwaste dations and infiltrations, and a separation of adhesions in tendon sheaths and in joints They increase They relieve the the oxidizing powers of the blood congestion of the brain, lungs, intestines, uterus, liver and kidneys by increasing the flow of blood to the They stimulate directly the sympathetic muscles nervous system, thus increasing secretion, and reflexly the activity of unstriped muscle fibre, and so relieve various functional derangements And they educate morbidly affected muscles, to convert abnormal into normal actions, and to suppress useless movements

Dr J Schreiber, in his book (page 67), says "We understand by passive movements all movements performed by the physician upon the patient, the latter remaining passive The following results are obtained

"r Extravasations occurring about dislocated ment treatment, and the use of exercises for general joints are, by pressing and rubbing the tendons and His ligaments in which they are embedded, finally liquefied, and thus more quickly absorbed

"2 In stiffness of joints the contracted muscles and tendons are forcibly but gradually elongated, and any existing exudations or vegetations within the joints are disintegrated and absorbed

"3 By the forcible stretching of the muscles their nerves are likewise stretched, molecular changes "4 Forced extension of the muscles causes press-cure, as Ling called it "Sjukgymnastik," that is

celerating the circulation

neuralgic pains been kept in a state of mactivity, have some of their much-needed exercise restored to Heilmethoden, Berlin, 1882) calls it "Gymnastics them Passive movements thus form in certain dis- and Massage" Schreiber's term is, "Mechano-Thereases, as in neuralgia and rheumatism, the introduc- apy " tion, as it were, for the more painful active motions call it "The Swedish Health gymnastics," but very which have to follow "

Dr J. Graham, "Treatise on Massage," page 23, In 1844 the Supreme Medical Board of Russia appointed two members of the Medical Council to inquire into the merits of movement and manipu- on account of lack of knowledge and part on account lation treatment as practiced by M de Ron, one of of fraud Ling's disciples at St Petersburg, who had been using all embracing term would be "Swedish Movement it then for a period of twelve years From the highly commendatory report of the councillors we quote the are executed by an external agent upon the patient, sion when applied to the muscles in question for the 15 well as active ones produced by the effort of the propulsion of blood, lymph, and exudations from the voluntary muscles, and the different positions with periphery toward the centre the aid of the apparatus or without it, are practiced according to a strictly defined method, and con- in local troubles, such as Neuralgia, muscular rheu ducted rationally, since they are based upon mechanical as well as anatomical principles Experience cerebral congestion, chronic dyspepsia and constipateaches us the usefulness of the institution, as many tion, chorea, writer's cramp, etc. Dr Weir Mitchell, patients thus treated have recovered their health after having suffered from disease which could not be cured eases by Rest," has applied massage, as he says in his by other remedies"

Before speaking about more details of this system, I must say a few words about what is meant by the word "massage" Dr J Graham says to knead or handle—is a term now generally accepted by European and American physicians to signify a group of procedures which are usually done using massage in nervous diseases is of very great with the hand, such as handling, manipulating, rolling, and percussion of the external tissues of the body in a variety of ways, either with a curative, palliative, or hygienic object in view many instances be combined with passive, resistive from Dr Mitchell or assistive movements, and these are often spoken of as the Swedish movement cure There is, however, an increasing tendency on the part of scientific not teach massage" But suppose we admit that men to have the word massage embrace all these varied forms of manual therapeutics, for the reason that the word 'cure,' attached to any form of treatment whatsoever, cannot always be applicable, masmuch as there are many maladies that preclude the possibility of recovery and yet admit of amelioration "

In this I cannot fully agree with the author Mass- by "Swedish movements and massage?" age means kneading, and when we go so far as to say that massage means the handling and manipulation of the flesh as in kneading, pressing, stroking, tapping, etc , I think we have embraced all that can To say that a passive come in under this term movement, such as flexion and extension, or even a duplex movement, is massage or kneading, is too much to say, and has been a source of great harm formance both to patients and to the original Swedish system,

as I shall have occasion to show later on

the word cure" If these men had read little about viz Ling's system they would not have found the word these he subdivided into a number of starting posi-

ure on their blood- and lymphatic vessels, thus ac- "gymnastics for invalids," or better, "the treatment of diseases by movements," which also embraces the "5 Finally, such muscles as have by rheumatic or different manipulations now grouped under the term Rossback (Lehrbuch der physikalishen massage Rothstein, Neumann, Eulenberg and others few take to the term "massage" to mean both manipulations and active and passive movements It is true that we frequently see "movement cure" on circulars and in some books, but the term is used purely I should think that the most correct and and Massage Treatment"

Massage embraces the processes of kneading, press-"All passive movements, or those which ing, stroking, rubbing, tapping, hacking, and percus-

In Europe this is used, combined with movements, matism, sprains, stiffness of joints and tendons, of Philadelphia, in his "Treatment of Nervous Dis-"Fat and Blood," page 71, "to deprive rest of its evils".
This massage consists of gentle but firm rolling, kneading, friction, etc., of the skin and muscles of "Massage the whole body in order to bring about a free circulation of the blood and thereby improve or maintain the nutrition of the muscles No doubt this way of value, but all over the United States we find men and women pretending to give "massage" in the broadest sense of the term as used by Dr Graham Its application should in professionals claim to have received their training

> According to Dr Graham's book, page 34, "Dr Mitchell states over his own signature, that he does some of them have learned from Mitchell's masseurs, still, what do they know? How is it possible that a man who has been taught to use his hands only in a certain way for a special malady can know how to use them, and how and when to apply proper movements in all the different diseases which are treated

Much experience and hard study is required in order, understandingly, to give a full treatment The different manipulations may be for some persons easy enough to learn, but the active and passive movements so indispensable for the cure of certain forms of disease, require and exact knowledge of anatomy and physiology for their proper application and per-

I will now in a few words describe the mode of treatment which Ling systematized Ling distin-"Scientific men will use the word massage to avoid guished between five different fundamental positions, standing, sitting, kneeling, lying and hanging,

tions with the arms, legs, trunk and head, which combined in various ways make nearly 12,000 positions in which the different movements may be either taken or given. And so the number of movements may be said to be endless to suit each particular ailment.

The movements may be spoken of as Strengthening movements, such as flexion, extension, torsion, etc., Stimulating movements as, percussion, vibration, etc., Quieting movements, as rotation, friction, etc., Derivation movements of the extremities, Purgative movements, as kneading, pressing and active movements on the bowels. Some movements have a special effect on the respiration, others on the cuiculation, etc.

To illustrate how these movements are applied in different cases let us take, for instance, a patient suffering from anæmia If he is well enough to sit up, we will give him

- r "Chest lifting," a respiratory movement, the chest is expanded, the inspiration becomes deeper and is followed by a stronger expiration. Thus a greater amount of oxygen is taken in and waste matter given off. This must stimulate the functions of the organs and thus accelerate the process of renewal and an exchange of material in all parts of the body.
- 2 "Foot rotation," to equalize the circulation by increasing the flow of blood to the feet
- 3 "Stomach vibration," which has a direct effect on the stomach and will improve the appetite and the digestion
- 4 "Forward arm rotation," a respiratory movement, which has a similar effect on the first one
- 5 "Trunk rotation," which brings the muscles of the waist and bowels into play and acts on the circulation, especial in the portal system
- 6 "Knee flexion and extension" with resistance This has a strengthening effect on the flexors and extensors of the leg and promotes the circulation
- 7 "Bowel friction," to promote operations of the and all can be relieved "bowels
- 8 "Back percussion," which stimulates the nerve centres

These movements can of course be applied to the patient in different positions according to his strength, and when the patient improves other and more vigorous movements are used — In a case of constitution a prescription of movements like the following would be most effective

- r "Leg flexion and extension," an active movement under pressure on the sacral region and bowels This movement brings into play the flexors and extensors of the legs and has a purgative effect on the bowels
- 2 "Backward leg traction," a duplex movement, alternately from a standing position the patient resisting forwards. Here the muscles of the bowels, the flexors of the thigh and extensors of the calf are in action. Therefore this movement has a purgative as well as a derivitive effect on the organs of the pelvis.
- 3 "Forward trunk flexion," pressure being exerted on the sacral region and the bowels from a lying its highest degree position—active movement

- 4 "Trunk torsion," from a kneeling position—duplex movement
 - 5 "Trunk rotation," from astride, sitting position—passive movement

The third, fourth and fifth movements bring into play all the muscles of the bowels, increasing the circulation of blood in the portal system, they have a good effect on the digestive organs and act purgatively in a measure

6 "Breech percussion, deep," standing position—passive movement This acts on the sacral nerves,

and has a stimulating effect

7 "Bowel kneading and friction," reclined position, with the muscles of the bowels perfectly relaxed—passive This acts directly on the intestines and promotes the operation of the bowels

ffering from anæmia If he is well enough to sit 8 "Vertical arm flexion and extension," sitting position—duplex movement. This has a strengthening effect on the muscles of the arms, chest and test is expanded, the inspiration becomes deeper back, and tends to equalize the circulation of the did is followed by a stronger expiration.

In cases of heart disease movements must be given, which shall diminish the pressure of the blood and decrease the activity of the heart. Inspiration acts as a pump on the circulation towards the heart. Muscle contractions produce a pressure on the walls of the blood-vessels, whereby the blood is forced towards the heart, hence, respiratory and circulatory movements are here of great value.

Dr Gustaf Zander, of the Mechanico-Therapeutic Institute in Stockholm, says "In heart disease, movement treatment is an uninterrupted necessity, at least during the winter. It is a pity for any such patient, who has the opportunity not to use this treatment. It is astonishing what excellent effects, regular, gentle, but many-sided muscular exercises, have on diseases of the heart. Some of these when not too far gone, can be entirely cured, others can be stopped from further development, and all can be relieved."

In scoliosis, in which the muscles on the convex side are weakened and pathologically changed, and the muscles on the concave side normal, it is clear that the weakened muscles on the convex side must be strengthened and developed According to Dr T J Hartelius, the principal of the Central Gymnastik Institute in Stockholm, "The restoration of a pathologically changed muscle cannot be produced by mechanical extensions, but only by muscular ex ercise and electricity" "But," he says, "for the restoration of a curved spine extension is necessary The question is, therefore, whether this can be effected by the organisms own remedies? This is easy enough to prove In mild cases of lateral curvature, where there is not yet any deformity in the vertebre, the spine is straightened at each extension of the back By flexion to the convex side, the spine is not only straightened, but it can be bent so far as to display a curve to the other side cases where the deformity of the vertebræ makes a full extension of the spine impossible, it is still possible by its own strength to produce an extension in For instance, in a "Forward trunk flexion and extension" the patient stands supported on the thighs and bends forward, when he joints are treated on the same plan raises himself up the operator resists him on the neck Or, in "Backward trunk flexion" the patient is lying require a much longer time in order to produce a on the front of his legs, and raises the back up

These, and a few other active movements, can better than any other mechanical remedy, straighten out the curved parts In a one-sided scoliosis, for instance, with the convexity to the left, "lateral trunk flexion to the left" may be given. The optrunk flexion to the left" may be given erator puts his hand on the highest point of the curve, and resists the patient when he bends down This can be performed either with the patient sitting, standing, or lying on his right side Several other movements are also given, with the view and intention of strengthening the muscles on the convex side, and straightening out the spine, and should be used according to the strength of the patient, and the particular shape of the deformity

"The treatment Dr Schreiber (page 86) says of scoliosis by the Ling system, which has scored some of its greatest successes in this very department, requires, however, quite a special study, and can hardly be carried out without both apparatus stood that it is absolutely necessary that the operaand trained assistants" Dr M Eulenberg in "Die Schwedische Heilgynmastik, Berlin, 1853," says "Ling's method is the only truly rational therapeutic means for the cure of chronic disturbances of motivity, such as result from spinal curvature, and for pseudo-anchylosis, the phthisical-tendency, pigeon-

breast, peripheral paralysis, etc

Even in cases of paralysis from lesions of the cord, it may still effect a cure, where all other measures, undertaken after the original disease has run its course, will be found useless Ling's gymnastics have an even greater and more certain effect upon innervation and nutrition, than the common form of gymnastic exercises Spinal (lateral) curvatures, resulting from faulty carriage (in consequence of a preponderance of muscular force on one side of the body), are nowadays never treated by any good orthopædist by any other means than the "Swedish system"

In various joint affections this treatment has been used with great success If may be used to increase the circulation in and around a joint, or to promote absorption and to squeeze exudations out of the joint

In treating a sprain of the ankle we begin with gentle centripetal frictions, commencing at the toes and gradually proceeding upwards as far as the painful spasm reaches, using the finger tips, then the whole surface of both hands As the pain diminishes more and more force may be employed, and when the contraction has so far relaxed as to leave the joint movable, gentle passive flexion and extension, and rotation of the foot should be per-After the second or third sitting the movement of the ankle-joint will generally be quite free and almost painless, then more force may be ap plied and active and duplex movements used Usually the treatment is repeated three times daily Provided there is no fracture, four to ten days is enough to cure the patient, and the sooner treatment is begun the quicker will be the cure

But the hip and shoulder joints are more difficult to treat, and And so on, each different disease has its own cure peculiar treatment

It may be stated as a fact, that not only in the Central Institute in Stockholm, but in a number of Swedish movement institutions in many parts of Europe, that the following diseases have been treated successfully according to this method Chlorosis, anæmia, scrofulosis, scorbutus, different neuralgias, rheumatism, gout, different venous con gestions, adhesions of the pleura emphysema, hysteria, hypochondria, general nervousness, insomnia, epilepsy, paralysis, chorea, writer's cramp, bronchial catarrh, heart diseases, dyspepsia, constipation, hyperæmia of the liver, paralysis of the bladder, disordered menses, prolapsus and adhesions of the uterus, round shoulders, chicken-breast, scoliosis chronic joint diseases, stiff and sprained joints and tendons, hydrarthus, muscular atrophy, and a few

After what has been said, it may be easly undertor should not only be fully acquainted with the movements and their uses in different cases, but should also have a full knowledge of anatomy and physiology, and of the exact character of the disease Still it has happened several which he is to treat times that I have been called in by physicians to treat some of their patients, and when I have asked what the trouble was, I have been told that it was not my business to know

It is cooperation between the medical profession and the gymnastics, which is desirable and necessary in order to produce the best results

[The author then gave a number of cases, illus trating the beneficial effects of massage and move ments]

The following are a few extracts from reports of

the Swedish Movement Institution in Bremen

"Of ten digestive disorders, constipation, cardi six were cured, three algia, flatulency, dyspepsia greatly improved and one improved twenty three

"Of fifty-nine spinal deformities were cured, seventeen greatly improved, fourteen

improved and five still under treatment

"Of six cases of muscular weakness five were

cured and one greatly improved "Of eight rheumatic disorders seven were cured

and one greatly improved "Of thirteen sprains, wrist, finger, knee and ankle being involved all were cured in from four to

The Swedish movement and massage treatment is twelve sittings " well worthy of adoption by the medical profession in

the United States

WEICHARDT (Prager medicinische Wochenschrift) has employed an ice-bag wrapped in flannel, laid over the spleen in typhoid fever, and thinks that a reduction of temperature and a hindrance in the develop Other ment of bacilli resulted

ON THE IMPORTANCE OF PRIMARY SUTURE OF DIVIDED NERVES, WITH AN ILLUSTRATIVE CASE OF SUCCESSFUL SUTURE OF THE MEDIAN AND ULNAR NERVES

Read before the Philadelphia County Medical Society, March 14, 1888

> BY CHARLES B NANCREDE, M D, OF PHILADELPHIA

Although I have a most profound faith in the vis medicatrix naturæ, I still think that Dame Nature should always have fair play in her battle with injury or disease, and this she certainly fails to receive at

the hands of too many practitioners

In a paper published some fifteen years ago I contended that if, with such vascular structures as those of the face, which certainly would unite sooner or later in some sort of fashion, we habitually resorted to suture, merely for cosmetic effects, we were all the more bound to do so for such avascular structures as tendons, which, if they failed to heal well, much more if no union was secured, must entail dis ability or total uselessness of a member Now a days a surgeon who should fail to suture a divided tendon would be considered derelict in his duties manner, I trust that in the near future the general practitioner will be so impressed with its importance that he will consider that his duty is unfulfilled until he, or some surgeon summoned by him, has sutured any divided nerve

It is needless for me to dilate upon the evils con sequent upon the abolition of function of an important nerve, but I would recall to your minds cases which must have occurred in the practice of most of those present, where divisions of even such small trunks as digital nerves have resulted in troublesome

ulcerations, causalgias, etc

Doubtless the indifference of practitioners to wounds of nerves, or, more strictly speaking, their inclination to "leave them to Nature," has ansen from two causes, viz 1, the fear that suturing might in some way determine tetanus, and 2, the well known fact that nerves divided or even excised with the avowed intention of abrogating their function,

too commonly reunite

The first cause should not deter us, as we now know that a suture, per se, can never originate tetanus, while as to the second objection, certain facts which I shall submit for your consideration warrant the conclusion that traumatic divisions of nerves, unless effected by a clean cut-or perhaps ball wounds-involving solely the nerve and little, if any, of the contiguous structures, differ so materially from those purposely effected by the surgeon's knife, that conclusions derived from the result of neurectomies cannot safely be applied to accidental divisions of

Besides, granting that reumon will occur without suturing, as a stitch can do no harm, why not use one, since it will at least conduce to a more rapid

at times occur, and would doubtless be of more frequent occurrence, if sutures were the rule and not the exception

My aim in this brief note is merely to call your attention, as general practitioners in whose hands many of these cases will fall, to the duty of suturing divided nerves as a routine practice, just as you would tie arteries, and to describe a simple, effective

method of carrying out the indication

A critical examination of the histories of nearly all exsections of nerves where reproduction has occurred, will show that they were removed either from a bony canal or from an intermuscular space in which they normally laid, with the minimum of injury to the surrounding tissues Moreover, even when their ends have been turned back and sutured in position or even buried in the surrounding tissues, they have been so secured in the same intermuscular space which the nerve normally traverses In other words, the bony canals and the intermuscular spaces likewise act as moulds which direct the course of the reparative material from the proximal to the distal end of the severed nerve

In extensive wounds, however, this condition does not obtain Intermuscular spaces are dislocated, large masses of scar tissue are formed, so that, instead of the new nerve-tissue being compelled to grow in only one, and that the right direction, it has too often an inseparable barrier interposed, and union

In the case which I now show you,1 the proxima ends of the ulnar and median nerves were directed at right angles to their intermuscular space, and would have been infallibly fixed between the ends of the torn muscles in a dense mass of scar tissues, resulting in permanent loss of power of the member In the seventh month after suture—1 e, the usual period required for the degeneration and regeneration of a nerve, first sensation and then motion returned, until now, although the functions of the member are not perfect, the boy can earn his living, and do nearly all that can be effected by a normal hand and forearm

Further quotation of my own cases or those of other surgeons seems hardly necessary, and such good results as I here show you have been frequently reported

Finally, how should the sutures be passed and what should their material be?

Fine aseptic catgut passed by means of an ordinary sewing needle is to be preferred, but fine aseptic silk can be used, and I myself have resorted to this in an emergency Should the nerve be very much lacerated and frayed out it may, perhaps, be sometimes proper to cut off a portion to gain a clean surface, but this is rarely desirable The needle should be passed from below upward through the proximal end of the nerve at one border, across, and then passed from above downward near the opposite

resumption of function? While primary union of nerves with immediate resumption of function—1 e, in a week or ten days, is a surgical rarity, jet it does

border, entering the needle from 18 to 14 of an inch on his mirror, or on the wall like a calendar." The from the cut end, according to the size of the nerve The needle must now be passed from below upward through the distal portion of the nerve at the border organism called the comma-bacillus, on account of corresponding to the last passage of the needle its peculiar form in cholera through the proximal end across, and made to pierce human intestine, increase rapidly under favorable the nerve from above downward, when the suture will be found to correspond to the free end of the thread in the proximal piece of nerve

Gentle traction with an appropriate position of the member will, by the tying of one knot, accurately approximate the nerve ends, in a word, by this simplc method all the advantages of the two separate sutures commonly recommended are obtained with a far greater degree of security I need not say that people the strictest asepsis should be secured, which is easy enough provided the wounded part, the surgeon's intestinal affection hands and his instruments be strictly cleansed, and the wound be freely irrigated with the bichloride and trolling the disease after it has broken out, we should If the surgeon gets an untartaric acid solution contaminated wound, it is his own fault if he has suppuration, and even with the ordinary run of accidental wounds, if he will thoroughly scrub his hands with a nail brush and hot water, and likewise so treat the parts surrounding the wound, pour boiling water over his instruments, without any further antisepsis, in most cases healing without suppuration can be secured, while the omission of these details will mar results with gillons of mercuric solution flowing over the wound

MEDICAL PROGRESS.

SUBCUTANFOUS SEPARATION OF TRACHEA FROM LARYNY -At the Versammlung Deutscher Naturforscher und Aerzte last September, Noll, of Hanau, reported the case of a workman who received a severe blow on the front part of the neck from a The skin was not wounded, piece of machinery and only a little blood was coughed up The neck was soon very much swollen, and attacks of suffocation soon came on On making a tracheotomy Noll found that the trachea was separated from the larynx, and very much retracted, and that the cricoid and thyroid cartilages were fractured The trachea was drawn up and sutured to the laryna, and a can-Later it could not nula was placed in the passages be removed because it was held in by a cicatricial The usual methods of dilatation failed, contraction and a laryngo fissure was made, in which a Dupuis's The trachea cannula was worn for nine months The patient is and larynx are now grown together in good condition, but his voice is hoarser than before -Deutsche med Wochenschrift, No 52, 1887

PERSONAL HEALTH-RULES IN TIME OF CHOLERA -SANITATSRATH DR PAUL SACHSE, of Berlin, acting on what he believes to be a well-grounded supposition that cholera is due to the cholera bacillus, has distributed in time of cholera, so that "every one cause catarrh of the stomach and intestines, so also, can carry a copy in his coat-pocket, and hang one over-eating and over-drinking are to be avoided

rules that he advises are as follows

Cholera is caused by infection with the microscopic These get into the circumstances, and cause the peculiar symptoms of This begins always with an apparently cholera harmless diarrhea, which continues for several hours before the disease breaks out with force, and becomes dangerous to life

The possibility of infecting one's self in time of cholera with that bacillus is increased a thousand fold by assemblages and intercommunication of The outbreak of the disease is favorably influenced by everything that causes any stomach or

Since we have no absolutely certain means of conespecially beware of becoming infected, and should take all precautions to kill or at least render as harm less as possible the cholera germ before it gets into our bodies, and by a regular mode of living and prudent deportment avoid anything that can disorder the digestive apparatus

Since the cholera germ gets into the stomach through the mouth, and from the stomach into the

intestines, we should take care

I To take only cooked food and drink This is Even the washing, rinsing, the most important rule and bathing water should be free from germs, and the water from the wells should never be used, but

only that from the city pipes

- 2 To keep the body clean, and especially the hands, by frequent washing, especially before meals, and this should be done with disinfecting solutions, such as a 5 per cent solution of carbolic acid (or a 1/3 per cent solution of sublimate), and of this in time of cholera at least a quart should be used for washing the hands
- 3 To live judiciously and carefully in time of cholera, and

a) Not run away!

- b) Not to harbor people from cholera places
- c) Not to visit a house in which there is cholera
- d) Still less eat or drink anything in such a house
- e) Especially, to take nothing, food, linen, laundry, playthings, or anything else, from house in which there is cholera
- f) To avoid in every way anything that may disturb digestion, therefore

Avoid taking cold, and sudden cooling off after

Do not sit up late at night with friends (drinking being heated

cold beer, for example) Do not wear clothing that is very thin, and do not

take off underclothing suddenly On no account bathe in running water Water

courses often bear the germs of cholera Avoid collections of people, fairs, festivals, etc of

4 All kinds of food are to be avoided that may

Every one should take the greatest precaution with regard to what comes into the house

What may one eat and drink? What is forbidden? What allowed?

FORBIDDEN !!

Unboiled water!

Raw meat

Raw milk and raw cream, and sour milk and whipped cream! Butter and buttermilk! Freshly baked bread! All cold soups

Cold, cut meat that has stood for a long time Salads of every kind

Mayonnaise and crêmes

fruit juices Cheese. Cookies Ice

VITOMED

Boiled water, with cognac, ar rac, or red wine Good soda or seltzer water, and natural mineral waters

Red wine Good lager beer Coffee, tea, and cocoa Baked bread must be heated for at least 1/2 hour in the house before it is used! All hot well cooked soups

All hot (boiled, stewed, roast) All cooked vegetables (potatoes, rice, maccaroni, asparagus, green peas, cauliflower, etc.) Raw fruit and unfermented Freshly cooked, warm com potes, Eggs, and food made of eggs Puddings

GOOD DAILY DIET

Morning 1st Breakfast Coffee, tea or cocoa (with or without well boiled milk) eggs, bread (that has been well heated and dried in an oven or stove for ½ hour [in other words, bread that has been cooked a second time]) without butter

2d Breakfast Boullion with egg, bread as above, warm meat, wine

Noon meal Hot soup, boiled or stewed meat, roast meat, vegetables, fresh cooked compote, red wine or good beer

Tea Coffee or tea

Supper Tea, or soup made from the meat left over from the noon meal, with the morning's bread, or warm meat Wine or beer as above

5 Every irregularity of the body should be most strictly guarded against in time of cholera Apparently slight diarrhoea should not be neglected, but a physician should be consulted immediately

Sachse suggests that in case of threatened invasion of cholera these rules should be printed in the news papers, journals, etc , in addition to being printed on slips for public distribution [The more important parts of these rules should be printed in bold blackfaced type The large foreign element in America would render it necessary that these rules be printed in other languages than English For the German, the rules may be copied verbatim from the original? -Deutsche medicinische Wochenschrift, December 22, 1887

CHOLECISTOTOMI WITH RECOVERI -On February 14, M Polaillon reported to the Academy of Medicine of Paris a case of cholecystotomy by M TERRILLON, that was followed by recovery

The patient was a woman, at 24, who had had no

The skin was tended to below the umbilious normal, the umbilical cicatrix regular, and there was no enlarged subcutaneous veins Palpation showed the tumor to be as large as the head of a fœtus, tense, elongated vertically, smooth, and very It did not appear to follow movable transversely Its extent was easily the respiratory movements Its dulness was coexmade out by percussion tensive with that of the hver In other respects abdominal percussion was normal There was no any kind There was some dyspepsia and emacia-The urine was normal It was evident that the tumor was connected with or adherent to the No exploratory puncture was made, but Terrillon determined to make an exploratory lapor-

Operation on November 23, 1886 A median vertical incision was made, about 4 cm long, and afterwards enlarged to 8 cm When the abdomen was opened the lower border of the liver was easily recognized, since it was lower than normal level of the lower border, and attached to the inferior face, was an elongated tumor, which descended very low, had bluish walls, was very fluctuant, and of a cystic appearance The finger introduced into the wound showed that the tumor was a distended gall-bladder Puncture with a capillary trocar gave issue to a liquid as clear as water, but a little thicker, and the last drops of which were of a milky whitness It was then found that in the gallbladder was a gall stone as large as a cherry bladder was now drawn partly out of the abdominal wound, and then opened Its walls were very Hæmorrhage was guarded against by forceps, and the cavity was explored

The first calculus found was easily extracted, though it was adherent to the bladder by a thin The finger carried into the bladder then found, at the far side, the summit, of the cavity, a second calculus imbedded in the mucous membrane It was so deeply imbedded that, at the distance it was from the opening, it was impossible to detach it

The bladder was then drawn further out, so as to lessen the depth of the cavity, when the stone was removed in fragments by means of forceps

Having resected a portion of the base of the bladder, the operator sutured it to the abdominal wall, making a large biliary fistula in which two large drains were placed, and a dressing then applied

In about a month the fistula was so far closed as to admit only a very small filiform bougie flowed abundantly from this orifice, generally between 9 P M and 2 A M—about four hours after the last meal Two cauterizations with the thermocautery caused the fistula to close completely, two months after the operation Meanwhile the patient had gained flesh, and was completely cured

In commenting upon the case M Polaillon says that, generally, the most favorable incision for cholecystotomy is one following the external border previous liver trouble, until she noticed a tumor in of the rectus muscle But in order to have more the right side On examination M Terrillon made room one must sometimes add to this a more or less out a tumor, below the border of the ribs, that extransverse incision a little below the border of the costal cartilages M Terrillon's incision, however, was for an exploratory laparotomy

Opening of the gall bladder may give rise to hæmorrhage, which must be controlled by hæmostatic forceps, or to extravasation of bile, which must arsenic, copaiba, bromide of potassium, nitro be prevented at all hazards by drawing the bladder muriatic acid, henbane, vegetable infusions, pro out and protecting the peritoneum by aseptic longed counter-irritation, electricity, turpentine, iron, Suture of the abdominal wall completes the operation in cases in which there is no calculus When a biliary fistula is established the more pressing danger is passed, and intraperitoneal rupture of the gall bladder is prevented -Bulletin de l'Academie de Medecine, No 7, 1888

TREATMENT OF MEMBRINOUS ENTERITIS -DR W A LDWARDS, of Philadelphia, in an article on membranous enteritis, says We may consider the treatment under two headings the prophylactic and the active, or that which is appropriate during an interval or remission, and that which will resort to during an exacerbation It is during the remissions or intermissions that we can hope to do more for our patient's permanent good than during an actual attack, it is at this time that diet, regimen, and hygiene are indeed the sheet anchors A careful supervision must be had of the patient's daily life, all sources of irritation are to be removed, as hæmorrhoids or uterine disease Easily digested or even pre-digested food should be supplied, and care should be taken that undigested particles of food are not irritating the intestinal canal As constipation usually exists, sometimes to a most stubborn degree, mild saline laxatives are usually most efficacious, or enemata may be resorted to

Exercise for those who can stand it is of paramount importance, this, if possible, should be out Dr Fowler most aptly says he who stints himself in the drinking of water is dirty inside, and he also tells us that we must drink between seventy and seventy-five ounces of water per day in order to make up for the amount which is excreted by the lungs, skin and kidneys, amounting to ninety ounces a day, with the solid food we get but about fifteen ounces Very few persons at home drink as | Sciences, April, 1888 much as that, but should they go to any of the numerous springs, in which our country is so peculnarly rich, drink five pints of water per day, lead a regular outdoor existence, breathe pure air, as many of our springs are situated in most beautiful mountain regions, where the life spent out of doors is most beneficial, the patient will be improved in health, independently of any mineral agent whatever most satisfactory, but in the others, in spite of re-Unfortunately, however, all of our in the water cases will be unable to avail themselves of a course of treatment at the springs, but as there is no doubt that most of the natural mineral waters preserve their value for a long time, we can put patients through a thorough course at their own homes with the additional advantage of having the case under our own supervision

During the acuteness of an attack opium will often be found necessary to afford relief, and possibly to check excessive secretion or hæmorrhage Belladonna in the form of the extract, Dover's L'Union Medicale, No 33, 1888

powder, subnitrate and subcarbonate of bismuth, together with local counter irritation, all tend to abort the paroxysm, or, at least, to shorten its dura The following remedies have been suggested tion cod-liver oil, oxide or nitrate of silver by mouth or by high injections, chloride of ammonium, sulphate of zinc, bichloride of mercury, chlorate of potassium, oxide of zinc, blisters, warm water enemata, nux vomica, ergot -American Journal of the Medical Sciences, April, 1888

LACTIC ACID IN THE DIARRHŒAS OF CHILDREN -Dr G HAYEV, more than a year ago, called attention to the remarkable utility of lactic acid in the diarrheas of children Recently, in a communica tion to the Academy of Medicine (Revue de Therap, February 15), he has renewed his suggestion, and presented new evidence of the value of the remedy He finds that better results are had from larger doses than he formerly advised In the more severe cases he has administered a 2 per cent solution up to twenty teaspoonfuls in the course of twentyfour hours The formula employed by him is the following

Lactic acid (pure) Syrupi Water

The strength of this is about one minim to the The quantity given will vary with the teaspoonful age of the subject and the nature of the attack Sevestre, one of the physicians to the Children's Hospital, confirms the statements of Hayem regard ing the therapeutic power of the remedy in question, and he also finds that a considerable quantity is re The latest experiquired to effect the best results ence demonstrates that a teaspoonful of the 2 per cent solution should be given every five minutes in the worst cases, and from this up to a teaspoonful an hour, the amount required varies with the condi tions present - American Journal of the Medical

ARTHRECTOMY FOR WHITE SWELLING OF THE KNEE -In the Société de Chirurgie on March 7, M Chauvel reported four cases, operated on by DELORME, of Val-de-Grâce, in a period of five months The patients were cured, two with fistulæ, and two In the latter the result seemed to be completely moval of all fungous synovial tissue and all the liga M Chauvel had ments, the cure was not complete seen one of these cases, and thought that surgeons should be very careful about operating on patients TILLAUX thinks that when more than 40 years old the lesion is limited absolutely to the synovial membrane, arthrectomy is indicated, especially in chil dren, in whom resection is a cause of arrest of [In the opinion of development of the limb many good surgeons, a fistula will not remain if the tuberculous material is completely removed] -

ANATOMICAL SCIENCE IN THE DISTRICT OF COLUMBIA

House Bill No 5040, for the promotion of anatomical science and to prevent the desecration of graves in the District of Columbia, was discussed in the House of Representatives on March 26, and will, we learn, come up for final action on April 9 Bill is not peculiar in any respect, and differs but little from those now in force in most of the States in which there are medical colleges It provides, briefly, that the bodies of such deceased persons as are required to be buried at public expense shall be delivered to the medical colleges of the District of Columbia, under certain conditions, among which are, that the person thus dead has not requested burial, that public notice shall be given of such death for forty eight hours previous to delivery to the colleges, and that the person was not an honorably discharged soldier or sailor or member of the U S expenses of the transfer of the bodies

At first sight one would not suppose that it would be a difficult matter to have such a wise and neces sary bill pass the House of Representatives ten pages of the Congressional Record, of March 27, in which the discussion on the Bill is printed, show that objections can be and are raised where there is really no room for objections these objections more closely

are to be buried at the public expense are those of poor people, and leaves out of sight the fact that it is just as easy for a poor person to request burial as for an unknown millionaire to do so In fact, the clause, "such deceased persons as are required to be buried at the public expense" is a leveling clause, it effec tually and absolutely shuts out any idea of class leg-And more than this, it assumes, what is islation true, that an unclaimed body, and that of a person that has made no request concerning his remains, is in reality the property of the State, and that the State has a right to utilize for the best interests of The State may bury or cremate such a the public body, as it sees fit, or it may hand it over for proper and legal dissection if the public interests are best subserved in that manner Of all bodies, those that "are required to be buried at the public expense" are the ones to be handed over to the dissecting-rooms in the interests of the public and of humanity

The second objection was that the Bill would not prevent grave-robbing Aside from the fact that a punishing clause for grave-robbing was added to the Bill as an amendment, it would be extremely difficult to find such practice in existence when bodies could be obtained more easily, more cheaply, and with no risk to anyone of being shot or otherwise injured while robbing a grave

Third objection "Human dead bodies are sacred, and should not be mutilated except for necessity ' In the sense in which the word is used here, dissection is not mutilation Medical students do not tear the limbs from a dead body from mere wantonness Each student knows that he has to learn the anatomy of the human frame, and that no material must be wasted Such "mutilation" as is done in dissecting rooms is "for necessity," and it may be, when the student shall hold in his hand the very life of a sick or injured human being, for dire necessity of the "sacred rights" of a dead body are violated in a dissecting-room Even when the grave is robbed, Marine Corps, and that the colleges must bear the it is not the rights of the dead, but of the living, that And while it is a well-settled principle are violated that there is no such thing as property in a dead body, civilized Governments recognize that it is a matter of public policy to allow a right in so far that friends or relatives may claim a body and decently dispose of it Mr McAdoo of New Jersey, was the author of this objection, and he also said "Science, But let us notice in a utilitarian age, selects its victims by reason of their poverty This Bill, with a sort of refine-The first objection was that it was legislation ment of cruelty, prescribes that persons dying in the against the poor That is based upon the assump- almshouses or asylums, unless of their own accord tion that all the unclaimed bodies, and all those that they request the privileges of a Christian burial, shall be handed over to the savage, soulless science of the medical schools " Inasmuch as a dead body-after death-can be neither a victim of anything, nor have poverty nor riches, it is somewhat difficult to see the force of these words And under this Bill, science does not select its material by reason of "poverty," but because there are no friends to claim that body, because the owner of the body did not, before dying, request burial, and because it is necessary for the health and life of all the millions of this country, alive and yet to be born, that some such material be at the command of "the savage, soulless science of the medical schools," and from considerations of public policy and public interests, it is better to take the material mentioned in the Bill than any othercertainly better than to have graves robbed of their contents

"Imagine for a moment," says Mr McAdoo, "a poor, homeless, friendless, suffering man, in the very throes of dissolution, his faculties deserting him, the earth and its ties receding, and just as he is about to penetrate the veil of the tremendous future, he is obliged, in order to preserve his body, the temple of his soul, from a dissecting-table, to collect his thoughts and cite to the attendants, if any there be, an act of Congress passed for the District of Columbia asking that his body may not be handed over to the surgeons to be mutilated after death" It is very difficult to imagine any such thing, if we remember that all the man has to do is to say or indicate that He need not spend he wishes his body to be buried a moment's thought on Congress or any of its acts, or on the District of Columbia

The member from New Jersey says further, in reply to a question as to the necessity for subjects for dis-They have dissected so "I do not know many and for such a long time, and there have been made such perfect charts and casts showing the whole science of anatomy, that it would seem scarcely necessary that this process of dissecting bodies should from an unprofessional view I do not continue see the necessity of continuing it further Scıence will find means to disseminate itself " somewhat difficult to regard anatomical science as a kind of ferment or yeast that can enter a given number of medical students and leaven the whole by a process of self-dissemination Science cannot always disseminate itself without material and assistance, and anatomical science is now before the House of Representatives asking for a legal and unobjectionable means of disseminating itself by the passage of In so far as the dissections that have already been made, and the charts and casts can take

the place of dissections, and as regards the doubts of any further necessity for dissections, it may be said that the same argument may be used for the en tire abolition of Congress There are, apparently, laws, acts, and statutes enough to last the country Why not govern the country for several centuries with these for awhile? Why should school children be made to draw maps, seeing that maps and globes are already in existence? The absolute necessity of anatomical study by means of dissections is so ap parent that it would be a waste of time to discuss We sincerely hope, for the sake of his the matter personal comfort, health, limbs and life, that Mr McAdoo may never fall into the hands of a doctor who has learned his anatomy from charts and casts

"The Bill throws the burden of Fifth objection securing his body from dissection upon the person about to die " After the person is dead what differ ence can it make to him that his body is in a dissect The Bill, and the general custom of ing-room? handing dead bodies over to relatives and friends, are for the benefit of the living, not of the dead It makes no difference to a dead man what becomes of his body, and if he have no friends no one's feelings and sentiments are hurt if the body be sent to a dis Such a bill as the one under consid secting-room eration is an act for the benefit of the living in two It gives assurance to people that the graves of their dead friends and relatives are not violated, and it provides for the living that come under the care of the doctor by giving the medical students the means of learning by actual dissection the structure Such knowlenge cannot be of the human body learned in a practical way, nor for practical purposes, If it could it may be said from any charts or casts to be a matter of certainty that dissection, which is not a pleasant duty, would not be practiced

Sixth objection "Why should this American Con gress suspend the consideration of more important measures and come to a dead stop in order to enact a law of this character?" For the simple reasons that the District of Columbia is under the direct con trol of the American Congress, and that such an act is a necessity for the inhabitants of the District, as To enter one of well as for the medical colleges the medical services of the United States the candi date must pass an examination in practical anatomy In refusing to pass this Bill, therefore, Congress will simply legislate against all students of medicine in the District of Columbia, unless they are allowed to continue to receive their dissecting [material from It would be another case of "bricks The civilized Governments of the grave-robbers without straw"

whole world have long ago recognized the necessity for furnishing dissecting material to medical students. Let us at least keep abreast of the march of civilization. The laws punish a doctor for any mishap arising from his negligence or ignorance, if suit be brought. And the laws should remove all obstructions in the way of the medical student's obtaining a proper and scientific knowledge of his profession. The medical profession of this country, and of the whole world, is a unit in believing that such bills as the one before the House are a necessity.

INVERSION IN SUSPENDED ANIMATION FROM ANÆSTHETICS

In a paper entitled "A very Valuable Lesson for those who use Anæsthetics," read before the Baltimore Academy of Medicine on December 6, 1887, Dr Julian J Chisolm makes a strong argument in favor of treating suspended animation from anæs thesia by suspending the patient with the head downward, and relates several cases that recovered in his own practice under this treatment case particularly, that of a child 3 years of age, upon whom Dr Chisolm was operating for cancer of the left eye, the value of the practice was fully shown, three or four times anæsthesia had to be stopped while the child was held head downwards to ream mate it, and the operation was finally finished with the child suspended in this position so that it might be brought fully under the influence of chloroform without danger In all, the child was suspended in the inverted position for about three-quarters of an hour

Dr Chisolm has used chloroform in about 10,000 cases, and without a death He has had some cases similar to the one mentioned, but they have been revived by inversion He never uses ether, or has not used it once in the last ten years In the administration of chloroform he has certain rules "All clothing must be loose around the neck adults an ounce of whisky is given in advance, but in cases of persons under 30 years of age this cardiac stimulant is omitted, unless the patient be Chloroform is administered with the patient lying on his back, and as soon as narcosis is induced the pillow is taken from under his head, so that he hes in an absolutely horizontal position snoring occur, indicating some difficulty in pharyngeal breathing, the chin is drawn forcibly upward This elevation pulls the anterior wall of the pharyna, with the hyoid bone and the root of the tongue, for-

from the nose into the lungs By this movement of the chin respiration becomes immediately quiet and The pulling of the chin is a much more efficient and convenient means of pulling the root of the tongue forward than by pulling out the tongue with a dressing forceps. It is not always easy at this stage of anæsthesia to get into the mouth, as the lower jaw muscles may not be relaxed tongue forceps is not often at hand, and to tear the tongue substance with sharp-toothed and yet slipping instruments, with the soreness and swelling which subsequently follow, is an abominable practice that The patient's chin and your should be abolished own hands are always present, and it only needs knowledge of the method to apply it, and to secure prompt and speedy relief "

The only inhaler that Dr Chisolm uses is a towel folded in cone form, with the apex of the cone open, so as to permit air to mingle with the chloroform The surgeon watches the face for signs of vapor approaching complication "If the ears remain pink, the heart and lungs must work properly, therefore, there is no need for feeling the pulse Any failure on the part of either of these organs can be seen in the change of the complexion more quickly than it can be felt at the wrist" Of course one point of great safety in ophthalmo-surgical work is the fact, that when anæsthesia is complete the administrator must stop, and get out of the way of the operator, hence, the administration of the anæsthetic cannot be injuriously continued Dr Chisolm has operated for cataract 1,500 times It is wellknown that cataract patients are usually old, and that most frequently they are subjects of decided semile changes, the average age of cataract patients would probably be about 60 years Before cocaine came into use Dr Chisolm gave chloroform in all cataract cases, and must have given it to a large number of patients with fatty hearts When a patient has very feeble heart-pulsation, with irregularity, he increases the amount of whisky administered in advance of chloroform inhalation "I consider it much the safer practice to put whisky into the stomach, where it is ready for use if wanted, and where it can do no harm if it is not needed." In a word, in regard to the selection of cases for anæsthesia, he says "No pathological lesion in any other parts of the body deters me from the use of chloroform should an eye-operation be required "

This elevation pulls the anterior wall of the pharynx, with the hyoid bone and the root of the tongue, forward, making for the air a clear and straight passage have been resuscitated had the surgeon immediately

hung the mammate body up by the feet, instead of "wasting time in applying hypodermic injections, cold-water splashings, spanking, fanning, electricity, or even attempts at artificial respiration or all of these things if you will, but hang up the patient first, and that instantly, as soon as the heart and lungs fail It is the horizontal position that is fatal in chloroform poisoning, and leads to death if the body is kept in it, as all the reports of fatal cases with chloroform show" What Dr Chisolm says agrees perfectly with the results of Nélaton's experiments with chloroformed rats those that, after thorough narcotization, were hung up by the tails would slowly revive, while those left lying on the If, after being hung up, the rat was placed on the table to soon, breathing would again cease, and the rat would die unless suspended again When the rat was not already dead suspension was the only thing that would restore it to life

AN INTLRNATIONAL DENTAL CONGRESS

The Dental Review, of March 15, 1888, in advocating the holding of "An International Dental Congress at Paris, France, in September, 1889," disclaims any intention of interfering with a Section of Dental and Oral Surgery in connection with the Tenth International Medical Congress to be held in Notwithstanding this disclaimer, it is Berlin, 1800 difficult to see how the editor of the Review could more directly and certainly interfere with the organization of an efficient and successful Dental Section of the International Medical Congress in Berlin, than by persisting in his scheme of forestalling it, by a separate International Dental Congress the year The full recognition of properly preceding in Paris educated Dentists by the successful organization of a Section of Dental and Oral Surgery, as a part of the great International Medical Congress at London, in 1881, and its repetition with still greater success as a part of the International Medical Congress at Washington, in 1887, leaves no room for doubt about the purpose of organizing a similar Section in the next Congress at Berlin, and of its permanent recognition as a legitimate department of the great Then why should field of medicine and surgery not every enlightened member of the profession use his influence for perfecting the unity of all the departments, and the promotion of such harmony in the organization as will afford mutual support and There is no interest, social, scientific or practical, to be promoted by an exclu- regular meeting, says the Medical Record, voted

sive International Dental Congress in Paris next year, that could not be more efficiently promoted by a Section of the International Medical Congress the following year at Berlin The published pro ceedings of a Congress of Dentists will reach but few outside of its own members, while the work of a Section becomes a part of the published transac tions of the general Congress, and thus receives a wide distribution to members of all other Sections, and vice versa, the work of all other Sections be comes the property of the members of the Dental So true it is, that cooperation and union imparts strength and diffuses knowledge, while seg gregation and exclusiveness limits both

MEMBERSHIP IN THE ASSOCIATION

As this number of The Journal will be placed in the hands of a large number of medical men that are not members of the American Medical Association, we wish to call attention to the way in which mem bership can be gained

State and County Societies can send a certain number of delegates to each meeting, who thus be come members, and retain permanent membership thereafter so long as their annual dues are paid

Membership can also be obtained by procuring of the Secretary and President of such Societies a cer tificate of membership in good standing tificate, together with the annual dues of five dollars, must be sent to the Treasurer of the Association A permanent membership can be gained in this way at There is no limit to the number of such certificates that the officers of a Society may issue to its members Membership, however gained, entitles one to this weekly journal without extra charge In it are published all the proceedings of the meetings of the Association, all the papers read before its Sections, as well as a very large number of papers from other sources, and editorials, proceedings of the leading societies of this country, foreign and domestic correspondence, book notices, and miscellaneous news

Those desiring to subscribe for The Journal, but who do not wish to become members of the Associa tion, can do so by forwarding to the editor the price of subscription, five dollars

FOREIGN SURGICAL INSTRUMENTS

The New York Neurological Society, at its last

unanimously not to indorse the resolutions of the Georgia State Medical Society, asking for the removal of all duties from surgical instruments and The ground was taken that the charges supplies made against native instrument makers were too in-Surgeons were better temperate and sweeping served by having their instrument-makers at hand rather than in Europe

On the other hand the Medical Society of the County of New York, at the meeting of January 24. Resolved That the Medical Society of the County of New York urge upon Congress that in the cause of humanity the import duty should be removed from all medicines, medical and surgical ap pliances, and every thing used in the treatment and diagnosis of disease

So long as the fact remains that foreign surgical instruments and appliances, at the same price, are far better than those made in this country, it is difficult to see what the character of American instrument makers has to do with the case And while it may be more convenient to have an instrumentmaker just around the corner than in Europe, if we can get the better instrument of foreign make, at a lower price than now, from the shop around the corner. are we not better served? And if this will induce our own makers to make better instruments at a lower price, do we not obtain "the greatest good for the greatest number?"

SURGEON-GENERAL OF U S NAVY —The regular term of service of Dr F M Gunnell as Surgeon-General of the Navy expired on the 26th of March, 1888, and Dr. John M. Browne has been nominated as his successor by the President Dr Gunnell hav ing arrived at the age of 62, and rendered faithful service over 40 years, is entitled to retire with the relative rank of Commodore Dr Brown, who succeeds him, entered the medical corps of the Navy in 1853, and was commissioned as Medical Director in 1878 He is eminently qualified for the important position to which he has been promoted

WILLIAM BENJAMIN GOLDSMITH, Superintendent of the Butler Hospital for the Insane, at Providence, R I, died on March 21 of acute pneumonia, aged He was graduated from the College of Physicians and Surgeons of New York in 1877, and Bloomingdale Asylum

In 1886 he was Insane Asylum at Danvers, Mass He was a most earncalled to the Butler Hospital est, useful, and promising member of the profession.

THE CINCINNATI MEETING OF THE ASSOCIATION. As will be seen from the programme published in this number of THE JOURNAL, the officers of the Association have been diligently performing their The Committee of Arrangements also are to be commended for the zeal they have shown in en deavoring to provide pleasant and convenient accommodations for the meeting of the general sessions of the Association and of its Sections They have also in store a most pleasant social programme, the details of which are not vet officially announced Together with the programme, we publish to-day the arrangements with the railroads for reduced rates, and a list of hotels in Cincinnati, and other information that will be of interest to those about to attend the meet-A very large attendance has been prophesied, and the excellent programme that is offered cannot fail to attract many new members At the last meeting 1,300 were present, we hope this year the number will be increased by at least one-third

CHANGES IN THE FACULTY OF THE MEDICAL DE-PARTMENT OF GEORGETOWN UNIVERSITY -DR JO-SEPH TABER JOHNSON, who has heretofore held the position of Professor of Obstetrics and Gynecology in the Medical Department of Georgetown University, having resigned the Professorship of Obstetrics. the chair has been divided into two separate professorships, Dr Johnson retaining that of Gynecology, while Dr P J Murphy has been appointed Professor of Obstetrics

MEDICAL COLLEGE APPOINTMENTS - Nicholas Senn, M D, of Milwaukee, Wis, has been appointed Professor of the Principles of Surgery and Surgical Pathology, in the Rush Medical College, Frank T Andrews, MD, has been appointed Professor of Histology in the Chicago Medical College, and Henry F Lyster, MD, of Detroit, has recently been appointed to the Chair of Practical Medicine in the University of Michigan made vacant by the death of Professor A B Palmer

THE TEXAS STATE MEDICAL ASSOCIATION WILL soon afterwards became second assistant in the hold its next annual meeting in Galveston, from the After a period of study 24th to the 27th of April, 1888 A full and profitable abroad he was made first assistant, and in 1881, when meeting is expected J F Y Paine, M D, Galves-28 years old, he was made Superintendent of the ton, is Chairman of the Committee of Arrangements

ASSOCIATION ITEMS.

LIST OF OFFICERS AND PROGRAMME

Of the Thirty-Ninth Annual Meeting, to be held in Cincinnati, May 8, 9, 10, and 11

GINIRAI OILICIRS

President —A Y P Garnett, Washington, D C Vice-Presidents -Duncan Lve, Nashville, Tenn, Darwin Colvin, Clyde, N Y, C J O'Hagan, Greenville, N C, A Stidman, Denver, Col

Treasurer -Richard J Dunglison, Philadelphia,

Permanent Secretary -W B Atkinson, Philadelphia, Pa

Assistant Secretary, Joseph Ransohoff, Cincin-

Librarian -C H A Kleinschmidt, Washington, D C

Chairman of Committee of Arrangements -W W Dawson, Cincinnati, Ohio

Sub-Committees of Arrangements

Section-Work, J T Whittaker, Chairman

2 Halls and Decoration, B Stanton, Chairman 3 Entertainments, N P Dandridge, Chairman

4 Exhibits, J C Culbertson, Chairman

5 Programme, J Ransohoff, Chairman 6 Reception, J T Whittaker, Chairman

Finance, S C Ayres, Chairman

8 Registration, Jas M French, Chairman

9 Printing and Invitations, J C Culbertson, Chairman

10 Transportation and Hotel, Geo Purviance, Chairman

PROGRAMME OF GENERAL SESSIONS

The General Meetings will be held in the Cincinnati Music Hall and the Sectional Meetings in adjoining rooms in the same building

FIRST DAY, MAY 8, 11 A M

Meeting called to order by Dr W W Dawson, Chairman of the Committee of Arrangements,

Prayer

Address of Welcome

Announcement of Programme of entire Session Annual Address by President A Y P Garnett, of Washington

Call for volunteer papers and their appropriate

reference

New and miscellaneous business

Notification for the appointment of the Nominating Committee

SECOND DAY, MAY 9, 10 AM

Report of Committee of Arrangements Address on General Medicine, by Professor Roberts Bartholow, of Philadelphia

Annual Report of the Board of Trustees, by J

M_Toner, M D, Chairman

Report of Special Committee on Dietetics

Consideration of proposed amendments to the Constitution

Announcement of Nominating Committee

THIRD DAY, MAY 10, 10 AM

Report of Committee of Arrangements

Address on General Surgery, by E M Moore, M D, of Rochester

Report of Committee on Rush Monument, by A

L Gihon, M D, Chairman

Report of Treasurer, R J Dunglison, M D Report of Librarian, C H A Kleinschmidt, M D Report of Committee on Necrology, by J M

Toner, M D, Chairman

FOURTH DAY, MAY 11, 10 AM

Report of Committee of Arrangements Address on State Medicine, by H P Walcott,

M D, of Boston

Final Report of Nominating Committee

Report of Standing Committee on Meteorological Conditions, by N S Davis, M D, Chairman

Report of Special Committee on Criminality, of Fœticide and Measures for its Prevention

Report of Special Committee on Duties com

monly exercised by Coroners Reports of Secretaries of Sections

New and miscellaneous business

PROGRAMME OF SECTIONS

Section of Practical Medicine, Materia Medica and Physiology

Chairman, -

Secretary-N S Davis, Jr, Chicago FIRST DAY, MAY 8

1 Topic-Pneumonia, Etiology, Pathology and Treatment

a "The Mechanism of Pneumonia and its Treatment," by C W VanBibber, Baltimore

b Henry Hartshorne, Philadelphia

c James L Whittaker, Cincinnati d N S Davis, Chicago

General Discussion

2 "Treatment of Empyema," by Wm C Dabney,

University of Virginia "On the Hippocratic Operation for Empyema,

with Illustrative Cases," by Frank Woodbury, Phil adelphia

General Discussion

4 E O Shakespeare

SECOND DAY, MAY 9

TOPIC-Diagnosis and Treatment of Diseases

a "Some Practical Remarks on Diagnosis of Dis of the Stomach eases of the Stomach," by Dr Wm Pepper, Phila delphia

b F C Shattuck, Boston

c J Adams Allen, Chicago General Discussion

2 "Observations upon Nutrition," (with Especial

¹ The late Dr A B Palmer was Chairman elect of this Section

Reference to Origin of Fat, Urea and Animal Heat,) by Henry C Chapman, Philadelphia

3 "Septic Dysentery," by Bedford Brown, Alexandria, Va

4 "Food in Nervous Affections," by Ephraim

Cutter, New York 5 Morton Prince, Boston

THIRD DAY, MAY 10

1 "Albuminuria and its Relation to Life Insurance," by James Tyson, Philadelphia

2 C W Purdy, Chicago

3 "Evolution of the Cystic Kidney," by I N

Danforth, Chicago

4 a "The Differential Diagnosis between Central Nervous and Peripheral Nervous Affections" b "The Iodoform Cap in Tubercular Meningitis," by E C Spitzka, New York

5 "Cerebro-Spinal Meningitis," by J McFadden

Gaston, Atlanta, Ga

FOURTH DAY, MAY 11

1 "Relation of the Solar Plexus to Certain Obscure Forms of Disease," by J Adams Allen, Chicago

2 "Sympathetic Nervous System in Disease," by

John North, Keokuk, Iowa

"Abortive Treatment of Typhoid Fever," by

L D Woodbridge, Williamstown, Mass

4 "Clinical Experience with so called Typho-Malarial Fever," by J B Marvin, Louisville, Ky

5 H N Moyer, Chicago

"A Second Paper on Naphthol," by J V Shoemaker, Philadelphia

Section on Obstetrics and Diseases of Women

Chairman—Ely Van de Warker, Syracuse, N Y Secretary-E W Cushing, Boston, Mass The Address of the Chairman, "How Gynecology

15 Taught," by Ely Van de Warker, Syracuse, N Y "Separation of the Symphysis Pubis in Labor, and its Treatment," by R B Bontecou, Troy, N Y

"A Plea for Early Operative Interference in Cases of Obscure Pelvic Pain, and Recurrent Attacks of Pelvic Inflammation in Women," by Rufus B Hall, Cincinnati, O

"Exploratory Laparotomy," by Henry O Marcy,

Boston, Mass

"The Management of Extra-Uterine Pregnancy,"

by A M Johnson, Danville, Ky

"Observations on the Technique of Vaginal Hysterectomy, with Report of Cases," by Chas A L Reed, Cincinnati, O

Section on Surgery and Anatomy

Chairman-Donald McLean, Detroit, Mich Secretary-B A Watson, Jersey City, N J

Address by the Chairman, "Some Thoughts on Retrospective and Prospective Surgery," Donald McLean, Detroit, Mich

"The Appendix Vermiformis, its Functions, Pa thological Changes, and Treatment," by Henry Hollingsworth Smith, Philadelphia, and

J Ransohoff, Cincinnati, O, J McI Gaston, At-

Innta, Ga

Discussion

T G Morton, Philadelphia, H C Chapman, Philadelphia, Elisha H Gregory, St Louis, Mo, Reed Brockway Bontecou, Troy, N Y

"Intestinal Obstruction in its Surgical Aspects,"

Chas Bingham Penrose, Philadelphia, and

R Harvey Reed, Mansfield, O

"Rectal Insufflation with Hydrogen Gas as an Infallible Diagnostic Measure in ascertaining the existence of Visceral Injury of the Gastro-Intestinal Canal in Penetrating Wounds of the Abdomen Illustrated by Three Experiments," by N Senn, Milwaukee, Wis

"The Surgical Advantages of the Buried Animal Suture and its Adaptability to Special Purposes," by

Henry O Marcy, Boston

"A New Method of Excision of the Intestine," by Henry H Mudd, St Louis

Discussion

Hunter McGuire, Richmond, Va, PS Connor, Cincinnati, O, S H Weeks, Portland, Me

"Electrolysis as a Prime Agent in the Removal of Nasal and Pharyngeal Neoplasms," by D S Campbell, Detroit, Mich

"An Antiseptic Surgical Cabinet" by H Landis

Getz, Marshalltown, Iowa

Section on State Medicine

Chairman—H B Baker, Lansing, Mich Secretary-S T Armstrong, New York Address by the Chairman, H B Baker

"The Causation of the Essential Fevers," by Vic-

tor C Vaughan, Ann Arbor, Mich

"The Internal Origin of Fevers," by J A Larrabee, Louisville, Ky

"Atmospheric Temperature and Intermittent Fever," by Henry B Baker, Lansing, Mich J N McCormack, Bowling Green, Ky

"Report of Committee on Form of Law for Regulation of Practice of Medicine," by Perry H Millard, Cnairman

A paper by E O Shakespeare, Philadelphia

"Recent Discoveries and Researches with Regard to a Common Cause of certain Infectious Diseases," by C W Chancellor, Baltimore, Md

"Should the National Government Defend our Ports Against the Invasion of the National Enemy, Contagious Disease?" by Benjamin Lee, Philadelphia, Pa.

"House Drainage," by Joseph F Edwards, Philadelphia, Pa

"Cremation of Garbage," by J Berrien Lindsley, Nashville, Tenn

"Eastern Carolina as a Residence for Tuberculous Patients," by J M Baker, Tarboro, N C

"Personal Prophylaxis Against Malarial Disease,"

by Geo H Rohe, Baltimore, Md "Hygnene of Infancy and Childhood," by F B Greenley, West Point, Ky

Section on Ophthalmology, Otology and Laryngology

Chairman-F C Hotz, Chicago, Ill Secretary -- Edward Jackson, Philadelphia, Pa

FIRST DAY

Address by the Chairman, F C Hotz

"Mel motic Disease of the Conjunctiva and Episcleral tissue, with Five Illustrations," by Rob Sattler, of Cincinnati

"Ocular Troubles Influenced by Nasal Diseases,"

by I H Taylor, of Wilkesbarre, Pa

"Binocular Astigmatism," by II Culbertson, of

Zanesville, Ohio

"The 14 Dioptric Cylinder Lens the Most Useful of the 11st of Cylinders," by J J Chisolm, of Bal-

"The Treatment of Strabismus due to Paralysis or Extreme Over correction with Loss of Motion," by 1 le Prince, Jacksonville, Ill

"The Size and Illumination of Test-type," by E

Jackson, Philadelphia

SECOND DAY

"Some Practical Suggestions Regarding Certain Anomalies of the Ocular Muscles," by George T Stevens, of New York

"Gummata of the Ciliary Region," by S C Ayres,

of Cincinnati

"On Nutrition, or the Constitutional Treatment of Diseases of the Ear," by Laurence Turnbull, of Philadelphia

"Some Remarks on Diseases of the Labyrinth,"

by Francis Dowling, of Cincinnati

"The Bougie in Catarrhal Inflammations of the Middle Ear," by W Cheatham, of Louisville

THIRD DAY

"Reflex Nasal Cough, with Report of Cases," by Max Thorner, of Cincinnati

"Reflex Phenomena in Childhood caused by Rhi-

nitis," by J A Stucky, of Lexington

"Naso-Pharyngeal Fibromata," by E F Ingals, of Chicago

"An Interesting case of Fibroma of the Larynx,"

by Jos Eichberg, of Cincinnati

"Tubercular Laryngitis," by W E Welsh, of Marshall, Chicago

Grand Rapids, Mich

"Illustrative Points in the Examination of the Nose and Throat," by Carl von Klein, of Dayton, O

FOURTH DAY

"Tobacco Amblyopia," by A R Baker, of Cleve-

"The Advantages of Leaving One Eye Open durland, O ing the After-treatment of Cataract Cases," by J J Chisolm, of Baltimore

"Staphyloma of the Region of the Macula," by

E Jackson, of Philadelphia
"A Plea for the Better Recognition of the Oculist in the Service of the U S Pension Department," by J W Wright, of Columbus

Exhibition of instruments and apparatus

Section on Diseases of Children

Chairman-F E Waxham, Chicago Secretary—W B Lawrence, Batesville, Ark 1 Foods for Prematurely Born Children, 2 Mixed Diet, 3 Artificial Foods, 4 Feeding in Acute Disease," by C W Earle, Chicago "Infant Feeding Discussion opened by Wm H Parrish, Philadel- Richard Gundry, Baltimore

phia, M P Hatfield, Chicago, J Lewis Smith, New York, Wm Perry Watson, Jersey City, J T Whittaker, Cincinnati, J. H. Ripley, New York, I. N. Love, St. Louis, G. Wheeler Jones, Danville, J. A. Larrabee, Louisville

"Treatment of Pseudo-Membranous Laryngitis" Discussion opened by J Lewis Smith, New York, Fordyce Barker, New York, C W Earle, Chicago,

Wm Pepper, Philadelphia

"Tracheotomy in Pseudo-Membranous Laryngi

Discussion opened by C G Jennings, Detroit, Chas T Parkes, Chicago, I H Hance, New York, J M Keating, Philadelphia, W E Casselberry, Chicago, J H Ripley, New York

"Report on Intubation in Pseudo Membranous Laryngitis," by J O'Dwyer, New York, or F E

Waxham, Chicago

Discussion opened by E F Ingalls, Chicago, M J Stern, Philadelphia, L H Dunning, South Bend, E Denhardt, New York

"The Surgical Treatment of Empyæma," by D

A K Steele, Chicago

"Hepatic Incompetence in Children," by M P

Hatfield, Chicago

"Chorea," by Geo Wheeler Jones, Danville, Ill "Antifebrin as an Antipyretic in the Treatment of Febrile Diseases of Children, with a Report of Fifty Cases," by F J Parkhurst, Danvers, Ill

"Some Points Concerning the Etiology and Treatment of Fevers of Childhood," by J A Larrabee,

Louisville, Ky

Section on Dental and Oral Surgery

Chairman-J Taft, Cincinnati Secretary-E S Talbot, Chicago Address of Chairman, J Taft

"Fracture of the Superior Maxilla and Upper Bones of the Face, Treatment by the Aid of the Inter-dental Splint, with two Illustrations," by John

"Etiology of Irregularities of the Teeth," "Development of the Superior Maxilla in the Idiot, Deaf and Dumb, and Blind and Insane," by Eugene S Talbot, Chicago

"Treatment of Irregularities of the Teeth," by

Geo W Keely, Oxford, Ohio

"Dentogeny," by W C Brittan, Detroit, Mich Discussion of this paper will be opened by M H Fletcher, Cincinnati

"Heredity in its Relation to the Teeth," by A O

Rawls, Lexington, Ky

A E Baldwin, Chicago, Ill

Section on Medical Jurisprudence

Chairman—E M Reid, Baltimore, Md Secretary—C B Bell, Suffolk, Iowa Address by the Chairman of the Section, E M

"Paralytic States, their Relation to Testamentary Reid, Baltimore

Capacity," by E C Spitzka, New York

"Medical Jurisprudence in Relation to Wills," by

"Expert Testimony in Medical Jurisprudence," by

Orpheus Everts, College Hill, O

"Fœticide, its Increase, and Inadequacy of Law for its Prevention and Punishment "by H C Mark-| Seventh streets ham, Independence, Ia

"Some Phases of the Civil Law in relation to the Development of Man," by J W C Cuddy, Balti-

"Some Points in the Medical Jurisprudence of In-

sanity," by E N Brush, Philadelphia

"The Medico legal Relation of the Inebriate to Society," by I N Quimby, Jersey City, N J

"The Influence of Experimental Science upon

Law," by Clark Gapen, Chicago

"The Relation of Meconeuropathia, Opium Toxæmia and the Opium Psycho-Neurosis to Law," by C H Hughes, St Louis

"The Medico-legal Relations of Hysteria," by D

R Brower, Clucago

"Alcoholic Trance, its Medico legal Relations," by T D Crothers, Hartford, Conn

Section of Dermatology and Syphilography

Chairman-L D Bulkley, New York Secretary-F Dunlap, Danville, Ky Address of Chairman, L D Bulkley "The Use of Arsenic in Dermatology," by B M Ricketts

Those desirous of reading papers in any of the Sections should at once send the title of their paper to W W Dawson, M D, Cincinnati, and to the Chairman of the Section in which they wish to read it

RAILROAD ARRANGEMENTS

The Committee on Railroads have secured a reduction on the certificate plan from all railroads en tering the city of Cincinnati The rate will be full fare coming to the meeting of the American Medical Association and one-third fare returning Physicians will please ask for a blank certificate at the railroad office at the time they purchase their tickets, which cer tificate will entitle the holder thereof to a one-third rate returning Drs Geo Purviance and William Judkins are the local subcommittee in charge of railroad and hotel accommodations

HOTELS OF CINCINNATI

Fifth, \$3 to \$5 per day

Burnet House, Vine and Third Sts, \$3 to \$5 per

Grand Hotel, Fourth St and Central Ave, \$3 to \$5 per day

\$1 50 to \$4 per day European plan

Palace Hotel, Sixth and Vine Sts, \$2 and \$2 50

Hotel Emery, Vine St between Fourth and Fifth, rooms \$1 to \$2 50 per day European plan

St Jumes Hotel, Fourth St near Main, \$2 to \$2 50 per day

Dennison House, Main and Fifth streets \$2 and

Walnut Street House, Walnut between Sixth and \$2 and \$2 50 per day

Saint Clair Hotel, Sixth and Mound streets \$3 50 to \$5 00 per day

Hunt Hotel, Vine between Fourth and Fifth streets \$1 75 per day

Crawford House, Sixth and Walnut streets \$1.50

to \$2 oo per day

Geneva Hotel, Sixth and Race streets \$1 25 to Rooms, European plan, 50 cts to \$1 50 per day \$1 00 per day

Galt House, Sixth and Union streets \$1 50 per

The following boarding houses may be mentioned Mrs S G Morris, Seventh and Plum streets \$2 and 2 50 per day

Mrs Rathburn, 119 Broadway \$2 and \$2 50 per day

Mrs W P Knight, 105 Broadway \$1.50 and \$2 50 per day

Mrs Saffern, 88 East Fourth street \$1 50 and \$2 50 per day

Mrs Fennell, 102 West seventh street \$1 50 per day

OBJECTS OF INTEREST IN CINCINNATI

Admission to the following places of interest by simply showing membership cards can be had by members and their wives

The Art Museum in Eden Park Reached by Highland House cars at Fifth and Walnut streets Its attractions vie with the best collections even of the old world, and hours can be profitably spent in its inspection

The Museum of Natural History on Broadway

near Third is also well worthy of a visit

The Zoological Gardens, located in the North part of the city, and covering over sixty acres of beautiful park, is reached by the Cincinnati Northern R R, depot at Court and Broadway, or by the Vine street line of cable cars These gardens, we are proud to say, have the finest collection of animals and birds in this country The pair of giraffes owned by the garden, and the polar and grizzly bears are said to be the finest specimens of these animals m captivity The collection of birds of plumage and carnivorous animals is very large and fine A day Gibson House, Walnut St between Fourth and can be profitably spent in the gardens by delegates and their wives

The Rookwood Pottery, located at 207 Eastern Avenue, is reached by the Elm street line of street The Rookwood was established through the cars The St Nicholas, Fourth and Race Sts, rooms for the manufacture of the finest grades of pottery ware, and especially to cultivate a growing taste for the beautiful in art as illustrated in home adorn-As this industry has been entirely conducted ment by ladies, it will be of special interest to the wives of delegates

The Cuvier Club Rooms, on Longworth near Race, contains a museum of prepared specimens of

fish, birds, and all kinds of game that are well worth visiting

The gymnasium, at corner of Longworth and

Vine streets, is a complete institution

The Public Library and Reading Room, on Vine between Sixth and Seventh, and the Mercantile Library, on Walnut street between Fourth and Fifth, are worthy of a visit and will furnish delegates an opportunity to see the newspapers of their own locality

The Highland House, with its incline plane railroad, affords one of the finest views of the beautiful river and its spans of bridges that it is possible to

obtun

The Cincinnati Hospital, on Twelfth and Central A) enue

St Mary's Hospital, on Betts and Linn The Good Samaritan Hospital, on Lock street The United States Marine Hospital, on East I hard street

The Children's Hospital, on Mount Auburn Longview Insane Asylum, at Carthage on C H

The Ohio River Bridges and the Centennial Expo sition Buildings

SOCIETY PROCEEDINGS.

CINCINNATI ACADEMY OF MEDICINE

Stated Meeting, January 30, 1888 DR GUSTAN ZINKL reported a case of

CASAREAN OPERATION, WITH A DESCRIPTION OF THE SANGER OPERATION

(See p 413) DR C D PALMER said that, having been present at the autopsy, he could testify to the accuracy of the pelvic measurements as reported The pelvis, if classified, might be called a justo-minor, except that the antero posterior diameter of the brim was contracted out of all proportion to the remaining diam-The contraction at the brim was about 2 inches for the conjugate, and I to I 1/4 inches for the oblique diameters In the treatment of pelvic deformities we have at our disposal five different, distinct methods of delivery, viz the induction of premature delivery, the forceps, version, cramotomy, or its improved modification, and Cæsarean section or some of its modifications While these come in conflict in some cases, to a large extent each has a spe-Although the question of cial field of application the induction of premature labor has no direct bearing on this case, at the same time it may be interesting to inquire whether this poor woman could have been delivered of a living child if the condition of her pelvis had been known early enough in pregnancy, or whether, if she had recovered and again become pregnant, could she be delivered per vias of both mother and child, from the 32d to the 36th of election, while craniotomy is the operation of

week of utero-gestation—the earlier the better for the mother, the later the better for the child, cate is paribus Delivery has been induced as early as the 7th lunar month with a living child, with a pelvis as small as 2½ inches conjugate But when we recall that this pelvis was not only so small in the conju gate, but much contracted in all other diameters, it implies that delivery would have to be induced nec essarily earlier than the 7th lunar month, and com pleted, it is not improbable, by the forceps or version, with some delay, and at a time when the child was very young and feeble, it seems merely possible that it could have been born alive, or if alive, for it to live on account of prematurity It is safe to say that the induction of premature labor with a live child in this case was impracticable If this woman had survived and become pregnant again, one of two things would have had to be done the induction of an abortion very early in pregnancy or, better still, the allowing of the pregnancy to go on until term, and then, at a favorable time in labor, to perform abdominal uterine section

This was no case for the forceps, for the range of this instrument is for pelves of from 4 to 31/2 or 31/4 inches conjugate He would not wish to condemn the practice of the gentlemen who used the forceps in this case, hoping thereby they might effect deliv Under the circumstances, a non-acquaintance with the exact pelvic dimensions to be encountered, a lack of knowledge only to be supplied by the ex perience then obtained, almost any obstetrician would have applied the forceps at first, to test what they could do Their application could do no harm, if their use was not unduly and forcibly persisted in Nor was this a case for podalic version of application of version is in pelves with conjugates from 3½ or 3¼ inches to 2¾ inches Version is done with the expectation of delivering a live child, and offers in proper cases a most useful means to improve upon nature's mechanism in head cases, as well as the utilization of additional forces to aid the The conjugate diameter of expulsion of the child the brim is more frequently and decidedly contracted in pelvic deformities than any other Therefore, its measurement has served as the chief guide—the key to the lock of the pelvis A conjugate ranging from 23/4 to 13/4 in is the field of utility of craniotomy and The conjugate of the pelvis under discussion was 21/2 inches, and within this Cæsarean section Manifestly, then, one or the other of these two methods was to be considered A live child at term could not have been delivered per vias natu rales, and if the child was to be saved, Cesarean section offered the only means As a general rule, we say that if the child is dead, with these pelvic measurements craniotomy is the proper resort, and But no absolute or in if alive, Cæsarean section There are excep flexible rule can be laid down Craniotomy under certain circum stances may be best even although the child is alive, and Cæsarean section is to be preferred with a dead child if the pelvic contraction is very great great extent, Cæsarean section is the operation necessity In all cases we are to look first to the mother Her interests are not tantamount, but par-This principle in management, although mother is undoubtedly called upon to sacrifice somewhat of her chances for life that she may have a living child, she should not be asked to sacrifice herlife No woman in parturition should be advised to submit to an operative procedure which places her life in great reopardy for her child's sake, if there is a more favor-Unless there is a reasonable prospect of saving her life as well as the infant's, the Cæsarean section should be ruled out. She has the right to decide

Should craniotomy, then, be abolished? In a recent discussion of this subject, Dr Meadows, one of the most eminent of Great Britain's obstetricians, "Where now is craniotomy?" In reply the speaker would remark that it still lives, and should live Next, then, to the life of the child in determining between these two operations, is the question of the risks of each With pelvic contrac tions not greater than 21/2 in the risks of craniotomy are not greater—less than by Cæsarean section done early very few indeed need die Death after craniotomy is largely due to delays and injuries from other manipulations But the risks very rapidly increase when the contraction extends below 21/2 in Near to 2 in it exceeds those attending Cæsarean All things equal, as to the time of operathe two operations are about the same with a pelvic measurement of 21/2 in Just at this point these two operations, cateris paribus, must come into very severe competition As the mother's interest is paramount, craniotomy is not to be laid aside unless! Cæsarean section holds forth equally good chances The following is a condition in which for her life craniotomy is justifiable although the child is living may be days, the liquor amnu has drained off, the uterine discharges are dark, offensive and unhealthylooking, the feetal head is impacted within the pelvis, or it may be floating above the brim, the cervix is swollen, cedematous and bruised, the vagina swollen and livid, the uterus tetanic, or has ceased to act, the patient exhausted, with anxious facies, fre quent pulse and feverish. This is no very uncommon picture What conditions are these for uterine section? What chance has such a woman to recover Craniotomy, unless the contraction is at or below 21/2 in, offers a far better chance for the mother

Much of the opposition to craniotomy has arisen for two reasons First, because it has been per formed too frequently, and of course unjustifiably But abuse is no argument for total abolition Second, favorable for the section, still, it was probably to be because of the very favorable reports attending Cesurean section, especially in Germany very few others, the recovery has been nearly 80 per did not widely differ

speaks very unfavorably for us Out of nearly 160 cases collected from this country by Harris the rate of recovery is only 375 per cent old, stands to day as strong as it ever did While a ures must not be taken on their face without an inoury into the causes and circumstances attending In the first place, the operations in Germany are done by a few experienced and skilful men Each has had much experience Most of the operations have been done in hospitals with good sur-They have been done early in labor at roundings most favorable times The exact opposite is true, as a rule, in the United States No better proof of the earliness of the operations done abroad can be offered than that, out of 33 cases, 31 children were If we collect the cases in which the born alive operations were done early in the United States, we shall see that the rate of recovery is very good, viz about 70 per cent

Sanger has placed great stress upon his method of While the speaker would not wish to detract one tota of merit justly due this faithful and deserving worker, nevertheless it must be apparent to the careful investigator that his great success is not so much attributable to this, as to the earliness of The Sanger operations in this counthe operations try (5 cases) have all proved fatal, because they The Sanger technique could not nere done late save them, they died in spite of the operation They died in advance of the operation The three great factors of success of Cæsarean section are first, tion and conditions, it may be said that the risks of that it be done early, while the patient's general conditions are favorable, second, it must be done antiseptically, third, the uterine wound must be most carefully sutured The first factor is the most im-Now, this conflict between craniotportant of all omy and Cæsarean section will continue so long as the dangers of the latter exceed those of the former When the technique of the Sanger operation is perfected, when this technique is well understood, when A long, difficult labor, extending over many hours, it the operations are done early, when pelvic deformities in this country are more thoroughly studied and appreciated, then will the section be more frequently made, its rate of success gradually increase, and in the same ratio will the necessity for craniotemy equally diminish Then shall we be obliged to ercounter a fewer number of those dreadful cases where at our first interview we are brought face to face with a parturient woman exhausted after several dajs' labor, a midwise and several practitioners in attendance, each having exhausted himself in fruitless efafter Cresarean section? In what state is such an forts to deliver, with soft parts bruised, swollen and uterus to be cut, to contract, to be sewed, to heal? lacerated, and finally a craniotomy or a section with a forlorn hope The abolition of craniotomy on living children is a consummation devoutly to be wished, but in the present state of affairs it is an advance not yet to be realized

preferred to craniotomy, because the child nas living, hands of Sanger, Martin, Leopold, Credé, and a that border line where the risks of the two operations cent If we contrast this high rate of recovery in an open question whether the woman might not have Germany with the rates in the United States, it recovered under cramotomy Dr Palmer did not

regard this as a proper case for the Porro operation The uterus was in a fair condition for section, and it | Harris is always to be preferred except in those cases where operations, only 54 women (371/2 per cent) recovthe organ is greatly bruised, lacerated, gangrenous or septic These complications may make the Porro Muller operation not only superior but necessary I aparo elytrotomy possesses certain advantages in the diminished risk of a loss of blood, and septic infection, but its technique is not so well understood, nor as easy of execution The improved section is generally preferable. The improved Casarean section is an outgrowth of many improvements in abdominal surgery, running through many years Although the Singer operation has nothing distinctly original due to Singer, but embraces points understood and executed by Muller, Frank, Leopold, Kehrer and others, nevertheless Sanger has formulated to advise the operation that afforded the best chance all these improvements, shown their combined utility, and hence with perfect propriety the operation as no i understood and now recognized as the best, craniotemy, were the true facts presented to her It ought to be called the Singer operation

tion had (to his knowledge) been performed but He was of the opinion that it was not the fault of three times in Cincinnati, once by Dr Walton, on the operators, but the result was largely due to the a dwarf, done early, once by Dr N P Dandridge, prevalent custom of employing midwives in the par-(Inpuro elytrotomy) done late, and finally the one turient stage, a physician not being called in until reported this evening by Dr Zinke All were fatal

DR W II WINNING said that the indications for the operation were accurately given by Dr Palmer The statistics of the Singer method certainly show a great superiority over the old manner of operating, and the results are so brilliant that we may confidently hope to see Casarean section exhibit its triumphs as well as other abdominal operations. We all remember that ovariotomy was at one time bitterly opposed by men high in authority, and whilst it was then often considered unjustifiable, the reverse is now true, it is unjustifiable not to operate if there be any hope of success He could not help being struck, however, with the unfavorable record of this operation in the United States when compared with Ger-This could, however, readily be explained by the fact that the recent records of the Sanger operation are from men well-skilled in abdominal operations, being either professors or their trained healthy uterus Moreover, the patients were seen early, the deformity diagnosed early and the operation performed before futile attempts at delivery had been like his own would hold good made The statistics operation performed secundum artem in this country are based upon operations performed by a large number of men, some of whom perhaps never witnessed or performed a laporotomy before The comparison could not be considered altogether fair, if the average was a general one for all Germany as for the United States, he doubted its being any better than our own He then read the statistics of technique is fully understood the first 50 Sanger operations as published by Credé in the Archiv fur Gynakologie, vol xxx, No 1, in haps unjustly which the percentage of recovery was shown to be not what they should be Whose fault is this? They 72 per cent for all and 88 2 per cent for Germany have their sphere In natural cases, a woman of alone, the United States contributing four cases with ordinary intelligence, properly trained, can unques the increasing mortality in this country as shown by of labor with propriety She should also possess

Dr J Taber Johnson, based upon the record of Dr According to his statement of it of 144 ered, but while the first 50 showed 54 per cent of recoveries, the last 50 showed a favorable result in but 24 per cent These figures might be somewhat modified by the additional cases mentioned by the This record also shows the superiority of the Sanger method over the Porro operation The first 50 Porro operations show 21 recoveries (42 per cent), whilst the Sanger method shows 36 recoveries (72 per cent), a difference of 30 per cent in favor of the latter He felt confident that Cæsarean sec tion would ere long supplant embryotomy of the liv ing child

DR T P WHITE said it was the attendant's duty to both mother and child, but doubted if the mother would ever accept Cæsarean section in preference to is unfortunate for the reputation of Cincinnati that In conclusion, Dr Palmer said that Casarean sec- all three cases operated upon had terminated fatally the woman was exhausted In consequence of such delay the operation could be but a dernier ressort, and the prospect of recovery greatly diminished by reason of the unfavorable local and general condi-In the case under consideration the gangrenous condition of the uterus at the autopsy clearly demonstrates its condition and no wonder the termi In such cases he prefers the nation was in death Porro operation, as he thinks the prospects of recov ery much better

DR GUSTAV ZINKE desired to refer to but a few

1st That gangrenous peritonitis existed cannot be doubted if the character of the pus and pelvic pen At the time of the toneum be at all considered operation however, the parts seemed to be in a per fectly healthy condition The uterus contracted promptly and the placenta was expelled as from a

2d He did not believe that the criticism in refer ence to the advisability of Porro operation in cases True the removal of They were removed to the clinic and the the uterus would act as a safeguard against future But what surgeon would amputate an pregnancies arm or leg to prevent a possible future fracture The aim of surgery is to save and restore if possible to perfection the injured or diseased parts operation is justly limited, to the case described in The Sanger method will be adopted in the essay preference to the Porro operation, wherever its

Female Medical Aid to the Women of India-The Health of Manchester—Surgical Treatment of Empyema - Haya Poison, a New Anæsthetic-Pulsating Tumor of the Orbit, with Protopsis-Foreign Practitioners in Switzerland-Sir Movell Mackenzie-The British Nurses' Association

The third annual report of the association for supplying female medical aid to the women of India. presented to the recent meeting under the Presi-lish free drainage by making a second opening for the future of this important movement scholarships founded by the high priest of the Temple at Baidquath have, it is true, not yet been utilized, will bear Elsewhere, according to the report, evi- with considerable benefit dences are multiplying of the weakening of the ble experienced from the intercostal arteries women of India to hopeless suffering event of last year was the Jubilee collection tions of one lakh from the Maharaja of Jeypore, and £1,890 were collected in England and nearly five lakhs in India already estimated at 30,000 rupees per annum

In spite of able and energetic municipal officers and a liberal expenditure of money on sanitary objects, Manchester, according to the address of Dr cocaine, but lasting eight or ten hours some expressed an opinion that during the last titles of erythrophlerine twenty years there has been some improvement in the physical condition of the work-people of Man-teresting case of pulsating tumor of the orbit with

knowledge of abnormal conditions and where they than the one preceding it, and that the result has been a distinct improvement in the appearance and He concedes that of late, especially in the in the health of both male and female workers hands of Lawson Tait, a la ative in the form of Epsom Ransome urged that accurate measurements should salts has in many instances dispelled the approach of be made every ten years of representative groups of He expressed the hope that, the population at certain ages, so that these could be

Mr Mansell Moullin, speaking recently of the surgical treatment of empyema, said everything pointed, except in children and tuberculous cases, which were expressly excluded, to operation as early as possible He considered primary excision of a rib was hardly ever required, unless the empyema was localized, as India rubber tubes very soon wore the ribs away, so that there was little danger of their being nipped as the thorax collapsed Based on an analysis of thirty-four cases, Mr Moullin considered two tubes must always be inserted, even if they were only a few inches apart, they might be in the same intercostal space, but there must be two for effective The situation he generally chose was in the fifth or seventh interspace in the mid axillary Washing out the cavity was found to be quite unnecessary, if air was allowed to pass freely out and in there was no decomposition, the pus in amount diminished almost to nothing and the cavity rapidly In old cases the first thing was to estabclosed in dency of the Viceroy, abounds in signs of good omen five cases it had been necessary to trephine the ribs, The as the chest wall had practically become a solid bony cuirass In two cases some of the ribs had been resected, in one two inches of four had been removed, as no Hindoo female medical students belonging to in order to allow the thorax to collapse, but the paany of the high castes have been found willing to tient, who had other complications, sank from excome forward and claim them It is a significant haustion ten days after. In the other, portions of fact, however, that a Hindoo lady of Calcutta has two ribs were excised, as the sinus ran rather round founded two prizes for female medical students in the thorax following the direction of those ribs, than memory of her deceased husband, whose name they upwards as in the former case This was attended In no case was any trouprejudices which have so long condemned the native direction in which the sinuses run must in each case The great determine where the ribs should be cut, how many should be removed and how much of each

An English firm has produced another new anæsof half a lakh from the Nizam and Maharaja of Ul- thetic, called Haya poison The substance is of two war, with many large subscriptions from others, have kinds the first amorphous, dark brown externally, been received By means of Jubilee collecting cards | brownish-green on fracture, compressible and powdered only with difficulty, the other almost black, The income of the association is translucent and brittle Experiments having been made with a view to determining the presence of its anæsthetic properties, it was found that Haya poison produced in the cornea anæsthesia similar to that of Ransome to the local Statistical Society, is still the dermically injected it produces in animals a slowing most unhealthy city in the Kingdom-its death rate of the heart's action and paralysis of the extremities, being 60 per cent above the average of twenty-eight | nith subsequently disturbance of the respiratory func-A somewhat better account is to be tions, dyspnœa, convulsions and salivation At presgiven of the twin borough of Salford, which is only ent it is thought that the anæsthetic properties of the 25 per cent behind the same localities Dr Ran- new product are due to its containing minute quan-

Mr Adams Frost has had under his charge an inchester, that the generation now growing up has, on proptosis In answer to questions the man had again the whole, been better fed and less severely worked and again stated that the injury was caused by being

struck by a piece of wood as thick as his thigh and many pounds weight, that it struck him with considerable violence, and that the end was blunt and as This history made the case present large as a fist difficulties as to the exact cause of the phenomena, they being as consistent with an intracranial as with an intraorbital lesion Looking at the pathology of other cases, Mr Adams Frost is disposed to take the view that a fracture has been produced passing across the carotid artery in the cavernous sinus

Sore tribulation has arisen among the British invalids in the Engadine, on account of a decree being suddenly passed by the authorities forbidding any one not armed with a native diploma to practice medicine in Switzerland The flocks of sufferers thus deprived of their regular medical attendants fession, but how long he will continue to carry this burden, we have appealed to our Minister at Berne The decree certainly seems somewhat suicidal, for it is the foreign visitors who have made the fortune of these Swiss health resorts, and if the winter residents are driven to seek fresh fields and pastures new, the legislators responsible for the enactment will find that they have killed the goose that laid the golden eggs

From Berlin it is reported that Sir Morell Mackenzie is looking very careworn and haggard, evidently feeling the heavy responsibility attached to him is stated to be continually receiving letters in which his life is threatened if he does not take his departure from the German capital He is attended by two detectives when he walks by himself in the grounds at-

tached to the palace

The British Nurses' Association is going to establish a register for nurses, which shall be a guarantee to the public that those whose names are on it have received a sufficient amount of training to make them thoroughly efficient G O M

MISCELLANEOUS.

THE INDEX MEDICUS -The number of student physicians in any place can be fairly judged by the number of subscribers to the "Index Medicus" As a matter of curiosity we append the following list of paying subscribers in and out of the United

Memorandum Showing the Number of Paying Subscribers to the "Index Medicus"

Foreign Unsted States Argentine Republic California Australia Connecticut Belgium District of Columbia Canada Denmark Georgia 8 Illinois England Indiana France Louisiana 33 Germany Holland Maine Maryland Massichusetts Ireland 34 7 2 Italy Michigan Japan Peru Minnesota 5 Missouri Russia Nebraska Scotland 78 6 New Jersey New York Switzerland Turkey Ohio -39 Pennsyly ania Rhode Island South Carolina Total, United States and Foreign Vermont Virginia Wisconsin

In addition to these, 100 copies are taken for distribution to the medical officers of the army at special rate, making 463 total

In the home list it is curious to remark that New York his twice as many subscribers as Pennsylvania, and that in Massa chusetts, Maryland, and the District of Columbia, a reading physician does not seem to be a very scarce animal. In the great State of Illinois, with the fermenting mass of commercial nctivity like Chicago, but eight doctors have had pride enough in their country's publication, interest enough in medical set ence, or a love of reading sufficient to warrant their spending ten dollars a year in sustaining the most illustrious medical pub lication in the United States, and nurturing their own souls and bodies by medical culture. Worse than this, a rich State like Kentucky, with cities as large as Louisville, does not even seem to require one copy of the publication

The receipts from the "Index Medicus" to the publisher, are not nearly enough to cover the cost of so extensive a publica Mr Davis deserves the very warmest thanks of the pro do not know It is most extraordinary that he does not in this matter receive better backing. The thanks of the profession are good, but the thanks which do not express themselves in bank-notes are only an exemplification of the old proverb, "Soft words butter no parsnips"-Therapeutic Gazette

DAMAGES FOR DEFECTIVE HOUSE DRAINS -A case of some hygienic and public importance came last week before Mr Commissioner Kerr in the City of London Court sought to recover £25, damages sustained by them by reason of the defendant's misrepresentations as to the state of the drain age at the house occupied by them as tenants at a rental of Lgo 1 year It was stated for the plaintiffs that a distinct as surance was given either by the defendant or his agent that the druns were in perfect order, but soon after the plaintiffs entered into possession they discovered that the drains were defective Some repairs were made, and then came a plague of rats, as many as twenty two having been killed in a fewer number of days. When complaint of this was made to the agent, he philosophically replied that "they would go away in due course." It was also stated that set he result of the manuary state of the house the plaintiffs' boarders became ill and left, and the plaintiffs had suffered loss to the extent of the sum claimed. Mr Commissioner Kerr recognized the claim, and give judgment for the plaintiffs for £10, with costs on the higher scale

ANTISEPTIC INHALATIONS IN PULMONARY DISEASES

BY S J RADCLIFFE, M D, OF WASHINGTON D C

MEMBER OF THE AMERICAN AND OF THE BRITISH MEDICAL ASSOCIATIONS AND VICE PRESIDENT OF THE MICROSCOPICAL SOCIETY, OF WASHINGTON D C

In the treatment of pulmonary complaints the tendency at the present time is towards local medi-This arises principally from the general acceptation of the germ theory, which teaches in the this sepsis main that diseases originate from microorganisms, and the belief that from this it must follow, as a necessity, that these microorganisms must be destroyed or rendered harmless to organized tissues, either as a means of cure or as a prophylaxis to such disease It is from the supposition that those microorganisms known as bacilli exist in the lungs in tubercular disease, and that their destruction eventually becomes necessary in order to cure the pathological condition recognized as tuberculosis, that the study of antiseptic or germicidal inhalations have for the past few years received more than usual attention The presence of the tubercular bacillus, made renowned by Koch, has been too frequently verified by competent observers to admit of a doubt as to its reality, nor can there be much less doubt as to the dependence of the phthisical process on the presence of the bacıllus This is now acknowledged by most pathol ogists and bacteriologists At the same time it has been made apparent that the bacillus can be more readily destroyed in a culture fluid than in its habita tion in the lungs In the first place because it can be reached more easily, and in the second place because antiseptics of sufficient power to kill it out of the body would, if applied to it in the lungs, jeop ardize the life of the subject on whom it is found

For these reasons attention has been directed more particularly to the study of means whereby antisep- bacillus is peculiar to the lungs, and peculiar to the lungs more directly, certainly and safely than has disease changes in other parts of the economy, that is to say tion more or less putrefactive or septic according to the

amount or degree of suppuration, or the extent of the virus or poison infused Pavy says, "It is only in the presence of the organisms in question that putrefactive decomposition occurs," and "we are bound by the evidence now before us to look upon putrefaction as the issue of the influence everted by the living organisms to which our attention is being given " (Harveian Oration)

Antiseptic inhalations for the treatment of diseases of the lungs of course presupposes sepsis as their object and aim, and upon this ground is based the theory of antiseptic treatment The object of antisepsis is to destroy or counteract the influence of Whether this sepsis is contained in the bacillus, acting as a direct poison, setting up a peculiar inflammatory process more or less purulent in character, which constitutes the whole of the disease, or in the products of this inflammatory action produced by this or other causes-these forming the medea, the culture beds, or feeding grounds, as is the case with other microorganisms under allied conditions, no one is so far advanced in these investigations to decide There can be no doubt that the tubercular bacillus lives and multiplies under septic conditions All microorganisms thrive best and increase more rapidly during putrefactive changes Bacteria it is said cannot live in healthy tissues, that healthy organisms are able to resist their formation and growth, while dead tissues have no such preventive power, that bacterial growths and the destruction they cause occur mostly in the areas of stasis, where the resisting effort is far below the normal, in localities where there are distinct tissue changes, or accumulations of a character requisite for their growth and increase, that these conditions are not presented when the natural forces and vigor of the constitution are up to a healthy standard, but only when there is actually lowered vitality either from inherited tendencies or from causes accidentally acquired

The teachings of Koch are, virtually, that the tics or germicides may be made to reach it in the lungs in certain conditions of them—as in tubercular hitherto been known It is no part of the object of mation, that the character of the products of such these remarks to discuss the pathology of tubercular inflammation differs from the products of other inconsumption, about which so little is known, but it flammations, and the sepsis or poison is contained in may be said the state in which we find the lungs in the bacillus, which never occurs spontaneously but is this disease is the same we find in other destructive always found in connection with this diseased condi-

It is not germain to the subject whether some dis-

pute or reject this formula or not med the sationale of the whole germ theory, regard- he says, "It appears probable that the lethal influence ing it as absurd or false. There are a few others who of the bacillus is due to the production of certain believe that microorganisms are the result of disease poisonous products. That such a product is separ and not its cause, that each microorganism, bacterium, bacillus or coccus, is peculiar to the disease in which it is found, and the result of the disorganization in such disease, that they are only carriers of frogs, mice, and other animals disease-ptomaines-which are germinated during properties of the product are, speaking generally, decomposition of organic matter. There are still a few others who maintain that it is not the microorgamsms themselves that are poisonous to man but the products to which they give rise, which is chemical in its character, and we are told we must now seek to discover under what conditions and from what substances various microorganisms elaborate poisonous substances and also to determine the composition of these products

The subject is too extensive for ordinary discussion, and as the doubtful points are so much more numerous than the true and reliable ones, it is best to bide the time when it can be elaborated with more satis-The fact is that so many questions have arisen since the first introduction of the recent doctrines of tuberculosis that it is absolutely confusing case, if the active invading area of the diseased por to one who has not given it his whole continuously undivided attention Whatever may occur afterwards bacilli, what treatment can be more rational and there is no doubt in phthisical disease the initiatory step in the pathological process is in the presence of the bacillus The absorption of waste products may be the ulterior effect—this absorption poisoning and priate which neglects to follow this indication? The subduing the whole system under its influence, producing the rapid waste and destruction of the tissues of the body we see in the general emaciation of the the presence of these infective organisms in phthisical

snbject

Phillips, of Edinburgh, "On the Etiology of Phthisis," (read before the Section on General Medicine, International Medical Congress -Medical Times, Oct 1, 1887) asks, what then is the modus oper andi of tubercular bacillus in leading towards death? it the (1) progressive asthenia, (2) loss of hæmatosis, (3) the lighting up of fresh inflammatory foci, (4) the absorption of waste products? Its fatal properties cannot I think be regarded as merely irritant or In all probability they are attributable to a power possessed by it of elaborating new products which are afterwards absorbed? Koch savs we must find the microorganisms in the blood, lymph or tissues We must isolate these microof the diseased man organisms and cultivate them and carry on these pure cultures through successive generations to But in spite of all this if our prove their identity antiseptic inhalations are to be of any avail we must come back to the initial stage when the bacillus first gets its lodgement and begins to work This is the time when treatment would seem to be the more effi-When the virus is absorbed into the blood, lymph or tissues, by way of the lymphatics and bloodvessels, all treatment would by a priori reasoning appear to be useless We cannot, must not wait for this period if we would arrest the phthisical process That the active principle of the bacillus is a virulent Dr Philip (op cit) with the extract of sputa obtained diseases, the hope is that not only may antiseptic in

A few have de- from phthisical patients able from the carefully selected and prepared spu That the product is possessed of well marked tum physiological properties, being eminently toxic to depressant, and more particularly on the heart A large majority of the profession accept the doctrines promulgated by Koch, and it is upon a clear appre ciation of the points enumerated by him that our therapeutics depend If the tubercular bacillus is a septic poison capable of rapid and destructive propa gation in certain conditions of the lungs the ationale of the antiseptic treatment must be accepted as a sine qua non and unequivocally

In a lecture by Dr I Burney Yeo (Brit Med Jour, July 1, 1882) on "Antiseptic Treatment of Pulmon ary Consumption," he says, "If the expectoration of the matters discharged from the air passages of phthisical patients swarm with infective microorgan 1sms as we are assured on the highest authority is the tion of the lung be crowded with these same infective more appropriate than that which aims at destroying the life and activity of these organisms? Indeed I might ask what treatment can be rational or approonly question that admits of argument in connection with the subject are these two. Are we satisfied that lungs and their causal relationship with phthisis have been demonstrated? and second, Have we the means of treating this disease antiseptically—that is to say, do we possess in an appreciable form the agents which will destroy these microorganisms and avert the progress of the disease? If in phthisis, as seems most probable, we have to do primarily with a specific virus or infective organism, and secondly with an inflammatory process excited by it, our treatment must have a two fold objectthe destruction of the virulent agent, and the reduc tion of the accompanying inflammation, and in ac tual practice my own experience certainly shows that the best results follow the combination in treatment of these two ends" And "I know of no disease in which so many various indications arise during its But if pulmonary phthisis be pulmonary tuberculosis, and if tuberculosis depend on the presence of infective organism in the tissues, a rational treatment of phthisis must include the administration of antiseptic agents, or the surrounding our patients with antiseptic conditions

"The term antiseptic in fact presupposes the ex istence of some septic process as we now know to be caused by bacterial growths It has long been thought possible by inhalations of creosote to limit decomposition in the expectoration, but now that the investigations of many observers have shown the constant presence of certain bacteria in phthisical halations control septic processes in dead secretions, but that they may be destructive of those microorganisms which are the root of tubercular diseases in living structures" (S C Smith, M D, etc, Brit Med Jour, Feb, 1884)

Some practical questions arise here for consideration, the most important of which are, first, can we destroy these microorganisms in the lungs with safety to the patient? and secondly, can we reach them by methods in our possession after we have satisfied our-

selves they can be destroyed?

In all investigations tending towards a solution of these problems failures seem to be due in a great measure to causes arising out of misapprehension of the nature of microorganisms-particularly as to their vitality or power of resisting destruction made apparent to us that antiseptics do not act uniformly For instance, we may kill the full grown bacillus and yet they multiply notwithstanding Antiseptics may destroy the parent but fail to kill the By boiling a cultivating fluid containing bacıllı for hours leaves the germs, or spores, untheir multiplying ceases (Tindall) Lex found some bacteria still moving rapidly at a temperature of 120°C Tindall's experiments have shown that there this also seems problematical are stages in the life of the bacteria during which "It has been proven," at about 110° C, or 230° F killed or losing their power of multiplication obvious that all evidence shows that it is impossible either to keep germs out of the body or by antiseptics to kill them "

In some experiments by Koch, in 1882, (Practi tioner) as to the reliability of disinfectants (the spores of splenic fever were generally used) he found carbolic acid in a 5 per cent solution only sufficient to arrest the development of spores after two days, while a 1 per cent solution was sufficient to destroy in two minutes the bacilli themselves A solution of 1 in 850 was sufficient to check the development of the latter The fact was very noticeable that carbolic acid in oil or in alcoholic solutions is absolutely with out effect on the bacilli and spores The spores after 110 days, and 70 days, respectively, in a 5 per cent solution of carbolic acid and oil, and in alcohol, were repeatedly found intact Salicylic acid and thymal showed unsatisfactory results, and even sulphurous acid, under such favorable conditions as are not ob tunable in ordinary practice, fails to destroy the whole of the minute organisms that may be present fever spores (Elliston)

crooorganisms in the lungs by the same means used for their destruction out of the body tions are totally different, and unless we can change the surroundings of the organisms or possess an agent only noxious to them and entirely innoxious to the pulmonary tissue, it would be useless to try such a procedure so manifestly fraught with danger, and predicating, therefore, our knowledge upon what has already been ascertained, it would appear to be entirely unsafe with the means we now possess to destroy germs so deeply imbedded in such delicate tissues without other means, also, to protect the latter from senous injury, or the general system from its toxic result Considering the tenacity with which microorganisms hold on to life—continue their life history—how they resist chemical actions of the most varied kind, it is no wonder that our efforts have been unsuccessful in curing diseases of which they are the integral part by ordinary antiseptic means

But supposing we had this agent especially adapted, a safe and unfailing agent, one particularly destructive to the infective virus, and not injurious, but touched, but if boiled successively at short intervals salutary rather to the lung tissue, do we possess the the young brood are destroyed as they appear, and means to reach it in the terminal bronchi, air cells, or parenchyma of the pulmonary structure? From experiments and from the literature of the subject

During some remarks on pneumatic differentiation they resist almost any degree of moist heat Sander- at the meeting of the American Climatological Assoson puts the death-point of common septic bacteria ciation, held in Philadelphia, May 10-11, 1888, Dr I H Platt, of Brooklyn, said he believed unfounded, says Parkes, "that they can stand a short boiling, two of the claims put forth by Dr Williams and Mr that they can be floated in air-bubbles through vitriol, Ketchum in regard to the Cabinet, the second of that they can be washed with carbolic acid solution which was that the spray or vapor used in conjunction of any strength short of 5 per cent without being with the differential process can be carried further Is it into the air passages, or more thoroughly condensed likely we are capable of destroying organisms which upon them than a spray or vapor could be under are so retentive of their vitality? I think it is quite normal conditions. They cannot, he said, be carried so far, for the reason that the residual air is increased and consequently the inspired air which carries the vapor or spray cannot penetrate so far It is claimed, he said, that the vapors of medicinal substances is condensed in the lungs during the differential process by compression consequent upon the commencement of the respiratory act. This is impossible, he said, first because compression only acts to condense a saturated vapor, and the air passages cannot be saturated with the vapor of a medicinal substance, and secondly, because no greater compression is produced at the commencement of tle expiration under the influence of differential pressure than under other circumstances (THE JOURNAL, May 22, 1886)

Dr Nathan Hill Hassall (Lancet, May 5, 1883), "On the Comparative Inability of Antiseptic Inhalations as at present practiced in Phthisis and other Diseases of the Lungs "defined the scope of the subject of the inquiry, which was, more particularly, Chloride of lime in a 5 per cent solution was also halations in the class of diseases referred to, as carried out by means of different forms of oral or oro-nasal There is sufficient evidence to prove that it would phenol, or carbolic acid, creosote, thymol, and iodine The substances experimented with were be exceedingly dangerous to attempt to destroy millt was shown that in the case of the three first named

substances more than four fifths were still present in the sponge at the end of the inhalation, while it was proved that the iodine on coming in contact with the mucous membrane of the mouth and checks became rapidly converted into an iodide, in which condition its antiseptic properties were of course greatly impared if not destroyed He said, also, that the unrecovered portions might be at least accounted for without supposing they were inhaled, by loss in extraction from the sponges, by loss in condensation of moisture in the inhaler, or the skin of the chin or cheeks, and in the mucous membrane of the mouth and fauces of the person inhaling. He also remarked, that but This pressure is exerted equally in all directions, and little evidence has yet been adduced to prove that any of the substances employed do really make their way into the lungs in any appreciable amount and so reach the seat of the disease

In an address by Dr Hassall, "On Inhalation, more particularly Antiseptic Inhalations in Diseases of the Lungs," read in the Section of Medicine, British Medical Association, 1883 (Bit Med Jour, No-sember 3, 1883), he says "It was with a view to cember 3, 1883), he says obtain evidence on this point that my first endeavors to the respiratory act, impediments either to inspira-I continued the following arrangement were made in imitation, as near as I was able, of natural respiration " It consisted of a syringe of 200 inches capacity, provided with a hollow piston with a valve attachment, a Wolfi's bottle filled with water, or bulb tube filled with spirit, as the case might be, attached to the syringe, the bottle in turn was attached to the termination of the trachea of an unskinned sheep's rapid respiration in this case being from two causes: head and neck with a well-fitting papier maché respirator furnished with the usual cribriform receiver and sponge syringe was intended to take the place of the lungs, and the Wolfi's bottle to intercept any substances used which might pass from the respirator down the trachea, with a view to their subsequent determina-The syringe was capable of being worked at tions the rate of 250 times per hour

The first experiment was with 1/2 gram, equal to about 71/2 grs, of carbolic acid After the rapid action of the syringe for an hour and a half the piston in the bottle was tested by Chandelon's very accurate and delicate process, with the result of finding in it only 0 003 gram of carbolic acid, that is to say, In the case of eucalyptol the faintest possible odor, only recognized with difficulty, was perceptible in the alcohol through which the air was passed With turpentine the spirit was found to possess a decided smell of the oil, though it was obvious that the quantity actually passed was but very mi-With rodine the alcohol did not become colored in the slightest degree, nor did it furnish any evidence whatever of the presence of iodine quotations might be multiplied to show how difficult passages, and this difficulty throws additional light acid, watery vapor, a small quantity of ammonia and on our inquiries in regard to our therapeutic failures If these vapors do not pass into the pulmonary cavity-only, indeed, to the mouth and fauces-we are naturally led to inquire into the cause of the impediment, and the answer to this inquiry would possibly be that there is some vital resisting power which has of gases (Ganot)

been doubtless overlooked Physical forces are always met by physical forces, and the weaker yields to the stronger, let us see if some vital or physical forces are not the foundation for these impediments.

The atmosphere is composed, in round numbers, of 20 volumes of oxygen and 80 volumes of nitrogen, with a trace of ammoniacal gas, and 3 to 6 parts. in 10,000 of its volume of carbonic acid. The height of the atmosphere is estimated at 30 to 40 miles, and its pressure equal to 10 lbs to the square inch pressure upon the surface of a man of medium size. is estimated to be 37,560 lbs, or more than 16 tons the internal air has the same density as the external air, modified possibly only by the difference in temperature, but for all practical purposes they are alike The body being immersed in this vast volume of air, by the immense pressure exercised upon it, has all its open cavities filled as a compensation to the external pressure, and this equable pressure or condensation of the atmosphere renders respiration less difficult. Were it not so there would be constant interruptions tion or expiration, and consequently failure of the lungs to carry out their specific functions Rarefied air has the same proportionate pressure of condensed air, only the pressure being reduced, and the com bined apparatus employed in respiration being re heved of its accustomed weight, carries on the respiratory act with more difficulty, the difficult or more The nose and mouth were covered first, from lessened pressure, and second, from the rarefied air, which contains less oxygen in a given quantity, and therefore requires increased respiratory acts to insure sufficient for oxygenation If we ev haust the air around the body of a person we exhaust the air also in the air passages in proportion, because there must be equalization of pressure in both direc-The fluids then flow towards the surface, following the capillaries of the skin and integument and also the mucous membrane of the air passages

In the respiratory act at or about the ordinary sea level we have the following kinds and quantities of 1, residual air, 2, reserve air, 3, tidal or ordinary breathing air, 4, complemental air In a healthy male of medium stature the residual air which cannot be expelled from the lungs amounts to about 100 cubic inches, the reserve air, which can be ex pelled but which is not changed in ordinary respira tion, amounts to about 100 cubic inches, the tidal air which is changed in ordinary respiration amounts The complemental air to about 20 cubic inches which may be taken into the lungs after the com pletion of an ordinary act of respiration, amounts Inspiration, breathto about 110 cubic inches ing in, consists of the ordinary atmosphere, ex piration, breathing out, of the expelling carbonic conditions the air is the only principle absorbed by Gases mix by the general law of diffusion without chemical action, and the force of diffusion is inversely as the square root of the density

impediment in reaching the lungs by vaporized me dicaments by the ordinary means used for such purpose? Do we see a factor in atmospheric pressure is moist which resists forces to unbalance its fundamental law of equability, in the physiological act of respiration itself, which is dependent upon this law, or in the reckoned among the difficulties of penetration regulated by fixed principle?

cubic inches, and the tidal air only to 20 cubic inches changed at each respiratory act, about eighteen times in a minute This seems to be necessary in order to The largest part of the air, therefore, remains in the lungs, the quantity expired being soon replaced by fresh air How is it possible then to replace this air, except by the complemental air which, by distending the chest to its full capacity by an additional 110 cubic inches, would, if long con tinued, embarrass respiration and cause muscular fatigue or capillary plethora This difficulty of replacing the air contained in the lungs would seem to be a barrier to the introduction of other vapors, unless it could be so mingled as not to interfere with

its due proportion or properties

Gases are bodies whose molecules are in a constant state of repulsion, and are continually tending to occupy a greater space Fluids, as we have said. mix by the general law of diffusion, whose force is inversely as the square root of their densities (Ganot) The denser the gas, by this law, the less is its power of diffusion, and the lighter the gas the so, as fluids are virtually incompressible greater its power of diffusion be necessary, in introducing vaporous substances anto the lungs, to be governed by the law of diffusion the difficulties to their introduction vaporized fluids, and this must be taken into account vaporized fluids, and will be found nearer to the natural process, and more fitted for mingling with the congestion if long continued air of and absorption from the pulmonary cavity

Absorption from the respiratory surface is, of "It is now almost course, undoubted Flint says universally conceded that animal and vegetable emanations may be taken into the blood by the lungs and produce well marked pathological conditions Among the most striking proofs of the absorption of vapors by the lungs are the effects of the inhalation This passes into the blood and manifests of ether its characteristic an esthetic influence almost imme-Experimenters on this subject have shown the lungs and the air passages, but it must be rememto admit of this action

Can we see in all this the cause or causes of the else by these surfaces is unnatural and generally deleterious "

The normal condition of the respiratory surface It is continually bathed in watery vapor, making it always in a state of supersaturation and capable of resisting further moisture This also must be general law of diffusion of gases, which are always density and pressure of the atmosphere, the kinds and quantities of air in the lungs, the influence of the In ordinary respiration we see that the residual air residual air, the reserve air and the tidal air, as also amounts to 100 cubic inches, the reserve air to 100 the complemental air, the law of diffusion of gases, and the degree of moisture and absorption of the that is, only one eleventh of the air in the lungs is respiratory surfaces, must consequently be taken into account in calculating the chances of successful pulmonary therapeutics And therefore, some modirelieve the internal pressure as gradually and little as fications will have to be made in the means employed —in the apparatus and in the medicinal substances employed-so as to adapt them to their state, and condition of vital action

So far as the mechanical means are concerned, there does not appear to be much difference between the results of the simplest and the most complicated The simple oro-nasal respirator has contrivances been just as successful as the close chamber of the pneumatic cabinet Both act on the same principle, the breathing of vaporized substances, with the addition of pneumatic differentiation in the latter, which is not yet proven to be of any especial service action is yet debatable, and equally trustworthy investigators take different or opposite sides in regard to its utility There are very grave doubts whether, by exhausting the air about the patient, it exsanguinates the mucous surfaces It would be rather This law is applicable to the gases contained in the probable that it produces a state of congestion, or, on the other hand, by compressing the air, it can do It would therefore most important part of the discussion is whether it can produce differentiation at all-whether it can make the air surrounding the patient and that in his of gases, which has been heretofore perhaps one of lungs, the external and internal air, to differ in dens-Another thing ity Rarefied air is the same whether in a cabinet or to be considered is that gases are more miscible than in high altitudes, and its breathing qualities are governed by the amount of oxygen it contains in the calculation of the admissibility of either into rarefied air seeks a larger space, the pressure is so the air passages In all cases gases are preferable to reduced that the fluids flow in to fill the space and make compensation for that lost, and would produce

Dr Hosmer A Johnson, of Chicago, in a paper read before the Association of American Physicians, June 2, 1887 (THE JOURNAL), said "The pneumatic cabinet I consider cumbersome and expensive, with nothing especially to commend it in the treatment of pulmonary diseases" This is the general opinion

For the purpose of diffusing antiseptic vapors through the atmosphere the patient breathes Dr Burney Yeo (op cit) says he has found none answer better than the simple perforated zinc respirator the facility with which liquids may be absorbed from which he has contrived, which, he says, practically costs nothing and which, with a little instruction, a bered that the natural conditions are never such as nurse can make in a few minutes, in which, he says, The normal function of the you have the decided gain of being able to apply lungs is to absorb oxygen and sometimes a little ni the antiseptic inhalation almost continually and of trogen from the ur, and the absorption of anything almost any degree of strength. It is made by taking a piece of perforated rine 4 × 6 inches, cutting with the air surrounding the body and that entering the a pair of strong shears one side round and the other lungs is rendered of different densities. There are in four flaps, bending it half oval so as to fit the nose three forms, he says, which for convenience may be and mouth, bending in the flaps so as to form a cage described as positive, negative and alterative. The for the sponge for the antiseptic fluid

that the most effectual and natural method which can be adopted for inhalation is by chambers, the air of which is charged with the antiseptic or other medicament which it is desirable to employ He says the following are the conditions and principles of the construction of a true inhalation chamber 1, the dimensions should be moderate and in some cases even small, 2, the fireplaces and all inlets and out- and by the increased expansion and movement of lets closed, 3, the temperature of the room should the lungs favoring their greater activity and modify-be kept at about 19° C (66° F), 4, the air of the room should be somewhat humid. In regard to the Some of these points made so positively are probmeans whereby the air of the chamber is to be ably open to discussion. He himself combats, as charged with suitable medicaments it occurred to him that, if any substance possessing even a very feeble volatility at ordinary temperature were dissolved and spread over a very large surface, the amount of the substance which would become volatilized would be in proportion to the quantity taken, the extent of the surface exposed, the temperature of the chamber and the amount of moisture therein contained

To test this point 50 grams of carbolic acid (771 gra) were dissolved in water, two Turkish towels being saturated with the solution and exposed to the air of the room at a temperature of 22° C (72° F), the room also containing rather much aqueous vapor At the end of two hours a portion of the air of the room was, by means of a large syringe, drawn through a solution of alcohol, a few drops of which, on evaporation gave with bromine water decided evidences of the presence of carbolic acid, 13 cubic centimetres antiseptic inhalations of the vapor or moisture which had settled on the windows (equal to 200 grs) were collected and were introduced by Dr Bergeon, of Lyons, by gaseous found to contain 0 029 gram of the acid, equal to o 447, or nearly ½ gr After the lapse of forty-eight hours the towels were quite dry, and he was surprised to find they did not possess the slightest smell or One of the towels was then taste of carbolic acid tested and found to contain only 0 07 gram, equal to 1 08 gr —the whole of the acid, 771 grs, with the exception of the small quantity referred to, had dis In the experiment with creasote 1 25 gram, equal to 19 grs, were taken-in one case creasote was placed on the towel without any addition, in another water was used, in a third the creasote was After four hours the cloths dissolved in alcohol From that with the creasote only o 91 gram was removed, from that with the creasote new remedies only to fall back on the old, that I was and water o 41 gram, and from that with the alcohol o 39 gram, amounts which correspond with 14 01, Experiments with 4 31 and 6 or grs respectively thymol gave also analogous results

The pneumatic cabinet, an apparatus of American origin, invented by Mr Ketchum and first introduced by Dr Williams, of New York, for treating diseases of the lungs by pneumatic differentiation, has been differentiation, Dr Platt says, is the process by which require its description here. It was, in brief, as ex-

effect of residual air-pressure upon the periphery of It appears to me, says Dr Hassall, before cited, the body is to increase the expansion of the thorax in inspiration, consequently to increase the amount of residual air By the increased pressure in the lungs it will tend to exsanguinate them and to raise the arterial blood-pressure in the general circulation He believes that such benefit as results from the use of the cabinet is due mainly to the reduction of con gestion in the lungs by the air pressure within them,

before quoted, the claims put forth by Dr Williams and Mr Ketchum first, that the effect of removing a slight pressure from the periphery of the body was radically different from that of increasing the press ure of the air entering the lungs, and second, that the spray or vapor used in connection with the differential process can be carried into the air passages or more thoroughly condensed upon them than a spray or vapor could be under normal conditions

From the large amount of literature on the subject of the cabinet it cannot be said to have increased to a very material extent our facilities in treating diseases of the lungs, over even the condensed air apparatus, the ordinary hand bulb or steam nebalizer, or the common nasal or oro-nasal respirator They all have the same object in view, but none of them, so far, have achieved the success we have been looking for, or that success which is the chief object of

Another mode of reaching the lungs is the method This method, known before on the Conenemata tinent, was first introduced to the profession of England and America through a communication to the British Medical Journal (December 18, 1886), by Dr J Hughes Bennett, who said Dr Bergeon came to see him at Evian les Bains, Lake Gereva, in order to bring under his notice his new treatment of He says phthisis and other pulmonary diseases "When Dr Bergeon first told me that he had discovered a new mode of treatment by which pulmonary phthisis and other pulmonary diseases, asthma, chronic bronchitis, etc , could be cured and nearly always alleviated and retarded in their evolution, I I have so often heard of and tried smiled internally His explanation of his treatment, howincredulous ever, at once dispelled this frame of mind, leaving me with the impression that he had hit upon something absolutely new and of serious import Indeed, I felt bound to admit that he had opened out a new field in pulmonary therapeutics, and that his views deserve and must imperatively obtain serious consideration and trial"

The method of Dr Bergeon is too well known to

sorbed by the intestinal venous system and rapidly a very favorable impression on the mind sulphurous gas its usual shape and softness he had repeatedly witnessed

Dr Bennett says Dr Bergeon claims marvelous therapeutic effects for this medication than 200 cases, although the experiments were made at Lyons, where the climate is bad, the results have some importance astonished him cient time has elapsed to give it extensive trialearnest, intelligent trial by the best observers in lodoform, turpentine and carbolic acid all countries? Let us examine the record even partially, from it we glean the following In 60 cases four kinds treated (Dr Shakespeare examining the sputa) there was no apparent reduction in number or character The good effects in my hands have submitted to the treatment lus of tuberculosis be the real cause, we lack thus made In about 50 per cent the condition has centimetres, 7 cases were treated amelioration In no case was there no result (Cohen) Produced collapse in varying degrees, weak pulse, vomiting, headache It produced no good effect I Toxic symptoms may follow its use, 2, causes Med News) great abdominal discomfort, 3, is in no sense a specific (Shattuck and Jackson) red blood globules, causing great anæmia, vomiting, as those treated with sulphuretted hydrogen (Forch heimer) Sulphuretted hydrogen is toxic to dogs

plained by Dr Bennett, to pass carbonic acid, an a mere mucus, which shows the gas is not inimical innocuous medium, through sulphuretted hydrogen, to this form of organism (Bruen) The perusal of a powerful microbicide, obtained from the water of the discussion at the meeting of the Association of the Eau Bonnes of the Pyrenees, and slowly inject American Physicians on the Bergeon method of this into the intestines, twenty minutes being pre-treating phthisis by enemata of sulphuretted hydroscribed for the slow, gradual injection of 4 litres or gen and carbonic acid, described by Dr Henry Ben-This is well borne by the intestines, is ab- net in The Journal last December, does not leave Between exhaled by the mouth through the lungs. In two or 50 and 60 cases altogether were mentioned, but in three minutes, on applying the nose to the patient's no one do we gather that the improvement was very mouth, the air emitted was found to be tainted by the marked, in a very considerable proportion the treat-Within half an hour after ceasing ment had to be abandoned owing to the occurrence the injection all the gas was absorbed and expelled of colic, diarrhoea, vomiting and collapse (British through the lungs and mouth, the abdomen regaining | Medical Journal, October 17, 1887) And so quot-This, Dr Bennett said, stions might be multiplied indefinitely going to show we have not yet obtained the desideratum in pulmonary therapeutics, and the way is still open for fur-In more ther investigation

The choice of the microbicide or antiseptic is of There are at present a sufficient been successful to a degree that has surprised and number for all ordinary purposes, each having its But what is the verdict after suf-favorites and its proper claim of usefulness favorites are bichloride of mercury, iodine, bromine,

Dr Renzi, of Naples, has employed inhalations of 1 Iodoform and essence of turpentine -20 drops of a liquid containing 1 part of 10doform and 20 parts of spirits of turpentine, 14 patients were 2 Iodine volatilized been reduction of temperature, reduction of expectevery day in a bedroom 30 cubic metres in capacity, toration, very often a complete suppression of bron- in the amount of 0 40 to 2 10 grams, heated in a capchial catarrh, and relief of cough Should the bacil- sule by means of a sand bath, 3 operations were 3 Sulphuretted hydrogen evolved by the far a specific therapeutic remedy, and from my rec- action of sulphuric acid on powdered sulphide of ords it does not appear that Bergeon's method will iron, in such proportion that every cubic metre of help us much with this indication for treatment atmosphere in the chamber should contain 75 cubic been greatly ameliorated, in 25 per cent there was acid made by burning sulphur in a closed chamber, slight amelioration, and in 25 per cent there was slight so that there should be 43 cubic centimetres of the gas in a cubic metre of the chamber Of all the inhalations Dr Renzi decides in favor of turpentine and sulphuretted hydrogen (Lancet, July 25, 1885,

Prof Arnaldo Cantani, of Naples, in view of the Our conclusions are, fact that other bacteria are destructive of Koch's bathat the treatment of phthisis by gaseous enemata cillus, has recently made some experiments relative has had undue value attributed to it, that it is sel- to the therapeutic treatment of tuberculosis by means dom of any benefit, but that it may prove service- of the bacterium termo He first found by experi able in occasional cases (Pepper) Sudden glyco-ment that the bacterium termo, whether inoculated, surir may arise under gaseous enemata (F Billings) inhaled or injected, exercises no baneful influence The effects on the urine are that the sulphates are upon the tissues of living animals He then caused largely increased, and sulph hydrogen was frequently a spray of fluid containing the bacterium to be indetected in the urine in a free state, much oftener haled by a patient suffering from tubercular disease The tonic action of the gas of one lung, whose sputa contained tubercle bacilli causes increased secretion from the gastro intestinal in large quantities as shown by the microscope, and can'l and skin and is lavative, finally impairing the also by the results of injections practiced upon small debility, and a feeble condition (Hutchinson and month, were followed by the rapid improvement of The patients treated with air did as well the patient, especially in the conditions The sputa, examined at frequent intervals, were found to become Is harmless only when injected in small quantities full of bacterium termo, and their injection into the Bergeon finds that the sputum in tuber- lower animals failed to produce tuberculosis (Med cular cases still contains bacilli when it is reduced to News, August 29, 1885) On the contrary, however,

Dr Ballazi has carefully followed the bacterio-therapy details advised by Cantani in 8 cases of advanced phthisis with moderate fever. During the inhalations the sputa were daily examined for bacilli Read before the Philadelphia County Medical Society, March and bacterium termo, with the following results In none of the 8 patients was a diminution of the bacilli demonstrated 2 Fever, cough, and other symptoms were as troublesome during the four or five weeks during which the inhalations were given 3 No arrest or regression of the phthisical process was at any time demonstrable by physical examination 4 In one case diarrhea occurred, which ceased only upon stopping the inhalations 5 After ten to fourteen days the patients objected to the inhalations, and only | held out beyond four or The nauscating smell and taste of the rare malady five weeks (treshly prepared) solution of bacterium termo decreased the appetite, and the strength of the patient also decreased (Med News, July 10, 1886)

At a recent meeting of the Odessa Medical Society Dr Filipovitch, of the Odessa Fever Hospital, made a very instructive communication on six cases of advanced pulmonary phthisis which had been treated by him after the bacterio-therapy method recom mended by Prof Amaldo Contant He obtained pure cultures and aromatized the mixture with one or two drops of peppermint and the patient made to inhale by means of Richardson's spray-producer The inhalations were repeated twice daily. In one of the patients the experiment was given up at the end of a week since the man's state commenced to grow worse from the very beginning, and fever, steadily increasing bronchitis, and hemoptysis, had Three other patients died under treatdeveloped ment, one in fifteen days and another after seven days, and the third after twenty-five days maining two patients left the hospital after treatment for seventeen and fifteen days, respectively Filipovitch came to the general conclusion that "no good whatever may be expected from the treatment of tuberculosis by the inhalation of the bacterium termo" (British Medical Journal, Oct 2, 1886) The conclusions at which we may arrive in analyz ing these remarks are I That we have not yet discovered the ways or means to destroy microorganisms in the lungs in phthisical diseases 2 That our studies probably have not been in accordance with the teachings of physical or vital laws in order to 3 That our failures in inhala fulfil this indication tion therapeutics may be due to misapprehension of the relationship of microorganisms to disease That it would be strange that if in the end we should discover that microorganisms are not carriers of disease, but only the result of putrefaction, whether we find them in the dead carcass on the plains or in the lungs of the refined in luxurious habitations That the object of our treatment should be rather to preserve structures in health than seek to destroy organisms which are not amenable to treatment

Maryland Legislature has just passed a Practice ing one not seldom in grave doubt Act similar to that of Illinois

THE EARLY RECOGNITION OF EXOPHTHALMIC GOITRE (GRAVES' DISEASE)

14, 1888

BY J MADISON TAYLOR, MD, OF THILADFLPHIA

In the paper which I have the honor to read to you to-night, I shall not attempt to do more than call your attention to the importance of early recog nizing a disorder which often eludes one, to point out certain features which should enable us to do so, and to offer an illustration, very briefly, the salient points in half a score of cases

Exophthalmic goitre, or Graves' disease is not a At first it is merely a disorder, but frequently becomes a serious disease, and is known to cause death More often it unfits its victim for active usefulness, or, at least, limits this and sadly disfigures him

Like certain other ailments the outcome of irreglar nervous discharge, what in its incipiency is a very manageable complaint, produces in time a dis astrous effect upon the tissues, and forms a practic ally unconquerable disease

Dr Jonathan Hutchinson says

"Graves' disease appears to me to be of the ut most importance, not only on its own account, but as what we might call a type malady It is the most definite and striking example of which we know, of a severe and protracted malady which, despite its severity and persistence, yet has a natural tendency

In reviewing a large number of cases in the search for a complete symptomatic picture, I find that the most constant early feature is sudden and marked The vaso evidence of loss of nervous equilibrium Hence arise motor nerves seem quite unstrung flushing, sweating, and other skin changes, diarrheea If at this time a careful and transient albuminuria watch be kept, I think we should find irregularities in the action of the pupil

The skin usually loses its healthy hue, grows sallow or dark, and becomes greasy to sight and touch This oily look was present in most of the cases I have seen, though I have not seen it mentioned else Begbie recounts one case of pigmentation, or bronzing of the skin, Reynaud calls attention to vitiligo, and Edward Squire, to a discoloration in an isolated instance The oleaginous appearance seems to me quite constant on face and body less when salt sponging and belladonna form part of the treatment

Gowers calls attention to muscular tremor I have seen this rarely In cases 3 and 5 there is a tremulousness in the voice, which I ascribe to nervousness, yet it is constant

The emotions become often so overwrought that various mental peculiarities excite apprehension Or a wiser person may regard the case as one of pronounced hysteria, and, indeed, all through the MEDICAL PRACTICE ACT IN MARYLAND —The malady hysteria remains present, more or less, leav-

Frequently delusions occur, and these so closely

in unison with the ordinary habits and thoughts of the individual as to render them most difficult of detection (see Case 6)

Dr Hilton Fagge warns us to be on the lookout for "slight cases in which one or two of the cardinal symptoms may be absent throughout" Trousseau also insisted on this point

Von Graefe expresses the opinion that among women it is not rare to find instances of this malady where the only symptoms are disordered action of the heart, not accompanied by valvular trouble or hypertrophy, nor the faulty action of the lid as described by him

Heart disturbance most often leads the sufferer first to seek medical advice The pulse is always quick and irritable, usually intermittent The heartbeats, as a rule, bear surprising relationships to the Overaction of the heart is well known to be a frequent feature of anæmia and chlorosis Begbie thinks it a powerful factor in causing Graves' disease Ross regards the anæmia which is usually present as rather a result

Throughout the whole vascular system there is a manifest lack of tone So constant is this that it may yet be found competent to explain the causation of the disorder Certainly the graver features bear causal relation to this state The vaso motor nerves seem all out of balance, nor can it be confined to one part, though the cervical sympathetic is most prominently involved There are cases where limited areas not governed by the upper ganglia show derangement, as in a woman now under the care of my friend, Dr E T Bruen, where one side sweats from shoulder to toe, and the opposite eye is prominent Arterial tension varies rapidly, and un accountably, hence, the oft complained of noises in the head, amounting at times to terrific roarings (as in Case 5) This may explain the maniacal attacks, as well as blood-spitting, thirst, and transient albuminuria

The heart itself is rarely diseased action in time brings on hypertrophy, more commonly, dilatation It also suffers from the general malnutrition which is noticeable throughout the circulatory system The small amount of structural damage which this viscus sustains is a matter for re mark, however, when the profound functional disturbance is considered Systolic bruits are commonly heard, even over the auricles and the great vessels of the neck Dyspnœa is distressing at times, even early in the history, alarms one who feels naught else to complain of

The thyroid enlargement is liable to appear long before the eyes become prominent, but readily escapes attention It may happen that a sense of constriction is felt when swallowing, especially in men who wear tightly fitting collars Both lobes are, as a rule, enlarged, but if one only, it is generally When recovery takes place, this badge remains to chronicle the victory

The eye prominence is late to appear, as a rule, and it would seem to mark the height of the dis-

pathognomonic, a belated action of the lid in following a downward movement of the ball the lower lid is tardy in following an up glance This obtrusion of the eye-ball is the most picturesque feature, but happily it is not constant, and is often very late It is of both eyes, mostly, but if of one only, again the right suffers Sight is seldom affected, except where the outstanding, unprotected cornea suffers hurt or irritation, then opacities may If errors of accommodation exist, this correction, in my opinion, greatly aids in reducing the exophthalmos Fundus lesions are not characteristic, though pulsation of retinal vessels may serve to confirm suspicions

Knee-jerks are rarely abnormal, often in slight

Electrical examination has been, very recently, shown by Charcot, and confirmed by Vigoroux and Norris Wolfenden, to aid greatly in fortelling the onset of this trouble, the bodily resistance being greatly lessened most peculiarly in this disease This may prove a valuable aid in diagnosis

Case I illustrates extremely well the more distinctive features other than exophthalmos, which is not present-especially the marked vaso motor disturbance

Jennie H, aged 23 years, single, no neurotic history, intelligent, hopeful temperament, somewhat emotional and talkative Vague history of a fall at 21/2 years, followed by a convulsion, and, from time to time, "fits" are described, but not clearly first they seem to have been epileptiform, but later resemble emotional overflow At 14 years had typhoid fever, and for twelve months was "weakly" Some swelling of the limbs noticed—then came a period of good health At 17 years menstruated first, but not regularly for a year or more years began to work in a shoe factory, in a very exposed room, excessively cold in winter, frequently sat in wet shoes all day long At 20 years, after a very painful day from cold, walked home in slush, profoundly exhausted soaked her feet in hot water and went to bed Then followed a nervous chill with throbbing pain at heart-it beat rapidly, an overwhelming sense of suffocation arose that moment the heart has been disordered followed a series of medical pilgrimages to different dispensaries, with small benefit

I think many of her symptoms were, even ther hysterical, masking effectually her real trouble She had hemoptysis, cough, great emaciation, and was treated for phthisis The fits brought her under treatment for epilepsy So far as I can learn, no one noticed anything amiss with the eyes or neck I think there has been at no time exophthalmos, but a peculiar fluctuation in the condition of the pupils, which I infer is not recent The dyspnæa grew worse steadily, till it became impossible to lie in bed, and for six or eight months she slept fitfuly propped up in a chair In May last a profuse blood-spitting prostrated her for four weeks, soon after the urine order Before the exophthalmos, there may gener-very dark, thick, offensive fluid passed During the ally be noted the sign asserted by von Graefe to be past summer was very weak and thin, but attempted

Over-exertion at the wash-tube repeatedly to work bowled her over again, several hiemorrhages followed, and on October 1, she applied to me at the Howard Hospital

I found a very pale, thin woman, suffering great dyspnwa, respiration 24, pulse fairly regular, 130 to 135, coughing incessantly, carotids throbbing wildly, pupils widely dilated, von Graefe's sign ab-There was complete mydriasis, as we found that she now enjoys excellent health The heart was labor- heart trouble, no gottre later, but no fundus lesion ing, loud musical murmur over base, apex beat downward and outward, "bruit de diable" in vessels of neck, thyroid gland enlarged, especially to right side, conveying thrill to hand, neck fourteen and rotic history, one child Two years ago she seemed three quarters inches, skin pale and oily looking, readily sweated, and became chilly, legs odematous, menstruation had been absent for three years, b swels always loose, urine, small amount, bright red | disease with blood, sp gr 1009, no casts, knee jerks excessive in both legs, station bad from weakness

Treatment -The treatment consisted of carefully regulated feeding and rest, to drink plentifully of flasseed tea, iron, in form of Basham's mixture, and digitalis, and hot hip-baths, belladonna plasters to the over-excited heart, later, cod oil and bromides, In a week the pupils became rewith digitalis sponsive to light, cough greatly moderated, the urine only smoky, heart sounds more defined

To be brief, in two months the cough ceased, she could lie comfortably in bed, ate well and slept well, pupils became normal, had two or three "spells"—a little scolding aided these months the girl pronounced herself cured, but she courtesy I was allowed to see her repeatedly She is readily upset by trivialities, twice the pupils have widely dilated on catching a slight cold, and once recently the urine showed traces of albumen menstruation was established twice, and slight showing at other times She can now work at house chores with small fatigue Pulse about 85 to 95,

Case 2 -Mrs H, aged about 28, no neurotic history, two living children, came under my care in 1881 during a miscarriage with adherent placenta A similar disaster had occurred also some months My attention was drawn to a most disbefore figuring degree of exophthalmos This had been observed within a few months by a well-known physician, who also warned her that she could scarcely hope again to bear a living child-probably on accourt of the disorder thus indicated There was then menstrual derangement and great dyspnœa Digitalis and ergot were ordered, also care to avoid exertion, but no clearly defined schedule of living This I supplied and rigidly enforced-insisting upon systematic feeding and rest I also found an irrita ble pulse and temper, muffled heart sounds, etc, but very slight right thyroid enlargement, a markedly livid oily skin, sweating surface, loose bowels, and occasional albuminuria

Under treatment consisting, as stated, of regulated living, digitalis, ergot, along with iron and eight months there remained only dusky skin and tonics and rest gained steadily the eye and lid symptoms These last I felt sure seashore in summer, rapidly picked up flesh and

would improve under use of glasses rightly adjusted -she having a high degree of myopia After some persuasion this was accomplished with most admira bie results, for the exophthalmos materially lessened thereafter

I may say, as a matter of interest, that I have since delivered this lady of three healthy children at term, each of which she suckled for a full year, and There is no

Case 4 -Graves' disease, obscure and abrupt cause, extreme nervousness, cardiac distress, death No autopsy permitted -Mrs S, aged 36, no neu in perfect health, weighed 160 pounds Happily married, surrounded by every luxury and loving Sustained no shock, no fright or exhausting care Fell into the hands of gynecic surgeons, who found displacements and tears, and repaired While sitting in these, as it proved none too well perfect health at a theatre, not in the least excited or especially interested in the play, she suffered a nervous chill, and from that time the disorder rapidly The chills frequently recurred, changing to grew what she described as "waves of feeling up and down the body," on the slightest exertion sense of constriction in chest, and skin broke into a sweat Afraid to step about the room Bowels loose, slept badly, lying awake for hours feeling afraid The disorder was not recognized

Sent to Dr Weir Mitchell with a description of "neurasthenia and heart disease," and through his was a very exciteable nervous woman, rather thin, weighing 110 pounds, with a frightened, restless ex-Eyes slightly prominent, some little slow pression ness of upper lid, injection of cornea, tremor in voice, tremulousness of hands on movement, constantly plucking at bed clothes or handkerchief, or arranging her hair or dress, throbbing carotids, pulse of 125 to 135 lying, and very irregular, loud Bronzed, glistening skin, musical murmur, etc chilly hands and feet, sweats readily, etc Thyroid enlarged almost symmetrically conveying thrill to Some improvement under rest and tonics Another operation was found necessary, and though slight, she sank and died No autopsy allowed

Case 4 -Graves' disease, slight exophthalmos, slight thyroid enlargement, cardiac disturbance, delusions and rapid loss of flesh, cause probably exhaustion from bearing ten children, and precipi tated by sharp dysentery, recovery -(By permission of Dr Weir Mitchell and partly under my care) Mrs J, aged 39 years, family history good, most favorable surroundings, ten children, began a year ago to lose flesh rapidly during severe dysentery, appetite very poor since Slight delusions, vertigo Eyes only noticeably prominent, corneal vessels injected, restless expression, slight tremor, skin clammy and glistening, dyspnœa larged a little, heart noisy, no valve defect, very emotional, albumin and muco-pus in urine Under emotional, albumin and muco-pus in urine Referred to me at

strength there, gained forty pounds scribes herself to be in good health

Case 5 —Graves' disease, slight ophthalmos, slight modative defects, but no fundus lesion thyroid enlargement, cardiac disturbance and tre-mor, improvement —Miss R, aged 25, history good At 10 years had typhoid fever, at 11 very severe dysentery, long in regaining strength, much headface and marked prostration, noticed rapid breathing, soon eyes were remarked as being "curious the ears In 1881 again fell ill In March, 1882, conthat time had much cedema in legs, ordered dig-1883, she saw another physician who relieved the Pulse 128 to 130 uncreasing diarrhoea May, 1881, to May, 1884, menstruated only once, thence irregular till a year ago, since then fairly regular Weight about 135, skin moist and shiny, beads of sweat on upper lip, tremulous lip and tremor in voice, this seems a con stant feature, at times tremor in muscles elsewhere readily, not pale, heart tumultuous, no valve defect, pulse intermittent, one beat in three or seven, very difficult to count Thyroid enlarged sym metrically, well-marked thrill, loud bruit in right neck, buzzing in head, sweats almost constantly, respiration 28, sighing, dyspnœa great on slight exertion, cannot lie in bed at night, bowels loose

Rapidly improved in most respects under treatment by regulated living, digitalis, and belladonna, tonics, iron, etc., salt sponging, hot hip baths, attack of nervousness at night time, sense of great shocks pressure in head and flashes of heat over body, ringing in ears Schweinitz, who found slight hypermetropic astigmatism, no fundus lesion Alternate hot and cold and carefully selected sedative measures water to nape of neck relieved the sounds in head

Is steadily improving to date

Case 6 -Miss D, aged 24, family history decidedly neurotic Mother "queer" At one year scarlet fever followed by water on the brain," soon judgment in selection of cases recovered good health Menstruated at 15

August, 1885 Dysentery

December, 1885 Heart began to alarm her Vertigo sitting or walking, grew weak, short of breath, and extremely nervous, could not sleep, began to groan loudly in sleep, which continued till Skin itches intolerably, sweats readily on recently evertion Roaring noises in the head swelled, also feet-"the buttons were burst from the

Murch, 1886 Neck enlarged In May the eyes started forward Appearance eyes very prominent, sclerotic shows half an inch or more above and below, lids puffed, corneal vessels injected, face bloated and livid, skin greasy

Bowels very loose, tremulous voice Now de- 112 standing Eyes examined by Dr Hansell show some accombuminous Decided delusions No improvement

Case 7 -Miss M D, sister to above, well-grown gul, well till a year ago, when she had "walking typhoid," afterward very weak, fainting spells, ache at 19 years, an illness began by neuralgia in vertigo on walking, sweats readily, constantly chilly, especially the hands and feet Buzzing in Menstruated at 13, but extremely irregulooking," tried to gain strength by exercise in open lar, rarely lasts over two days. Eyes showed no lid sign, no exophthalmos Thyroid enlargement sulted Dr Seguin, who pronounced unfavorably, at right, neck twelve and three-quarters inches Heart quick and feeble, muffled sounds, roaring rtalis, quiet Following November grew much noise over the right clavicle and through the thyroid, better, partly in bedfor several months December, also marked thrill Carotids pulsating visibly Very pale Is improving

Case 8 -Mrs S, aged 46, mother living, a "fidgety" woman, has two children Fairly good health till 1881, when she had typhoid fever, followed by large abscess in the abdomen, opened in two places Treated in the Jewish Hospital shortness of breath began In 1881 a financial blow Exophthalmos slight, von Graese's sign in both eyes, greatly worried her, she would sit and brood over pupils normal, corneal vessels injected, flushes her troubles then the fever Exophthalmos began, along with diarrhoea, sweated a great deal on both Buzzing in the ears Appearance strongly built woman, weight 130 pounds, skin muddy and dusky Left eye very prominent, right less so, lid signs of both eyes Carotids throb moderately Heart sounds clear and distinct, slight bruit been under treatment for eight or nine months Digitalis and iron and belladonna Dyspnæa greatest on cold days Urine at times profuse, no al-Œdema of legs fluctuates Is steadily rebumen menstruation more comfortable In January had an covering, though susceptible to fatigue, cold, and

> I hope to discuss the treatment, on which I have Eyes were examined by Dr de some decided opinions, on another occasion consists mainly of rest, judicious feeding, tonics,

Competent glasses, too, are essential, at times sharp counter-irritation, especially diuretic remedies and attention to the emunctories Galvanism, too, has immense value in some instances, but requires

In brief, whatever measures tend to repair the tone of the vascular system and allay nervous excitability will best bring about gratifying results

ELECTRICITY IN MODERN MEDICINE

Legs Read before the Medical Society of the District of Columbia, December 7, 1887

BY ROBERT REYBURN, M D,

OF WASHINGTON D C.,

PROFESSOR OF PH\Stolog\ and of clinical surgery in howard

About one hundred years ago, a Professor in the Thyroid enlarged University of Bologna, named Galvani, was experiin three directions, most on the right, neck thirteen menting with the nerves of the lower extremity of a reand three quarters inches Heart sounds clear, im cently killed frog He found that by placing a piece of pulse heaving, slight systolic whire Pulse regular, zinc under the upper portion of the nerves, and touch-

ing the upper portion of the nerves with a piece of cop per wire violent contractions of the thigh muscles would immediately ensue Very likely others before him had observed the same phenomenon, and had looked upon it with simple curiosity without caring of the muscles, or in cases that require a stimulating to inquire why this was so Prof Galvani, however, application, yet, after all, the use of this kind of galwas not of this class, and he pondered the matter, as vanism is comparatively limited and insignificant in the presence of his students he over and over compared with the benefits derived from continuous, again repeated his experiments sion was that a mysterious and occult form of animal remedial agent. It is found that by placing the two electricity was produced, having the power to act poles of the battery carrying the galvanic current in upon the nerves, and thence to the muscles of the contact with the external or internal parts of the body, and this force has been called, from its discoverer, Galvanism

Little did Galvani know how far-reaching and wonderful would be the results of the discovery he had made to the comfort, health, and even lives of Another Professor, in a rival Unihis fellow-men versity, that of Pavia, Professor Volta, repeated the give you a sketch of what has been done by Prof. experiments of Professor Galvani and confirmed the Apostoli and others for tumors and morbid conditions facts but could not agree with the explanation given He asserted that the contact of the different metals was the cause of the galvanic current which produced the contractions in the legs of the frog Hot and furious raged the contest between the partisans of the two theories of galvanism for many years, but we now know with certainty that Professor Volta's theory was more nearly the correct one, to this is due the of the uterus, or uterine hyperplasia of various kinds. fact that this force is called, indifferently, galvanic or Space will not permit me to go into details but the voltaic electricity Professor Galvani, the first dis-|final result is that 95 per cent of those persons were coverer, found, like many another man, that his cured, and restored to a condition of usefulness to labors to a great extent were simply the scaffolding their families and to society, and out of the entire upon which others climbed to still higher heights of number only two died during the treatment. These theory of galvanic electricity, and showed that the ever adopted as to attract the attention of physicians amount of the galvanic current present is directly of all countries, and in our own country Drs Marcy, dependent upon and proportionate to the amount of Newman, Cutter, Martin and Garrett have likewise chemical action But the time fails me even to men-adopted it with great success tion the names of the many great men who have devoted their lives to the development of electrical To Ohm we owe the celebrated law of electricity that has brought it from empiricism to those of exact science, and the labors of Seebeck, Oersted, and Ampère have marvellously aided in its develop

But "cut bono," as the Spanish say, is all this history of the progress of galvanism I now turn to what is a much more interesting topic to the layman as well to the medical man, namely, the application of galvanic or voltaic electricity to the cure of disease Most persons know that a galvanic battery, so-called, is composed of plates of zinc, copper, or of other metals that are immersed in acids or chemical solu- and causes its disappearance without the use of the The terminal plates have attached to them knife wires or connecting metallic cords, which are called the negative and positive poles of the battery When galvanic currents can dissolve the substance of tumors we touch or connect the poles of the battery together why do they not dissolve the healthy tissues? The we find that a certain force, namely, the galvanic answer to this probably is, that in the first place current, so-called, is developed capable of producing morbid growths such as tumors and hyperplasia of certain changes in the body If the galvanic current vital organs have not the same resisting power or viis passed through a coul of wire under certain conditality as the healthy parts of the body tions of rapid alterations of the current we have a for instance, is much more easily injured by a blow somewhat disagreeable feeling known by the name or other hurt than the healthy organs It will inflame of the galvanic shock, which is accompanied by vio- or even ulcerate by an amount of violence that would

lent contractions of the muscles of the body While the galvanic shock is a valuable addition to the armamentarium of the physician in treating cases of paralysis accompanied by atrophy or wasting away His final conclu- gentle, yet powerful applications of this wonderful body, that the most powerful effects may be produced. Tumors and neoplasms of all kinds, for instance, may be dissolved without the use of the knife or caustic destructive agents, or in any way injuring the textures or vital organs of the body

In order to show that this is possible, I will simply of the abdomen, more especially in females In his paper read before the British Medical Association, in Dublin, Aug 2, 1887, Prof Apostoli said that during the five years from July, 1882, to July 1887, he had treated 403 patients, and made to these patients 5201 applications of electricity Two hundred and seventyeight of these patients suffered from fibroid tumors Faraday then still farther carned on the results so far surpass any other method of treatment

> It will be necessary to explain to those that have not studied the laws of electricity, that when the positive and negative poles or terminals of a galvanic battery are placed in a fluid it is decomposed and the components of the fluid arrange themselves in a certain order around each pole, oxygen, chlorine, iodine, etc, arranging themselves around the positive pole, and hydrogen, the metals etc, arranging themselves around and in contact with the negative pole Prof. Apostoli, by the use of very powerful currents of electricity, from 50 to 150 milliampères, and sometimes using even as high as 200 milliampères, actually produced a galvano-caustic and electrolytic effect, which effectually dissolves the tissues of the tumor He also uses the electro caustic method

The objection may be raised that if the powerful

not apparently wound the body in the natural or healthy condition Another reason for this exemp tion from injury in the application of these strong currents is the precautions taken in using large electrodes or poles when applying them to the body. As the strength of the current is to a certain extent in pro portion to the square surface of the electrodes or poles if, for example, we apply a certain strength of current to an electrode one square inch in area, by increas when employing the weaker current In order to external electrode is covered with wetted clay, cloth, flannel, wet sponges, etc The negative pole is positive pole on the outer surface of the body adja-The positive pole, you will remember, is always the one by which the electric current leaves the battery, and the negative pole the one by which it reenters it The positive pole has very powerful properties in arresting hæmorrhage from tumors, and hence is frequently applied in that class of cases with very beneficial results

Dr Alfred C Garrett, of Boston, reported to the Ninth International Medical Congress, recently held in Washington, 184 tumors of the breast treated by galvanism, from 1864 to the present time, in his practice One hundred and fifty-seven of these were cured and disappeared entirely Several others did not become quite obliterated and a small lump remained that gave no inconvenience In every case the tumor disappeared or became harmless He also recommends the use of soft, large poles with currents

of from 10 to 50 milliampères Dr Ephraim Cutter reports 400 cases of fibroid tumors treated by electricity, with the greater por tion relieved Dr F H Martin, of Chicago, read a very interesting paper upon the electrical treatment of fibroid tumors, before the Gynecological Section of the Ninth International Medical Congress, and enumerates the following advantages of this method PAPILLOMATOUS CYSTIC TUMOR OF OVARY, WITH

I It is entirely free from danger

It is absolutely painless

It invariably checks hæmorrhage

4 It rapidly reduces the size of tumors

It relieves neuralgic pains

6 It admits of exact dosage, so that we know exactly how strong a current we are using

Dr R Newman, of New York, reported to the Section on Surgery, American Medical Association, which met in Chicago, June, 1887, his record of 100 The concurrent testimony given, and which might be largely in galvanic electricity a most potent remedial agent, which is to revolutionize some of the branches of the healing art.

tion to state that the ampère is the measure of the strength in intensity of the galvanic current imagine the galvanic current flowing along the wires connecting the poles like the flow of water in a river As the water flows along the banks with greater or less friction, the rapidity of the current is retarded or accelerated, just so with the galvanic current It is retarded in its progress more or less, and this resistance to the current we can measure ing the area of the electrode to one hundred square of resistance, or rather rate of velocity, is called the inches we give the current one hundred times as ohm, from the celebrated scientist, and is composed strong with little more disturbance of the parts than of a column of mercury one square millimetre in section and 106 centimetres in length The unit of prevent injury to the external parts of the body the the intensity of the current is the ampère, from the name of the distinguished French electro-physicist

To give this concrete expression, it may be stated usually placed in contact with the tumor and the that an ampère represents the quantity of galvanic electricity generated by the unit of electro-motor cent to the tumor or inserted into the substance of force, the volt circulating in a conductor having the unit of resistance the ohm, during the unit of time The volt is the measure of pressure or difference of potential of the current It has been ascertained practically that this is the quantity of electricity furnished by a Daniels' battery Having now obtained a standard, namely, the ampère, we can measure the intensity of our electric current just as accurately and almost as easily as we can measure a distance upon the earth by the use of the English yard or the French metre The instrument by which this is done I now show you, and it is called the milliamperemetre As its name implies, it is a measure of the intensity of the electric current, and enables us to know just as exactly the dose of galvanic electricity we are administering as we know the dose of medicine we are giving to a patient. It is capable of measuring from one-tenth of a milliampère to 500 milliampères, and is destined to do as much for the application of electricity to medicine as the use of the clinical thermometer has done in accurately determining the amount of fever present in a patient

> A HERNIAL POUCH DEVELOPED IN THE CICA-TRIX OF THE ABDOMINAL WOUND FROM A FORMER OVARIOTOMY

Read before the St Louis Medical Society, March 10, 1888, BY L H LAIDLEY, M D,

Professor of gynecology beaumont medical college Surgeon to PROTESTAL T HOSPITAL CONSULTANT TO ST LOUIS
FEMALE HOSPITAL

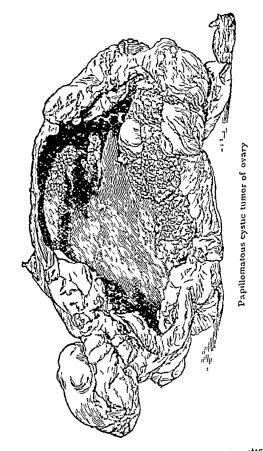

Mrs C, æt 39, American, married, had one child cases of stricture, making 200 in all, which have tory She was of healthy parents, menstruated at which is now eight years old, gave the following his-14 years, was a healthy gul, marned at 22 augmented if necessary, shows clearly that we have the left side (it was a large, multilocular, benign ovarian tumor) One year after the operation she was delivered of a child at full term The recent I have mentioned several times the words ampere nial pouch, which allowed the bowels to protrude, operation and the pregnancy developed a large herand milliampere, and it may be necessary in explana- forming a tumor as large as a child's head at full

period herma in position, and for the past two years she measurements before operation were seven inches was confined to the house. Eleven months prior to by four and a half inches, a portion of the mesenmy first visit another tumor made its appearance, tery was attached to the cicatrix of the old wound, beginning in the right iliac region, it developed rap- and it was ligated, cut and returned to the abdomen idly, occupying a position on the right side which The cavity was thoroughly cleansed of blood, the could readily be felt through the hermal sac months after its first appearance a "magnetic doctor" was allowed to treat the case, which he did by "the laying on of hands," in this case rather roughly, as the results will show This doctor claimed "to coax the fluid out through the Fallopian tubes" When the tumor was pressed upon the patient noticed a great rush of water with blood from the vag-This was repeated some time afterwards with the same results, the tumor almost disappearing

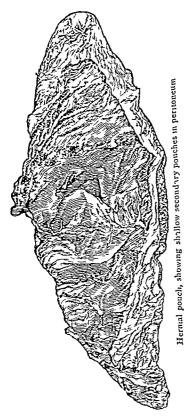

I was called last November, and found a deplorable state of general health, anamic, appetite poor, and patient so weak that she could not go from her chair to the bed without considerable fatigue She had a distinct mitral bruit, weak and rapid pulse, temperature 100° F I continued to visit her for one month, feeding and administering medicines to She urged an early operation build her up examination of the abdomen revealed a tumor in the right iliac region as large as the head of a child at full period, which was fluctuating, movable, and easily The uterus was plainly felt defined by percussion through the hermal pouch, separate from the tumor Change of position did not influence its shape No ædema of lower extremities, nor abdominal dropsy Examination per vaginam showed a violent vaginitis with an opening through the floor of Douglas' culde-sac, which allowed the passage of a sound in the direction of the base of the tumor A fluid escaped through the opening, pressure on the tumor increas-That which escaped was white in color ed the flow The amount of flow a day and mixed with blood was estimated by the patient to be one pint Diag nosis Cystic tumor of right ovary, probably unilocular, with fistulous opening into vagina

An operation was performed December 6, with every antiseptic precaution, assisted by Profs Coles and Graves, and members of the senior class of the Beaumont Hospital Medical College An elliptic incision was made over the site of the tumor, at least seven inches in length, the tumor exposed and the fluid drawn off, which was the same that flowed from There was only one the opening into the vagina adhesion to the tumor, that of the extremity of the This was torn off with the appendix vermiformis finger nail, and the end cauterized, completely controlling hæmorrhage (Greig Smith reports his having to remove the entire organ without serious results) The tumor was lifted from its broad base, which was transfixed at its attachments to the floor of the pelvis, the ligature tied, and all that remained Another ligature of the sac charred with a hot iron was placed below, and entirely around the pedicle, so as to close any opening that might exist with the

No instrument could be made to keep the same time be able to approximate the walls Five edges of the wound (closed with sutures less than one half inch apart) were made to coaptate accurately, a drainage-tube was placed in the lower angle of the wound, the parts dressed antiseptically, and the patient put to bed Reaction was complete within two hours, and for the first time since November her temperature was less than 100° F aggravating nausea, which would not yield to any of the prescribed remedies, necessitated feeding per rectum from the first day The temperature range for the first twenty-four hours was 99° to 99 8°, pulse 72 to 80 She did not sleep more than one half hour during the night On the second day the temperature continued less than 100° until 9 PM, when it rapidly rose to 103 8°, the pulse was rapid and weak, a dusky hue of the face was present with constant nausea, which forbad anything remaining in the stomach

Believing that I had an incipient peritonitis to deal with, I ordered calomel, grs 1355, placed upon the tongue, which was the first retained since the I continued the dose every half hour until ten grains was used, when I gave every hour Be- A M the next morning, by the use of a rectal tube, fore operating the line of incision was mapped out a half pint of thin fecal matter was expelled, which with iodine so as to remove all the pouch, and at the was followed by an enema, and the bowels thorfor six hours The temperature went down to 99 6° From this time she retained food, and showed nothing unusual in the progress of the case. On the seventh day the stitches were all removed (the tube having been removed on the fifth day) showing the walls had united by first intention A well fitting truss, made from the cast of the abdomen, was ad go about the room with comfort months later, she was much improved in health, the fistulous opening into the vagina had closed, and the operation had proven entirely satisfactory submitted the tumor for examination to Dr Adolf Alt, who said it was of the papillomatous form

Coblenz believes that when ovarian tumors show a papillomatous development they invariably arise at the hilum of the ovary, this form is the most com mon affecting these organs, and like villous growths elsewhere is not always malignant. In the malignant form papillary growths will be found in patches upon adjacent structures, or else the womb and broad ligaments are also involved in one cauliflowerlıke tumor Tut observes that he has had two cases of ovariotomy in which he left large masses of papil loma attached to the womb, yet in each case these masses wholly disappeared and the patients are both that this specimen is a benign tumor?

oughly cleaned out, flatus for the first time began to fore the operation, causing the fistulous opening pass, the patient became free from pain and slept May we not conclude, if it is true, as Tait and Bantock claim, that tapping hastens degeneration, and after an accidental rupture of such a cyst the pentoneum will be found studded with patches of papillary cancer (hence they argue that ovarian tumors should never be tapped and that they should be removed in their earliest stages before any malignant transformations have taken place), that had this tujusted four weeks later, which allowed the patient to mor been removed entire at the time it was injured, Examined three there would be no question that it would not return? Grand and Washington Aves

> SIMULTANEOUS TRIPLE AMPUTATION FOR RAIL-WAY INJURY, WITH REMARKS ON THE TECH-NIQUE OF MULTIPLE AMPUTATION

Remarks before the College of Physicians of Philadelphia, March 7, 1888

BY JOHN ASHHURST, JR, MD, PROFESSOR OF SURGERY IN THE UNIVERSITY OF PENNSYLVANIA SUR GEON TO THE UNIVERSITY HOSPITAL

This patient is brought before the College largely on account of the rareness of simultaneous triple major amputations It is quite possible that some of the Fellows may not have had an opportunity of seeing such a case

The patient is a Moor, 20 years of age He was admitted to the University Hospital November 28, 1887, having been run over on the Pennsylvania Railroad I saw him within two hours after his ad-I found a compound comminuted fracture mission of the right leg, the laceration extending above the knee, complete avulsion of the left leg, the limb having been torn off in its lower third, and a compound fracture of a severe character of the right hand There was also a compound fracture of the skull, involving the frontal bone This, however, was an impacted fracture, of course without much depression, and did not require interference addition to these injuries there were numerous brushburns and contusions, some of a grave character One upon the left buttock was so severe that the separation of the slough left a cavity fully two inches in depth Notwithstanding these serious injuries, the patient's general condition was very good, he had reacted thoroughly, and his axillary temperature was Under these circumstances I felt justified in proceeding to the immediate removal of the injured limbs, and amputated successively the right thigh by the antero-posterior flap method, the left leg, about its middle, by a modified Sédillot's external flap operation, the modification consisting in making both flaps from without inward, instead of cutting the external flap by transfixion, and the right forearm by an oval incision, making use of the uninjured skin of the back of the hand and wrist Certain variations from the ordinary procedure in amputations I shall refer to when I come to speak of what I have ventured to term the technique of multiple amputain perfect health. If this is true, may we not hope tions. After the operations were completed, the tem perature had fallen only to 98° F The patient had This tumor was roughly handled five months be- no bad symptom and rapidly recovered, and as you see him now all his wounds are perfectly healed, and tourniquet and Esmarch bandage being both emhe is entirely well

multiple amputations I am able to find but one instance of quadruple synchronous amputation—a case moval of one limb, it will be found that further operin which the operations were done for frost-bite by ation must be postponed on account of the patient's Dr George E Jackson, of Dakota eral cases recorded of multiple amputations, not syn- him with the less severe injuries. In this case I chronous, the one which approaches nearest to a began with the thigh After amputating the limb, I synchronous operation being that of Champenois, a secured the main vessels, which were readily found French surgeon, who amputated three limbs on one I attempted to tie the arteries with catgut, but as the

dry and the fourth a few days later

reported four successful cases, not including that the right leg, securing the vessels in the same man presented to-night one by Dr Kohler, of Schuyl- ner, and then passed to the forearm I then came kill Haven, Pa, one by Dr Lowman, of Johnstown, back to the right thigh, screwed up the tourniquet Pa, and two referred to by Professor Agnew, in his and removed the Esmarch bandage, and secured all Surgery, one occurring in the practice of Dr Stone, of New Orleans, and the other in York, the name of the surgeon not being given There are reported vessels had been secured in each case, a towel dipped four or five triple amputations not synchronous have myself resorted to synchronous triple amputa- flaps tion in two cases Several years ago I had occasion to perform this operation, removing both legs and the right forearm of a man æt 45 years, of intemperate habits The patient died on the tenth day, the fatal result being due rather to the visceral lesions resulting from alcoholism than to the operation

Double amputations are comparatively numerous I have personally performed fifteen such operations, this number not including two successful cases of double partial amputation of the feet I have done the temperature, and even in comparatively slight fifteen double major amputations, of which five have ended in recovery One of the patients who recovered I had the honor of exhibiting to the College some years ago, the amputations in his case were rely upon washing with hot antiseptic solutions before through the right hip-joint and through the left leg In the fatal cases, seven of the deaths occurred in less than one day, the immediate result of the shock Three patients of the injury and of the operation died, one in three days, one in four days, and the The latter would probably third in eighteen days have recovered but that he also had suppurative disease of the middle ear, which appeared to be the cause of the pyæmia which proved fatal, for when the stumps were examined, after death, they were found to he in good condition

With regard to what I have termed the technique of multiple amputations, there are some points which my experience justifies me in urging upon surgeons Wagstaffe says I have been struck, during the place, it is very important that the time occupied by room, with the fact that a natural twist is given to the operations should be brief, that the operations the instrument during its removal from the bladder should be done systematically, so as to keep the patient under the anæsthetic as short a time as possitance, is to keep up the temperature of the patient curacy of one's impression I have adopted, after during the operations I have been led to think that various trials, the simple one of using a bougie à this is, perhaps, of more importance than anything boule of medium size (about No 10 of English guarded against, and loss of blood directly causes bladder, and then withdrawn until a check is felt by loss of temperature In this case, hot cans were kept the neck of the bladder From this point the ob around the patient during the entire operation, and servation starts, and the distances are taken from in order to save time I operated systematically, the this start point

ployed to prevent any loss of blood I began with I have collected some statistics of synchronous the most serious injury, and this is, I think, a point of importance It may happen that, after the re-There are sev- condition, and then it is, of course, better to leave ligatures broke, I substituted silk and, in order to Of synchronous triple amputation there have been save time, left both ends uncut I next amputated the vessels that required ligature, then passing to the other limbs in the same order as before. After the I in a hot antiseptic solution was placed between the The wounds were then dressed in the same order, and in this way the operation was completed in a comparatively short time

> The points which I have mentioned I believe to be of great importance, and I think that much of the disappointment of surgeons from these operations is due to a want of attention to these matters

> I should also say that, in order to preserve the bodily heat, I did not use irrigation during the amputations I think that this often seriously reduces operations where it has been used, I have seen the temperature fall to 97° F, and even 95° F I think that in any grave case, it is better to omit it and to and after the operation Also, the packing of wet towels around the seat of operation, as is very com monly done, tends to depress the temperature, and in grave cases should be omitted

> $ar{\mathbf{I}}$ think that it is to an observance of these precau tions that I have owed success in this case, and in many other serious operations of various character

MEDICAL PROGRESS.

Physics of the Male Urethra -MR W W In the first passage of catheters and bougies in the out-patient and urethra of the male, a rotation very sensible to the feel, especially when light and flexible instru The next point, perhaps of even more imporments are used In order, therefore, to test the ac-Of course, loss of blood must be scrupulously measurement) This is passed thoroughly into the rust outside the meatus by external means piece of fine silk noosed round the stem near the semen by the arrangement of the urethral column After its first start, however, so little traction any external traction bougie à boule no doubt helps to explain this forward movement, as the urethra contracts upon a conical as' Hospital Reports, vol vi Where stricture is said to have existed in these cases it was either very slight or imaginary, for the bougie equal to No 10 English passed without difficulty When a rather larger instrument was used no material difference was noticeable in the results, but, as may be seen in Obs ix and x, a larger instrument sometimes showed the results more clearly, nd in this case the urethra was larger than usual

The first result of these observations is that in all the cases the direction of the rotation given to the In one case the rotation began bd igie is the same with a small divergence to the patient's right side. but this was followed by the usual rotation to the In all the other cases rotation began at once to the patient's left for a certain distance and to a certain degree-generally making the index stand directly opposite its original position-passing, that 1s to say, through 180° or half a circle This position was reached when the instrument had passed about 4 inches from its start, and then began a reindex stood at right angles to the start An explanation of the phenomenon is probably to be found an the peculiar construction of the urethra In the ordinary (collapsed) state the canal is represented by a fissure bounded by columns of mucous mem- losis, 2 had diabetes brane which may be traced from the bladder outwards, running in the direction of an elongated spiral The change begins in the prostatic urethra, where the tube as seen in transverse section takes the form of an inverted U, owing to the upward projection of the verumontanum point that the rotation of the catheter begins the apex of the prostate the fissure is shorter and horizontal, with only a slight convexity forward in the bulbous horizontal, with a slight sinuosity. The the glans is gradually replaced by an inverted T, the vertical limb of which, at first very short, gradually elongates, while at the same time the horizontal limb becomes shorter and at length disappears, leaving a single perpendicular slit that ends at the external

The degrees of rotation are estimated by means somewhat after the manner of a gun-barrel, but the of a pin fixed vertically into the stem of the bougie spiral of the urethral tube, which runs from right to The bougle à boule having left in about the upper three fourths of its length, ususo fine a stem, and a bulbous end which can be read-ally becomes reversed near its distal extremity The ily grasped by the part of the urethra it is in contact object of the spiral grooving in the case of the gun is with, is rotated with readiness, and I have therefore to secure for the projectile a rotatory motion and been careful to avoid any rotation being given to it greater precision in the direction of aim, and we may I have found that the simplest fairly assume that similar advantages of a physiologimeans of withdrawing the bougie has been by a cal nature are gained for the outflow of the urine and

The practical application of these observations is is necessary that the observations have to be taken not yet obvious, but it is a question whether the arpromptly, as the instrument is passing often without rangement of the urethral mucous membrane may The shape of the bulb of the not point to the kind of rotation which would render most easy the introduction of a catheter - St Thom-

OPERATIONS FOR RECTAL FISTULA -GREFFRATH reports 61 cases of rectal fistula operated on in the The fistulæ occurred be-Heidelberg Polyclinic tween the ages of 20 and 40 years in 57 4 per cent of all cases The youngest patient was 6 months Only I case occurred in a woman The fistula was incomplete external in 655 per cent, incomplete internal in 4 9 per cent, and complete in 29 5 Of the incomplete external (33 cases per cent noted) the fistula was lateral, between the anus and tuber ischii in right side, in 242 per cent, on left side, same situation, 39 4 per cent, around the anus, with different openings, 24 2 per cent, external opening in the middle line behind the anus in 122 per cent The seat of the incomplete internal fistula was in every case just above the external sphincter Of the complete fistulæ (noted in 17 cases) the seat was on the left between the anus and tuber ischil in 41 2 per cent, right, same situation, 17 6 per cent, verse rotation, usually, but not invariably, until the around the anus, with different openings, 5 9 per cent, external fistulous opening posterior 23 5 per cent, anterior 11 7 per cent

Of the 61 cases 10 had symptoms of pulmonary tuberculosis, 7 had hereditary tendency to tubercu-Of the patients 2 had had acute rheumatism, r attributed his trouble to longstanding hæmorrhoids, i to eczema, 3 to local injury and causing progressive alteration in the form of the In 9 the fistulæ seemed to have come on spontaneously, and 43 gave the history of a small abscess having formed and caused the trouble

In 16 cases the fistula was operated on by means It is at this of the knife, in 43 with the thermo-cautery 16 operated on with the knife 11 had normal internal organs, 3 had symptoms of pulmonary tuberculosis, In and 2 had hereditary tendency Of the 11 with the membranous urethra the section becomes stellate, healthy organs 80 per cent were completely cured, latter form is maintained through the greater part of Of the 3 phthisics I died of sepsis, I was not cured, 1 died (of tabes?), and 1 was not completely cured the penile portion of the canal, but in approaching it lost sight of Of the 2 with hereditary tendency I was not cured, I lost sight of

Of the 30 cases with healthy organs treated with the thermo cautery 4 were lost sight of, 22 were

single perpendicular slit that ends at the external meatus

In tracing out these changes carefully upon the subject it will be found that the urethra is rifled

It is sometimes stated that a twisted stream is one of the early signs of stricture but this is misleading since the normal outflow is always perceptibly spiral. This phenomenon is perhaps not altogether subject it will be found that the urethra is rifled of a narrow smooth-edged slit does not continue in a straight 'tape" jet, but is shot out as a spiral.

completely cured (85 per cent), 3 not completely | had in acute cases in which the temperature became cured, 1 died (presumably of phthisis) Of the 5 almost stationary after a period of fever, and in with hereditary tendency 2 were completely cured, which, as a rule, the lesion was catarrhal and unilat-2 died of phthisis (whether fistula was cured or not eral is not known), and i died, with questionable diag- 6 or 7 m of creasote a day, he has not given more nosis Of the 7 with phthisis treated with the thermo- than 7 m, and thinks it necessary to continue treatcautery 2 were lost sight of, 1 completely cured, 2 not cured, a died of phthisis, uncured

Grestrath concludes thus

1 The eschar made by the thermo cautery protects the wounded surface better from infecting material from the first day, and with care the patient may go to stool on the first or second day after the operation

without homorrhage of any importance

3 Better granulations are obtainable from the thermo cautery than after the use of the kmfe

adhesion of the wounded surfaces impossible

After the use of the thermo-cautery antisepsis can be carried out more efficiently, and Greffrath recommends iodoform as an excellent antiseptic in these At the conclusion of the operation the whole wound is disinfected with a 5 per cent solution of chloride of zinc, and then iodoform is applied

Greffrath's cases and results lead him to consider the question of operating on rectal fistulæ in phthisi-

He concludes that cal patients

1 There is a causal nexus between tuberculosis and rectal fistula, but tuberculosis does not contra-

indicate operation on the fistula

2 Fistulæ form in diabetics on account of inflammation of the cellular tissue, and patients suffering from rectal fistulæ should have their urine examined for sugar - Deutsche Zeitschrift fur Chinungie, Bd 26. Hst 1 and 2

Anthrarobin in Dermatology -Anthrarobin is a product intermediate between chrysarobin and pyrogallic acid, superior to the second, and without It is a yellow pow the inconveniences of the first der, soluble in 10 parts of pure glycerine and in 5 parts of absolute alcohol at 100°, and more soluble in the latter in the proportion of 1 2 at a temperature of 15° C When applied to the skin it colors it yellow, and causes a slight sensation of dryness

According to Liebermann and Behrend it is used by bathing the affected part with the alcoholic tineture or with a 10 per cent glycerole, and munction Its application with a 10 to 20 per cent pomade should be preceded by bathing the affected part with an alcoholic solution of potash soap Its indications In psoriasis it is applied are those of chrysarobin by friction with a brush, after removing the crusts In herpes touserans Behrend claims that it is equal to chrysarobin - Revue Gen de Chnique et de Thérap —March 22, 1888

CREASOTE IN PHTHISIS -VON BRUNN has treated 1700 cases of phthisis with creasote in 8 years, and The cases were both ambulatory, in which there was but little rise of temperature, and with good results cases of active tuberculosis The best results were ruary, 1888

Von Brunn thinks it unwise to give less than ment for several months The more creasote the patient can bear, the better, he thinks He uses the the creasote wine originally prescribed by Bouchard

Creasote	13 parts
Tr gentian	30 ''
Alcohol	250 "
Tokny or Malaga wine	ad 1000 "

One teaspoonful well diluted with water three times 2 The operation can be done in a few moments a day -Berlin klin Wochenschrift, Feb 20, 1888

ITAI IAN TREATMENT OF PULMONARY TUBERCULOsis —Prof Enrico de Renzi (Il Morgagni, abstract 4 The eschar of the cautery makes the immediate in Centralbl fur d gesammte Therapie, February, 1888), passes under review the influence of creasote by the stomach and by inhalation, of iodoform, turpentine, iron, sulphuretted hydrogen, sulphurous acid, etc , by inhalation, and of the gaseous rectal injections

Excellent results were had from the iodoform inhalations, and also from sulphuretted hydrogen Cre asote in considerable doses greatly lessened the bron chial muco-pus and the purulent matter of cavities, and exercised a favorable influence over the general The following formula was used nutrition

C	5 parts
Crensote (pure)	100 ' "
Alcohol	** **
Balsam of Peru syrup Water	\$\$ E\$

Dose, 1 tablespoonful

The rectal gas injections exercised a favorable influence on cough and expectoration, but had no effect on the existing pulmonary lesions

He concludes that the most clearly curative effects are obtained by large use of 10dine and 10doform-Amer Jour of the Med Sciences, April, 1888

STOPPAGE OF THE NATURAL FLOW OF URINE, SAYS ULIZMANN, may be caused by

1 Occlusion of the smaller urmary tubes, as in

cholera and any of the renal diseases

By occlusion, twists, and turns in the urethra Ultzmann records the case of a man, æt 43 years, with calculus of the kidney, who suddenly developed anuria, which caused death in two weeks topsy showed a cyst of the left kidney as large as a goose-egg, with obliteration of the ureter, and on the right side an enlarged kidney, with three small stones

By a tumor of the bladder -Internal klin filling the ureter Rundschau, Nos 9-17, 1887

OINTMENT FOR SCABIES -LASSAR uses the following ointment

Naphthol, grm 5-10 Gum soap Precipitated chalk Washed sulphur

THE PUBLIC AND PUBLIC HEALTH

Desired advances in public health reforms and legislation can scarcely be hoped for in a country of universal suffrage until the public, and especially the leaders of the public, are educated up to the point of knowing what public health, in its broadest sense, means, and until it is made plain to them that the whole matter may be reduced to one of dollars and cents. Business men are always ready and willing to listen to any one who can show them how dollars and cents may be made and saved. The public press, recognizing this fact, is always willing to publish anything that will show people how to save or make money.

But the public and the press want something more than ambiguous statements, they want facts and figures, that carry conviction on their face It is not enough to tell them that certain sanitary reforms and measures have saved lives and money to a country, they want to know how many lives, how many years of aggregate life, and how many dollars Populus vult decipi is a hackneyed and often untrue saying People do not wish to be deceived In the majority of cases in which they are deceived, they act on the best of their knowledge and belief, they have not been taught what is best for them, and pursue the wrong path because they cannot read the sign-board that is so plain to the more fortunately educated

Public health legislation and medical legislation have been and are difficult to secure by popular vote because the people are inclined to look upon such as class legislation. An example of this tendency may

be found in the Congressional Record, of March 27, in the ten-page debate on the anatomical bill for the The members of the House District of Columbia that opposed it showed, by their objections and the foolish amendments offered for the purpose of making the bill non-operative, or of killing it, that they regarded it as a piece of legislation entirely for the good of the medical profession, and hence for the detriment of all other classes of people Such ideas are fostered and disseminated by the public press, especially in new countries, and in the newer and more recently civilized parts of new countries, where an assumed title of "Professor" carries more weight than utterances of modest wisdom Members of the press seem to reason as follows People that advertise in our papers are wise, good and honest, reputable physicians do not advertise, ergo, reputable physicians are not wise, not good, and not honest Scarcely a month passes in which every one of the newspapers of this city do not publish, editorially or otherwise, spiteful and malicious articles concerning the medical profession, thus following in the footsteps of a notorious Chicago journalist, sometime deceased, who was known to be insane for years before his death In regard to the matter of advertising in newspapers, it does not seem to have occurred to the writers to find out why reputable physicians think such advertisements improper, and why they must in the end, be detrimental to the public

As was said at the outset, the public and the leaders of the public must be educated up to the point of knowing what sanitation and public health mean But how are they to be taught? One may hire a hall By this method, however, only a very and lecture small minority of the public are reached through the daily press that the public is best reached As a rule, however, the daily press will not give space to such information It does not contain the details of a triple murder, or a scandalous divorce case, it is not "taken from the diary" of some ignorant detective or policeman, that probably never kept a diary, it has no information concerning prize fights and base-ball games, and, a fatal objection, it gives no opportunity for publishing a bad wood-cut of some notonous woman or thief With these objectionable and even fatal defects, an article on any subject relating to public health is not considered "news" by the Palladium of our Liberties

Some time since the Agricultural Department of Wisconsin University published the results of an example of this tendency may

pigs The publication was sent to a large number of papers, both in this country and England Not a single paper in North America gave as much as one column to a review of the experiments An English paper, on the contrary, gave more than a page to the subject.

The newspaper is the best medium for the dissemination of knowledge among all classes because it is cheap. If, on the one hand, one ask the editor of a daily newspaper why he does not print what will teach the public and give it information, he promptly replies that teaching is no part of the business of a newspaper. If, on the other hand, one be asked, what is the great means and medium for instructing the public? he answers, just as promptly and positively "The daily press"

There are some papers that, at intervals, attempt to discuss scientific matters, sanitary, medical, and Just about as often as these attempts are made, however, facts are so misstated and distorted (generally unintentionally) that what is written has It would seem that an editor that had any desire to give facts would have such articles written by men competent to write on these subjects, in which case well-informed men would not be disgusted, and the general public would not be misinformed This is done to a very large extent in England and on the Continent, and when articles of this kind appear in such papers as the London Times they are generally of such a nature as to carry conviction There is no more important field for a great daily newspaper to work in than that of informing its readers on public health matters

But how can a newspaper consistently preach public health in its editorial columns, and at the same time sell advertising space to quacks? Long usage and experience shows that consistency is not among the jewels that may be owned by a newspaper. And it may be said that sanitarians should be tolerably well satisfied if the papers would begin to pay some attention to public health matters. As the matter now stands, so soon as any one begins to agitate for sanitary legislation, the public and the newspapers cry out that the doctors want something for themselves. They may be informed, however, that all the doctors ask for themselves is that the public will be more prompt in paying their doctors' bills

EXTIRPATION OF THE LARYNX —On February 19
PROFESSOR CACCIOPOLI, of Naples, performed the
13th extirpation of the larynx in Italy—for sarcoma
of the larynx

CESOPHAGOTOMY FOR FOREIGN BODIES

In the Deutsche Zeitschrift fur Chirurgie, Bd xxv, S 565, 1887, GEORG FISCHER, of Hanover, published a list of 80 cases of æsophagotomy for foreign bodies, with remarks on the general indications as to treat-He has recently (Deutsche Zeitschrift für Chirurgie, Bd xxvii, S 273, 1888), republished his list, stricken out one case, and added 29 published and unpublished cases, making a total of 108 cases from which to draw conclusions Of these Germany furnishes 26, Great Britain 20, North America 19, Austria 12, France 10, Italy and Russia 10 each, Denmark 3, Switzerland, Belgium and Holland 2 each, and Spain and Asia 1 each Of 100 cases 67 were male and 33 female In 6 cases the foreign bodies stuck in a stricture of the œsophagus, 5 of these in Billroth's clinic, I of which was twice oper Between 1738 and ated on (1n 1878 and 1885) 1870, 31 œsophagotomies were performed, and 17 since 1870

Taking out a case of œsophagotomy in which gas trotomy was subsequently performed, with a fatal result, 107 operations give 79 recoveries and 28 deaths, a mortality of 26 16 per cent A study of the cases as regards the time that elapsed between the impaction of the foreign body and the operation shows that the mortality of operations done during the first two days is about 5 per cent less than between the third and sixth days (inclusive), and that the mortality of operations done during the first three days is about 15 per cent less than between the fourth and eighth days (inclusive) Of 70 opera tions done during the first eight days 27 14 per cent were fatal, but of 9 between the first and fifth week 22 22 per cent were fatal, and of 14 done after the In regard lapse of months or years 21 42 were fatal to the age of the patients, the mortality of 9 operations between the ages of 10 and 20 years was nil, between 20 and 30 (18 cases) 11 per cent, between 30 and 40 (21 cases) 28 per cent, between 1 and 10 (12 cases), 40 and 50 (12 cases), and 50 and 60 (6 cases) 33 per cent, and between 60 The youngest patient was 11 and 70, 80 per cent One child of 16 months, 2 of 2 months old (died) years, and 4 between 3 and 8 years recovered, though 1 had 20 epileptic attacks within 24 hours after the The oldest patients were a woman of 70 operation (died), and a man of 74 (recovered)

In regard to the nature of the foreign bodies, 34 operations to recover false teeth gave a mortality of 20 per cent, 33 for impacted bones of various kinds gave 33 per cent of deaths. Of 7 operations for impacted coins 1 died. All the cases in which fruit

stones (6 cases), needles (5 cases), and fishbones (2) were operated for recovered Two operations for These were the foreign bodies stones gave 1 death that indicated the operation more than once

Fistula after operation occurred in Cheever's first three cases, but the fistulæ, caused by reopening of the wound, closed again Of the fatal cases, 12 were caused by ulceration, perforation, or gangrene, with involvement of the posterior mediastinum, burrowing of pus into the pleura, stomach, and to the base of the skull, and to pneumonia and pulmonary gangrene, 6 deaths were from hæmorrhage, 5 from exhaustion, I each from sepsis, pulmonary cedema. tuberculosis, and pulmonary trouble In regard to the deaths from hæmorrhage (6), in half of them the foreign body wounded an artery, and hemorrhage took place from the mouth or into the larynx and No fatal hæmorrhage occurred during an In 3 cases the hæmorrhage occurred operation during the after-treatment, from unknown cause, in 1 case the ascending cervical artery rupturing on the eighth day, in I case presence of a drainage tube, with the assistance of a 5 per cent solution of chlo ride of zinc, caused hæmorrhage from the common jugular, and in 1 case the thyroid cartilage was most probably wounded by the stomach tube tion carried off a 3 year old child, 3 patients between 60 and 70 years, and a man that had had a set of teeth in his œsophagus for 12 years The case of pyremia occurred in Nussbaum's service in the Munich Hospital in 1868, "when pyemia was the order of the day "

The indications given by Fischer for the opera-1 A recently swallowed for tion are as follows eign body must be removed by œsophagotomy, in case the bloodless method fails up to the end of the day after it was swallowed Tracheotomy must be performed for threatened asphyxia 2 If the foreign body has been impacted for some days one trial may be made with the bloodless method, and if this fail esophagotomy should be performed im-3 If the nature of the foreign body be mediately such that any attempt at extraction or to push it down is dangerous, operate immediately 4 When infiltration of the neck already exists, or when hemorrhage has taken place from the mouth, esophagotomy must be done at once These indications presuppose that the surgeon sees the patient early As a rule, however, the patient goes from one physician to another, each one attempting to remove the body, until finally, possibly after the lapse of Gays, the patient goes to a hospital Precious time has

perforated, and the favorable time for operation is The physician, should he not wish to operpast ate, should send the patient to a surgeon without making more than one or two attempts to remove the body

Of the technique of the operation, and of the after-treatment, something may be said The diagnosis and location of the body may be rendered un certain by enlarged or softened glands (case of Konig), or an abnormally large carotid tubercle may cause an error (case of Esmarch) It must be remembered that the body may slip into the stomach during an esthesia on account of the now relaxed condition of the esophagus The body may be too large to remove through the incision, Lawson had to cut a set of teeth in two with bone-forceps in order to remove them It does not seem advisable, according to Fischer, to lay down any rule in regard to whether the œsophageal wound should be sutured If the suture be used berhaps it is best to use isolated sutures, first used by Colin on animals, and recommended by Terrier As to feeding the patient, Fischer says r Every patient with a suture in the œsophagus should take fluid food a few hours after the operation, but should not be fed with an œsophageal tube Exceptions are cases of incomplete and very painful deglutition and extreme exhaustion of the patient 2 Under the open treatment of the wound the patient should be fed at first by means of a tube carried into the stomach through the wound

PRFVENTION OF DIPHTHERIA

In complying with the request of a correspondent, in The Journal for March 31, 1888, we gave as the formula for preventing diphtheria "an abundance of pure air, good water, wholesome food, clean soil and a clean personalty" Now we are asked by another highly esteemed correspondent, whose letter can be found in another column, whether we have not "accidentally given the wrong formula" And he suggests as the "correct formula for the prevention of diphtheria isolation and disinfection " In reply, we ask whether our formula was a mistake, or whether our correspondent has mistaken the object for which our formula was given? If the conditions given in our formula actually exist in any community or household, what can our sanitarian find to isolate or disinfect? The coexistence of the conditions being established, the only thing necessary is to maintain been lost, the esophagus has been injured, perhaps infection or cases of infectious disease as the presence of either at once destroys the conditions demanded by our formula But if the air, water or food are allowed to become contaminated by the presence of infectious persons or things the primary question is not one of prevention, but of how to get rid of what already exists? In answering this question, the formula of our correspondent becomes appropriate, te, isolate the infectious person and disinfect or purify all the infected surroundings, until the conditions of purity required by the formula for prevention are restored

MFDICAL GRADUATES IN FRANCE -From 1882-83 to 1886-87, inclusive, the six diploma-granting faculties of France graduated 3057 students deaus graduated 378, Lille 76, Lyon 242, Montpellier 338, Nancy 104, and Paris 1919 From 1882 -83 the number of graduates steadily diminished from 662 to 546, in 1886-87 the number rose to 624, but in this year 99 diplomas were granted, under the new organization of the service de santé, to members of the corps de sante of the marine, leaving 525 diplomas granted to actual students of medicine, which is proportional to the diminishing ratio of the preceding sessions

PRIZES OF THE LOMBARD INSTITUTE -For 1888 A well demonstrated discovery in the treatment of pellagra, or on the nature of contagious miasms Memoir to be deposited before De-(2500 francs) 1 History of hypnotism, For 1889 cember 31 critical examination of questions relating to it, with personal experiments (1500 francs) 2 Original researches hand before April 30, 1889 on the embryology of the nervous system of mam-3 Show some point in the mifers (2000 francs) macroscopic and microscopic anatomy of the human brain (2000 francs)

MAL PERFORANT AND SPINA BIFIDA -Kirmisson published (Bulletin Médical, Sept 7, 1887) a case of perforating ulcer which he ascribed to spina bifida S Bonandi (Gazette degli Ospitali, March 21, 1888) also publishes a case confirmatory of Kirmisson's case, and concludes that it is at least plausible that the arrest of development of the vertebral column and the dystrophy of the spinal cord is the primary cause of mal perforant in cases of spina bifida, and that these cases support the theory of the nervous origin of the foot affection

LIEBERMEISTER and ERB have both declined the Tenn

Chair of Clinical Medicine in Leipzig made vacant by the death of Wagner

SEVEN AMERICANS attended the chemical laboratory of Prof Fresenius in Wiesbaden this session, out of a total of 75 students

ASSOCIATION ITEMS.

The following additional titles of papers to be read at the approaching meeting have been received since the programme was published in the issue of THE JOURNAL for April 7

Section on Practical Medicine

"The Unity of Tuberculosis," by J H Musser,

Philadelphia

"My own Clinical Experience in the Administra tion of the Iodide of Potassium in the Treatment of Syphilis," by Morris H Henry, New York

Obstinate Hæmaturia and its Treatment, by H

D Didama, Syracuse

Section on Obstetrics and Diseases of Women "Treatment of Acute Peritonitis," by William H

Myers, Ft Wayne, Ind

"The Value of Galvanism as Applied by Apostoli in the Treatment of Fibroid Tumors of the Uterus, with Cases," by Franklin H Martin, Chicago

Section on Diseases of Childien

"Membranous Croup and Laryngeal Diphtheria, Are they Identical?" by I N Love, St Louis

Section on Surgery and Anatomy

"On the Radical Cure of Varicocele Attended with Redundancy of Scrotum," by Morris H Henry, New York

Section on State Medicine

AMENDED LIST

At the coming meeting of the American Medical Association at Cincinnati, O, May 8 9, 10 and 11, papers are expected before the Section on State Medicine, as follows

First Session, Tuesday, May 8 Address by the Chairman of the Section, "Recent Advances in State Medicine," by Henry B Baker,

"Should the National Government Defend our Lansing, Mich Ports Against the Invasion of the National Enemy, Contagious Disease?" by Benjamin Lee, Secretary of the State Board of Health, Philadelphia, Pa

A paper (title not yet learned) by J N McCormack, Secretary of the State Board of Health, Bow-

"Cremation of Garbage," by J Berrien Lindsley, ling Green, Ky Secretary of the State Board of Health, Nashville,

"House Drainage," by Joseph Edwards, Philadelphia, Pa

SECOND SESSION, WEDNESDAY, MAY 9

A paper (title not yet learned) by E O Shakespeare, Philadelphia, Pa

"Personal Prophylaxis Against Malarial Disease,"

by Geo H Rohe, Baltimore, Md

"Atmospheric Temperature and Intermittent Fever," by Henry B Baker, Secretary of the State Board of Health, Lansing, Mich

"Abstract of Laveran's Researches on the Hæmatozoon of Malaria," by S T Armstrong, U S Ma-

rine Hospital Service

"The Internal Origin of Fevers," by J A Larra-

bee, Louisville, Ky

"Uniform Medical Practice, Report by a Committee of the Association," by Perry H Millard, Cn'n

Third Session, Thursday, May 10

"Recent Discoveries and Researches with Regard to a Common Cause of certain Infectious Diseases," by C W Chancellor, Secretary of the State Board of Health, Baltimore, Md

"The Causation of the Essential Fevers," by Vic-

tor C Vaughan, Ann Arbor, Mich

"Hygiene of Infancy and Childhood," by T B Greenley, West Point, Ky

"Eastern Carolina as a Residence for Tuberculous Patients," by J M Baker, Tarboro, N C

"The Duty of the State and of the American Medical Association to Consumptives and their Medical Advisers," by I E Woodbridge, Youngstown, O

Each paper should take twenty minutes, and there

should be discussion after each paper

If those who are to contribute papers see any error or omission in the title as here given, they will confer a favor by notifying the Secretary of the Sec tion, S T Armstrong, M D, Marine Hospital Service, New York, or the undersigned,

HENRY B BAKER, Chairman of the Section on State Medicine, American Medical Association, Lansing, Mich

SOCIETY PROCEEDINGS.

ST LOUIS MEDICAL SOCIETY

Stated Meeting, March 3, 1888 THE PRESIDENT, Y H BOND, M D IN THE CHAIR

Dr I N Love read a paper on

THE PRACTICAL APPLICATION OF GLYCERINE

There is no one disturbance that superficially viewed, seems so trivial, and yet which may be the cause, directly or indirectly, of such positive injury to the human anatomy as constipation In infantile life, and during all ages, particularly among women,

Any procedure stipation, cannot be computed that promises relief for this dire disturbance should be thoroughly tested, and if efficacious, adopted

In the British Medical Journal, of December 24, 1887, Dr Julius Althaus reports, with the endorsement of his own experience, a procedure recommended by Anacker for the relief of habitual constipation, viz, the injection by means of a small glass, or hard rubber syringe, of a teaspoonful of glycerine An evacuation of the bonels into the rectum usually occurs immediately, or within a few minutes

The rationale of its action given by Anacker is that glycerine, in consequence of its pronounced affinity for water, when placed within the rectum, abstracts moisture from it, causing hyperemia and irritation of the sentient nerves of the rectum, which leads reflexly to active and prompt peristaltic contractions, ending in defecation The greater the accumulation of fæcal matter in the rectum, the There is no unpleasantmore decided the effect ness or pain, but the action takes place cito, tute et jucunde Sometimes a little fulness and throbbing is felt in the rectum for a few minutes afterwards

Althaus expressed the opinion that this plan, on account of its simplicity and readiness, would be found to constitute a ventable improvement in the therapeutics of constipation The simplicity and practical value of the idea impressed me the moment my eye fell upon the article of Althaus, and I demonstrated its value within an hour, and from that time to the present, a period of over six weeks have applied it many times daily where the conditions suggested it, and no matter what the age, or degree of constipation, the response has been uni form and prompt In a large number of infants and mothers where habitual constipation had been present from the birth of the former the remedy produced instantaneous relief, and coupled with broken doses of the mild chloride to stimulate the secretory system, I believe it furnishes a key to unlock the constipated condition which can be depended upon I have directed the use of the glycerine injection at a definite hour each day, and have succeeded in establishing regularity in almost every instance

There is no question about the securement of an evacuation almost immediately after the glycerine injection The main point in order to obtain a result that will be lasting in character is to impress the patient or attendant with the importance of giving the injection at a certain time each day cases of piles and severe rectal irritation accompanying constipation, both conditions were more satisfactorily relieved by the glycerine than they had been previously by purgatives and sedative oint-This remedy is a valuable one in being ments efficient, simple and convenient. It is surprising that some one had not thought of and applied it

Apropos to this subject, Dr Edward R Mayer, of Wilkesbarre, Pennsylvania, reports in the Medical it is a prevalent disorder. The number of cases of News, of February 25, the use of an injection of two humorrhoids, prolapse of the rectum, fissure and fluid ounces of warmed glycerine through a large fistula of the anus, not to speak of the cases of fever flexible rectal tube, inserted at least seven inches, due to absorption of ptomaines, all traceable to con- for the relief of intestinal obstruction due to paralysis of the muscular coat of the bowel, superinduced truded by the pouring out of large quantities of and accompanied by peritoritis All other means liquid, and by the violent expulsive efforts of the for securing an evacuation of the bowel having muscular coat of the intestines to exert their specifailed, Dr Mayer having been uniformly successful in the application of the Anacker-Althaus plan of using glycerine, it suddenly occurred to him to extend and amplify the method as above stated insertion and the injection produced no distress or immediate effect, and he left the invalid with directions to her nurse to cause the hips and knees to be Upon his return after several elevated for a time hours, he found a greatly changed condition of affairs, comfort where their had been agony, and an anxious and pallid countenance replaced by beam-

ing smiles and hopeful expression

He was informed that within ten minutes after the administration of the glycerine enema, the patient felt a warm thrill and glow extending itself and permeating all through her intestines, followed by the tion of gaseous rectal medication " vermicular movements which precede peristalsis, by audible and sensible displacements of gas, and finally by acute colicky pains Within twenty minutes after the injection, there was an urgent call to stool, with the result of the escape of a large amount of flatus, and later, of a pint of semi-liquid evacuation of mingled yellow and green color, with some small scybale and a very pronounced odor evacuation was succeeded in an hour by another of Considerable tympanites and a similar character tenderness still existed, but the abdominal distention was decidedly reduced, and the distress greatly The temperature, which had been kept depressed to about 100° by the antipyrin, soon fell to 99°, and the thready, jerking pulse of 120 had descended to 100, and the next day was not above 90, becoming rapidly soft and full The nausea abated, and in a few hours disappeared and did not return

Enemata of warmed glycerine to the extent of two ounces each, were now administered night and morning during the next three days, each one resulting in a copious fæcal evacuation, at first liquid, The temperature varied during and then formed several days between 99° and 99 6°, the pulse soon dropped to 80, the tenderness gradually disappeared, and the distention slowly melted away Milk punch, beef-tea, and revalenta arabica were greedily taken in small quantities, retained and digested, and upon the ninth day of the illness, the patient, while feeble, was entirely convalescent, a salutary diarrhœa having set in after the enemata were discontinued, and The only drug treatment employed soon ceasing after the symptoms improved, was a single very small dose of a saline laxative and a nightly hypodermatic of six minims of morphia solution, to se-

The result in this case was extremely satisfactory, and very important in its suggestion of possibilities Dr Mayer further says "If glycerine, injected by

the method described, does really penetrate and permeate the upper colon or even the small intestine, it remains to be ascertained whether drugs combined with it as their vehicle, would measurably reor would be too completely washed away and ex- remedies in glycerine solution were not taken up

fied influence Should it be that any considerable portions of such drugs would remain in situ, it is manifest that an improved method of internal medication is near at hand, and that such drugs as antifebrin, antipyrin, aloin, belladonna, calomel, croton oil, colocynth, ergotin, hydrastia, hamamelin, naphthalin, physostigma, the terebinthinates, and even nitrate of silver, and some of the germicides may be introduced by an entrance into portals hitherto closed to them excepting by a devious journey through the ordinary avenues He would be a rash man who, with our present knowledge, should attempt to sterilize typhoid bacteria by a direct attack upon the agminate glands, but stranger things than this have happened, particularly of late, in the direc-

DR ROBERT BARCLAY I am glad to hear the doctor's testimony added to that which already exists as to the efficiency of glycerine as an aperient He speaks of its use by rectal injection, which to my mind is a very disagreeable method of administering it, except in the case of helpless patients, where there are large fæcal accumulations, or in The aperient properties of very young infants glycerine have been known for years, it has been in use as a adjuvant to other aperients It has been my custom to prescribe castor oil and glycerine, in equal parts-an ounce of each-with a few drops of oil of wintergreen added to give a pleasant flavor This often has a good effect where castor oil alone I give it by the mouth and not by will not answer the rectum It is just as well to give it in an agreea-

ble way and by the natural passage

I had occasion to treat some cases DR DEAN of oxyuris vermicularis, and I used glycerine with good effect I related this to Dr Hermann, of this city, and sometime afterward he brought me two children who were troubled with oxyuris vermicularis, they were little girls, and the worms had gotten into the vagina, which is frequently the case used glycerine in these cases with good effect I advised him to be careful in the use of glycerine, I have however, but he got an excellent result often seen the good result of the use of glycerine injected into the rectum of children for this trouble The worms shrink and shrivel up, and it is only a few minutes until the bowels are emptied of the The astonishing feature to me is that the beneficial effect of glycerine in the condition mentioned by Dr Love has not been discovered before I have for many years used glycerine injections for these worms that I have mentioned, but it is only within a few days that I saw this use of glycerine in constipation suggested

Some years ago I read DR FRANK GLASGOW an account of a series of experiments which had been instituted by some Frenchman, who made various applications of medicine to the surface of the body for the purpose of determining whether they would be absorbed or not He found that

This is probably because there is into the blood an exosmosis going on, of the watery particles of the was the same process which caused the result, which June and had not seen anything in July would render inoperative the use of glycerine per rectum as a vehicle for the conveyance of systemic remedies

The suggestion which Dr Glasgow has made is a very good one, and it is probable that the use of glycerine for the purpose suggested by Dr Meyer would be contra-indicated I want to say that Dr Barclay failed to grasp the main idea in the paper, that is that the glycerine by injection on account of its affinity for water produces an irritation of the sentient nerves followed by a peristalsis, and this secures a prompt action, the impulse being given from below upward securing a prompt effect The administration of glycerine by the mouth has no bearing on the subject whatever

MEDICAL SOCIETY OF THE DISTRICT OF COLUMBIA

Stated Meeting, December 7, 1887 THE PRESIDENT, JOS TABER JOHNSON, M D. IN THE CHAIR

DR P J MURPHY read the history of and presented the specimen of a case of

HYDATIDIFORM MOLE

Mamie H, colored, æt 18, single, first applied at Columbia Hospital Dispensary for, as she expressed it, "womb disease," Feb 9, 1886 She began menstructing at 13 years and for the following two years she had no difficulty with the flow She then became irregular, being unwell two or three times a month, and again seeing nothing for six or seven weeks She suffered intense pain at every menstrual epoch June, 1886 and usually the flow was profuse Now has a great deal of pain in back and a feeling as if her insides were coming out below She has a profuse leucor accompanying relative and herself an examination time ago was made The vagina was found to be quite capa cious and the uterus was of about normal size There pregnancy in 1886 was marked retroversion and retroflexion of the uterus and its cervix was close under the pubes, the anterior forms of the vagina was obliterated She continued about the same, working in the capacity of household servant, and was admitted to the hospital June 22, following The uterus was now found enlarged, slightly, and prolapsed, posterior lip of cervix elongated and anterior lip occupied by a hard mass about the size of a hickory nut July 7, after some paroxysms of pain she passed off "something" that upon exammation proved to be a fœtus of about 5 weeks development She was discharged from the hospital August 24, feeling excellent She was not again seen until she presented herself again at the outdoor ser- a tumor? vice of the hospital, August 9, 1887, complaining of

of appetite, and very much worned about her "courses" She had been irregular and profuse durblood, to the glycerine It occurred to me that this ing the spring, had been unwell three times in Dr Love mentions, and if so it seems to me it visit her breasts were swollen, deeply pigmented about the nipples and presented to view many of the enlarged papillæ known as Montgomery's tubercles The uterus was very much enlarged, extending about half way up to the umbilicus, and was quite soft Knowing her previous history, pregnancy was sus-October 14 she again returned and stated pected she had been confined to bed, had been unwell three She was requested to weeks, and was still flowing keep quiet in bed and was given 20 grains of potassic bromide three times a day November 1st, presented herself, saying she had been unwell three days and was in a bad way Abortion was suspected, and an examination made A mass of hydatidiform cysts was found protruding from the vulva and As much of it extending into the uterine cavity was removed as possible without entering the cavity The patient was readmitted to hosof the uterus pital, put in bed, and given a hot carbolized douche Some slight hæmorrhage with passage of shreds occurred for two or three days, and she was given 25 drops of aromatic sulphuric acid three times a day November 6 she was etherized for examination There was marked resonance on percussion all over abdomen, uterus not felt above pubes by external manipulation Cervix uteri small, uterus enlarged and thrown forwards, and its cavity measured four inches in length, some slight bloody discharge, the growth in the anterior wall of the cervix was still prominent, the index finger passed into the cervix as far as the internal os She was given pil ergotin comp (Schieffelin), one three times a day November 19, uterus about normal size and condition, patient felt well and was discharged from hospital

She declared she had not had sexual intercourse since the date of her first admission to the hospital. This declaration may be false, yet it is

possible it was true

DR T C SMITH Dr Murphy's specimen is in-It will be remembered that he presented teresting rhoea, otherwise feels all right At the request of her a specimen and read the histories of two cases some The interesting point is whether the hydatid degeneration developed at the time of the The woman may abort one of a twin pregnancy and retain the other in a degener-In such cases the question of chastity is ated state at stake, and hence the importance of being careful in the expression of an opinion

DR D S LAMB read the history and presented the specimen of a case of

SENILE HYDROCEPHALUS

(This paper will be published April 21) DR ROBERT REIBURN read a paper on

ELECTRICITY IN SURGERY

(See page 455)

DR FRIEDRICH How long does it take to cure

considerable nausea and vomiting, constipation, loss a week and the sittings are about ten minutes each DR REYBURN One or two applications are made

DR LAMB Do the tumors always atrophy, or do was substituted for the positive needle they ever slough?

DR RIYBURN

DR LAMB In the case of the tumor of the neck would it not have been more satisfactory to have amount used the knife?

DR REYBURN The patient refused to submit to its removal with the knife It was about the size of His experience with the knife has its former bulk a small pear been very poor, as such tumors are apt to return

DR Lincoin was glad that this subject had been brought before the Society, as he had been greatly interested in it for some years, and during the past and is as actively engaged in her domestic duties as year has been employing it daily His results have ever warranted its application in a variety of pathological conditions, and in some instances have been sim- as well as an anodyne influence upon the nervous ply marvellous In October, 1886, he was called to system see a case of uterine fibroid of most formidable dimensions, in consultation with Dr Bayne and the lignant disease President of this Society The patient, a lady from Florida, had been suffering from the tumor for sev-reported several cases of cure of cancer, a woman eral years, and for eighteen months had been rendered almost helpless by its enormous bulk, which rendered it impossible for her to put on her own shoes and stockings The tumor filled the abdomen, reaching to the hiphord cartilage, and she was 15 large as a pregnant woman at term The whole length of the ordinary sound was lost in the uterine with each pole of the battery were introduced into cavity reduced to an extreme degree of emaciation. It was rent from 40 cells—probably, as the battery was a unanimously agreed that operative procedures were out of the question, and the proposition by him to try the effect of electricity was accepted, and after Locally extensive sloughs were formed about the weeks, during which hypodermatic injections of ergot were almost daily used, with the effect of diminishing the hæmorrhage, but not perceptibly reducing arrested for two weeks the bulk of the tumor, he applied the electric cur-A Fleming battery of 40 cells was used The positive needle, insulated to one inch from the point, was introduced through the abdominal walls at a point one inch below the umbilicus, so as to penetrate the tumor to the depth of three or four inches, while the negative needle was introduced through The whole strength of the battery was gradually brought to bear, and continued for twenty The introminutes without any considerable pain duction of the needle was not more painful than that of the ordinary hypodermatic needle, and no anæs-The first application was, then, thetic was used attended with no pain, it immediately arrested a copious hæmorrhage, excited by the introduction of the speculum, relieved a severe pain in the back which had existed for a long time, and produced in a high degree the usual sense of exhilaration and Two similar applications were made subcourage sequently at intervals of a week and ten days respectively, the needle being entered through the abdominal walls about an inch below that on the previous occasion

The tumor, which was of great hardness, and with difficulty penetrated by the needle, was greatly softened by the first application Subsequently in three or four applications a large electrode, 12 by 9 inches,

This gave more pain and was less efficient After the first ap-The current decomposes the tu- plication, though the negative pole was used through the vagina, there was no more hæmorrhage, men struction becoming normal in regard to time and The circumference of the abdomen was in a few weeks reduced by four and a half inches, the tumor sunk to the level of and a little below the umbillcus, and was apparently not more than one-fourth The patient now feeling almost en tirely relieved of her disabilities, became anxious to return to her family in Florida, and she soon after Since her departure she has continued well,

Electricity often has a very exhibitanting and tonic That may occur in cases where no local changes for the better can be hoped for e g in ma-

Some 12 or 15 years ago, about the time Nestel was assisted into his office in the last stages of cancerous cachexia, from a scirrhus of the breast He was at the moment using a Graves' battery of 60 cells in a couple of cases of progressive muscular atrophy, and the temptation to try its effects upon this otherwise hopeless case was great Two needles connected By an almost constant hæmorrhage she was the opposite sides of the scirrhus mass, and a curvery powerful one, of an electro-motor force of 200 milliampères-was continued for twenty minutes needles, the pain which had been intense was dissipated, and the progress of the disease was apparently The next morning the poor woman, who the dav before had been unable towalk except with assistance, met him at her door, busily occupied with her broom, and informed him that she This condition of relief from suffering, was well renewed appetite and increased strength continued for some weeks when the patient again came for another application, which was given with a similar but less marked effect, but after this she gradually de clined, suffering but little pain, until her death

About the same time he treated a large recurrent sarcoma of the breast in the same way with the result of relieving entirely the pain, apparent arrest of the growth (previously rapid) for considerable time, when resort was had to cunderango by the patient who unfortunately died just before a cure by that

agent was effected He has employed electricity in a large number of cases of chronic metritic and pen metritic inflamma tion, accompanied with adhesions and exudations, Neoplasms rapidly melt anay with the best results under its use and pain is, for the time at least, almost instantly abolished Indeed this wonderful relief from suffering through its agency is regretted by Engelmann as the patient is tempted thereby to believe herself cured before the essential organic restoration is accomplished

Of course, electricity like all other valuable agents

place He remembers that the late Secretary of the Smithsonian Institution placed in his hands for review some years ago, a French journal in which a most ardent and sanguine Frenchman advocated the amputation of large limbs by the electro cautery

In suitable cases and with a competent knowledge to find electricity of mestimable advantage The surgeon will find abundant occupation for his knife for ages yet to come, but many a man and many more women will have occasion to thank God for an escape from that last resort of an incompetent pro fession through the benign agency of this wonderful He would insist that all who propose to employ electricity should first learn something about it With the works of Erb, Apostoli, Bartholow and the most elaborate and excellent paper of Engelmann in the Transactions of the American Gynecological Society at hand, there is no reason for ignorance on the subject He would further insist on the importance of the use of the milliampère meter resistance of the tissues, particularly of the cuticle, varies so constantly that the meter is absolutely essential to the proper use of the current

In conclusion he would say, without fear of contradiction, that no one who has ever intelligently employed this agent will ever abandon it, and that he accepts electricity as a universal panacea distrust of it exists only among those who have had

no experience of its marvellous powers

DR J FORD THOMPSON said he felt as if he had lost his occupation and that there was now no use for the surgeon As this was a surgical question he had something to say Such methods are apt to be carried to extremes One should not base his reputation on the cure of fibroid tumors of the uterus for they not infrequently get well without any treatment A new treatment springs up and a few enthusiasts claim to cure all cases At one times ergot was used for the radical cure, and for a time a great many physicians were running over with it, but its time was short He had frequently seen these tumors get well after treatment had been suspended In one case the woman was so large that she was confined to the bed and compelled to he upon her back She had had electricity, and he was called in to decide about an operation He declined to operate and she got better without any treatment How many maelectricity to it. He was summoned in great haste of the prominence of the eyeballs. The patient can and found the woman bleeding to death. The breast be made more comfortable and less conspicuous was filled with a blood clot, the skin had ruptured, it did not get well until its removal

growths are not cystic, and do not require any such the fissure of the lids

will be used by enthusiasts when it is quite out of treatment, in fact they often do better when let He never operates in the condition to which alone Dr Reyburn refers He thought electricity an agent for good, but it is too apt to be abused by enthusiasts A few cases of stricture of the rectum, treated by Newman, of New York, is worthy of mention Thompson diagnosticated cancer of the rectum in a of its nature and proper application, no one will fail student of medicine Drs Agnew and Sands agreed with his diagnosis He then went to St Luke's Hospital, in New York City, where a young physician cut the stricture The patient stayed in the hospital until the wound healed and then went to Boston where he was under treatment for sometime was almost insane and was sent to his mother in a deplorable condition He heard of Dr Newman and determined to try his treatment Dr N applied electricity for several months In about eight months a stout, healthy looking man entered Dr T's office but was not recognized He said Dr N could introduce an electrode as large as a hen's egg The rectum was dilated and there was a ring of hard The tissue present, but the man was apparently healthy He does not believe that this man has been cured but he is practically well and may live a useful life In large hospitals such cases are for many years surgical curiosities

Finally, he is willing to wait a little longer before

PHILADELPHIA COUNTY MEDICAL SOCIETY

THE VICE-PRESIDENT, W W KEEN, M D, IN THE

Stated Meeting, March 14, 1888

Dr J Madison Taylor read a paper on

THE EARL' RECOGNITION OF GRAVES' DISEASE (See page 452)

DR S D RISLEY I would like to ask Dr Taylor whether there is any indication by which the development of exophthalmos can be expected in cases in which it has not yet appeared

Dr J B ROBERTS I believe that the great ocular deformity which is so unpleasant to the patient, and attracts so much attention, can be remlignant tumers are reported on good authority as edied by a very simple operation merely putting a being cured by electricity? He had never seen such stitch at the outer canthus, after freshening the a case in his practice Sometime ago he was called edges of the lids, to diminish the optic commissure to see a case of cancer of the breast that had been after the case has made such progress that it is reas under the care of a specialist who had been applying onably certain there is to be no further diminution

DR EDWARD JACKSON The procedure sugand there was a fungus growth He amputated the gested by Dr Roberts might be resorted to for Everything between the skin and other than cosmetic reasons I recently saw a case the ribs was a mass of pulp resembling clotted blood of this disease, with very great exophthalmos, in and the arteries had ruptured This was an extreme which one eye had been lost through sloughing of the case with the intense application of electricity, but cornea due to exposure, and I afterward learned that the second eye had been lost in the same way Dr Reyburn frightened the goitre away Such Such an accident might be prevented by narrowing

Dr A V Miigs has completely recovered from this disease, a woman who had a very severe attack many years ago, under the care of my father The prominence of the eyes, which was very great, is now hardly noticeable, and yet no operation was ever done think much would be gained by sewing up the canthus, for while the disease is in its acute stage, it is hardly likely the operation would afford much relief, and later, if the patient recovers at all, the I think I know the case Dr difficulty cures itself Roberts had in his mind when he spoke, and Dr de ganic lesion of any kind has been detected either Schweinitz, who has seen the woman in question, will probably agree with me that nothing would be sible that this may be an early stage of Graves' dis gained by an operation One thing I have learned of recent years, and it is that it is not necessary in all cases to put the patient in bed I could mention three or four cases I have successfully treated with tonics and proper regimen, without its becoming necessary to have rest in bed, the cases, to be sure, were not severe Dr Taylor speaks of the early recognition of the disease For my own part, I do not see how a positive diagnosis can be made until we have at least two of the features of the disease present, namely, the cardiac palpitation and some thyroid enlargement, the prominence of the eyes occasionally does not manifest itself, but a diag nosis can undoubtedly be made in its absence

DR G E DE SCHWEINITZ case that Dr Meigs refers to, and I saw nothing to be gained by surgery The eyes were at first very prominent, but they were then receding, and now the normal relation of lids to eye-balls is restored Inasmuch as there was considerable myopia, and hence not uncommon prominence of myopic eyes to begin with, they will always be more or less con-

spicuous

I have been extremely in-DR S Solis-Cohen terested in this valuable paper of Dr Taylor's, the more so that I think I recognize in his first case a patient whom I have seen, but in whom I did not She was treated at the recognize this disease Jefferson Hospital some three years ago for anæmia, and was apparently cured A year ago she returned with the history of "fits" spoken of by Dr Taylor, and was irregular in attendance and unreliable in probably preventing the careful investigation the characteristic symptoms of Graves' disease after the remarkable that thyroid enlargement should have a near and loved relative, and the discovery that he paratively frequent discovery of it at one time, in nence of the eye-balls was in this case very slight, cases of cardiac and vaso-motor disturbance, has put all the clinical assistants on the lookout for the I can thoroughly agree with Dr phenomenon Taylor that vaso-motor paresis plays an important part in the development, if not in the genesis, of The only case I have seen in the male this disease subject occurred in a young man subject to frequent companied with high temperature, in whom the It usually marks the height of the disorder, though rapidity of the heart's action had led to a diagnosis this may be the first feature noticed, especially when of hypertrophy of the heart, not warranted by it arises suddenly as from shock or overwrought physical exploration The eyes were not involved emotion

I know of one person who at the last time I saw the patient, nor was thyroid enlargement sufficient to attract attention without special examination I have now under my care in private practice a young lady not at all hysterical, subject to similar attacks of flushing which some-I do not times leave behind for a short time wheals like those of urticaria who has also had two attacks of sudden transient blindness, after which all that could be detected in the fundus was moderate congestion, and whose cardiac action, rapid and irregular at these times, is at other times perfectly normal No orby me or by more competent observers It is pos-Improvement has taken place under minute doses of picrotoxin, a drug which Dr Bartholow has prescribed in cases of exophthalmic goitre, at the hospital, with very good results One case especially I recall which was associated with purpura I would like to know whether Dr Taylor has met with A very interesting case of acute this association exophthalmic goitre presented at the clinic, which Dr C J Wilson may remember as the subject of one of his clinical lectures, an anæmic young girl affected from childhood with nystagmus, in whom goitre and exophthalmos were asserted to have developed within a short time after a fall from a ladder She was unable to button her collar, which friends I have examined the had opened in attending to her after the accident

DR J C Wilson recalled the case mentioned by Dr Cohen, but not with sufficient distinctness to add anything of importance to the account already Dr Wilson briefly narrated two cases of Graves' disease, recently seen in his private practice, in which the symptoms developed rapidly after The patients were young women mental shock The first, a servant, aged 24, of previous good character, was engaged to be married to a joung man who was by occupation the driver of an ice cart Within a day or two of a visit to her, he was acci dentally killed, and her first knowledge of his death came through the newspapers Cardiac overaction at once developed, and within a month thyroid enlargement, and slight exophthalmos and large doses of Fowler's solution complete re The second case was covery took place in a year that of a lady, aged 20, who rapidly developed the I consider it the more shock and grief occasioned by the disappearance of treatment by rest and arsenic decided improvement took place It is now a month since she last re-

In reply to Dr Risley's query, Does any sign clearly foreshadow the exophthalmos? I can only say that I know of none, nor did I see anything in the literature of the subject to aid us

DR CHARLES B NANCREDE read a paper on THE IMPORTANCE OF PRIMARY SUTURE OF DIVIDED NERVES

(See THE JOURNAL of April 7, p 427)

I have seen one or two DR H R WHARTON cases of primary nerve-suture, though none in which the injuries were so extensive as in this interesting case of Dr Nancrede's The results in these cases There is another point to be consid Shall we attempt secondary suture of the nerves when this has been omitted in the first place? I am very decidedly of the opinion that this procedure should be adopted, for a number of cases have been reported of this character in which the results have been, at least, good enough to make me feel that secondary suture should be attempted when there is any probability of restoration of the use of the injured part I thoroughly agree with Dr Nancrede as to the great importance of this subject

DR JOHN B ROBERTS The only case of nervesuture I remember at present is one in my wards, in which the work had very properly been done by the resident immediately on the admission of the patient It was a rather extensive incised wound of the leg, involving, I think, the musculo-cutaneous and ante-The muscles and nerves were surior tibial nerves tured and dressed antiseptically, and the results were above the wrist so as to make an accurate report as to sensation Dr Nancrede has incidentally touched upon a point of the nerve and found that it had been divided great importance, that of teno suture It has been my misfortune to meet with quite a number of cases in which this had been neglected by the attendant called at the time of the accident One of these recently seen was that of a man wounded in the forewas loss of flexion of the finger, but it was hard to physician believed it to be the wrist, but after cutting down, I found the tendon here flaccid and in-I then opened the finger-wound, and here found the tendon retracted into the sheath I sutured, but did not get a good result, probably from the extent of dissection necessary to get at the tendon in the sheath, and the great mass of cicatricial However, I never hesitate to reopen healed or partially healed wounds to suture tendons when this very important measure has been neglected

sis can be secured without chemical solutions This fingers is in marked contrast to one of my friends, a surgeon of prominence, who thinks that the employment of solutions renders care as to cleanliness unnecessary

DR J WILLIAM WHITE and bruised ends of the nerves The general prin- above the wrist ciples of nerve suture are admitted by all surgeons,

erable portion we increase longitudinal tension, and make greater strain on the sutures, on the other, we run the risk of including in the stitches tissue too There is some difmuch damaged to recover itself ference of opinion as to the particular suture to be I should think that the one proposed by employed Dr Nancrede, as shown in his diagram, would be open to objection if, as there apparently represented. it interposes a foreign substance, the catgut thread, between the ends of the nerve, this, if not absorbed. as is sometimes the case even with the best catgut, is liable to be a constant source of irritation, and to prevent union I prefer and employ a suture passing quite through the nerve above and below the point Evidence, either clinical, or pathological, of union or experimental, as to the relative advantages of different sutures is desirable, but I do not know of any, and I did not understand Dr Nancrede to say that there was such evidence

THE CHAIRMAN There are two cases I may briefly cite from my own experience in connection with the subject of our discussion

1 A case of primary nerve-suture in a boy 2 years. of age, with perfect recovery of motion and sensa-The case occurred ten years ago carrying a glass bottle, fell, and a fragment of glass. divided the ulnar nerve and artery about 11/2 inch The mother made compression good, though I did not follow the case after discharge with her thumb until I arrived, very soon after the After ligaturing the artery, I examined accident only my pocket-case containing coarse white silk and an ordinary needle Not wishing to leave the coarse silk in the wound, particularly not in the nerve tissues, I debated as to the method of suture, and devised one which proved eminently satisfactory. arm just above the wrist, and in the ring finger There Drawing the ends together closely with forceps, I passed a surgical pin obliquely through the two divitell which of the wounds to reopen in order to come sions, threw a loop of silk around the point of the upon and suture the divided tendon. The family pin (as in Simpson's method of acupressure), drew out the thread, passed it around the head of the pin, where it was secured At the end of forty-eight hours the pin was removed The thread was thus loosened and removed Perfect union of the wound took place in a few days There was no wasting of muscles, and motion was present after twenty-four hours. While the age of the child prevented exact observations as to the time at which sensation returned, at the end of forty-eight hours there was an exclamation of pain on pricking the little finger with a pin I have been glad to hear Dr Nancrede say that I saw the father of the boy about a year ago, who with cleanliness of person and of instruments asep- told me that his son had perfect use of hand and

Extensive teno-suture with quick union recent case shows the value of even a brief suture of tendons A man 25 years of age was admitted I do not know whether into St Mary's Hospital with complete severance of Dr Nancrede spoke of the resection of the crushed all the tendons of the forearm and of the sheath The resident sewed each tendon but the question of resecting lacerated or contused not remain more than three to five days, and then ends before suturing, or of allowing them to remain, closed the external wound and placed the hand in is one that should be carefully considered in each flexion on a splint. The man left without permission case On the one hand, by resection of any consid- after a few days, and it seems removed the splint and

tore out the sutures in the skin with a gaping wound in the forearm, but on testing had the hot moist sponge on his neck all the time the fingers separately each finger and each joint was In eight days he was strong enough to drive to his found to have perfect motion, showing that even this place of business, but was prevented by his mability temporary apposition of the divided tendons had a to keep the sponge warm. As soon as he went outperfect result I should prefer for the purpose, how- doors and the sponge became cold the cold air pro ever, either very fine silk or, better, the ordinary duced an excessive cough and some pain in his lungs

chronicized catgut

DR NANCREDE I pass around he will see that the nerve is securely nasal secretion-I connected the tracheal tube with and accurately coaptated by the suture distinct recollection of resecting the injured ends in this way the air from his lungs passed through his this case, in fact, I am nearly certain that I did not | mouth, up behind the soft palate and out his nose In some cases I have said it might be desirable, but This enabled him to blow his nose as perfectly as he I am dubious about it In two other cases that I had ever done During inspiration the air passed recall at this moment, I remember that I did not through his nostrils, mouth and rubber tube into his make any attempt of the kind, but brought the ends lungs through the tracheal tube, thus giving it nearly together as best I could Referring to the incidental the normal degree of warmth and moisture discussion, I am glad to hear that so many of our members always suture tendons I make it a rule to suture nerves and tendous in every case, and generally obtain fair results

Dr Howard F Hanseil presented a

CASE OF ECTOPIA LENTIS.

This colored boy presents Clarence P, æt 10 A peculiar shape of head, deseveral deformities viation of spine, anterior curve of each tibia, and is more or less undeveloped I have asked him to present himself before the Society in order that those members who may be interested may have an opportunity to see a case of "ectopia lentis," congenital upward displacement of each lens margins of the clear lenses may be distinctly seen about the centre of each pupil The right lens is dislocated upward, the left upward and outward Each eye is highly myopic—i e, as seen through the lens, and hypermetropic as seen under the lens The temporal side of each nerve shows a large patch of atrophic choroid - post-staphyloma There is no With the right eye coloboma of the iris or choroid the boy can read large print only when held 21/2 inches from the eye in an upward and outward posi-The left eye is useless

NEW INSTRUMENTS

TRACHEOTOMY RESPIRATOR BY THOS F RUMBOLD, M D, OF ST LOUIS

On February 21, 1870, with the assistance of Dr Wm Neihaus, of this city, I performed tracheotomy on Mr Wm D, at 43 years Immediately after he was placed in bed I had a large sponge, that was squeezed out of quite warm water, laid over the This warmed and moistened the air as it entered the lungs, thus preventing the necessity of having the air in the room unduly heated the tracheal tube and moistened, which is usually found beneficial in

He returned later tracheotomy cases While he was in the house he

For the purpose of allowing him to have warm Dr White has misunderstood moist air all the time, and also to allow him to blow There is nothing between the divided ends of his nose-which gave him a great deal of trouble and If he will examine the rough model which much discomfort because of the presence of profuse I have no a rubber tube, which he placed in his mouth In

Figure 1, Illustrating the application of an apparatus for conducting the warm and moist air from the mouth and nasal passages to the lungs in cases of tracheotomy a, tracheal tube in place b, short rubber tube connecting the tracheal tube with the secretion trap e, secretion trap, to catch the muco purulent secretion that is coughed from the trap, to catch the muco purulent secretion that is coughed from the lungs, and the condensed vapor from the mouth d, soft rubber tube lungs, and the mouth with the trap and tracheal tube. In the trap c is a small bag of pulverized charcoal to deodorize the secretions

It was found after a short trial that the muco-puru lent secretion from the lungs, and the condensation of the moist air from the mouth and nose, as well as some saliva from the mouth, accumulated in the rubber tube, which when they passed into the trachea caused intense spasmodic coughing For a few days he partially prevented this by clearing the rubber tube after taking it out of his mouth, by coughing through it rather forcibly As it was quite difficult to cleanse the rubber tube of the muco purulent secretion in this way I had a glass receptacle attached to the tracheal tube and the tube going to his mouth, so that the secretions were prevented from entering I have called the apparatus a "Tracheotomy Res-

pirator" I have applied the same kind of an ap- tion and disinfection paratus to other patients upon whom I have performed tracheotomy In one case of malignant and disinfection disease of the larynx, the patient's breath through the tube produced an intolerable taste For the purpose of correcting this I put a small quantity of pulvenzed charcoal, tied in a small bag, into the glass portion, or what might be called the secretion trap This has a partially good effect

DOMESTIC CORRESPONDENCE

PREVENTION OF DIPHTHERIA

Dear Su -On page 397 of THE JOURNAL, March 31, is a "formula for the prevention of diphtheria," which is "an abundance of pure air, good water, wholesome food, clean soil and a clean personality" Have you not accidentally given the wrong formula? Very extensive observation of statistical and other reports on this subject seems to show that diphtheria is about as prevalent among those who employ this formula as among those who do not, while the statistics are conclusive in proving that under another formula the disease is preventable. On page 489 of THE JOURNAL, Oct 15, 1887, is a diagram, which shows that in 102 outbreaks of diphtheria in which Diseases of the Heart and Circulation in Inisolation or disinfection or both were neglected, there was an average of a little over sixteen cases and three deaths to the outbreak, that during the same time in 116 outbreaks in which isolation and disinfection were both enforced, there were only about one fifth as many cases and deaths, which seems to prove that there was a saving of about

The correct formula for the prevention of diphtheria would seem to be isolation Very respectfully,

Lansing, Mich, April 2, 1888

A CORRECTION

Dear Sir -By some unintentional error, I find the article on "Methods of Examination of Bacteria for Laboratory Purposes" in Vol X, No 13, (March 31, 1888), ascribed to me, whereas the author is George W. Nash, M.D., of Boston

Very truly, SAMUEL N NELSON, M D

Boston, April 4, 1888

STATE MEDICINE

SANITARY PRECAUTIONS IN PENNSYLVANIA

To all Local Boards of Health and Borough Councils in Pennsylvania -This Board has received official information since the first of the year of the existence of small-pox in nine States of the Union Two outbreaks have occurred in this State State Board of Health of California has declared it epidemic in that State

It is raging with great virulence in the neighboring island of Cuba, where sanitary precautions appear to be extremely lax, and with which we are in constant communication It has prevailed extensively during all the past winter in portions of Great Britain

In the neighboring State of Delaware cases exist, and several deaths have occurred as the result of the importation of infected rags This Board therefore deems it its duty to urge upon all municipal and sanitary authorities the importance, First Of doing all in their power to promote vaccination in their respective communities, and Secondly Of keeping all new comers and returned travellers, and especially all immigrants, under observation for fourteen days after their arrival, in order that should symptoms of this disease manifest themselves steps may be taken to circumscribe and isolate the centre of infection with the least possible delay

BOOK REVIEWS

FANCY AND ADOLESCENCE By JOHN M KEATING, M D, etc, and WILLIAM A EDWARDS, M D, Illustrated with Photographs and Wood Engravings 8vo, pp 215 Philadelphia P Blakiston, Son & Co 1888 Chicago W T Keener This work appeared in instalments in the Archives of Pediatries, prior to its issue in book form four-fifths of the cases and deaths by thorough isola- authors have made an excellent systematic work

upon the heart with especial reference to its diseases as they occur in infancy and childhood periodical literature has been most carefully culled, so that we find in this work a synopsis of the most recent researches into the pathology and therapeutics of the heart Its contents are embraced in ten chapters which describe the following subjects Methods of Study, Instruments, Feetal Circulation, Congenital Diseases, Malformations, Cyanosis, Acute, Chronic and Ulcerative Endocarditis, Acute and Chronic Pericarditis, Treatment of Endo- and Pericarditis, Paracentesis Pericardium, Hydro-pericardium, Hæmo-pericardium, Pneumo-pericardium, Myocarditis, Tumors, New Growths and Parasites, Valvular Disease, General Diagnosis, Prognosis, and Treatment of Valvular Disease, Cardiac Neurosis, Angina Pectoris, Evophthalmic Goitre, Diseases of the Blood, Plethora, Anemia, Chlorosis, Pernicious Anæmia, Lukæmia, Hodgkins' Disease, Hæmophilia, Thrombosis, and Embolism

The work deserves commendation as an excellent treatise upon its subject. We were surprised to find the blunt statement made, that the authors had "never derived any appreciable benefit from convalaria in any way whatever, and indeed it seems that the drug merits no place in our considera-Unfortunately it is true that the preparations are so often variable in strength that they are not always reliable, but certainly from good preparations "appreciable benefit" can be obtained also, from their own experience, doubt the tendency of digitalis to accumulate in the system and produce suddenly toxic effects

Two photographic illustrations of hearts with mitral valvular lesions have been introduced into The photographs are very well made, but as is so apt to be the case where pathological specimens are thus depicted, the detail is so obscure

that the illustrations are not very instructive

MISCELLANEOUS.

RUSH MONUMENT COMMITTEE —The Rush Monument Com mittee will meet at Cincinnati during the meeting of the Amer-The hour and place of meeting will ıcan Medical Association be announced from the platform on the first day of the meeting GEORGE H ROHE, Secretary

HON MARSHALL D EWELL, LL D, one of the Faculty of the Union College of Law in this city, has been appointed Lec turer upon Medical Jurisprudence in the Law School of Cornell University for the next college year. This does not sever his official relations to the Union College of Law, in which he will still give his usual courses of instruction

HEALTH OF MICHIGAN FOR MARCH, 1888 -For the month of March, 1888, compared with the preceding month, the re ports indicate that tonsillitis increased, and that remittent fever and bronchitis decreased in prevalence Compared with the preceding month the temperature for the month of March, 1888, was higher, the absolute humidity was slightly more, the relative humidity was slightly less, and the day and the night ozone were less Compared with the average for the month of March in the nine years, 1879-1887, measles were more prevalent, and intermittent sever, diphtheria, consumption of lungs, remittent fever, pneumonia, whooping cough, scarlet fever and inflamma tion of kidney were less prevalent in March, 1888

For the month of March, 1888, compared with the average of corresponding months for the preceding nine years, 1879-1887, the temperature was slightly lower, the relative humidity was more, the absolute humidity and the day and the night ozone were less Including reports by regular observers and others, diphtheria was reported present in Michigan in the month of March, 1888, at twenty five places, scarlet fever at thirty three places, typhoid fever at thirteen places, measles at forty nine places, and small pox at one place

Reports from all sources show diphtheria reported at fifteen places less, scarlet fever at twelve places less, typhoid fever at four places less, and measles at ten places more, in the month of March, 1888, than in the preceding month Small pox was reported present at one place, both in February and in March,

but has now disappeared from the State

NASAL FIBROMATA

Read before the Section on Laryngology of the Ninth International Medical Congress, Washie gton, D. C., Septem ber, 1887

BY W E CASSELBERRY, M D, OF CHICAGO ILL

PROFESSOR OF MATERIA MEDICA AND THERAPEUTICS AND OF LARYN GOLOGY AND RHINOLOGY IN THE CHICAGO MEDICAL COLLEGE MEDICAL DEPARTMENT OF THE MORTHWESTERN UNIVERSITY

Under this title it is proper to include only neo plasms of a purely fibrous or predominating fibrous structure which originate in the pasal fossæ anterior Tumors in this situation are to the naso pharynx prone to assume a compound type, eg, the fibromyxomata and the fibro sarcomata The scope of floor of the nose this paper will not permit of consideration of these, notwithstanding their intimate relationship to the Likewise of fibromata which originate in the neighboring sinuses, and which involve the nose only secondarily, must such meagre mention suffice as is essential to the elucidation of the nasal growths proper

Recent literature has contained numerous reports of cases of naso pharyngeal fibromata, recounting the various operative procedures for their removal, includthe hard palate by Gussenbauer, osteoplastic resection of the superior maxilla by Langenbeck, Rouge's operation and the recent method by Furneau-Jordan Nor have rhinologists failed to emphasize the advantages of the intra nasal or intra-pharyngeal galvanocautery method as I will urge in nasal cases the use my own

Fibromata originating primarily in the nose antemor to the naso pharynx are comparatively rare The Internationales Centralblatt fur Laryngologie, Rhinologie und verwandte Wissenschaften, a journal of abstracts of all current literature pertaining to these departments, does not contain a report of a single case during the last three years

None are included in 265 cases of nasal neoplasm reported by Hopman, of Cologne (248 cases), and Schimegelaw, of Copenhagen (17 cases) Of this series there were 121 my lomata, 63 my lomatous hypertrophies of turbinated bodies, 24 papillomata, 1 lupus and 1 sarcoma

Yet their occasional occurrence has been recognized probably from the time of Hippocrates, who

had a large experience in connection with nasal "In cases of hard polypi Hippocrates' directed that the nostril should be slit open in order that the tumor might be thoroughly extirpated, and the roots afterwards destroyed by the hot iron "

Celsus treated polypi in various ways, but he strongly disapproved of meddling with the harder tumors, which he considered malignant

Modern authors treat briefly of the subject Stoerk's mentions fibromata as originating from the submucous structures Cohen' briefly but lucidly describes the neoplasm and mentions its comparative infrequency Sajous' mentions the roof as its favorite site in the nose, but remarks that cases have been reported in which fibrous polypi sprang from the septum, the inferior turbinated bones, and even the He further notes the rarity of its primary occurrence

"Fibromata may develop in any Wagners writes portion of the nasal cavity the floor of the fossæ, the turbinated bones, or lateral walls," and reports two cases

Robinson thinks it so unusual in the nose and so usual in the naso-pharynx that he considers difference in location a point in diagnosis between fibroma and myxoma

Mackenzie has reported a single case of his own ing preliminary subperiosteal resection, resection of and two others probably fibromata, and remarks in "Though fibrous polypus of the this connection naso-pharynx is not unfrequently met with, this form of tumor extremely seldom originates in the nose itself, the only case, so far as I am aware, in which such a growth has been proved to exist being one of There are, however, two other instances of similar means in preference to the other graver, in which there is every reason to believe the tumors disfiguring, and sometimes fatal operations were fibromatous." It seems probable, however, that nasal fibromata are really more numerous than the few cases recently reported would indicate—a probability which tends to enhance our interest in the subject

Growths in the nose and naso-pharynx in a measure correspond in type to the structural elements of the tissue from which they originate mucous membrane consists of two layers a superfi-

S Minist der Read in State in

cial mucous stratum which is covered by epithelium, and a deep fibrous layer which has the position and functions of periosteum and perichondrium . In the upper or olfactory tract these two strata are closely adherent, while in the lower or respiratory tract they are separated by variable quantities of connective The fibrous layer has been shown by Panas10 to be especially abundant and more densely fibrous at the upper and posterior part of the septum and the immediately adjoining space on the base of the skull, hence the frequency of naso-pharyngeal fibromata, while in the anterior nares it is least abundant, and hence the more common occurrence in this location of the myxomata Further, between these sites, around the posterior nares, the membrane presents a kind of transitional form, and growths in this nasal fibroma collected in this paper three were fe situation are likely to present a corresponding fibro-This observation, in connection with mucous type the assertion of Stoerk" that polypi arising from the mucosa (superficial layer) are of mucous structure, while those arising from the submucosa or periosteum are fibrous, affords a reasonable explanation of the comparative infrequency of true nasal fibromata True, the attachments of ordinary myxomata are sometimes traceable to the periosteum or to the bone, but it is probable that they have first originated in the superficial mucosa and only subsequently penetrated to the deeper structures, or else, as Woakes!" suggests, they have taken deep origin from the mucous elements which dip into and line the cells of the spongy bones

Nelaton, cited by P Koch,13 has advanced the opinion that fibrous polypi of the nose are never of a primary nature, but always proceed from neighboring sinuses, e g, the antrum of Highmore, etc practical refutation of this theory is furnished by a case reported by Gerdy in which, on post-mortem examination, a fibroma was found to be attached to the posterior part of the vault of the left nasal fossa

Fibromata may arise from any part of the nasal The vault, especially its posterior portion, is the favorite site, since here is found in greater abundance the fibrous stratum from which they primarily originate, but the turbinated bodies, the cribriform plate of the ethmoid bone, the septum, and the floor of the nose may furnish points of origin More or less extensive secondary adhesions may form in the course of the expansion of the growth as the result of friction and pressure, so that it is sometimes difficult to determine the original point of attachment

Of the accessory cavities the antrum of Highmore is a favorite site of origin, fibromata in which become very large and encroach secondarily upon the cavities of the nose and orbits, and next in order are the frontal sinuses, tumors from which extend into the same cavities

The etiological factors in the development of fibro-

mata are not definitely known, but a local irritation from traumatism may serve to excite a hyperplasia of the fibrous elements, as in one case of fibroma of the septum which was directly attributable to a blow In other instances a localized perveron the nose sion of the chronic hypertrophic inflammatory pro cess may act as the exciting cause by stimulating the fibrous elements to unusual proliferation

Both sexes and all ages seem equally hable In this respect the disease differs from naso pharyngeal fibroma, of which Lincoln14 collates 38 genuine cases, all of them males under 25 years of age Nelaton," cited by Mackenzie, knew of no example of naso pharyngeal fibroma becoming developed in a female of any age or in a male over 35 Of six cases of males, one of 35 years, one of 39 years and one of 50 years of age

The rapidity of growth, as indicated by the dura tion of the symptoms up to the time of operation, averages about two years The early symptoms are those of a catarrhal nature, followed by obstruction and distension of the fossa Its development con tinues to the detriment of bones or cartilages that may be in the way These are absorbed, enveloped and rent asunder, the neoplasm penetrating into fis sures, accessory sinuses and neighboring cavities The bridge of the nose is flattened, the eyes bulged forward and the cheeks swollen, the whole constitut ing the hideous deformity known as "frog face" Fre quent and dangerous attacks of epistaxis may pro ceed from surface ulcerations Extension upward may open the cranial cavity

A probable diagnosis is not difficult Its appearance in situ differs much from that of the mucous polyp It is not multiple, but may be lobulated The base is broad, the color is dark red, there is no translu cency, and it is firm and resistant to pressure by a probe It is more difficult to distinguish it thus from The microscope is the fibro-sarcoma and sarcoma only means of positive diagnosis

Fibrous tumors in this situation present the ordi nary pathological characters of fibromata in general, In consistence they vary, being sometimes very dense and at other times softer and more succulent The fibres which constitute the chief part of the growth are grouped in bundles of various sizes, or are simply closely interlaced and devoid of definite arrangement A few minute cells, either round or spindle-shaped, may be present among the fibres or in larger num The vessels are not bers around the blood vessels usually numerous, but it is probable that the tumors, or parts of them, may partake at times of the erectile structure of the turbinated bodies A smooth fibrous capsule usually envelops the whole

Concerning the prognosis, nasal fibroma tends to degenerate into sarcoma when it is incompletely re moved, or even without any interference There is a tendency to recurrence after removal, although, if thoroughly extirpated and the base cautenzed to the bone, the prognosis should be good

I have tabulated and appended the records of eight solution on cotton introduced and allowed to remain cases, including one of my own which is also related in contact with the fibroma for three minutes

Mrs R, at 39 years, first had a nasal polypus described as an ordinary myxoma removed from the left nasal fossa, by means of forceps, about ten years ago She remained well for five years and then again noticed gradually increasing obstruction, and later a dark reddish mass presenting at the left anterior nasal Four years ago she submitted to operation under chloroform The operation was a failure, only a few small pieces being removed by means of forceps and without the aid of artificial illumination hæmorrhage was occasioned at the time and continued intermittently for weeks No relief was af-She declined further interference until February, 1886, at which time she came under the observation of Dr W T Coleman and Dr A P Gilmore, of Chicago, through whose kindness I have a portion The left nostril was much distended, of the record showing evidence of commencing frog-face, and the fossa anteriorly was thoroughly filled in all directions by a firm elastic tumor which projected slightly from the anterior aperture There was no undue prominence over the antrum of Highmore, nor encroachment upon the orbit These gentlemen operated skilfully by means of the galvano cautery to include the neoplasm failed on account of its large size tight fit and numerous adhesions So the lower portion was slit up by the knife electrode, some adhesions separated in like manner, and a large section, perhaps one half of the tumor, extracted by means of forceps The operation was necessarily prolonged, painful and bloody Through the courtesy of Dr Coleman, the case was now referred to me

Status Præsens - Examination about ten days sub sequent to the operation just described, March 4, The left half of the external nose is decidedly more prominent than the right The left nasal fossa above the line of the inferior turbinated body is completely filled by a firm, elastic, irregularly lobulated neoplasm No middle turbinated body is discernible, its position being occupied by tumor inferior meatus is free, corresponding to the portion The of the growth already removed The anterior twothirds of the septum narium has been pressed far over to the right, narrowing the right fossa and enormously increasing the capacity of the left chamber Rhinoscopic inspection posteriorly shows the naso pharyn to be approximately normal Only a faint The postenor part of the septum is in the median line

First Operation, March 10, 1886 -The affected nostril was first thoroughly cleansed by cotton swab bing and by means of a condensed air spray of Do bell's solution ordinary method of reflected gas rays projected thesia of the entire nostril was induced by hydro- base

ployed Flemming's galvano cautery écraseur, devised by Seiler, which consists of a universal handle into which is inserted a pair of parallel tubes threaded with wire The ends of the wire fall through eyelets, one on each side of the wheel in the axle bar of the windlass, which is inserted into a slot in the handle so located that while holding the handle the loop can be wound in on the windlass by means of the thumb I substituted steel or a tempered iron wire (piano wire No 5) for the platinum usually employed Plat-Severe inum is devoid of resiliency, a property that enables the écraseur loop of steel wire to retain or regain its contour after contact, when one of platinum would remain permanently indented The steel loop offers some resistance to tissues against which it is pressed, thus facilitating envelopment of the part The steel wire is sufficiently tenacious and takes the glow from the battery practically as well as platinum, but a fresh piece must be used at each application Before threading the parallel tubes it is well to withdraw the temper from the ends of the wire by heating them to redness, as the portion thus rendered ductile will wind more easily around the windlass

I would catch in the écraseur the most easily en-Efforts veloped lobule or corner of the growth, then connect the battery by running down the treadle with my foot, and at the same time wind in the loop, thus severing, without pain and with little or no hæmor rhage, a cubic centimetre or more of the growth By a repetition of the process three or four such pieces would be removed in a sitting Occasionally it became necessary to make a preliminary incision into the substance of the tumor with the knife electrode in order to prepare a place for the wire, or by the same means to detach an adhesion that the écraseur might take hold The operations were repeated weekly, the patient using a cleansing spray in the interval They might have been performed more frequently, every day or every alternate day for a time, thus shortening the duration of treatment, but the slower method sufficed and for good reason was preferable in this case

During the course of some weeks the growth was thus followed up to its primary attachments, which extended along the horizontal plate of the ethmoid bone backward to the anterior surface of the body of the sphenoid I regard the posterior portion of the vault, including the anterior perpendicular suroutline of the tumor, located well forward, can be face of the sphenoid bone, as the point of origin of the tumor, the base of which extended thence along the cribnform plate of the ethmoid bone, becoming adherent at the same time to portions of the superior turbinated body and the walls of the ethmoid cells The absence of the middle turbinated body, which The parts were illuminated by the had been reduced to a rudiment by absorption from through the anterior aperture, which was widely di- parts above and not only facilitated operation, but lated by a bivalve speculum Complete local anæs- enabled me with certainty to follow the tumor to its chlorate of cocaine applied in the form of a spray of be included in the snare, I cauterized the base by a 5 per cent solution repeated three or four times at means either of the galvano cautery point, knife, or intervals of three minutes, followed by a 10 per cent | moxa electrode, causing the instrument to penetrate

This also I did a small part formation of adhesions each time to the bone at a time, fearing to produce much inflammatory action on account of the proximity to the cerebral meninges through the cribriform plate of the ethmoid I cauterized everything which had any appearance of fibroma, preferring to touch that which was not fibroma rather than to leave untouched that which was At the end of six months the tumor seemed thoroughly eradicated The fossa above the inferior turbinated body was unoccupied by anything uninterrupted

At the end of nine months a recurrent tumor the size of a small bean was discovered attached to the lateral wall, just above the anterior ends of the inferior turbinated body and redeveloped, for on account of the recession of the lateral wall it was at a point difficult of illumination and access, being just within the anterior aperture, but around the corner, as it were This tumor was removed by the same means. At the end of further recurrence, although in view of the known tendency to relapse in such cases she cannot even yet be considered wholly free from liability to redevelopment I am indebted to Dr Elbert Wing, Demonstrator of Pathology in the Chicago Medical College, and Pathologist to Cook County Hospital, for the microscopic examination of sections of the tumor which, confirmed also by my own examination, demonstrated it to be a fibroma

Treatment -Of the seven other cases appended, in No 1 attempts at removal by ligature and forceps failed, and were followed by an attempt to cut through the base of the polypus with a bistoury, which re-In case No 3 the tumor avoiding an external operation projected posteriorly and was removed by forceps introduced through the naso-pharynx In three cases, Nos 4, 5, and 7, external operations were performed to give access to the tumor in No 4 a crucial incision was made over the left side of the nose, and the nasal bones were lifted out, in No 5 the nasal columna and septum were divided and the nose Read before the Medical Society of the District of Columbia, turned up, in No 7 a median incision was made through the bridge of the nose In case No 6, possibly fibro myxoma, the tumor was successfully removed, piecemeal, in fifteen sittings, by a cold wire The advantages of the intra nasal, galvano coutery method, as detailed in my own case, are sufficiently obvious General anæsthesia is unneces sary and the consequent shock and dread of operation are avoided There is no external disfigurement, no dangerous hæmorrhage, and under cocaine, little or no pain My patient would sit in the operating or no pain My patient would sit in the operating On November 4, 1886, Mr W E S was referred chair and have piece after piece removed without to me by Dr Z T Sowers, with the following history manifesting even discomfort It is certainly a more

Moreover, the slower method of removal, piece by piece, offers the advantage of greater deliberation, implying also as it does greater precision, for when sufficient oozing occurs to interfere with the view further action is postponed until the next time By repeated sittings the patient becomes accustomed to manipulation and learns to assist the surgeon by holding correctly The surgeon also in turn by repeated opportunities to study the parts becomes so familiar with the area over which but rudiments of the middle and inferior turbinated he is working that he can readily trace out all the bodies, the view of the vault in all directions being ramifications of the growth. No undue inflammatory reaction follows and sepsis can be avoided by thorough cleansing of the nostril by means of an antiseptic spray

In the case of Mrs R, to whom any facial disfig-Probably a point of sec- urement would have been exceedingly abhorrent, the ondary attachment here had escaped cautenzation galvano cautery used in this manner was the one means which rendered a formidable external operation avoidable The nature of the case would have precluded an effective intra-nasal use of the coldwire snare, ligature, forceps, or chemical caustics

An agent capable of effecting such brilliant results seventeen months there is no appearance of any naturally engenders an enthusiasm which is liable to lead to its abuse and a word of caution is not unnecessary in this respect Accurate diagnosis, precise indications for its use, and a certain amount of skill on the part of the operator are essentials to the judicious employment of the galvano cautery And it must not be supposed that all cases of nasal fibroma will be susceptible of this means of cure size and penetration into accessory cavities may render it ineffective

Electrolysis has been successfully employed by Lincoln in naso pharyngeal fibroma and it might prove serviceable in nasal fibroma of enormous growth, at least to reduce the size to such a point sulted in death from hæmorrhage The treatment in that the galvano-cautery could cope with it, thus

An analytical record of cases is given 70 Monroe Street

A CASE OF LARYNGEAL GROWTH

December 14, 1887

BY C W RICHARDSON, MD, OF WASHINGTON D C

Operations for the removal of laryngeal growth are of such common occurrence and the subject has been so thoroughly treated by laryngologists, that there would seem nothing new or interesting upon this subject to be added The case I am about to report, while not individual, is one of uncommon nature and presents certain points of interest

brilliant operation, when possible, to encircle the of any character previous to the development of the entire tumor and remove it in toto at one sitting, but present affection. His family history is excellent, in case of the larger fibromata this will usually be no hereditary tendencies being found upon either impracticable on account of the impaction of the paternal or maternal side. When about the age of mass into the inequalities of the nasal fossa, and the it he began to sing as chorister boy, filling a soprano

part, in the church at his native home, near Sheffield, dition Pharynx congested, and presenting here and and continued to serve in that capacity until his 16th there small shreds of adherent mucus Naso pharynx year, when he was obliged to desist on account of the period of mutation having set in try to show the influence of this singing upon the mirror, and the patient having been told to intone a, his voice had rounded into a deep bass, marred, however, with a very slight touch of hoarseness. Two a fact readily explained by the large clumps of mucus years later this hoarseness had increased to such a interposed between and firmly adherent to their free degree that he was obliged to give up singing change in his voice became greater and a new symptom developed, which the patient described as a "catch in the voice" About this time our patient came to America

Shortly after his arrival in America he noticed that he breathed with greater difficulty, especially at night, which continued to increase until the removal of the growth Dysphagia was present to a slight extent

Present Condition - The first point that attracted my attention was the character of his voice, and his apparent difficulty of breathing This voice was not one of marked hoarseness, as is usually found in cases of laryngeal growth, but rather resembling the hoarseness of laryngeal blennorrhea, produced by | ing him to rest a few moments, I requested him to three factors, viz the excessive amount of mucus make a deep inspiration, to be followed by a forced which adheres to the chords not only preventing their expiration, at the end of which he was to intonate a, apposition but also producing secondary tones, paresis, and infiltration into and thickening of the substance of the chords conversing with this slight hoarseness there was a sudden arrest of the voice, while the lips moved and the patient made violent attempts to speak—resembling very much the efforts seen in a stutterer—the words remaining unpronounced After a few ineffectual efforts, a toss of the head, followed by a deep inspiration—attended with a decided stridor—he re-He continued to converse in this gained his voice slightly hoarse voice until again interrupted by another complete cessation of the voice These attacks, if I may so call them, were at times—when the patient persisted in his efforts to speak-accompanied by marked dyspnœa Dyspnœa was another symptom from which the patient has suffered considerably, and it was this one alarming symptom which caused him to seek medical advice He had no special hunger for air while in repose, or taking moderate exercise, but should he exert himself, as in walking fast, ascending heights and steps, or bicycling, the want of air became very pronounced

Dyspnœa was very marked at night, and not infrequently attended with severe asthmatic seizures The patient states, "For the last six months I have not had a pleasant night's rest I am constantly aroused from my sleep by feelings of suffocation and when asleep toss from one side of the bed to the other" These asthmatic paroxysms occurred almost always while the patient was on his back, and very right vocal cord within a line of the anterior commisfrequently while his face was covered with the sheet sure -a habit of which he was guilty while asleep

Objective Examination - The tongue was normal, as well as the mucous membranes lining the surface of the buccal cavity Tonsils, uvula and palatine arches presented no deviation from the normal con-

quite roomy and showing slight glandular hyper-Later I shall trophy On the first introduction of the laryngeal At about his 20th year, there was apparently nothing foreign discernible The cords showed only a slight want of opposition, The whole of the larynx, epiglottis, aryedges epiglottidean folds, false cords and arytenoids, pre sented quite a marked appearance of congestion The vocal cords themselves were infiltrated, of a dirty, pinkish-yellow color, passing into a bright red at their free edges-covered here and there with small masses of adherent mucus I told the patient to clear his voice, and introduced the mirror a second time-with no better result than before caused the patient to make a deep inspiration, in order to get a good view of the sub cordal portion of the laryny, but could discover nothing, except that this portion of the larynx was excessively con

The patient, being now quite restless, after allowsharply Just before he finished his expiration, I quickly introduced my mirror and beheld the follow While the patient was ing a large, bright red body about the size of a cherry was imprisoned between the vocal cords, extending from the anterior commissure to the processus vocales, posteriorly and overlapping to some extent the vocal This growth presented two lateral and one cords inferior lobe, the latter being imprisoned between the cords, the former spreading over the cords on each side, thus acting like a valve, and explaining the pronounced dyspnæa which occurred during the aphonic stages It can be readily seen how, the patient persisting in his efforts to phonate- the cords contracting upon the inferior lobe, the lateral lobes spreading out over the surface of the cords-the growth interfered with respiration until the desire for air became so great as to cause him to relat his efforts, the growth being drawn into the sub corded portion of the larynx in the manner already The patient being asked to inspire, described which he accomplished after several efforts, the cords separated and the growth passed into the sub cordal portion of the larynx It is well to observe here that the cords, even during a deep inspiration, did not ev pand fully-the right cord, to which the growth was attached, never passing beyond the cadaveric posi tion, the left cord making only a slightly greater excursion than its fellow After several more examin ations, I came to the conclusion that the tumor was attached to the under surface and inner edge of the After putting my patient through a thorough course of training, which the use of that valued agent, cocaine, does not render unnecessary, of four days' duration, and being satisfied that he would follow all directions, I decided to operate on the fifth day

On Monday, November 8, in the presence of Dr

Sowers, after thoroughly applying a 20 percent solu-parting this information to our patient—a little tion of cocaine to the larynx, I removed the growth with Schræther's modification of Turck's pincette On the first attempt at introduction of the instrument, and as I was passing back of the epiglottis, he made an effort at deglutition which compelled me to remove the instrument and the mirror In a few moments I quieted him and again introduced my instrument, passing it well downward and forward to the anterior commissure to the point of attachment, and after firmly grasping the growth, evulsed it Again examining the larynx, to see if all the growth had been evulsed, I found it so filled with blood as to obscure entirely the supposed site of attach-On examining the patient the following day, I observed a small portion of the pedicle, about the size of a mustard seed, projecting from beneath the free edge of the right vocal cord This was removed without difficulty and brought with it a small portion of mucous membrane My patient had now nearly a clear voice For several weeks thereafter, I made local applications of nitrate of silver for the purpose of relieving the co existing laryngitis After this course of treatment, I discharged my patient, com pletely relieved, with every function of the larynx normal, and he so remains at the present writing am sorry that I did not have a careful microscopical examination of the growth made-which I would have done had I intended reporting the case From macroscopical appearances it bore all the characteristics of a fibroma

There are several points of interest in this case, the most important of which, and the one to which I first call your attention, is that these forms of growth, especially when quite small, frequently lead to errors in diagnosis, even if one be an adept in laryngeal examinations That they are not mere fancies, but that errors do occur may be illustrated by my own experience as well as that of others who have had vast experience in laryngological work By citing a hypothetical case, which will not be overdrawn, I may better illustrate this point

A patient comes with a history of slight hoarseness of some years duration, possibly slight dyspnœa, his patience exhausted by a long course of ineffectual treatment by the general practitioner, and, I might add, in a doubting frame of mind The patient undergoes his first laryngeal examination which on account of his nervous condition is attended with a little difficulty A hasty view is obtained and the laryn is seen to be in a state of chronic inflammation, the vocal cords are infiltrated, presenting here and there little shreds of mucus running from one cord to the other, possibly showing a little insuf The sub cordal portion is seen to be in a much congested condition, and the growth on account of its small size and situation, being of the same bright red color as the sub cordal mucous membrane, and lying well hidden beneath the anterior commis-

guardedly, probably—and with the advice to call on the morrow, dismiss him The same information he has probably received before, hence he leaves never to return A few days later a neighboring specialist narrates to you an interesting case of laryngeal growth, and in it you recognize your case of a few days ago Chagrin and vexation would not have been yours, had you been a little more careful and thorough in your examination As I have previously stated, such cases are not fanciful, for I have seen three such mistakes committed, and in one of the cases was the error committed by quite a distinguished laryngologist Prof Schroether once made the remark while speaking of a case of this nature, that no laryngologist should allow such a patient, one presenting the symptoms enumerated above, to leave his consultation room with a diagnosis of chronic laryngitis only, without adopting all manœuvres necessary to explain such a condition, of which the forced expiration after a deep inspiration, with the rapidly following intonation of a, is important in proving the existence or non existence of a growth attached to the under surface of the cords Even in the present case, the growth being quite large, at the second examination after the greatest care and effort I could not bring the growth to view and almost doubted my having seen it on the pre-

On the fourth day—the patient now submitting freely to laryngeal examination-one of my professional friends who is quite an adept in the use of the laryngeal mirror, called, and, after I explained to him the nature of the growth, he proceeded to examine the patient After introducing his mirror several times I could see by the expression of his face that he was beginning to doubt my diagnosis I subsequently proved to him the existence of the growth, with evident satisfaction, as the incredulous expression gradually gave way to one of credulity useless for one to assert that he would not make sich an error, for even with these facts fresh in his memory, he may on the morrow be guilty of committing such an error It is only by constantly calling attention to the possible errors in diagnosis that we are able to avoid them

1106 L Street, Washington

ETIOLOGY OF TYPHOID FEVER, AS OBSERVED IN COUNTRY PRACTICE

Read in the Section on Practical Medicine, Materia Medica, and Therapeutics, at the Thirty Eighth Annual Meeting of the American Medical Association, June, 1887

BY L N DAVIS, M D, OF FARMLAND IND

Philosophically it would not seem true that the forces of nature which shaped the human body and sure and the cord to which it is attached, fails of de- with a formidable foe to mankind. Such an admistions which could give rise to such symptoms, we not a reproach to the laws of nature But the "germ eliminate all except chronic laryngitis, with slight theory" of the origin of many diseases, at present, is paresis, the evidences of which are present, and im- dominant, and it would seem poor policy for a medical men to oppose the specificity of typhoid poison It would be equivalent to inviting the contumely and | nated in recovery in 21 days

discredit of his profession

Not many years since the only requisite of science to establish the cause of an outbreak of typhoid fever, consisted in developing a defective sewer pipe, an illy kept cellar, or impure water supply The specific element was by no means always a consideration in the elaboration of the poison With so light a task pefore him, the attending physician seldom traversed much territory, literally or mentally, before the hot bed of disease was discovered If in the country, a hogwallow or a pile of rotten potatoes would answer, in the absence of the above essentials He must now, however, account in some manner for the presence of an organized poison or germ in the production of The ingenuity of the country doctor typhoid fever is often sorely tried in such an inquiry, but his credulity many times leads him to the desired results The wonderful and unique properties attributed to the disease germ makes almost any theory of its de- the neighbor women by night and the husband dur velopment or transportation probable, and allows ing the day Seven or eight persons were thus en credulity a wide range of application, but doubtless gaged, by turns, during the whole course of the case often, a priori, the views adopted are incorrect

For the last 8 years typhoid fever has occupied the place formerly held by malarial fevers in our section (Randolph Co) This change has been noted in the time she commenced to wait upon Mrs Ford, many other instances, by great authorities, why it occurs they do not attempt to tell Drainage has been steadily advancing in the district for the past 30 years, but does not yet approach perfection Typhoid fever has prevailed sporadically, with no large number of cases in any given locality, and during the time specified I have known of almost every case within an area of ten miles square To exemplify the impossibility of finding, in the country, the positive source of and medium through which the virus of typhoid fever enters the body of the patient, and as bearing facts upon the period of incubation, contagiousness and predisposing causes of the fever, I will give a brief history of the following outbreak

On the 26th of September, 1886, I saw Miss Ida Ford, æt 24 years, junior member of a family of four Miss Ford was born persons, including a farm hand and raised on the farm and in the house she now ocstay over night for more than three months, nor has of 20 years, had been employed in the Ford family the family visited or entertained visitors within that about four weeks during the sickness of the latter twenty feet in depth that has served them continu- mother The well is situated from the sick-room ously for a period of 25 years on a slight eminence, so that the surface water inclines away from it in every direction, neither is it probable that there is any infiltration from the distant barnyard or meadows

There has been no sickness in the Ford family for 10 years of any character, and never was a case of typhoid fever on the place since it has been settled To my certain knowledge there has not been a case of typhoid fever nearer the residence by the whites than two and one-half miles for 15 years

even at this distance for more than 2 years

The case was pronounced one of typhoid fever

nervousness, but no diarrhœa at any time, and termi-

The dejections from the bowels were of a solid character throughout the disease, were always disin fected with nitric acid, carried a distance from the The clothes of the house and buried in the earth patient and the bed linen were changed every other Visitors had been rigidly excluded from the sick room during the continuance of the case Her mother was her sole nurse, and she was scarcely absent from the bedside of the patient 20 minutes at one time during her sickness, many times, indeed, she occupied the bed with her daughter over night

About 28 days after the attack of Miss Ford, her Mrs Ford was 54 mother took the disease also years of age and of delicate build, she had two severe hæmmorrhages from the bowels at the end of the second week, was sick one month and three days, when she died

The nursing in this case was entrusted largely to Of this number Mrs Bales, who lived about a mile distant, bore about an equal part of the burden

On the 12th of December, or 28 to 35 days from Of the seven or eight nurses Mrs Bales fell sick above referred to, Mrs Bales was much the most feeble of constitution It has never been my fortune to wait upon a worse case of typhoid fever than fol She had two hæmorrhages from the bowels, and passed much of the winter in a semi conscious

condition, but finally recovered

The Bales family consists of eight members, but a farm hand and an assistant in the kitchen were em The Bales' residence is ployed during the sickness a commodious two-story frame house which has only been built 3 years The site is elevated and has never before been occupied by a building. The well was dug and the outbuildings constructed when the house was built Prior to the sickness of Mrs Bales there has been but one case in the family demanding the attention of a doctor since the house has been occupied—a case of summer diarrhœa in an infant of The eldest daughter, who is a rugged girl The family uses water from a well about Later she became the principal attendant upon her I need scarcely add that the fecal discharges were cared for as in former cases, and the bed linen changed every forty eight hours The sleeping apartments of the children were upstairs, while the sick-room was on the first floor

Notwithstanding the precautionary measures, pre cisely twenty four days after the mother took sick the five children, æt from 8 to 18 years, began to mar The subsequent three ifest symptoms of the disease weeks gave full development to all the phases of typi cal and grave typhoid fever in each of the five cases
All recovered The oldest daughter, who had shared the danger, whatever it might be, in both families, es It was attended with a high temperature and much caped, also Mr Bales and both hired assistants

In the Ford family the husband, hired hand, two or three Litchen girls and all of the nurses but Mrs Bales escaped, thus giving indubitable proof, which requires no argument, that the water could not have been the source of the poison

Excluding the drinking-water, which is the vehicle of such baleful influence in so many well authenticated epidemics of typhoid fever, to what source must we look for the cause of our first case? Water is thought to be the channel through which the poison is conveyed to the patient, masmuch as 95 per cent of all the cases are thought to be thus caused

The atmosphere is the only other means that is recognized as capable of conveying the poison, and it is potent only at a very short distance If atmospheric infection be offered as a solution of the mys tery, we meet with the same difficulty as with the water we cannot account for the introduction of the poison, nor why so many who breathed the same air escaped the disease

Therefore we are compelled, in this instance—as in many others—to ascribe to it autochthonous ori-The constitutional prochvity of our first case invited the attack, it was the only case originating from the first cause

Mrs Ford contracted the disease, directly or indi rectly, from her daughter, she was the only close attendant and the only other member of the family who became infected virus, it seems to have been limited to the immediate vicinity of the patient's body, and to have been capable in twenty-eight days of producing an effect on the constitution of a previously healthy person. Mrs. Bales imbibed the poison in the Ford family In twenty-eight days from the time carried it home it made an impression on her system, it was capable of striking down five of her children The sittingroom occupied by the children communicated with the sickroom of their mother, and they received the poison through an infected atmosphere The eldest children—who went through the entire sickness in both families escaped, Mr Bales and two hired assistants, besides visitors and transient help, escaped At the Ford residence all save Mrs Bales, who was of very feeble constitution, escaped, showing quite conclusively that the drinking-water, as before ob served, of neither of the families contained the poison, otherwise the infection would have been more gen-The conclusion which follows, therefore, is that the real nature of the materies morbi of typhoid fever is but little known, that if it is not autogenetic, its origin many times is involved in impenetrable obscurity, that the organism or chemical product is as likely to assume an active form in the healthy surroundings of an isolated farmhouse as amid the filth of a badly neglected village or city, that constitutional prochvity, feeble health, or bodily fatigue has much to do in determining an attack It is more than probable, also, that the poison may remain latent in the system until evoked by physical exhaustion, despondency, or other conditions of vital depression. Twenty four to twenty-eight days constitute sufficient time for the poison to escape from the E5e Strain '(New York Medical Journal Jan 7 1888)

body of the sick, ripen if imperfect, and produce a toric effect on the system of a previously healthy The poison which perpetuates the disease is not contained in the stools alone, but may emanate directly or indirectly from the body of one sick with typhoid fever Water is certainly not the medium which conveys the poison, even in a small majority of the cases, in the country But we cheerfully admit that the country doctor is not trained in the kind of knowledge which makes his observation of May we not the etiology of disease highly valuable also question the propriety of the present trend of the highly learned in the profession, in practically accepting as facts very much that is not susceptible of demonstration, relative to the causation of disease?

GRADUATED TENOTOMY IN THE TREATMENT OF INSUFFICIENCIES OF THE OCULAR MUSCLES (STEVENS' OPERATION)

Read before the Philadelphia County Medical Society, March 14, 1888

BY CHARLES HERMON THOMAS, M D, OF PHILADELPHIA

The study of disorders of the ocular muscles in Whatever the nature of the relation to functional nervous diseases has received a strong forward impetus during the past year, chiefly due to the published results of the labors in this direction of George T Stevens, of New York, whose work on "Functional Nervous Diseases, recently published,1 has challenged special attention, even where it has not met with entire approval

The subject occupies a standpoint on the line between the two important specialties of ophthalmology and neurology, it takes somewhat from both, and has already, by force of circumstances, become in a certain sense a specialty by itself The operation daughter in the Bales family—the most rugged of the and its application have, until recently, remained to a remarkable degree personal in the hands of Dr Stevens, notwithstanding that for many years he has reported it before medical societies and in the medical journals. All this, however, has been recently changed by the publication, within the last year, of his work above referred to, which has brought the method into such prominent notice as to compel recognition

Other operators have now entered the field, among whom is Prof A L Ranney, of New York City, who, as a neurological specialist, has reported's a series of cases of the gravest neuroses successfully treated by the Stevens' method Beyond question a point has now been reached which shows the subject to be worthy of the most sincere investigation

What I have to present to night is, to a certain extent, in the nature of a preliminary report, as my

work is necessarily incomplete in some particulars, owing chiefly to the considerable length of time required for observation to arrive at a just estimate of the permanency of the results obtained-especially in the gravest and, therefore, most important cases I shall attempt to add little that is new to the presentation of the case as made by Dr Stevens himself, and I cannot hope, in the length of time allotted for its consideration, to make a statement commensurate with its importance, but I have thought it right to rehearse briefly its principal features and to give my own experience in connection therewith, together with a sketch of a few of my own cases, because I have become convinced of the importance of the subject, and also because it has not, heretofore, been brought before this Society-nor, so far as I can learn, before any other of the medical societies of Philadelphia

It is now about ten years ago that the operation was first brought to my notice by patients who had ful stimulus which the need of binocular vision pre been under Dr Stevens's care incredible that results such as they claimed were in the normal state be directed to a distant object, produced in their cases could have been derived binocular vision will occur without the need of from the cause assigned practicability of performing the operation in the properly bear upon the object definitely graduated manner which was said to be Under these circumstances, and in the absence of better information, my position was for a long time one of earnest opposition to the About three years ago, howpractice in question ever, having under my care several cases of muscular asthenopia which I was unable to relieve, though I obtained the advice of several of the best known ophthalmologists, and being freshly reminded of the work of Dr Stevens by a patient of unusual intelligence and reliability, who reported great relief obtained at his hands, I asked his assistance in the He kindly demonstrated treatment of these cases to me, upon patients of his own, the practicability of the operation, and I became convinced of its The results obtained were so satisfactory that since that time I have investigated the great value muscular as thoroughly as the refractive conditions in all cases coming under my care, and have as faithfully undertaken to correct them

For the discovery of abnormality in any of the straight muscles, their physiological condition, both while at rest and in action, and in all states of the acommodation of the eye must be thoroughly under In order that binocular vision may result, the visual lines of both eyes must converge upon the same point, whatever may be the position and It is only under such cirdistance of the object cumstances that the rays of light are brought to a focus at corresponding points upon both retinæ A slight deviation results in diplopia, constituting strabismus, a subject sufficiently well understood, and to which Stevens's researches do not directly But while there may be perfect binocular vision, and not the slightest indication of strabismus, there may be, nevertheless, grave faults affecting the It is these faults that Dr Stevens has emphasized, and to these his observations have been chiefly confined

In the normal condition of the ocular muscles the visual lines of both eyes naturally preserve an almost exactly parallel direction when looking at distant objects, and they maintain such a position of their own accord from muscular tonicity alone, without the necessity of any additional stimulus This can be shown by prismatic tests diplopia produced in making the test will be such that the two images will lie in that plane which is at right angles to the base of the prism 1 If, for ex ample, diplopia be induced by a prism placed before either eye with its base directed either outward or inward, the two images will lie in the same horizontal plane, and similarly, vertical prisms, with base up or down, will induce diplopia, but in this case the two images will be situated in the same vertical The reason for this is because the normal visual lines of both eyes naturally lie in the same hor izontal and vertical planes, even when the power-Hence, if the eyes It seemed to me sents is abolished by the prism Again, I questioned the extra muscular action to bring the visual lines to If, on the other hand, the visual lines of the two eyes do not natur ally take the proper position, one of two things will result, either there will be no effort to bring them into correspondence, and strabismus with attending diplopia occurs, or, more frequently, by an extra nervo muscular effort, called into action by the de mand for binocular vision, the proper position will be maintained, just as in facultative hypermetropia accommodation is necessary, even when parallel rays coming from a distant object are to be brought From this forced, to a focus upon the retina though it may be involuntary or even unconscious effort to maintain the proper direction of the visual lines, the abnormal conditions under consideration We have abundant clinical evidence of the enormous expenditure of nerve force under these result circumstances, and of the development of marked reflex disturbances, which are manifested both in symptoms of irritation and of exhaustion

Dr Stevens has introduced a series of terms de scriptive of the various abnormalities to which the recti muscles are subject The word exophoria desig nates simply an outward tendency of the visual lines, without implying anything as to which muscle or set The opposite condition, of muscles is at fault namely, tendency to convergence, is designated by the word esophoria, meaning an inward tending either visual line deviates above its fellow, the fact is expressed by the term hyperphonia, right or left as the case may be, always remembering that the lower image represents the higher tending visual It is to be remarked that the condition of hyperphoria is far more frequently productive of

⁴ Not that Dr Stevens was by any means the first to employ priority for the discovery of muscular irregularities, but he appears to have used them with greater precision and by more systematic methods than the heretofore prevailed have heretofore prevailed have heretofore prevailed 15"A System of Terms relating to the Conditions of the Ocular Muscles known as 'Insufficiencies', by George T Stevens, I D Ph D, (New York Medical Journal, Dec 4, 1886)

serious reflex disturbances than any other fault, and mainly for the reason that a small amount of deficiency in this direction may, and usually does, in volve a considerable proportion of the total co ordinating power of the vertical muscles, and this because the power of surcumduction is usually limited to about three degrees, while that of abduc- more serious results besides tion is about eight edgrees, and that of adduction quote The generic may be fifty degrees and upward term to express any deviation whatever from ortho phoria, the normal, is heterophoria Finally, the amount of heterophoria found in any given case is prism required to correct the fault

In practice, the tests for insufficiency are made by placing prisms before the eyes with their bases in certain definite directions Lateral diplopia is pro a prism either up or down If in lateral diplopia so induced, either image is above the plane of its feleye whose visual line is lowest, to be expressed as to visual troubles" hyperphoria of the opposite eye If, in induced diplopia be homonymous, exophoria if crossed

In applying the prism test for the discovery of says muscular anomalies it is not sufficient to be content sometimes have apparent myopia through spasm of they are, in fact, reflex phenomena use of temporary correcting prisms for whatever relief to the tension of a superior or inferior rectus" fault may be manifested, and following it up-but not leading it—as it develops, by a new correcting results from simple conditions justified in proceeding to operation erate dose of morphia administered hypodermically under morphia to be expressive of the true condition be completely remedied of the drug as a matter of ordinary practice discovery of an efficient and safe agent for the rebe desired

error first not infrequently the muscular difficulty might be removed" soon disappears, showing the muscular to have been dependent upon the refractive state tion of refractive errors, especially those of a hyper treatment directed to ocular difficulties, the affection metropic character should always be made before applying the prismatic tests

Defects of refraction and accommodation are well known as the source of serious reflexes, especially headaches or severe migraine, nausea and dizatness, but it is not so well known that defects of muscular adjustment through faults of the guiding muscles of the eye produce all these and many From Dr Stevens I

"Respecting the importance to be attributed to ocular, refractive, and muscular anomalies, I fear that my views will for some time to come continue to be regarded as something more than radical, but equivalent to and expressed by the degree of the I am ready to reaffirm the proposition made years ago, that, among the various elements constituting the neuropathic tendency, these anomalies must be regarded as occupying a preeminent position

"Summing up the experience in this field of work, duced by a prism with base in, vertical diplopia by it is shown that, not in occasional and rare instances only, but in a large proportion of cases of the most redoubtable neuroses, unusual and most salutary relow, we know that the higher image belongs to the sults may be anticipated from attention directed

Among the neuroses shown in many cares to be vertical diplopia, either image deviates from the dependent upon such troubles, are to be mentioned vertical, we have lateral fault-esophoria if the neuralgia, spinal irritation and neurasthenia, choica, epilepsy, and mental disorders Dr Stevens further

"Not only are those painful or irregular condiwith the results of a single or even several examina- tions usually described as neuroses in great proportions, because we must always bear in mind the tion responsive to the relief from ocular tensions, possibility of latency-that is to say, like latent but a great variety of conditions commonly rehyperopia, the true fault may be concealed or garded as local affections yield as readily, and Indeed, as in latent hypermetropia we prove that with some possible local complications As an instance the muscle of accommodation, so in actual esophoria of this class of trouble, I may mention the fact that an apparent exophoria may be manifest, the result in more than a score of cases of extreme dysmenorof spasm of the externi, and this is equally true of rhoea—in each of which the periodical suffering has the other muscles It is only by a careful considera- been of intense character, of regular occurrence, tion of all the circumstances, such as the degrees of and of the full duration of the menstrual life of the abductive and adductive power, and, finally, by the patient—the dysmenorrhoea has failed to occur after

So far as my experience goes, epilepsy very rarely The ocular anprism until the fault becomes stationary, that we are omalies in epilepsy are of the most complicated, In one obsti- and often of the most obscure character A simple nate case of exophoria I have several times ob- insufficiency may induce headache or other minor tained relaxation of spasm of the interni by a mod- manifestations, but the ocular causes of epilepsy are usually of a character most perplexing to the sur-But, though the after-results proved the observation | geon, and sometimes of a character which cannot Hence, great patience, in this case, there are obvious objections to the use and, in certain cases, much time and skill are required to accomplish that which can finally be done

If, in the meantime, the patient and his friends laxation of spasm of the recti muscles is greatly to are constantly assured by both lay and professional advisers that his efforts must, of necessity, prove It sometimes happens that muscular anomalies of fruitless, he is apt to withdraw from treatment, even considerable degree are discovered in connection while defects which are of great importance, are with refractive faults. By correcting the refractive known to exist, and which, by continued efforts,

Professor Ranney is authority for the statement The correc- that in cases of epilepsy of long duration under

⁶ See 'Ocular Irritations and Nervous Disorders by Dr George F Stevens (N) Medical Journal April 16 1687)

has been scarcely less tractable than diseases com- the elasticity of their edges is an influential factor in monly regarded as easily curable

As furnishing a suggestion as to the possible method of production of epileptic attacks from eyestrain, it is interesting to note some experiments performed several years ago by Drs Dercum, Parker, and others in the artificial induction of convulsive seizures produce spasms in many persons by the following method 11

"The subject being scated, the tips of the fingers of one or both hands were so placed upon the surface of a table as to give merely a delicate sense of contact—ie, the fingers were not allowed to rest upon the table, but were maintained, by a constant muscular effort, barely in contact with it other position involving a like effort of constant muscular adjustment was found to be equally effici-Any one object in the room was now selected, and the mind fixed upon it, or some subject of thought was taken up and unswervingly followed

"After the lapse of a variable period of time, extending from a few minutes to an hour, and depending upon individual peculiarities to be noted, the subject was frequently thrown violently to the

ground in a general convulsion, preceded by tremors

which rapidly became more violent

"Seizures equalling in violence a general convulsion were by no means induced in all subjects, and were generally the result of experiments repeated many times during the same evening In the experimentors the convulsions became so easily induced that it was thought advisable to desist for a long period"

The effort of constant muscular adjustment here spoken of appears not unlike the condition found in the eyes in cases of insufficiency of the ocular muscles, and it seems not unreasonable to infer that if such strain of the muscles of the forearm would produce results of the kind reported by the authors just named, that the strain upon ill-balanced ocular mus cles (which must be continuous during the whole of the time that the eyes are opened) should be productive of even more serious, and, indeed, permanent

results In the majority of these cases there is but one satisfactory method of treatment, and that is graduated The operation consists in making a small opening through the conjunctiva, exactly over the insertion of the tendon, when the tendon is seized by extremely fine forceps and divided outwardly in each direction, preserving the extreme outer fibres, or at least the reflection of the capsule of Tenon, which serves as an auxiliary attachment mies for strabismus and so-called partial tenotomies have, of course, long been made, but there are radical differences between these and the operation here

The fan-shaped expansion of the tendons of the described recti at their points of insertion into the sclerotic are somewhat wider than is generally supposed, while

⁷See "Artificial Induction of Convulsive Seizures," by Drs F \ Dercum and A J Parker, (Journal of Mental and Nervous Diseases, October, 1884)

determining a favorable result in the purpose of the operation—that is, in bringing about a relaxation which shall be permanent by permitting the divided portion to retract and form a new attachment to the globe further back

The use of prisms as a means of treatment of They found that it was possible to marked heteropheria is not to be relied on, as in many cases they are found to be insufficient and disappointing 6 They have, however, a certain value as means of systematic exercise of the ocular muscles,

particularly in the milder cases

When the correction is made by tenotomy, all that is necessary to be done in a given case should be regarded, in a sense, as one operation, though it may be in several stages and at different periods-as a watchmaker counts the regulating of the watch one operation, though he may be obliged to move the regulator a number of times, or as the correction of an astigmatism is one operation, though it may in volve a number of sittings

In one complicated case I have operated as many as seven times, the first operation nearly two years, and the last a week ago, the net result being an un questionable gain both in head symptoms, which were at one time alarming, and in the severe asthenopia to which the patient had long been subject to the operation she had suffered from severe pain in the region of the eyes and in the back of the head, accompanied by general nervous distress of an en An eminent ophthalmol tirely disabling character ogist declared her to have organic disease at the base of the brain from the appearance of the eye ground To day this lady This was about three years ago assured me that she felt "wonderfully better," and expressed her entire satisfaction with the treatment she had received

It is to be reemphasized in this connection, as an additional caution, that no operation is ever to be undertaken unless the indications for it are positively From a perfectly plain case, evident to the merest tyro, to one demanding the greatest skill and patience of the most experienced, there is every Nothing would tend more to bring dis credit upon the procedure than premature opera tions, which might result in such disturbance of the ocular muscles as seriously to cripple binocular vision without in the least alleviating the reflex condition

for which the operation was undertaken

Mrs G H C, referred to me by Dr W H H Githens, æt 32, married, mother of four children, has suffered for many years from almost constant severe headache combined with a feeling of drowsiness, the seat of the pain being the brow and vertex balls painful, always felt better when the eyes were There is frequently double vision, but no General condition markedly closed manifest strabismus Although there was no error of refraction except a very slight amount of hyperopia,

accomplished neurologist—who habitually wears speciacles for the correction of refractive errors and who also suffers from murcular faultier acconversation with mesaid with emphasis. "It is to find they not like they may be a conversation with mesaid with emphasis and know they not like they may be a conversation with mesaid with emphasis and know they not like they may be a conversation with mesaid with emphasis and know they not like they may be a conversation with mesaid with emphasis."

shown only under full mydriasis, the patient was unable to use her eves at any near work, such as readnegative

Muscular tests esophoria of o°, which, under the use of partially settled fault of 20° of esophoria and 28° esophoria

in accommodation

Tenotomy of the left internus relieved all the mus cular fault except 10, which I have allowed to remain The relief of all symptoms was immediate and com-The headache, the pain in the eyes, the intolerance of light, the drowsiness and double vision have all vanished She is now able (without the aid of glasses) to read and sew as well as anyone, and threading a needle, which previous to the operation was almost an impossibility for her, is now done with The general health and spirits have improved to a remarkable extent Perhaps no change in her condition is more marked than of her tone of voice, which from being high-pitched, nervous, almost wailing in character, has been moderated, mellowed, and vastly improved

As additional illustration of what may be accomplished, I may mention the following case of Dr

J H W, thoroughly healthy boy, without any nervous symptoms whatever, has been under my oversight since infancy Except for a chronic tarsal ophthalmia there was nothing to call attention to the Very slight hypermetropia, for which I had prescribed glasses several years ago On examination three months ago there were 11° of esophoria manifest, for which an operation was performed, removing 7° of the fault Two weeks later 4° additional were manifested, a week later the total manifest esophoria was 9°, when a second operation was performed, which resulted in the removal of 8° of the 9 then existing A recent examination shows a manifest esophoria of 3°, being a let out of 2° since the last operation

From the first operation a marked change took place in his facial expression, his eyes, which had previously been almost closed, opened widely, the to keep the eyes from closing, which he had not noticed as dependent upon any condition of his eyes

until after it had been reheved

of demonstrating the amount of set-back given to the tendon, which, though invisible under ordinary circumstances, may be readily seer, upon causing each eye, about 2 millimetres wide in one and a little less in the other where the sclerotic is plainly visible through the conjunctiva

disposition is more frequently due to eye strain than intestines were not opened

strain from muscular fault is the cause of grave and varied reflex neuroses, and that in these cases careing, sewing, etc., and at all times suffers from extreme fully graduated tenotomy promises relief, besides, intolerance of light Ophthalmoscopic examination there is in such cases often sufficient justification for the sake of the eyes and sight-apart from the ner-The first examination showed an vous condition—for the correction of the fault

My own experience covers many of these operacorrecting prisms worn for ten days, developed into tions, performed for the relief of a variety of conditions and, notwithstanding serious difficulties at times encountered, I have a steadily increasing confidence in the legitimacy and value of the method

SENILE HYDROCEPHALUS

Read before the District of Columbia Medical Society, December 7, 1887

> BY D S LAMB, M D, OF WASHINGTON D C

I show this specimen to illustrate the atrophy of the brain that sometimes takes place in old age, as well as the compensatory dilatation of the ventricles that takes place at the same time, made necessary by the fact that the brain is in a hard case woman was old, said to be 82 years, and had been somewhat demented for an indefinite time, explained doubtless by the progressive atrophy November 24 she was seized with left hemiplegia and died six days afterwards, the 30th The post mortem exammation illustrated well the abundance of pathological material which is sometimes found in an old person The brain was atrophied and its ventricles dilated, the ventricular fluid, as well as the subdural and subarachnoidal, was increased in quantity, but transparent and clear as water There was some congestion of the dura mater The arteries were markedly atheromatous, and there were clots in several of them The spinal cord, as low down as it could be examined from the brain cavity, was atrophied roid cartilage was brittle, with chalky deposit, and broke with ordinary handling There was a muco purulent accumulation in the pharynx and larynx-The lungs showed small chalky and pigmented nodules in upper lobes, probably from the cure of incipient tuberculosis The lower lobe of the right tarsal ophthalmia showed prompt improvement, and lung showed sufficient recent pleurisy and pneumohe expressed himself free from a constant struggle nia to prove in a weak person a sufficient cause of death

The heart and pericardium were everywhere closely attached to each other by old adhesions I present the patient this evening for the purpose substance of the heart itself was fatty, the aortic and mitral valves, as well as the aorta, were atheromatous There were old adhesions of the liver to the diaeither eye to be rolled outward, as a vertical line in the gall bladder was as much distended with bile as I ever saw it, projecting several inches forwards from the anterior border of the liver, apparently she had Whether the claim made that the neuropathic pre- accumulated The spleen was much atrophied, the to other conditions is fully justified by the facts or showed contraction and small cysts, as well as some not, it is unnecessary at present to determine, seeing adhesion of capsule, suggesting chronic nephritis that enough is known to make it certain that eyedus and projecting into the cavity a polypus the size and shape of an almond, the uterine mucous membrane was covered with dark blood, so that we might say that the polypus was still active were atrophied, the Fallopian tubes dilated

MERCURIC ALANINE IN SYPHILIS

DR R DE LUCCA, Assistant in the Clinic of Prof Ferrari in the University of Catania, has recently published, in La Riforma Medica, March 22 and 23, 1888, his results with alaninate of mercury (mercuric He was led to make the experiments with this compound after seeing Schmiedebarg's Compendium der Pharmacologie, in which it is stated that combinations of the oxide of mercury (HgO) with certain amidic acids of the fatty series (acetamide, glycocollamine, asparagine) should act well in the treatment of syphilis, and these preparations have the advantage of being very soluble and easily absorbed Preliminary experiments on animals showed that mercuric alanine was not very toxic, and caused no local irritation when injected under the skin

Alanine is α -amidopropionic acid, produced by the action of alcoholic ammonia on α -chloro- or α bromopropionic acid, or by heating aldehyde ammonia with hydrocyanic acid and hydrochloric acids, the reactions being precisely similar to those by which glycerine is obtained from the corresponding derivations of acetic acid Alanine unites with acids, bases, and It crystallizes in tufts of hard needles, dissolves in 5 parts of cold water, less easily in alcohol, and is insoluble in ether. When slowly heated it melts and sublimes undecomposed, but when quickly heated it is resolved into carbon dioxide and ethlya Nitrous acid converts it into lactic acid

The alanimate of mercury used was prepared in the following manner 1 part of alanine was dissolved

ally raised to the boiling point, while the liquid was boiling it was poured over a small quantity of the oxide of mercury (HgO?) until it was all dissolved Then the liquid was filtered and evaporated, the residue crystallized, and a whitish substance, mercuric alanine, was obtained, which under the microscope showed the characteristic needle-shaped crys-When thus pretals, grouped in crosses and tufts pared alanmate of mercury is soluble in 3 volumes of cold distilled water, this aqueous solution is perfectly colorless, clear, is changed neither by exposure to air nor light, and will keep indefinitely In dilute solution it will not coagulate albumen, in concentrated solution its coagulating action is limited to causing a cloudiness of that part of the liquid with which it comes in immediate contact. In other respects it has the general properties of other salts of mercury

In practice De Luca used the drug in three different solutions, of 4, 8, and 10 mgrm to 1 ccm of distilled water (gr $\frac{1}{16}$, $\frac{1}{16}$, and $\frac{1}{16}$ to 16 \mathbb{M}), both for internal and hypodermatic or intermuscular use was used by injection in 20 cases (adults), 19 cured, one improved The quantity used daily on each patient was from 5 to 10 milligrams (13 to 1/6 gr) The average number of days of treatment for each patient was 37 o5 days, average number of injections to each patient 27 7, average age of patients In the case of improvement that was 23 2 years not cured the patient stopped treatment cases were those of secondary syphilitic lesions The average quantity of the drug used was 228 mgrm (35 gr) to the patient Suppuration at the site of injection occurred only 3 times out of all injections, 53 per cent As regards the duration of treatment, then, mercuric alanine has a slight advantage over the bichloride, as to quantity, it has a decided advantage, being about as 22 8 to 42 to the efficacy of the alaninate, in 12 cases (out of the 20) that could be seen to find if any recurrence had taken place, there was only 1 recurrence, in a case of syphilitic papule of the larynx it seems that the alaninate gives more permanent results than other mercurial preparations in not a single case in which the drug was used by injection was any stomatitis or other unpleasant effect produced

From a tabulated statement of 20 cases treated by the internal use of the drug, it is seen that for the cure of 10 adults, with secondary syphilis, there was an average of 45 4 days and 641 mgrm (9 9 gr) of mercuric alaninate to the patient in 20 parts of distilled water, which was then gradu | dren treated 1 died on third day | For the cure of

9 children, average age 7 4 months, with hereditary or acquired syphilis, each required an average of 54 6 days and 159 mgrm (2 45 gr) Of these cases 6 were seen in from 8 to 9 months after treatment, and there was no recurrence in any one There was not a single case of stomatitis, and there was only i case of intolerance to the drug on the part of the stomach, which was completely controlled by the administration of cocaine As regards the internal use of the alaninate, then, it is not to be preferred to the tannate or the phenate in the opinion of De Luca, but the easy tolerance of the drug and the excellent manner in which it acts on the syphilis of infants make it an important addition to the list of antisyphilities The child that died was only 2 months old, and was in a desperate state when it came under treatment De Luca claims that the decidedly calmative action of the drug gives an especially happy effect in infants

While 40 cases may be considered a small number from which to draw conclusions, the good results obtained by De Luca show that this preparation of mercury is one well worth trying Possibly it may be found that it will give good results in the late manifestations of syphilis

TIGHT LACING AND GALL STONFS

The advocates of female dress reform and the enemies of the corset will be pleased to know that there is a causal connection between tight lacing and At least, so says Professor F Margall-stones CHAND, of Marburg, in the Deutsche medicinische Wochenschrift, of March 22, 1888 One may be easily convinced, he says, that gall-stones and lacingfurrows of the liver are very frequently coincident, and when the situation of the lacing-furrows are observed with reference to the gall-ducts on a preparation, the whole matter becomes quite clear rule the course of the lacing-furrow is obliquely across the right lobe of the liver, from which there is'a tendency to atrophy, of various degrees, in the region of In the higher degrees, in which a the gall-bladder true lacing-lobe is formed, the gall-bladder remains entirely on this part of the right lobe, and the thinned portion of the liver is just at the region of the neck of the gall-bladder and of the cystic duct infrequent, in such cases, to find the gall-bladder tightly distended, and extending far beyond the border of the liver, and in these gall-bladders stones are requently found

have to deal in these cases with a striking and fre- Aerzte, has issued a circular asking for information

1

quent coincidence, or with a true causal relation The first is not impossible, since both lacing furrows and gall-stones are of frequent occurrence, and both are frequent in the female sex Stagnation has been held to be one of the most important causes of gall-stone formation, though it is extreme ly probable that there is also a chemical change in the composition of the bile that plays an impor tant part Anything that may cause thickening of the bile, occlusion of the bile-passages, faulty evacua tion, especially when the bile is thick and rich in solid matters, leads to the formation of nuclei, upon which stones are easily formed Anything that exerts pressure on the bile-passages, especially on the cystic duct, may be considered as favoring the formation of biliary calculi Pressure upon the border of the ribs may exert such influence It is known that sedentary habits predispose to some degree to gall

In the case of tight lacing the pressure of the bor der of the ribs upon the liver acts continuously only At night there is no pressure, or during the day much less, and then only when the tight lacing has This intermittent changed the form of the thorax pressure, Marchand claims, actually favors stagnation of bile and the formation of concretions in the gall bladder, it becomes distended during the day, and cannot empty itself completely at night Marchand's opinion, the first and most frequent cause of the formation of gall-stones is of a mechan ical nature, and in the numerous cases that occur in women he thinks that the mechanical factor is tight And not only cases of calculi of the gall bladder, but many cases of cancer of this viscus may be attributed, he thinks, to tight lacing, and he illus trates the manner in which the liver is pressed into by two cuts from actual preparations of cancer of the liver with biliary calculi

It is probable that Marchand's theory is applicable to many cases of gall-stone, and some cases of can The deformity of the cer of the liver, in women liver that is sometimes produced by the pressure of corsets and stays is a matter that almost any pathol ogist of large experience can testify to, and the sur gical world was but a short time ago astonished to learn that Langenbuch had excised a third lobe of the liver, caused by excessive pressure

COLLECTIVE INVESTIGATION OF SYPHILIS PROFESSOR KOBNER, of Berlin, Chairman of the Of course, there is some question as to whether we Committee of the Deutsche Naturforscher und regarding syphilis and the methods of treating it The circular states that the statistical publications from institutions and private observers regarding syphilis and the different methods of treating it are faulty because they contain many sources of error that cannot be properly eliminated, and because of the great inadequacy of the material published, since they deal only with the treatment of certain syphilitic symptoms, without regard to the different syphilitic individuals, though the great influence of andividuality on the natural course of syphilis, uninfluenced by therapy, is recognized by all On account of this one-sided method of making and re cording observations there still remain many points in the pathology and especially the treatment of syphilis, as regarding the relations of syphilis to other diseases, for which thousands of cases might Furthermore, it is important, for purposes of comparison, to know how other diseases, such as scrofulosis, tuberculosis, etc., are affected by the complication of syphilis and the methods of treating it Such an investigation, well carried out, can scarcely prove otherwise than valuable

A FASTER OF THE 16TH CENTURY -A recent number of the Archives de Neurologie publishes a report of Bucoldianus and others on a wonderful fasting girl whom the Emperor Ferdinand visited in 1542 This girl, 12 years of age, took neither food nor drink for a year, the report says, and learned men were at their wits' ends to account for the marvelous fast Hufeland's "Makrobiotik" is an account from the Historie de l'Académie Française, of 1769, of a case an which an insane officer took no food for 46 days He drank only water with a few drops of brandy in 1t, and during the last 8 days no water 36th day he was unable to stand On the 46th day he saw a child with a piece of buttered bread, when he began to eat, and soon recovered

DR C R AGNEW -- We regret to learn from the daily papers that Dr C R Agnew, of New York, is suffering from a severe attack of perityphlitis, and that there are doubts of his recovery Dr Sands performed laparotomy on him last week, but though some pus was evacuated the condition of the patient is very unfavorable at last accounts

A New Culture Fluid -Apothecary James Section on Ophthalmology, Otology and Laryngology Kunz, of Bern, exhibited to the Medico Phamaceu-

fluid that has the advantage of containing no pepsine, the presence of which renders the examination of bacterial cultures for ptomaines so difficult fluid is colorless, so that the growth of microbes may be very easily observed It is prepared by the digestion of albumen, ox pancreas, and water

TRAINING SCHOOL FOR NURSES IN LOWELL-From the Annual Report of the Lowell Hospital Association, January 1, 1888, we learn that a training school for nurses has been established in the Hospital, and that a course of twenty-four lectures on nursing was provided for the past winter

A BUILDING FOR THE BERLIN SOCIETIES -A plan is on foot in Berlin to construct a large building for the scientific societies of the city Most of the details have been arranged

Professor Donders has recently celebrated the 50th anniversary of his Professorship in the University of Utrecht

ASSOCIATION ITEMS.

THIRTY-NINTH ANNUAL MEETING,

To be held in Cincinnati, Ohio, May 8, 9, 10 and 11, 1888

> President, A Y P Garnett, M D, of Washington, D C

> > PAPERS AND DISCUSSIONS

The following additional titles of papers to be read at the approaching meeting have been received since the programme was published in the issues of THE JOURNAL for April 7 and 14

Section on State Medicine

On Thursday -b "What Evidence is there For or Against a Malanal Germ?" by Samuel N Nelson,

Section on Practical Medicine, Therapeutics and Physiology

"Etiology of Typhoid Fever" by V C Vaughan, Ann Arbor, Mich

"On Headache from Overlooked Causes in the Naso-pharynx and Ears, by Henry Gradle, Chicago

Section on Medical Jurisprudence

"Points Touching the Medical Jurisprudence of Alcoholic Inebnety," by S L Wright, Bellefon-

"Some Observations on the Extraction of Catartical Society of Bern, on Dec 6, 1887, a culture- act without an Iridectomy, and the Use of the Bandage in the After-treatment," by Geo E Frothing-

ham, of Ann Arbor

"Further Remarks on the Necessity for Reform in the Manner of Designating Lenses," by Dudley S Reynolds, of Louisville

"Fatty Tumors of the Orbit," by Jas H Buck-

ner, of Cincinnati

"A Case of Atrophy of the Bulbs of the Supercilia and Cilia, Associated with Atrophy of all the Fingernails, Microscopic Specimens of Cilia and Supercilia, and Cast of Fingers," by R Tilley, of Chicago

"Passive Motion in the Diagnosis and Treatment of Middle-Lar Affections, with a New Otoscope

(Pneumatic)," by S S Bishop, of Chicago
"The Tonsils as a Cause of Naso-Pharyngeal and

Aural Disorders," by H Gradle, of Chicago

"Tonsillotomy, with a New Tonsillotome," by S S Bishop, of Chicago

Section on Dermatology and Syphilogiaphy

Chairman-I. Duncan Bulkley, New York Secretary-Fayette Dunlap, Danville, Ky

FIRST DAY

Address by the Chairman, "Syphilis as a Nonvenereal Disease

Discussion on "The Etiology and Treatment of Eczema," opened by Dr Bulkley, or another

Nervous Causation of Eczema," by E Cheney,

Boston

"A Clinical Study on the So called 'Prairie Itch,' 'Lumberman's Itch,' etc, with a Consideration as to its Entity," by W T Corlett, Cleveland, O

"Two Cases of Pityriasis Rubra (primary exfoliative dermatitis)," by Frank Woodbury, Philadelphia

SECOND DAY

Discussion on "The Limit of the Period during which Syphilis can be Communicated by Contagion or Inheritance," opened by L B Bangs, New York

"Double Chancre à distance, an Inquiry into Syphilitic Automoculation," by A H Ohman-Dumesnil,

St Louis

"The Importance of Local Treatment in Syphilis," by Joseph Zeisler, Chicago

THIRD DAY

"Tuberculosis Cutis, with Report of a Case," by

George T Elliott, New York "Clinical Remarks on Perforating Ulcer of the

Foot," by John A Wessinger, Howell, Mich "The Use of Arsenic in Dermatology," by B M

"On the Value of frequently repeated Doses of Ricketts

Arsenic in the Treatment of Bullous Diseases of the Skin, especially in Children," by L. Duncan Bulkley, New York

RAILWAY ARRANGEMENTS

Attention is called to the advertisement of the Monon Route on the inside back cover of this issue This line has arranged to furnish and no one making one of this special party will regret having made the trip gret having made the trip

SOCIETY PROCEEDINGS.

COLLEGE OF PHYSICIANS OF PHILADELPHIA

Stated Meeting, March 7, 1888

THE PRESIDENT, 5 WEIR MITCHELL, MD, IN THE CHAIR

DR JOHN ASHHURST reported a case of

SUCCESSFUL SIMULTANEOUS TRIPLE AMPUTATION FOR RAILWAY INJURY

(See THE JOURNAL of April 14, page 462)

DR WILLIAM HUNT said Dr Ashhurst has dwelt upon the importance of saving time. There is one way in which time might be saved, and that is by more than one surgeon operating at the same time Dr Morton and I have done that on two occasions, each taking a limb and operating at the same time I do not know how it would work with three

I should like to make a DR H C Wood said remark with reference to this point of keeping up the animal heat Many people die in acute disease, in acute poisoning, and after severe operations, be cause the temperature is not maintained I have proven by experiment that if two animals are sub jected to severe injury, and one is kept in a moder ately cool room, and the other in a hot room, the In this con one will die, and the other recover nection, I will repeat a suggestion made to me by Dr Dercum, which would afford one of the most efficient measures for maintaining temperature—and that is, to fill the ordinary water-bed with hot water,

and allow the patient to lie on it

I did not know DR CARR, of Washington, said until I heard the remarks of Dr Ashhurst the im I have perportance of a case that I have had formed a quadruple amputation for frost bite patient was brought into the hospital in a condition of collapse with the four extremities frozen reacted well, and remained in the hospital a week, when his constitutional condition became serious, and after consultation it was decided that amputa tion of the four extremities was desirable. I operated, removing one foot above the ankle, the other foot through the metatarsal joint, one forearm about its middle, and one hand, leaving a small stump of the thumb, disarticulating it at the metacarpo-The patient did very well phalangeal articulation

In operating I secured the vessels with hæmostatic forceps, and left the stump in that condition while I

proceeded to amputate another limb

I understood from DR J WILLIAM WHITE said Dr Ashhurst's paper that in his classification of triple amputations partial amputations were not in I had last year at the University Hospital a double knee-joint amputation, with amputation of a portion of one hand, leaving the thumb and one finger, and should have been glad to present the pa

In reference to the technique, I have only one or tient this evening

ing up the bodily heat reference to the use of wet towels, which can be packing wounds with iodoform gauze vents the formation of a blood-clot, which is perhaps, next to a failure to secure asepsis, the most temperature noted important cause of the failure to obtain primary union Where there is danger of oozing, he packs Dr Hunt is an old one remain from forty-eight to seventy-two hours majority of cases union by first intention is secured Even when it was left in situ for from four to six days such union occurred after suturing In a case by packing the first operative wound with iodoform gauze as soon as the vessels are secured, and then This could be done by an assistant, and the patient removed to the ward much sooner than if time were taken to introduce stitches The or three days

deal of pleasure to the remarks as to the temperapossible influence of irrigation upon these cases

I would like to ask what some of the gynecological operators would say In their cases the abdomen is sometimes largely opened, and the intestines exposed, if irrigation lowers the temperature in ordinary surgical cases, how much more should it do so in these?

I think it would be advisable to have a series of ether, chloroform, and perhaps other anæsthetics, upon the temperature, when used for long periods As concerns the interesting case of triple amputaject here awaits some industrious observer

DR WHITE said made at the University of Pennsylvania, upon animals and clinical subjects, to determine the ble exposure of the lower part of the abdomen even where no operation of any sort has been confirms it

which the temperature fell four degrees The tem- operation of equal gravity in the whole range of eration (which was the removal of a tubercular testicle) it was 95° No irrigation was employed treatment, and I am in the habit of employing it,

duce the temperature, and, in fact, may aid in keep- similar results, though the average reduction of tem-The same is true with perature was not more than two or three degrees

DR WILLIAM GOODELL said In removing the wrung out of hot water and frequently renewed | ovaries, one has to be very cautious on account of Bramann, assistant to von Bergmann, has recently the collapse that may occur if the ovary is pinched detailed the results obtained at the latter's clinic by or roughly handled Something similar, I fancy, This pre- would occur in the removal of the testicle, and this, I think, had a good deal to do with the fall of the

DR ASHHURST said The suggestion made by Before the days of anæsthe wound with iodoform gauze, which is allowed to thesia it was thought that the patient might suffer It is less pain by having both operations done at once, then removed and the sutures applied, in the vast but, when the patient is insensible, there will certainly be less confusion by having only one done at

With reference to irrigation, as I have already of double or triple amputation time might be saved mentioned, I have seen the temperature fall as low as 97° after a simple operation, and in operations not usually considered capital, such as the removal of the breast, the temperature has gone even lower, and the patient has remained in an extremely critical condition for hours This has been where there has suturing could be done any time during the next two been no loss of blood, and no condition other than the irrigation to account for it In cases where an-DR MITCHELL said I have listened with a great tiseptic measures have not been employed, I have not seen this depression, except when there has ture of patients under ether or chloroform, and the been great loss of blood, or unnecessary exposure of the patient

In my list I have not included any but synchronous major operations The cases reported to-night seem to have been instances of minor amputation, as regards some of the parts removed, and can, therefore, technically be looked upon as only double, not triple or quadruple amputations

Another word with reference to irrigation, even experiments and observations as to the effects of if warm solutions be employed, they will tend to cool the body by evaporation, and the same is true with regard to wet towels, even if hot when applied, they will reduce the temperature unless covered with tion shown us by Professor Ashhurst, I would like to oiled silk, to prevent evaporation I do not think say that no physiological statement has been made, that the administration of ether alone has much so far as I know, as to the effect of large losses of effect upon the temperature, but under any circumtissue upon the pulse, temperature, nutrition, blood- stances we can better dispense with irrigation and A tempting sub- wet towels than with anæsthetics

In regard to the case of excision of the testis, Experiments are now being which has been mentioned, it may be said that operations on the testicle necessarily require consideraeffect of the administration of ether on the bodily is also a well known fact, that division of the cord is temperature, and seem clearly to indicate that a often followed by profound shock This observation drop of from one to three degrees may be expected, has been made by Mr Erichsen, at the University not only in cases where no irrigation was used, but College Hospital, London, and my own experience The moment that the cord is divided, The note of a case has just been handed to me, in from removal of the testicle than from any other

I have no objections to the antiseptic method of No general symptoms of shock, such as weakness or but I think we should not close our eyes to the fact fulure of the pulse, leakage of the skin, or shallow- that it may have some disadvantages I think that ness of respiration, were observed in this case A the maintenance of the patient's temperature is of series of nine cases of all sorts of operations gave more importance than the exclusion of a few

All that can be accomplished by irrigamicrobes tion can be equally accomplished by washing the part before and after the operation, care being taken to keep the patient warm and dry The ordinary antiseptic dressings were employed in this case after the operations, I consider that their chief advantage is that they permit infrequent dressing of the wound

MEDICAL SOCIETY OF THE DISTRICT OF COLUMBIA

Stated Meeting, December 14, 1887 THE VICE-PRESIDENT, D S LAMB, M D, IN THE CHAIR

DR LACHIAN THER presented a specimen, and read the history of several cases of

RUPTURE OF ANTURISM OF THE AORTA

Case 1 -On November 7th last, I made an autopsy of the body of a colored man, R M, about 40 years of age, who had received medical attendance at the Freedmen's Hospital fifteen days previous to death, but had consulted no physician subsequently was reported to have suffered intense agony for several days, and especially hours immediately before death, the pain complained of being located in the abdomen, left side, and in the lower part of the back I found death to have resulted from the rupture of an aneurismal enlargement of the abdominal aorta The intestines and peritoneal replications were flecked with clotted blood, which was, however, collected principally at a point of rupture just above the bifurcation of the aorta, and then formed an intricata hæmatoma in the meshes of the surrounding cellular tissue

Case 2 -On December 1st last, in an autopsy of the body of a white man, R C, 38 years of age, I found that his death had been caused by rupture of The history of the case the left auricle of the heart was to the effect that he had been accidentally run over by a dirt-cart, and died in a few minutes after-No external mark of injury was observed, but upon opening the thorax the middle segment of the sternum (gladiolus) was discovered to have been The theory accepted was that the heart bone and the spinal column forcibly enough to cause lapse, dying in about one hour after the doctor was had been compressed between the racilient breast

from whose thoracic cavity the specimen which you sternum there was found to be a large deposit of fat He was about 50 years of see here was extracted age I learned that he was a carpenter by trade and had left his home in the morning to go to work as usual, when he was suddenly stricken by death a You will observe an aneurismal block or two away enlargement of the aorta with a stellated rupture within the line of attachment of the pericardium The pericardial sac was filled with clotted blood and The man had experienced no dysphagia, but fre- tion from apex to base

quently complained of pain beneath the left shoulder blade, and also dyspnæa upon much exertion, his feet and ankles had occasionally become ædematous No alteration had ever occurred in the voice Rheumatism had been complained of, but the joints had never been enlarged, and he had never been confined to bed from the disease All the viscera ac cording to gross appearances were in a normal condition

DR REYBURN thought it rare to find rupture without hypertrophy or any lesson of the heart

DR BRYAN saw a case several years ago when attached to the U S S Powhattan, in a sailor, aged 40, stout, and round shouldered, had enlisted on account of dissipated habits Being a sail maker, he was compelled to bend forward most of the time Dr B was called to see the patient while at work one evening about 10 o'clock, and found him suffer Patient said he had felt pering from hæmoptosis fectly well during the day, had "turned in" about the usual hour, and fallen into a sound slumber from which he was suddenly aroused by a feeling of oppression in the chest, the dyspnœa increased, and his mouth was filled with a salty fluid which he at first spat out, but which later on spurted out of his mouth It was impossible to estimate accurately the quantity of blood, but it was thought to be over an ounce A thorough examination of the chest was made the fol lowing day, and the heart sounds found to be normal, all over the anterior and posterior surface of the left chest from near the apex to the base numerous large The percussion and fine moist rales were heard Four days after note was not perceptibly changed the first attack, in disobedience to strict orders, he made some undue exertion, followed by a sensation of something giving away in his chest, and almost immediately a large quantity of frothy blood spurted out of his mouth. This hæmorrhage was alarmingly profuse—the quantity of blood lost being much greater than at the first attack The patient rallied and rapidly regained his strength under treatment The chest was frequently examined but nothing could be found to account for such a profuse hæmorrhage Two months after the second attack, being called to the patient's cot, found him bleeding profusely This time the blood was vomited, was dark and grumous at first but soon changed to normal red color He complained of great distress in the epigastrium Then suddenly ceased vomiting and went into col

The following is the result of the autopsy so far as mortem examination in the case of the colored man it relates to the aneurisms Thoras -On removing found in the pericordial sac and the pleural cavities, the lungs were easily removed from the thoracic cavity, were free from adhesions, except the left which was attached by the posterior surface of the apex to the arch of the aorta and the junction of its adhe On section the right sive and descending portions lung presented a slight pigmentation, otherwise nor-The left was the seat of an intense pigmenta Removing the left lung

from the thoracic cavity it was detached from the cones and have it examined English walnut and was found to communicate with dangers The heart was next removed with male agents several bronchi the acita attached as far down as the twelfth dorsal The left ventricle was slightly hypertro phied, and there were a few fibrinous clots on the failed to detect its constituents The aorta was next laid open and in aortic valves its course were found two aneurisms one at the termination of the transverse portion of the arch which was filled with a firmly organized blood clot, the second aneurism was situated lower in the course of the aorta, opposite the fourth dorsal vertebræ the body of which was crowded down to its center this point the aorta was adherent to the cesophagus, and communicated with it by a small opening was a large gangrenous ulcer, and it was through this half inch long that the blood forced its way into the œsophagus At the time of the autopsy the aneurism was empty The walls of the aorta were much thickened and the internal surface was rough, presenting numerous small elevations and depressions for some distance down its thoracic portion There were numerous small ulcerations in some of which fibrinous deposits were found The stomach when opened was found to contain 572 c c of blood

This case is of interest from the fact that the early symptoms were latent, which rendered a diagnosis impossible The case will be found reported in full in the Proceedings of the Naval Medical Society, No 5, Vol I

DR A F A King It is remarkable that so many of these cases are latent In some there are no symptoms that would lead us to suspect such a grave affection He could recall the case of a former member of this Society who died from the sudden rupture of an aneurism He had been complaining for a long time but aneurism had escaped suspicion He made an appointment to see Dr Donaldson, of Baltimore, but that morning, about 9 o'clock, while lying on his bed there was a sudden gush of blood from his mouth, he called to his servant to help him, but before assisobscured by the laryngeal symptoms, which is often difficult, much more so than of lateral defects

DR TYLER saw a case several months ago in a it may have hastened it

DR FREIDRICH presented a

CAST OF THE VAGINA PASSED AFTER THE USE OF A CONE CALLED "ORANGE BLOSSOM"

Several ladies had arch of the aorta, and a large blood clot was turned come to him to ask if they could use them for various out of a cavity found in the posterior border just uterine ailments. The Society should investigate the below the apex, the clot remaining adherent to the nature of this remedy in order to stop its use if it is The cavity was large enough to lodge an such a powerful astringent and fraught with such It is being extensively advertised by fe-

DR LAMB had submitted a cone to Dr Gray, of the museum, for microscopic examination but he had

Dr Busey had never seen such a vaginal desqua-He had seen flakes and coagulated secretions, but this specimen seemed to be a cast of the entire vagina

DR CW RICHARDSON read a paper on

A CASE OF LARYNGEAL GROWTH

(See page 481)

In answer to Dr Bermann as to the size of the Where the tumor pressed on the cesophagus there tumor, Dr Richardson said that it was about one-

DR BERMANN said that that explained the difficulty in finding it His method is to quiet the patient and then seize the tumor during violent expiration uses Storck's instrument, which pleases him better than that exhibited by Dr Richardson The growth can be got through the guillotine

PHILADELPHIA COUNTY MEDICAL SOCIETY.

THE VICE PRESIDENT, W W KEEN, M D, IN THE

Stated Meeting, March 14, 1888

DR CHAS HERMON THOMAS read a paper on

GRADUATED TENOTOMY IN THE TREATMENT OF IN-SUFFICIENCIES OF THE OCULAR MUSCLES (STEVENS' OPERATION)

(See page 485)

DR H T HANSELL I would like to ask Dr Thomas for a more definite statement as to the means of diagnosis To my mind these are not at all satisfactory The recognition and the exact determinatance arrived he died The true nature of the case was tion of superior and inferior insufficiencies are very

DR B ALEX RANDALL I have for years taken great interest in the subject of muscular insufficiency, man 50 years old Physicians had treated him for the more so because I have myself been troubled laryngeal trouble as there was almost complete loss with a defect of the kind, which Dr Risley corrected He suffered for a year, and then went to for me ten years ago, and with his kind aid, and inthe seashore where he derived much benefit Last dependently, I have been studying the matter since summer he was very much better, and the diagnosis As to diagnosis, much has been written, sometimes was made the day before his death He could not pretty wide of the mark, and I cannot see that Dr say that the information that he had an aneurism Stevens has improved our methods. He has brought killed him but he died the day after he was told and forward a very nice set of terms for what we have long known, and he has expressed clear cut opinions which read well In the same way, Landolt makes out very pretty graphic charts of cases, and marks out well defined groups, which are to be treated ac-DR Buser would like someone to get one of these in practice refuse very often to be included in such

categories, and very dissimilar cases afford discouragingly similar charts

I understand from Dr Thomas' paper that the estimation of defects is largely made with a distant object, presumably a light at twenty feet. To do this we must know the refraction and the accommodation and I suppose that these are investigated as a matter of course. But it is not safe to take the accommodation for granted. I can myself change my exophoria to apparent esophoria by the accommodative effort, so called, and every patient may as readily do the same

As to correction by operation, I cannot speak, like Dr Thomas, from personal experience We all know that when a certain degree of error is reached it is necessary to operate, and Dr Stevens places that point very low His method of operating is highly praised as a delicate one, but the necessity of dividing the operation into many steps is rather unfor-However, if he can thus relieve epilepsy, that minor disadvantage may be overlooked. It may be said in conclusion, that except in pointing out that hyperphoria is a frequent cause of perplexing and irregular insufficiencies of the lateral muscles (?), Dr Stevens has added little to our knowledge of the nature of these affections, that in his claims as to their importance, he has gone much further than the adorned experience of equally competent and diligent investigators has enabled them to confirm him, and that in his operative treatment he has merely developed a refinement of the partial tenotomy long in use, as the only means of correcting without overdoing it, the minute deviations from the perfect balance which he deems worthy of operative interference

Lack of time prevented me from DR THOMAS treating at length in the paper of the points as to diagnosis which have been made the subject of There is a variability, and yet, after all, questions a certainty in these tests which comes as the result of practice and observation There is an irregularity in the results of the tests from day to day, but after getting the extreme limits of the swing and studying all the circumstances of the case, one is able to strike an average which very fairly represents the error to be corrected Then a prism is tempo rarily adjusted to compensate for this error, and thus we make a crucial experiment and are further A lighted candle at guided by the effects obtained twenty feet, and the dot and line of von Grafe at reading distance, are both to be employed as test objects, and a comparative study should be made of the results obtained—both in the absence and in the In this way we frepresence of accommodation Sometimes anomalies quently get important clews appear in the action of the lateral muscles comparing the tests at reading distance with those at twenty feet, and when great erraticism of this sort is shown, we may be pretty sure in the majority of cases that we shall in the end find a manifested hyperphoria Unfortunately, there is no known analogue of the mydriatics which we can well use in these cases, and yet with great patience and watchfulness we shall My results are hopeful in epilepsy, usually succeed but my operations are too recent to speak positively of cure

DOMESTIC CORRESPONDENCE

LETTER FROM NEW YORK

(FROM OUR OWN CORRESPONDENT)

In eatment of Rotary Lateral Curvature of the Spine, its Present Status

At the March meeting of the Orthopædic Section of the Academy of Medicine there was an interest ing discussion on the Treatment of Rotary Lateral Cur vature of the Spine, in which it was apparent that the dependence on steel supports formerly so universal has to a large extent been abandoned, and that the methods of Mr Bernard Roth, of London, as described in his valuable and suggestive article on lateral spinal curvature in Heath's Dictionary of Surgery, the principles of which have for several years been advocated here by Dr Lewis A Sayre, are being received with no little favor by our Amer ican orthopædists Very deep regret was felt at the absence on this occasion of Professor Sayre, who is the Chairman of the Section, but he was ably repre sented by his two sons, who have already won an en viable distinction in the department of surgery which his achievements have so long and so brilliantly

The paper of the evening was by Dr Samuel Ketch, and its title was, The Present Status of the To eatment of Rotary Lateral Curvature of the Spine By this condition he said he wished to be understood as meaning that lateral deviation of a portion or the whole of the vertebral column which shows as its most constant factor the rotation, torsion or twisting of the bodies or segments of the bodies of the ver tebræ, with accompanying or consecutive alterations in the shape of the thorax No deformity, he thought, exhibited in its slow, insidious progression, its in volvement of area, its secondary effects on impor tant external organs, so decided alterations of form and such marked disturbances of function as this When it became recognized that the condition we had to deal with was but the effect of some cause, some irritation, in fact, the exact nature of which was as yet unknown, it would be seen that the prob lem of treatment embraced something more than the attempt to remove the mechanical results of such cause by the use of opposing mechanical means

The present treatment of the disease, he went on to say, consisted principally of two methods, or a combination of the two, viz by apparatus and by exercises, or by the combined use of the two Having stated that he did not think it necessary to speak in detail of the treatment by complete recumbency or that by cutting of spinal muscles (tenotomy), both of which might be useful adjuncts at times, he referred to the apparatus now used as being of two varieties, progressive and fixative He strongly condemned treatment by the constant action of cumbersome and heavy instruments which, by their abnormal pressure, often gave rise to large exconations, and even sloughs, of the skin In his opinion, no lever brace should be used for any other purpose than simply that of retaining the spine in an improved posi-

tion, previously obtained either by appropriate manual exercises or combined manual and gymnastic movements Such braces should be light, easily simple enough to be easily applied by those having the home care of the case The second class, or fixation apparatus, were originally constructed with the idea of firmly immobilizing the distorted spine in an improved position, obtained by suspending or extending the patient This original plan had been modified to the extent of opening the brace in front, whether constructed of plaster of Paris, poroplastic felt, leather, or other material, with the object of easy removal, in order to allow proper exercises, and give attention to the subjacent parts

In regard to the matter of exercises he said that he attached most importance to those which had for their object the "unfolding" of the twisted vertebral These could be applied with the greatest precision and benefit by means of the surgeon's hands, and no appliance could rival the ease, proper appli-Their success, however, depended on detail, and they should always, therefore, be given either by the surgeon himself or a thoroughly trained as-

As to the matter of a cure, in his opinion this involved not only the restoration of the lateral deviation, with its normal curves, but also the disappearance of that most constant feature of the deformity, As generally understood, however, a cure implied only the prevention of further deformity or an amelioration of the condition originally ob In the cases observed by him he had never been able to convince himself of the entire disappearance of rotation, while he believed it to be essential that this symptom should be prevented or removed before a vertebræ could be considered as restored to a perfectly normal state It was in the direction of prevention that he thought the most signal success could be achieved, and it was only by the earliest recognition of the symptoms and an appreciation of their importance that prophylaxis could be accomplished

In a paper on lateral curvature which Dr Ketch read before the Section two years ago, which was based on 229 typical cases presenting the deformity in question, he had made three divisions of cases first, those in which the deformity was first observed from the first to the twelfth year, or during the age of childhood, second, those in which it was first obit was first observed after the eighteenth year, or during the age of complete development the period of childhood the deformity occurred in 120 cases, or over one half of the whole number, and among the conclusions at which he arrived in the paper were the following

r Rotary lateral curvature is principally a disease of childhood, and may be either congenital or ac-

2 The disease should be looked for early in life,

tion of children's spines becomes most important towards the prevention of deformity

He did not mean to say that, even were the spines movable, to allow of inspection of the parts, and of young children to receive the utmost care, and at the first suspicion of deformity the child were taken to a surgeon, that we should not have lateral curvatures, but he felt convinced that the inveterate de formities now seen in so large a number would be few and far between

> Dr Phelps thought that in lateral curvature, if there were changes in the bone, no apparatus or gymnastic exercises would cure the deformity, but at the same time it was of advantage to suspend the patient and, having got him into the best position, to secure this permanently by some fixed apparatus Stillman's brace was probably the most satisfactory steel instrument that has as yet been devised, but so far as his experience went, the plaster of Paris jacket had proved by far the best appliance at the command of the surgeon

Dr A B Judson said that he had an aversion to cation of pressure, and safety which such exercises using mechanical support in lateral curvature, and he did not know that he had ever seen a case in which he had found mechanical pressure do any good many cases it would be likely to increase the deformity rather than to diminish it, if it were applied with much force If direct lateral pressure were employed the force would fall upon the ribs and be transmitted to the vertebræ, and this would only intensify the existing curvature If direct pressure could be brought to bear upon the bodies of the vertebræ it would accomplish what was wanted, but this was manifestly impossible, and he did not think that oblique force could be applied with advantage While he did not believe in the use of mechanical pressure to any extent, he had adopted a certain system of therapeutics which seemed on the whole to be satisfactory, although it was somewhat difficult to give the details of this treatment

In the first place he thought it advisable to place the patient in such a position that the deformity was reduced as far as practicable, and then have him remain in that position as much as possible each day He recognized the importance of superincumbent weight in the direct causation of the deformity, so that it was fair to assume that if the individual could have always been in a recumbent posture the lateral curvature would not have occurred Hence he thought it desirable that, as a part of the treatment, he should he down as often as possible in his waking served from the twelfth to the eighteenth year, or tients to do this for two, three, or more hours in each Again, when the patient was lying down he day believed it important that he should remain on his back, and not only on his back but in such a position that a lordosis was produced This was accomplished by placing an air pillow blown up to its full extent under him in such a way that the shoulders and hips hung down on each side of the pillow for this was perhaps a little theoretical tion of the spinal column it was clear that the ante-In the rotanor portion of the vertebræ was most at fault and as a factor in early treatment the careful inspec- cated in the anterior portion of the vertebræ, and same was true in Potts' disease, the disease being lotherefore in Potts' disease also we produced a lordosis if possible We removed the pressure from the anterior part of the vertebræ to the posterior

was comparatively free from the deformity, and that both braces and plaster of Paris jackets all gave tes was when the body was suspended through the action of the pectoral muscles, and for this purpose the horizontal bars, rings in Sayre's suspension apparatus were of value In this connection Dr Judson referred to the theory of Dr Henry G Davis, who claimed to have cured certain cases of pulmonary phthisis by increasing the capacity of the lungs in he felt more and more that most of the machines It was well known that rotary lateral which he had seen were worse than useless curvature produced deformity of the chest and reduced to a greater or less extent its capacity Therefore, whatever would increase this capacity would by cures, and what by exercises He was in the tend to improve the curvature

In regard to those inveterate cases which are regarded as incurable, he said he had never as yet had any such cases under treatment, but if he had a case which he thought was likely to go on to this condition, he would be more strenuous than usual in carrying out the various measures to which he had alluded In such a case he would, furthermore, use an apparatus, but it would be one in which no lateral pressure whatever was exerted It would be a brace which would keep the spine in a state of lordosis

Dr Reginald H Sayre said that he agreed with Dr Ketch in the opinion that preventive rather than curative treatment was what we must aim at in lateral He could also bear out the correctness curvature of his observations as to the occurrence of the disease in early life He had seen one case in which the curvature was said to have been present at birth, and another where it was noticed at the age of 6 months, while he had personally observed one case at 2 months normal form, he believed it to be possible only in form those cases where there was very slight rotation Those which presented considerable rotation and curving of the ribs, he thought, could never be restored completely to the normal shape They might, however, be benefited, and he had been surprised to see the amount of improvement attainable in very nastic exercises than by any other means advanced and, at first sight, apparently hopeless

If possible, he said, he would treat a case by gymnastics and massage alone, with the object of educating the muscles of the patient and enabling him to retain such improvement of position as he could make by manipulations and exercises which, being different in various cases, it would take too much time to describe on the present occasion If a case were sufficiently distorted to require mechanical support also, or if it was necessary on account of paralysis, he would use a plaster of Paris corset, as he had never seen a case which became worse under this methods which had been so long in vogue mode of treatment On the other hand, he had seen a number of most frightful distortions under instru- putting Roth's system to a practical test ments of various kinds, applied while the deformity was very slight, as attested not only by the statements cussion was the subject of measurements, and he of the parents, but also by photographs taken at the thought it was of the utmost importance that some time of beginning treatment, and as this result had definite system should be adopted upon which all followed and treatment and as this result had definite system should be adopted upon which all followed instrumental treatment in the hands of vari- orthopædic surgeons could agree In carrying out

ous physicians of large experience, with patients whom he had found most obedient in following out instructions, he was forced to the conclusion that the There was another position in which the patient fault lay in the method His patients who had worn timony in favor of the superior comfort of the latter, a cu cumstance which, he said, would lead him to use this method even were the results no better than those obtained by instruments When, however, he saw improvement in patients who had steadily grown more crooked during years of instrumental treatment,

Dr Ridler said that he thought that surgeons were not sufficiently definite as to what they meant habit of dividing the cases which he saw into three classes for prognosis and treatment. In the first class there was little or no rotation, and the spine could be put into what seemed to be the normal position for a brief space of time. In the second there was more or less rotation and rigidity of two or more segments of the spinal column, and the de formity could not be reduced, but pain and weak ness were absent In the third there was marked curvature and rigidity and, in addition, pain and In the first class of cases he believed that a cure could be effected, and here he deprecated all use of apparatus in the treatment In the second he was inclined to think, with Mr Bernard Roth, that the spine could be made straight and the rigidity Gymnastic exercises were of great serovercome vice, but mechanical means seemed to him of somewhat doubtful value, although in certain instances he resorted to them In the third class the spine could not be straightened, or the rigidity overcome, but As for getting a perfect restoration to the the patient could be made to carry himself in better Here he was accustomed to furnish certain exercises, and in addition to use an apparatus which would act somewhat like the hand of the surgeon in correcting the deformity Of course, much could be done by baths, massage and electricity, but more could be accomplished by the use of suitable gym

> In the matter of exercises Dr Ridler strongly ad vocated the system of Roth, in which the "keynote" position in which the patient is to be exercised is described as that position of the trunk and arms in which the greatest improvement in the position of A cure, he said, was considthe spine is obtained ered by Mr Roth to have been accomplished when the patient was so educated that the best possible position became an habitual one If we knew just what we could accomplish in any particular case, a definite plan of treatment could be adopted, which was much preferable to the uncertain and slipshod

Dr Gibney stated that he was now hard at work the points which had not been taken up in the dis-

Roth's method it was very difficult, he went on to the need of any operation say, to get dispensary patients to come to the surgeon every day, and he had recently organized an evening school of gymnastics for young girls affected with spinal curvature Their powers of resistance bade fair to be a very successful one

In closing the discussion Dr Ketch said, in reply to Dr Judson, that he thought any analogy between inflammatory disease of the vertebræ and lateral curvature was inadmissible It seemed to him, also, that Dr Judson had been especially fortunate in not having met with any of those inveterate cases re ferred to in the paper and the discussion He then The former condition, however, was usually detected soon after birth, and measures were taken Gynecology, edited by Dr E W Cushing to correct it of inveterate club foot than of lateral curvature, since the latter was not, as a rule, treated at a sufficiently After all, the prevention of deformity was the point on which he desired to lay most stress He believed that no two cases were alike, and whatever the plan of treatment adopted, frequent inspection and the most careful watching were essential on the part of the surgeon

LETTER FROM BOSTON

(FROM AN OCCASIONAL CORRESPONDENT)

The Murdock Liquid Food Company

There has been considerable interest in medical circles in this vicinity over a discussion in some of the secular and professional journals about a certain food preparation, manufactured in Boston Believing that this interest is not confined to the Hub alone, perhaps a few words may be written of inter-We refer, of course, to the Murdock Liquid year a hospital in the building devoted to the manufacture of their food preparations, the latest of which other is "Food Suppositories" This, the "Free Surgical Hospital for Women," is apparently the climax of Mr Murdock's charity, liberality, and ambition, following his "West End Boys Home" and "Infant Hospital" This building is situated in the never district bordening on the aristocratic Back Bay of Boston, is easily accessible by horse-cars and for both occupies a conspicuous corner the hospital supported from the proceeds of the work

The main entrance is to the office, in the corner of the building, the entrance to that part of the hospital devoted to the regular profession being on the left of this, while that for the Homoeopathic hospital is on the right seemed, as far as he was able to judge, to have de-the entrance to the office is a large terracotta repreveloped wonderfully already, and the experiment sentation of the Bulls, colored prints of which are so often seen in apothecary stores The office is beautifully fitted up, there being oil paintings on the walls, referring mostly to the reputed components of the liquid food, fruits, mutton and beef, and also many pictures representing the different processes of reproducing pictures One or two paintings lav claim to some old master, and the paintings of the Bulls is here, all pleasing to the eye of the observer remarked that there was no deformity so much like Scattered about are groups of well-known statuary that of club foot as rotary lateral curvature of the Adjoining this office is the elegantly equipped office of the journal published by the company, Annals of Hence we met with much fewer cases journal is probably well known to most of the medical profession in the United States, enormous numbers having been circulated of the first three issues, in order that every member of the medical profession in the country might become acquainted with it

Just here we will say, that many modern conveniences are found in this building, electric locks guarding the doors, electric clocks telling the time, and the building is lighted by electricity, has an elevator, and in fact is a well equipped building the basement is a large engine to furnish power for the system of indirect heating that Mr Murdock has inaugurated the air comes from the roof, by means of fans to chambers heated by steam pipes, whence it is delivered to the different rooms at a propei temperature, within a few seconds The second floor of the building is devoted to the manufacture, (for account see February, 1888, number of Boston Journal of Health,) bottling and storage of the preparations, while the third floor is devoted to the Hospital and its appurtenances The Hospital is in est to those more or less remote from the centre of reality two, they being entirely distinct and separate, each having its own entrance from the street for pa-Food Company, of which the principal, Mr Murtients and visitors, and each having its own staff dock, is the active agent in maintaining for over a made up of gentlemen of the Regular profession on the one side, and of the Homœopathic belief on the Each has its own operating room, small and large wards, etherizing room, waiting rooms and necessary sanitary arrangements of a hospital of the wards on the regular side is called the Fabiola Ward in memory of founder of some Roman Hos-The convalescent patients of both sides eat pital at the same table, one kitchen doing the cooking In the regular side are special wards for It is of brick, sev- septicæmic and cancer cases, and also a well equipped eral stories high, and, as said above, is devoted to laboratory for such bacteriological and pathological the preparation and putting up of the food, and to work as may be of interest to surgical gynecological Of the merits of the food as such, we will about 150 patients Dr E W Cushing has charge make no remark, beyond stating that it has been of the regular side, and Dr Packard of the Homeocommented upon in a late number of the Boston pathic. It was in this hospital that Dr Martin, of Journal of Health, and also state that in many of Berlin, operated while in Boston, performing his op-Mr Murdock's wide-spread advertisements, he claims eration of removal of the uterus through the vagina that under this food many patients recover without | Each patient is required to take a certain quantity

of the food at each meal, before and after treatment, and, as was previously mentioned, some have recovered on this alone, and a list of the number of operations may be seen in almost every news-

paper published in Boston

A few words in regard to the discussion As has been said, the Hospital has been under operation for over a year, and as Mr Murdock states in his advertisements, one side is under the management of gentlemen belonging to the Massachusetts Medical Society, these gentlemen being connected with it from the start The whole thing has been looked upon as not exactly the proper thing, still, nothing was done, and things simply took their own proper course, till the Boston Journal of Health, in a series of articles exposing fraudulent and deceptive foods and medicines, took up "Murdock's Liquid Food" among the number, exposing the falsity of the preparation, composition, and profit in a lengthy article Mr Murdock then saw fit to answer this, stating why he thought the article had been written, and denying some of the statements, making quite a breezy article To this the Journal replies only in stronger terms, denouncing in emphatic language the preparation, and replying to some of Mr Murdock's statements or rather mis-statements, things were getting interesting

In the meantime Dr Marcy, who had severed his connection some time previously to any thought of the discussion, published in the Boston Medical and Surgical Journal, a card stating his previous withdrawal from the Murdock Hospital, and giving as his reasons for so doing that the hospital was not acting up to its agreement, in regard to running and Immediately, Mr management of the hospital Murdock replies in the following number of the same journal, contradicting flatly some of Dr Marcy's statements, and referring to letters of the Council of Ethics of Massachusetts Medical Society, in commendation of the enterprise, which in the next issue of the Journal, was flatly contradicted by the Council, thus leaving the way open for Dr Cushang to show the letter which they claim he has not

Here the matter rested, and interest is still main-Mr Murdock has very tained as to the outcome much retracted and modified his advertisement in the daily papers, but probably with the means at his disposal, among which may be reckoned the Annals of Gynecology and the hospital, will endeavor to keep before the public the merits of his food preparations, while the Journal of Health intends pushing its exposé, and bring the whole thing plainly and truthfully in its proper light, along with others, the latest being Scotch Oats Essence

I hope we have not wearied you with this account of our little tempest in our medical teapot, which has been written only with the idea that some of the wrath and fury of the storm may have bubbled over, and reached the outside world, thus concerning, perhaps, others than the ones directly interested

INVERSION FOR SUSPENDED ANIMATION IN ANÆSTHESIA

Dear Sir -In THE JOURNAL of April 7th, is an editorial on the recent paper of Dr J J Chisolm, entitled, "A very valuable lesson for those who use anæsthetics" It is customary, I think, for a writer or a reviewer in papers like those just mentioned to allude to the published observations of others who have experimented in the same field I have not a copy of Dr Chisolm's article and do not know what reference is made to other observers The general reader would, however, infer from the editorial that what had been written previously had escaped the attention of the author and of the editor

The subject of position is cases of apparent death from the use of chloroform is of great importance After repeated experiments in cases of slight and alarming symptoms during the administration of chloroform, I became convinced that a sure remedy was at hand in every such case. If death has oc curred, there is reason to believe that there was carelessness in watching for the first cessation of breathing and of the heart's action, and that there was an attempt to use other means previous to the

complete inversion of the patient

As an interne in the Massachusetts General Hos pital I once aided a distinguished surgeon in holding suspended by one foot, a boy with a crushed thigh, who was, as it were, dead He was held in this posi tion till life reappeared My own observations and experiments were made in 1867-8, and were published in the Transactions of the Illinois State Medical So Portions of this paper were ciety for the year 1868 copied in the work of Prof H M Lyman on "Arti ficial Anæsthesia," etc The story of Piorry, Nélaton and the rats was entirely unknown to me at the time The late Dr J Manon Sims, I made my report and a physician in New Orleans, whose name I have forgotten, published articles on this subject some E L HOLMES, M D years since

Chicago, April 16, 1888

[The limits of editorial space precluded the publi cation of the names of men that have used inversion in the cases under consideration, and their experi ments The writer of the editorial article in question knew that inversion has been used by other men than Dr Chisolm, and he himself has used it successfully in two cases in which he was the administrator Ob viously, also, it is impossible for a writer to search such inaccessible literature as State Society Transac tions for possibly existing papers The editorial was not written to tell something actually new, but to call attention to a method that has given good results in the hands of a surgeon of vast experience—En]

RUPTURE OF FUNIS

Dear Ser -On April 4th I was called to see Martha Brown (col'd), who had given birth to ten children. She had been in labor for about forts The head had been born about four hours before I saw her, and with the uterus most powerfully contracting failed to make any further

DR OLIVER WENDELL HOLMES has presented his medical library to the Boston Medical Library Association

around the neck, the epidermis removed from the Medical Inspector to the State Board of Health By gentle mangreater part of the face and neck ipulations and traction I very soon succeeded in delivering the child and found the funis detached from the umbilicus and greatly diminished in size The length was about normal I found the placenta partially attached to the fundus with hour-glass contraction

The fœtus, from the statement of the woman, must have been dead for more than a week as she received a fall from a fence and had felt no movement since Antiseptic precautions were strictly enjoined, and she is now doing well, having had for a day or two a slight rise of temperature

Rupture of the funts with the mother in the horizontal position, with normal length of cord (as in this case) has been reported in only two cases. One by Spath (fœtus macerated) and one by Dupuy these Budin (Paris) adds two cases

STATE MEDICINE.

STATE SANITARY CONVENTION

At Lewisburg, Union County, Pa To be held under the auspices of the State Board of Health, Thursday and Friday, May 17 and 18, 1888

PRELIMINARY ANNOUNCEMENT

(Subject to amendment)

FIRST DAY

Opening Address, by His Excellency, the Governor of Pennsylvania

Address of Welcome, by D J Hill, LL D, Presi

dent of Bucknell University

"The Prevention of Contagious Ophthalmia," Dr P N K Schwenk, of Philadelphia

"Diseased Meats and the Prevention of Trichinosis," Dr G W Furey, of Sunbury, Pa.

"The Water Supply of Lewisburg," Prof W G Owens, Bucknell University

EVENING SESSION

Annual Address, Hon S T Dans, M D, Lancas

ter, Pa
"Cremation as a means of Disposal of the Dead," Dr B F Hyatt, of Lewisburg, Pa

SECOND DAY -9 A M

"Small pox in Country Places," Dr Fetterolf, of Mazeppa, Pa

"Hygiene of the Teeth," Dr H Gerhart, of Lewis-

"Insanity Among Women," Alice Bennett, M D, Resident Physician, State Hospital for the Insane, Noiristown, Pa

M D, Sec'y of the State Board of Health

advance I found the child dead, with the cord Atkinson, Sec'y Penna State Medical Society, and

AFTERNOON SESSION

"School Hygiene," Dr G G Groff, of Lewisburg, member of the State Board of Health

"Household Hygiene," Prof Frances Emily White, Women's Medical College, Philadelphia, Pa

"How Germs Cause Disease," Dr V C Vaughan, of Michigan University

"The Drainage of Lewisburg," Mr S D Bates, of Lewisburg, Pa

EVENING SESSION

Illustrated Lecture, Dr Edwards, of the State Board of Health

Papers are also expected from Dr J H Kennedy, Shamokin, Pa, Dr A Schultz, Superintendent of the State Hospital for the Insane, Danville, Pa, and other distinguished scientific men

It will be observed that while distinguished sanitarians from a distance will take part in the proceedings, the aim has been to make the latter, to a considerable extent, of practical use to the citizens of Lewisburg and its neighbors, and to enlist them in the study of its sanitary problems For this reason they will be of great interest to all residents in small towns and rural districts, the conditions of which are necessarily very similar The Convention will be presided over by the Hon S T Davis, M D, member of the State Legislature, of Lancaster, Pa

A more definite programme will be issued later George G Groff, M D, Benjamin Lee, M D, Sec'y, Committee

NECROLOGY.

CALVIN ELLIS

Calvin Ellis, M D, was born in Boston, August 15, 1826, and died on December 14, 1883 a lineal descendant, in the seventh generation, of a farmer named Ellis who with some of his fellowtownsmen emigrated to New England in 1634 from old Dedham, County of Essex, England Dr Ellis was fitted for college at the Chauncey Hall school in Boston, and entered Harvard in 1842 His classmates remember him as a modest, genial companion, active in athletic sports, and ranking so as to secure Dr Ellis used to say of a commencement part himself that he played in college and "first awoke to to the full meaning of life when he began the study of medicine" He entered the Harvard Medical School in 1846, and immediately won the attention of his teachers by his diligence and marked pro-Appointed in 1849 as resident pupil in the ficiency Massachusetts General Hospital he was noted as an assistant who carried out orders promptly and implicitly After taking his medical degree, in 1850, he "Samtary Protective Associations," Benj Lee, spent two years in the French and German hospitals, making a special study of clinical medicine, morbid "Sanitary Shortcomings of Lewisburg," Dr W B anatomy and pathology On returning to Boston he

was chosen as Assistant in Pathology to Prof J B S Jackson, and soon became Admitting Physician and Pathologist at the Massachusetts General Hospital In 1863 he was made Assistant Professor of Theory and Practice of Medicine in the Harvard school, and in 1865 was appointed Adjunct Professor of Clinical Medicine Two years later he attained to the Chair of Professor of Clinical Medicine on the resignation of Prof II J Bowditch Still later, Dr Ellis was chosen Dean of the Harvard Medical School, in which capacity he everted a powerful influence upon the history of that school

Such, in brief, is the outline of Dr Ellis' official In appearance he was a quiet, modest man, with a square jaw and firmly-closed mouth, but with a kindly, genial eye His bearing was dignified and possessed that element of personal reserve which friend repelled undue intimacy but had no tinge of coldness about it His influence upon students was in the highest degree beneficial, for they constantly felt the force of his sterling character. He was a zealous champion of the dignity and honor of his profession and never allowed its standard to be lowered without instant challenge In his intercourse with students he was democratic and he was quick to recognize! and encourage any gleams of ability which they might show. We remember the pleasure which lighted his face at one time when he was assured by a recent graduate that he had won not only the respect but the personal love of his pupils

Dr Ellis was not a prolific or constant writer, but he contributed a number of valuable articles to various journals, and during his long illness he began a work upon Symptomatology in which he strove to embody his ideas of the proper method for clinical The two chief accomplishments of his life are associated with his Deanship and Professorship As Dean of the Harvard Medical School he labored with all the energy of his vigorous nature to organize and push forward the new departure by which the school was converted from an association of disjointed lectureships into a university system of graded In this work he was opposed by the conservatism of some of the older men who failed to grasp the true significance of the movement, but Dr Ellis' energy was unquenchable and he lived to declare that all his plans regarding the school had been a popular beverage He never narrowed his inter carried out to a successful issue The men who worked with him testify to-day to the encouragement which he gave them and to the unswerving faith which he had in their ultimate success

He was a warm supporter of medical organizations and joined the American Medical Association in 1853, attended meetings in 1855 and 1865

The other fruition of his life work stands to day as his monument in the Harvard method of clinical instruction. Despising cheap exhibition of expertism and "snap" diagnosis, Dr. Ellis insisted upon a rigorous method of differential analysis in every case which came before him and his classes. No matter how simple the case or how obvious the diagnosis, he compelled his students to give their reasons for their opinions, and to defend them against adverse criticism. Such a laborious process of eliminative.

diagnosis sometimes seemed finical to superficial observers, but hundreds of young practitioners to day gladly testify to the benefits which they enjoy as the result of the exacting precision of his methods

Dr Ellis was an enthusiast in the best sense of the term, and he ardently loved his profession, and throughout the suffering and feebleness of his long sickness, one needed only to mention the subject of clinical instruction to arrouse in him all his old time fervor. The closing hours of his life were in har mony with his whole career. He diagnosed his all ment as acute peritonitis from the perforation of a duodenal ulcer, and as he watched the steady ap proach of death, his mind was only intent upon softening for others the sorrow of separation. He was a noble example of true manhood and a lovable friend.

HENRY LYMAN SABIN

Henry Lyman Sabin, M D, of Williamstown, Mass, a son of Jesse Sabin and Esther Bulkley, was born at Williamstown, Mass, May 29, 1801, died at his residence February 24, 1884 At an early age he was sent to Lenox Academy, and subsequently en tered Williams College, where he was graduated at the age of 19 He taught school after he lest col lege, and studied medicine at Chatham, N Y He attended Lectures at the Pittsfield Medical School and at New York After completing his medical education he returned to Williamstown, where he commenced practice, and continued for over fifty During this period he endeared himself to the people of his native town, and no man ever lived in the community who was more beloved No man knew more intimately and sympathetically the lives of the people among whom he practiced than Dr He shared in their joys, sorrows, hopes, and Sabın Outside of his profession Dr Sabin associations His religion assumed his full share of public duties was the old-fashion, genuine New England article, and for just half a century he was deacon of the Congregational church When abolitionism was a reproach, Dr Sabin took it up with unselfishness, made his house a centre for its advocates, and he preached temperance when New England rum was ests within his immediate limits, but kept abreast of the great popular movements outside He early be came a Republican, was sent to the lower branch of the Legislature, served with credit in the Senate of In 1850 1857, and was prominent in county affairs he was President of the Massachusetts Medical So ciety, he was for many years a trustee and also med ical examiner of the Northampton Lunatic Hospital For more than thirty-five years he was one of the board of trustees of Williams College, having as sumed the office in 1838, about the time Mark Hop kins became president Dr Sabin enjoyed the offi cial association and was cordially esteemed by his associates of the board, among whom was for many years his classmate, the Hon E C Benedict, of He joined the American Medical Association in

a finer vein of natural eloquence than appeared in Or Sabin on many public occasions He was admirable as an occas onal extempore speaker, shining in after dinner efforts, when the inspiration of warm A Practical Treatise on Disfases of the Skin feeling was guided by nice native tact A brilliant and touching example of this power that never left the doctor was shown at the grave of his wife event was peculiarly sad, for she was buried on their golden wedding day, and preparations had been made for celebrating that anniversary body was lowered to its rest, Dr Sabin thanked his that illuminated the formalities of Puritan burial The home thus broken had been the centre of a refined and gracious hospitality, and in it the members of the County Medical Society had been bidden to celebrate the golden wedding of the local father of their profession

Dr Sabin was bound up in his household, and carefully cherished all family associations Few men, indeed, have ever been more widely loved or better deserved the general respect Dr Sabin was twice married, his first wife, Lucy Whitman, survived only about a year He subsequently married Abby, daughter of Nathan Benjamin, of Catskill, N Y As the issue of this marriage there are now five chil Nathan Henry and Charles, and three daughters Dr Sabin survived his second wife only Dr B H Paul discussed this subject in a paper

BOOK REVIEWS.

THE YEAR-BOOK OF TREATMENT FOR 1887 ical Review for Practitioners of Medicine and Sur-8vo, pp 336 Philadelphia Lea Brothers & Co Chicago A C McClurg & Co

This is a very good compendium of the changes that have occurred in the use of medicine during the known, and extended comment is hardly necessary It will be found exceedingly useful by those who wish in collected form an abstract of the therapeutic literature of the year Each department is ably edited by the following collaborators the Heart and Circulation by J M Bruce, of the Lungs and Organs of Respiration by R Douglas Powell, of the Nervous System by James Ross, of ert Maguire, Anemic and Allied Conditions by Sidney Coupland, Medical Diseases of Children by J F Goodhart, Continued Fevers by Sidney Phillips, General Surgery by F Treves, Orthopedic Surgery by W J Walsham, Surgical Diseases of Children by Edmund Ourus, Genito unnary System by Reginald Harrison, Venereal Diseases by Alfred Cooper, Diseases of Women, D B Hert, Midwifery, G E Hermike, Skin, Malcolm Morris, Eye, Henry Pownal, Dr R G Eccles, of Brooklyn gives an account of his

Probably no citizen of his county possessed er, Ear, G P Field, Throat and Nose, P McBride, and Summary of Therapeutics of the Year by W G

> By John V Shoemaker, AM, MD, Professor of Skin and Venereal Diseases in the Medico-Chirurgical College and Hospital of Philadelphia With colored plates and other illustrations pp viii, 633 New York D Appleton & Co Chicago A C McClurg & Co

This book has an advantage for the general neighbors of half a century for their kindness in reader over most works on diseases of the skin, in words of simple pathos It was a touch of nature that the new dermatological technical words and phrases are dispensed with as much as possible with a light as clear and tender as a gleam of sun- The consideration of the different diseases of the skin is preceded by some general considerations on anatomy, physiology, symptomatology, diagnosis, pathology, etiology, treatment, and prognosis treatment recommended for different diseases is such as almost any practitioner may carry out Half a hundred pages of formulary, and a good index, complete the book

MISCELLANEOUS.

COCAINE ADULTERATIONS AND IMPURITIES -At the meet ing of the Pharmaceutical Society of London, on March 14,

Samples of the hydrochlorate of cocaine may be classed as crystalline and amorphous, and it is well to note that the author of the paper doubted whether the salt in a pure state ever as sumed the amorphous condition. In fact, salts which are crystallizable with difficulty are in all cases mixtures, in various proportions, of cocame salts with other salts of a different na ture The test of purity, based on the more ready solubility of the non crystallizable portion of the salt in chloroform, is not altogether reliable, and the weight of the crystals obtainable on the neutralization of an aqueous solution by ammonia is stated to be preferable. Some investigators professed to have identified an impurity, which they called "hygrin," the presence of which accounted for the difficulty with which certain specimens. The series of which this is a volume is well as "amorphous cocaine" is not infrequently present, and admits of identification. Its hydrochloride is the usual impurity. It are crystallized This substance, however, Dr Paul considers is of a pale yellow color, a bitter taste, and of feeble arrest their properties. It has an alkaline reaction, and is propertied. thetic properties It has an alkaline reaction, and is sparingly soluble in water, though freely so in alcohol and ether, differing in this respect from the pure salt A dilute solution becomes Diseases of milky on the addition of ammonia, and remains so ous solution of this neutral hydrochloride becomes acid on boiling, and this accounts for the tendency of solutions of co came to become acid. Cocame itself readily undergoes decompo the Stomach, Intestines, etc., Sir Dyce Duckworth and Robert Maguire, of the Kidneys, Diabetes, etc., by Chas H Ralfe. Rheumatism and Gout by Rob. itself should be dealt with and not the hydrocal wasteful because of its extreme solubility. It would appear from these results that the quality of cocaine hydrochloride varies very much. In fact, as Dr Paul observed, the salt is makers and at a price far too low to ensure its purity. The makers who produce a good salt are heavily handicapped in the compe tition with others who supply an inferior article at a low price -British Medical Journal, March 31, 1888

analysis of a nostrum known as "Scotch Oats Essence" He declares that the preparation is about one third alcohol, and that each ounce of it contains nearly 12 gr of morphine, not-withstanding the fact that it is "pledged to destroy the mor phine craving and 'free the victim from his terrible bondage '"

Commenting on the matter, our contemporary sayseditorially "For many years outs have enjoyed an excellent reputation as an article of food. There has been a run, so to speak, on the out idea, and the bowl of parridge is systematically eaten, not so much, perhaps, from strictly hygienic reasoning as to its diet value as from a notion that it is a sort of special tonic or I rom this pleasant idea of a food that serves as a medicine in ordinary cases, the transition is easy to a belief in the efficies of a medicine derived from food when the case If the ont grains are good in ordi becomes extraordinary harry cases to prevent disease, why should not their 'essence' be potent as a restorer when disease has already made a begin ning? It is not difficult to develop so taking an idea, and an exance or extract of oats has been more or less talked of as a therapeutic novelty by a certain school of practitioners. With the value of such a preparation, or the want of it, we have nothing to do at present Our concern is with another utiliza tion of the out iden. For some time past public attention has been called by persistent advertising to a nostrum named 'Scotch Oats Lesence' Its extravagant claims have at last secured for it scientific attention, with a result that is most alarm-From the report of an analysis of this essence by Dr Eccles, which appears in another part of the Circ ilar, it will be seen that the inventor is possessed of more than common inge nuity, but ingenuity, unfortunately, of a most diabolical char Under the guise of a preparation which, from its name, might be expected to be nothing worse than a harmless humbug, he is furnishing an insidious poison. With a refinement of cru he is furnishing an insidious poison elty he lays a trap for the unwary, and under the bait of oats places the bane of opium. The dissemination of such a vile concoction is a manifest menace to the public health, and natu rally the question at once arises. Have we no law which will prevent such attacks on the people? Whether our present sanitary regulations are sufficient for the purpose is for the author-If they are not, the sooner we have stricter ities to determine If they are not, the sooner we have stricter ones the better Meanwhile, the only immediate protection the public can have is from the pharmacist He ought to be able to easily confirm the analysis of Dr Eccles, which, we might add, has already been verified by another prominent chemist, and, knowing the character of the 'Scotch Oats Essence,' it will be his duty to inform any intending purchaser of its real and dangerous nature "—N Y Med Journal, April 7, 1888

THE DUTY ON MEDICAL SUPPLIES —At the regular meeting of the Chicago Medical Society, February 6, 1888, the following resolutions were adopted, in response to the previous action of the Georgia State Medical Society, on the same

WHEREAS, A feeling of humanity suggests that all medical subject and surgical supplies, instruments, and appliances, and all for eign bound volumes upon medical and surgical subjects, includ ing those used in the diagnosis, as well as treatment of diseases, should be furnished to those needing them at the lowest possible

Resolved, That the Chicago Medical Society urge upon Con gress, that in the cruse of humanity the import duty should be removed from all medicines, medical and surgical appliances, and from every thing used in the treatment or diagnosis of

Resolved, That the Secretary of this Society transmit a copy of the foregoing preamble and resolutions to the Congressional Committee on ways and means, and to our Senators and Repre

sentatives ?

THE FIFTH ANNUAL MEETING OF THE CONFERENCE OF STATE BOARDS OF HEALTH, will be held at the Grand Hotel, Cincinnati, on Friday, May 4, preceding the Annual Meeting of the American Medical Association The Meeting will be of the American Medical Association Several very important questions called to order at 7 30 P M are proposed for discussion

THE GABRIELE BELLION PRIZE of the Academy of Sciences of Paris will be awarded annually to the one writing the best work on or making the most useful discovery in human sanita tion, or for the advancement of man

DEATH OF DR C R AGNEW -After the publication of the editorial page of this issue containing a notice of the dangerous illness of Dr Agnew, the telegraph brought the sad news of his death last Wedneesday afternoon. A notice of his life and work will appear next week

DR LEOPOID VON HOLST, for many years one of the editors of the St Petersberger medicirische Wochenschrift, died recently of pyremin

DR WM T LUSK, of New York, has been elected Corresponding Member of the Academie de Médecine de Paris, Surgical Section

QUA PROSUNT OMNIBUS -A Wisconsin paper says that a farmer in Georgia made \$100 off an acre planted in watermelons, and that a physician in the neighborhood made \$200 off the

PEPPER'S SYSTEM OF MEDICINE is shortly to appear in

AN ELEGANT PREPARATION—It is said that William R Warner & Co, recently had on exhibition in their window, 1228 Market St, Philadelphia, a pure white crystaline mass of caffeine, weighing 200 pounds, the product of ten tons of coffee The firm uses it in the preparation of their granular bromo soda

THE CHICAGO MEDICAL SOCIET: at its annual meeting on the 2d inst, elected James H Etheridge, President, and re elected Frank Billings, Secretary

THE MEXICAN GOVERNMENT has applied to the Health De partment of Chicago for full information regarding the actual working of the Department

CARPET-BEATING IN THE OPEN AIR has been forbidden by the Conseil de Salubrité, of Paris, they must be beaten in closed rooms, and the dust subsequently disinfected

DRESS OF WOMEN IN ITS RELATION TO THE ETI-OLOGY AND TREATMENT OF PELVIC DISEASE

Read before the Gynacological Society of Boston, December 15, 1887,

BY HELEN L BETTS, M D, OF BOSTON MASS

There are certain conditions of degeneracy that come to prevail in countries and among people, conditions are effected are not sudden nor forced They creep on gradually, in apparently legitimate ways, and many generations may slip away before some sage thinkers, more observant than the rest, or whose individual interests are more closely touched, throat of the dearest interests of home and country And these results do not come of malicious intent Ignorance of relation of cause and effect, and lack of thought, are often as powerful for evil as deep results now seen in sections of country which depended upon the once heavily timbered uplands beyond for their moisture and streams The pioneer learned too late that the pine and cedars were the gentle persuaders of the rain, and so the mainspring of agricultural prosperity, and now millions of money and years of planting cannot bring back this tremendous rain factor, or the stalwart beauty that was ignorantly sacrificed

This is not an inapt illustration of the vital harm that woman is doing to day to herself and posterity by her unhealthful dress It strikes a paralyzing blow at the root of vitality, beauty and usefulness

somewhere in woman's environment, which tends to degeneracy Perhaps the index to woman's physical status can be best obtained by noting the proportion of medical literature devoted to woman's diseases There are Systems of Gynecology, American and Foreign, which in themselves make whole libraries Ginecologists and gynecological societies are multiplying in every section of the land Where so

ing as the male, and careful study shows there is nothing lacking in woman's anatomical structure which prevents her from being vigorous or even powerful

But the fact remains that women, as a rule, are delicate, with little power of endurance They bear with difficulty one, two, or three children, then are faded and nervous, and finally drop into the long list of patients that have uterine disease or nervous prostration, or, if they have neither of these, they think they have, which indicates quite as unsound a conwhich strike at the root of vitality and therefore of dition of body and mind. Why should they not beauty and usefulness The changes by which such grow hale and hearty with the years, and with their husbands and brothers? It is not fair to say that any one factor effects all this wrong Much can be said of early crowding at school, irregular meals of indigestible food, late hours, imprudence at the menstrual period, untrue husbands, and fast living genopen wide eyes to find a relentless hand is upon the erally, but if woman brought to life's battle a properly developed physique, all these conditions combined could hardly effect such complete wrecks as often drag themselves into the office of the specialist Indeed, from a robust body, most of these blighting plotted mischief This is evident in the damaging influences would rebound, leaving it still symmetrical and unmarred No vigorous girl would be overtaxed by our ordinary school duties Wholesome tired ness would send her early to bed, a healthy appetite would find no satisfaction in caramels, limes, croquettes, and nondescript entrees at all hours woman with a sound mind in a sound body would be too sufficient to herself to make an alliance with one who lacked truth and honor A healthy, positive nature would find nothing satisfying in hot-house society life where social evil generates and thrives

Still, acknowledging these other unwise conditions, let us take this one factor-dress-and see what its physiological, or, rather, pathological bearings are We need not look back beyond the observation In early life girls are as vigorous and healthy as boys, and work of to day, to know there is a radical wrong but, as a rule, they are taught in-door sports When they should be romping and climbing in the open air, developing bone and muscle with which to meet the needs of mature life, they are keeping tiers clean, nursing dolls and being taught to be lady-like!

But, provided girls are allowed and taught climbing, running, ball and tennis, they can obtain but a small part of the good they might gain, because their much remedy is needed, there must be great disor-der. Is this a necessary condition? Was woman and is scolded for being a romp. Before a boy is born to my alidism? With the lower mammalia this six years old he is relieved of skirts, and the boy's is not so The female is quite as hardy and endur- real joy in his first pantaloons is not simply pride in

being dressed like a man, it is a natural, happy outburst at being fice Now he can run, leap, turn somersaults, stand on his head There is nothing to catch, chase or hinder His close garments are a part of himself No wonder the boy in his first pantaloons is exultant

comparative ease, if she cannot climb, but now, the lengthening of her skirts increases her bondage Just as every line and muscle is rounding with nascent strength and beauty, when growth is giving gencrously to the most active members and development is fast widening or limiting the relative power and skill of each system in the organism, what is every girl taught to do? She decorously confines the limbs by heavy clinging drapery which impedes every movement, each step is checked by the muffled friction of soft, pliant skirts that sway and wrap about the calves and ankles and hold her back from rapid walking, and make running exceedingly difficult The result is that all exercise involving rapid and extended movement of the thighs is gradually abandoned the next generation The pelvic bones, ligaments, muscles and fascia are in process of development, and this is a momentous period It matters notcustom and fashion say "Long skirts," so the limbs are pinioned Now what becomes of the obturators, the transversates, the levators, and sphincters? Their proper development cannot come, save from vigorous action, daily systematic, energetic exercise, which brings into play the back, thighs and abdom-No one who has dissected a pelvis, inal muscles or studied those magnificent plates of Savage, can doubt that woman is fully equipped for rapid, easy and safe parturition

Then why does woman dread childbirth, as cities dread the earthquake? Because she knows that in the last dread throes the foundations are often literally torn away And why? Simply because all those pelvic belongings are allowed in early life to lie dormant and undeveloped The forces that nature has appointed as a reserve corps, at both flanks and rear, to lengthen and strengthen the permeum in the last minutes of extreme pressure and tension, are unused use, congestion and unskilled, so they do what untrained members usually do when brought to the crucial test fail, and the perineum is sacrificed Where lies the So long as woman wears long, clinging skirts she cannot, as a rule, reach that point in physical development that makes child-bearing safe and desirable her little girl was learning slang from playing with sions, excessive and altered secretions, naturally boys. She ran in crying, "Mama, Bab stumped me arise from prolonged compression with displacement arise from prolonged compression with displacement to shin up the piazza post, and I did it, too" My advice was, "Forgive the slang provided she shins probable that the muscular fibres of the cervix ma), up the post successfully " It is this lack of bodily during a long-continued congestion, lose their resil freedom which makes woman fragile, she may have lency and elasticity, become fragile, and so, easily no disease, she may call herself well, but we have torn during the prolonged and violent dilatation of Health and Health or Whollie as the old Green have Health and Health, or Wholth, as the old Saxon has parturition? Would not dropsy and apoplexs of Health may simply allow its possessor to follow the ovarian follicles be a natural result of prolonged living carefully and guarding against extravagant which, together with the uterus, share in the general which, together with the uterus, share in the general outlay, the body may answer all moderate require- compression and stasis of blood? Do not the hi-

ments without sickness or pain Life is a calm, un impassioned, monotonous existence Health maj make life a glad song of joy, every faculty is tense and keen, simple existence is a luxury Eating, drinking, sleeping are physical delights, and breath ing is literally a constant inspiration This is as was Up to ten or twelve years a girl can walk with intended and what is possible, but it can only come with exuberant, robust health Whatever checks growth and development cuts off the possibility of a vigorous physique, and also the main avenue by which the most healthful, joyous influences reach us

I have seen women in mature life whose fragile, half-developed bodies have set relentless limits to enjoyment, mental and physical They looked out as from grated prison cells upon the spontaneous, active life, which was once, but now no longer, pos sible to them

> The moving finger writes, and having writ Moves on, nor all their penitence or wit Can lure it back to cancel one half line, Or all their tears wipe out one word of it

There is another feature quite as objectionable, Now this girl is the prospective mother of while the long drapery dwarfs the body and lowers its vitality, the corset with unsupported skirts in duces actual disease The prevailing style allows all the weight of clothing below the waist to rest upon the abdomen and hips, as the point of great est projection of the viscera is higher up than the hips and more prominent, this part forms the main support, consequently, there must be compression, with displacement of the abdominal viscera and a corresponding degree of disturbance of blood supply This often gives rise to a condition and nutrition of the uterus that for a long time was covered by the term inflammation, but that has been elaborated by different authors, according to their ideas of pa thology, and now we have the engorgement of Lis pane, the irritability of Hodge and Gooch, the act ive congestion of Chapman, the passive congestion of Emmet, Kolb's formative irritation, Hewitt's abnormal nutritive activity, the areolar hyperplasia of Thomas, etc , all agree that there is abnormal cell-proliferation

We will, for clearness, adopt a term in every day What follows a long continued congestion? First, disturbed nutrition of tissue Second, altered function, and with these two condi tions, without the aid of another single cause, we have the factors of nine-tenths of the disturbance that gynecologists are called upon to treat see if this statement is too broad Congestions, dis-A mother lately complained to me that placements, flexions, glandular enlargement, ero sions, excessive and altered secretions, naturally

What of lacerations of the cervin? Is it not most By and excessive hyperæmia of the ovaries and tubes,

tological researches of to day point strongly toward the congestion theory as being the most rational on which to explain fibroid growths? Among pathologists we may speak of our country-woman, Dr Mary Putnam Jacobi, as worthy authority, and her investigations all go to show that in subinvolution venous arterial hyperæmia necessary to inflammation, we have the venous hyperæmia necessary to growth Upon this ground it has been suggested that the fre quency of fibroids in the posterior wall of the uterus may be explained, the constant pressure from the crowded rectum causing venous hyperæmia, the potent factor in fibro-genesis

However, it is not necessary to trace all uterine disease to congestion in order to make attention to dress imperative Observation with ordinary rea soning, without a knowledge of pathology, teaches that great injury must be caused by continued weight With this fact granted, it is hard to and pressure understand why it is so generally ignored in other disturbances of the organism the environment is al ways taken into account in the treatment We not only use remedies which relieve, but we remove in fluences which have brought about or which increase What results from treatment could the disorder we expect in typhoid fever even with the most ap proved remedies, with the patient breathing sewer gas day and night? Or in a case of nervous pros tration in a teacher who spends her days in an illventilated school room and her evenings in correctfried pork and buckwheats, and dined on corned permit, and in a state of intense hyperæmia beef and cabbage? Would he be a scientific surprinciples of medicine and surgery as it is to expect simply her in-door garments plications to the uterus while the patient is steadily pelvis with from four to twelve, and often twenty, pounds of pressure? If it is reasonable and scien tific to regard diet in indigestion, mental and social influences in neurasthenia, atmospheric changes in pulmonary disease, is it not quite as rational to regard the force of gravity in uterine disease? And yet it is often left entirely out of account in the matter of treatment

I will speak simply from personal knowledge lady came into my hands for retroversion with enlargement, and of course, prolapsus This condition strength in the way of applications, douches, and pessaries, but she wore the usual weight about the hips, and mode of dress she had never been at all enlightened concerning its hurtful effect

bly weighing it into the pelvis For this patient, like very many women, had lost the dorsal curve, and so the body was carried at such an angle that the whole weight of the abdomen was precipitated directly upon the pelvis

Some months ago a gentleman came to the office, congestion is the etiological factor where without the and when I saw his sad, worn face and heard his pathetic voice, my mental diagnosis was, this man has either dyspepsia or an invalid wife It proved She had been ill two years, nine months the latter in bed, but had finally convalesced to that degree that she could sit up for two hours during the day She was assured that all she needed was strength, but, as for several weeks she had been losing ground, she, with her husband, were facing, as bravely as they might, the grim fact of invalidism for an energetic wife and mother of thirty years of age illness really began with subinvolution six years be-For four years this continued, with constipation and the usual half invalid condition severe exertion during sickness in her family, she was obliged to take her bed with an acute uterine congestion, soon mucous polypoid growths appeared and a surgeon from the city was called and an operation was performed Later, the retroverted uterus was replaced with a sound, which operation was followed by prolonged hæmorrhage After nine months in bed, a naturally strong physique came to her rescue and she regained her feet But she was in constant pain in her back, head and limbs She was wakeful, and her mind easily confused and depressed ing examination papers? Could we expect brilliant The uterus was engorged, and all the pelvic organs results in gastritis with a patient who breakfasted on were crowded as low as the floor of the pelvis would

The first, clearest indication seemed to remove geon who would apply a soothing disinfectant to a the superincumbent pressure, so, as usual, I examcompound fracture of the humerus, and then leave | med her mode of dress | You will be interested from the arm unguarded to dangle loosely in the coat a professional standpoint to know what this patient sleeve? But is not this as consistent with the first wore. I examined her at her home, so she had on successful results from pessaries and depleting ap- muslin drawers, flannel and muslin underskirts, hooppushing the abdominal contents upon and into the seven bands, fourteen thicknesses were buttoned skirt and bustle, then a muslin and a dress skirt, closely about the corset, and not long before, her physician having noticed that she wore her garters about her legs, said he feared they would interfere with circulation, and advised that she should put an elastic band about the waist and fasten the stockings to this! I asked if her clothes were not oppressive She said she thought she wore very light clothing, but had noticed at night a purple crease about the A waist where the bands came about the corset, and wondered if that could keep her from gaining had first been recognized six years ago She had poor woman was waiting to get well, wondering why been under the care of a specialist from time to time she could not stand, that her limbs ached and prickled, She had had everything commendable and why she could not walk without getting so tired Neither physician nor specialist had spoken of her

Her physician had exhausted all re- the patient is virtually well, her bowels move with-Her recovers -- for now at the end of five months sources in the line of internal supports in trying to out aid, she walks, rides, goes to church, eats and raise up the large and heavy uterus, while all the sleeps like other people, directs her house, is happy time a firm pressure of several pounds was presisti- and bright, and the husband is as cheery as the wifeher recovery was brought about in the simplest man- your limbs ments without bands. She took gymnastic exercise work. Feel the clinging friction at every step. Have regularly—two or three times a day she assumed the genu-pectoral position. The medical and local treatment I consider really unimportant compared with the changes of habit This consisted in the ordinary means for restoring tonicity to the intestinal tract, with the usual uterine applications

These cases will serve as an index to an interesting experience which has convinced me that there is a reason not generally recognized, why our brothers in the profession and in the flesh pass over so lightly the subject of woman's dress in their practice Men who have won enviable places and teaching in the profession, both as authors and workers, dismiss the subject with a few lines In the "Cyclopedia of Gynecology," published lately by Wood, consisting of eight volumes, it would be hard to find one half page that could possibly be construed to refer to woman's dress and practical handbook upon "Minor Gynecology," in two hundred and fifty pages upon treatment of displacements, two single lines enjoin removing the superincumbent weight from-not the uterus, butthe pessary, that it may not be displaced He describes and gives illustrations showing over seventy different pessaries and abdominal supports which are stipation, or most usually both, and in the pressure of made from leather, cotton, kid, hard rubber, celluloid, glass, whalebone and cedar wood In speaking of abdominal supports, he advises that they be suspended from the shoulders, and gives an illustration of an apparatus made of a metallic rim which shall rest on the hips and be suspended from the shoulders, to this with the skirts, he remarks parenthetically, the abdominal support is to be attached! The picture is almost pathetic, and with a knowledge of Prof Munde's love of mechanics and skill in contriving, it is simply astonishing The situation will admit of but one explanation

"What do you think is the Patients often ask reason my physician did not tell me about my clothes?" There is but one answer Because he did not know "But why should he not know? Physicians know how women dress" Oh, yes, but he never in his own body felt the bondage Nothing teaches like No surgeon is so thoroughly aseptic as one who has seen the germs grow in the culture tube and demonstrated them under the microscope had seen with his own eyes, and knows he has an actual factor to deal with, there is nothing that would so effectually convince physicians of the im mense factor for harm that woman's dress is to women, and so to the race, as a little individual experience You need not put on a fashionable calling suit with braid and jet which would weigh all the way from ten to forty pounds, the waist of which must be put on after the bonnet and gloves, for after it is fastened This would be exthe arms are literally pinioned would then have from four to ten pounds slipped must repeat itself can we not by earnest, wise effort Take an ordinary working suit, snugly down over your corset, with yards of drapery raise the next cycle to a higher plane than this? outside and beneath swaying and twisting about

Go about your ordinary work, which She took off her corset, adopted under gar-involves no more active movement than woman's a hand always ready to hold your skirts from your own and others' feet as you go up and down stairs. get in and out of your carriage Walk across Bos ton Common in a stiff breeze—this for one day only Three items I would confidently vouch for in the outcome first, most righteous, but undignified and unrestrained rage, second, rending of raiment, thin d, you would never attempt to treat a patient for dis placement, or congestion, or vesical irritation with out first working a reform in her dress

It may be said that women are used to their dress and so do not mind it "'Tis true, 'fis pity-pity'tis, tis true " The majority of women know no more of bodily freedom than the domesticated canary or parrot But the fact does not make them any more efficient or happy members of society, or fit their half-developed bodies to produce a hardy progeny In Prof Munde's very excellent Perhaps some lack of effort in this direction may be due to the fact that it is exceedingly difficult to per suade women to make radical changes in their dress They will tell you their clothes are not tight, they never lace, they can turn round in the corset Indeed their clothes are quite comfortable rather take medicine for the congestion or the con daily work, when I see that only a round half hour's talk with blackboard illustrations and full directions for the entire change of dress will effect a conversion, I have given the patient the desired bottle of medi cine, pocketed the fee, shut the office door with a groan over the hopeless condition of the patient, and let me add in self-defense, a groan over my own shift less treatment

Were this matter not one of vital moment, in view of the unwillingness of women to make the necessary change we might, with some peace of conscience, leave these miserable women and girls to their un healthful dress, treat them as so many emergency cases, whose lives are to be comforted and eked out in a superficial from-hand-to mouth way But this is not a side issue No fact in Biology stands better proved than this, that change of function is followed by change of structure With diminished exercise comes diminished size and development, and the dwindling of a little-used part has by inheritance been more and more marked in successive generations opinion, in his later life, Mr Darwin was careful to Although the especial fac keep constantly in view tor of natural selection which he first recognized still held its ground as playing an immense part in organic evolution, he repeatedly stated that great weight must be attributed to the inherited effects of use and disuse with respect to both mind and body If these are facts, and they stand proved every day to those who observe and think, what sort of a race will the half developed, half-furnished pelves of to day bring forth? Is it inevitable that the children of culture and intellect be always puny and sterile? If history

The matter of women's dress is one in which pub

brothers, their lovers, and their husbands could wield a mighty influence for good in this work if they but realized its importance. As man has a more extended field for observation, woman has come naturally to regard his opinions with deference

Women physicians, especially, work here at a disadvance ranks of thought, any suggestion in the way type of radical dress is brandished and they say, study medicine?"

Woman does not like to be laughed at and called discomfort in her body than to be wounded in her heart by those whom she loves This seems a plight -certainly we are warranted in using the word, for never was mortal more plicated, enfeebled, almost inextricably entangled—this seems a plight in which you, my brothers, have a work to accomplish, which for my inspection no one else can do Will you do it?

LEFT LAPAROTOMY FOLLOWED (A WEEK LATER) BY RIGHT LAPAROTOMY FOR SUPPURATIVE PERITONITIS.

Consequent upon Bulimia, Fæcal Impaction, Perityphlitis, and Septicæmia. Recovery on the Use of Arsenic in Septicæmia

Read before the District of Columbia Medical Society, Janu ars 11 1888

BY J F HARTIGAN, M D,

PROFESSOR OF DISEASES OF CHILDREN MEDICAL DEPARTMENT GEORGE TOWN UNIVERSITY ONE OF THE SURGEO'S TO PROVIDE CE HOSPITAL ETC. WASHINGTO. D.C.

I was called on January 24, 1887, to see O B, æt rr, the youngest of six children The mother said he had been complaining for several days of a "stuffy" feeling and headache, and not being in his usual spirits, she thought he needed medicine Having found upon examination no distinctive symptoms, I prescribed on general principles a brisk cathartic, and grapple with In a few days the patient began to and found that the medicine had acted once, but he dermic injections of morphia were the rule pulse accelerated, temperature 100°, and there was tongue was dry and furred tenderness over the ileo crecal valve, but no pain, the mischief seeming to point to impacted faeces

he opinion has a powerful influence, especially the that night with an equal quantity of bicarbonate opinion of men Women dress not for their own soda This had the desired effect, so that next morncomfort, or the health of posterity, but to please their ing the doctor discontinued his attendance supposing Men that the difficulty had been overcome

For several days subsequently there was no appreciable change in the patient, he had no inclination to leave his bed, the amount of fæcal matter that continued to pass being something extraordinary Contrary to directions he had been given such food With most women, save those in the as he craved, which was generally of a gross kind, and I also learned for the first time that before his of hygiene in dress is immediately branded as Dress illness he was in the habit of buying a pound of sugar Reform, and straightway the masculine, pantaloon at a time and eating it in the store, or he would go to the butcher's and purchase a like quantity of bo-"What else could we expect from one who would logna sausage or hogshead cheese, although he had plenty to eat at home, in fact it was evident that we had to deal with an aggravated case of bulimia and strong minded She would rather suffer pain and its sequelæ As I have just stated, through an overindulgent mother and a too-willing servant, our efforts were thwarted in abating resulting perityphlitis nas bewildered at the copious evacuations and the daily exhibition that confronted me, for it seemed to have been next to a religious duty to save everything

The first alarming symptom appeared the third week of his illness, when one morning I found him pulseless at the wrist, skin pale and covered with a cold clammy sweat, eyes dull, breathing imperceptible and gasping This state of collapse had taken place only an hour before my arrival, and it did not need any intimation to convince the mother-who was the only person present—that her boy was sink-Having hurriedly given hypoderms of whisky and ordered bottles of hot-water, and mustard to the extremities, I drove off for Dr Bulkley On returning there was no change, and it seemed that further efforts must be futile. The doctor agreed with me that an abscess had burst into the abdominal cavity, which accounted for the suddenness of the attack, and that apparently the patient had not many hours to live The treatment was continued, however, and towards evening we were rewarded by commencing The pulse gradually returned to the wrist, reaction the slin became warm and the breathing more regular, the familiar cry for something to eat was again heard

But now there was a formidable complication to gave instructions to inform me in a day or two should lose flesh rapidly, although his digestion had not he not be better I was called again on the 26th, failed, he became restless and wakeful, so that hypocontinued dull and stupid, not caring to leave his face presented an anxious look, occasionally as His skin was now hot and dry, tongue furred, night approached he would become delinous, his Eight-drop doses of Fowler's solution were now ordered, alternated with Repeated doses of calomel, colocynth, and aloes milk punch and other appropriate nourishment 4 grains ferri et quinia citras three time daily, with were ordered, followed by copious injections of cas- About the seventh week the parotid glands began to tor-oil and turpentine emulsions, without results A enlarge, and fluctuation being evident in three or week from the first time I saw him, having rontem-four days, I made free incisions, under cocaine, just plated the use of the long tube, Dr I W Bulkles was behind the lobes of both ears, making counter-incalled in, but upon consultation it was deemed advis- cisions below the angles of the inferior maxillæ able before resorting to it to try once more a large Having evacuated the contents, amounting to about dose of calomel, and accordingly 6 grams were given twelve ounces of putrid-smelling pus, I inserted

dramage-tubes through upper and lower wounds, and congested, the pulse could not be detected and the upon their removal within a week all traces of dis- breathing was hardly perceptible. While the ether charge had disappeared—the face resuming its wonted shape instead of the full moon aspect it had previously borne

For a week subsequently the lad became brighter, a decided mitigation in the symptoms followed, and having been thoroughly cleansed, the edges of the there was reasonable ground for belief that the poison wound including the peritoneum were drawn together was being rapidly eliminated But the same difficulty continued with his food, protest or argument did while reaction was established, the skin became warm, not avail-even a threat to abandon the case-there and the pulse and breathing stronger On visiting was always some one to bribe, or bring him a banana my patient later in the evening his condition con or pancake, or whatever there was in the kitchen, and the usual message would come for me at night enough to eat since he saw me-only one chop and to give him a corrective, or hypodermic of morphia and atropia to stem the resulting mischief Even the collapse-which I argued was brought about in this way—did not deter the servant from continuing her pig-headed course in response to his perpetual usual hypodermic I left him for the night cravings

Towards the end of March another crisis occurred, the temperature rose to 103°, pulse was small and balsam of Peru and iodoform to be applied to the fluttering, skin dry, face ashy, with an anxious, drawn | bedsore, instead of flaxseed poulticing, which threat look, urine scanty, tongue brown, thick sordes about ened sloughing Fowler's solution and the citrate of the teeth In a few days the body shrunk remarkably; and an extensive bed-sore appeared, through the patient steadily gained ground, the wound dis which the posterior superior spinous processes of ilin charged healthy pus abundantly, the emaciated limbs and middle segment of the sacrum almost extruded Another development about this time, which contributed to the rapid emaciation, was the vomiting of green fluid streaked with mucus, the amount per rence of dangerous symptoms, the temperature again day for two weeks averaged one pint, which was reserved for my inspection as religiously as the enormous quantities of fæcal matter passed in the first weeks of his illness required to eject this fluid, he would call feebly or point for his basin, and apparently would vomit with to a second operation being removed by the success the same ease that a suckling infant sometime regur- of the first, the next day, with Drs Bulkley and gitates its milk

When the case appeared hopeless and all our efforts to save the patient were in vain, my attention was attracted to a suspicious fulness in the left iliac region Dr Bulkley examined it with me next morning, and both agreed that it was pus The propriety of laparotomy at once suggested itself Was it advis able to do it in the face of almost certain dissolution? The mother, having been approached on the subject, left the matter with me, notwithstanding the hue and cry raised by some of the relatives and neighbors that it was cruel to operate on a dying child The matter was discussed by the doctor and myself, and it is only justice to him to say that he did not entirely approve it-adding that I would be condemned if the child should die on the table, as was otherwise, and having the mother's consent, I held flesh and strength, bedsore healed, the tongue became that it was an unwritten law in surgery not to let a patient die for want of an operation, so at my request the doctor consented to be present

Accordingly, the same afternoon, having administered a full dose of stimulant, Dr C J Osmun giving the ether, I made an incision three inches long over about entering the peritoneum, which was soft and establishment of surgical procedure in a condition in

was suspended and the usual artificial means nere being employed to resuscitate him I completed the operation, giving exit to more than a pint of foul This portion of the abdominal cavity smelling pus and sutured, and a drainage tube inserted In a little tinued to improve He said they had not given him a couple of rolls -and it was explained for my edi fication that it had not hurt him, notwithstanding the positive instructions that he should have nothing but milk punch and beef extract Having given the

Next morning he was bright and cheerful, after a prolonged sleep, his bowels moved freely Ordered iron and quinine were continued For several days and thorax and shrunken face began to fill up, and there was an improved appearance of the bedsore

In a week, however, all was changed by a recur rose, there was jactation, delinum, hectic, brown tongue, slight rigors, hot and dry skin On the right side of the abdomen, corresponding to the situation There seemed to be no effort in the left, was noticed another enlargement more diffuse and fluctuating The chances of objection Osmun, I made a similar incision, under ether No alarming incident occurred during the operation, which was similarly performed and which resulted in the evacuation of nearly another pint of pus, the cavity was washed out and sponged thoroughly, with antiseptic precautions, and the wound dressed after During the night all urgent the method of the first symptoms disappeared, but the boy now showed Under the judicious use of stim great exhaustion ulants, the continuance of his medicine, and greater care with his food, he gradually merged into a state of convalescence Both wounds were dressed daily, any retained matter being gently pressed out, as the discharge diminished they filled up, so that two neeks after the first operation one drainage tube was re moved, the other following a few days later

All anxiety was now over, the boy steadily gained clean, pulse and temperature normal-more than that his appetite became normal—so that about the 1st of May he was able to sit up He called at my office on the 18th of May in good health, and is to day a

strong, vigorous boy REMARKS — The foregoing case is unique in many When respects, and is offered as a contribution towards the which the patient has heretofore been abandoned to Richter suggested more than a hundred years ago that if in the abdominal cavity milk-like fluids are formed, operation is the only remedy for Whether he meant the more removal of the disease formidable one of laparotomy, or puncture by the the points of interest in my case trocar, does not appear, but it is certain that the latter method only has been employed until a comparatively recent date-modern surgeons, being dissatisfied with the results thus obtained, preferring laparotomy

The first recorded case that I can find is by Bertels in 1871, who made a 2-inch incision in the abdomen of a supposed phthisical patient, and successfully removed two wash basins full of pus Then followed Boye, Studensky, Kronlein, Selmer, Tait, Elias, Barwell, Marsh, Caselli, Schmidt, Roberts and otherspioneers who have placed this among the accepted The cases reported are prinoperations in surgery cipally for perforation or consecutive peritonitis from rupture of some portion of primæ viæ, bursting of a pyosalpinx or pelvic abscess, Mr Tait presenting by none with a history similar to my own, viz the de- it lasted, was so amazing praved appetite, impaction of fæces, perityphlitis, suppuration of the parotid glands as well as the peri-

With regard to diagnosis in these cases, it is reexperience, errors which will probably be continued and, except in rare cases, be deemed excusable have at present on hand an illustration in which there is a history of pelvic abscess of more than two years' standing, with anchylosis of hip, following a miscar-Having been sent to a hospital in this city last spring for treatment, the patient was discharged by the surgeon with the statement that the institu but hip joint disease At that time the same condition undoubtedly existed (at least in a less degree) which a month ago led to an incision by myself in the left dorsum ilu, giving exit to a large quantity of pus, followed since by discharge of fæcal matter The doctor, however, is in good company, for during the late International Congress an eminent London obstetrician saw the patient and gave directions how the anchylosed hip might be overcome, losing sight of the fact that there was pelvic abscess with fistulous communication in the rectum

The interesting question in these cases is when to operate, or when an exploratory meision should be ago vanced sentiment of the profession, in this respect, hip, presenting an erysipelatous appearance in the following terse paragraph

thoroughly with this subject, from a clinical standpoint, are ready to open the wall of the abdomen in any case where death threatens from any cause evi dently amenable to surgical procedure, or any cause which is obscure, and which can be only understood aging after the section is made. In many instances it is

The difference to the patient is, that amination recovery and cure will often follow the ante mortem examination, but recovery has never been known to follow the post-mortem examination "

Let me call attention briefly to what I consider It may first be asked why abdominal section was not made earlier in the disease, for instance, shortly after the collapse of the third week? Of course it could not have been done at the time of collapse, and, strangely enough, when reaction followed from the supposed bursting of the abscess, there were no symptoms to justify such a course, nor were there previously, as the abdomen was flat and quite tolerant of pressure I think the Society will agree with me that the fact that the boy rallied so well, and was free from pain and chills, as well as distension of the abdomen, precluded the propriety of such interference, and that if it had been done, and death had followed, ne would not have been able to present such an interesting statement this evening

It may be instructive to account for the green fluid far the largest percentage of recoveries, but I find vomited, the persistence and quantity of which, while Of the 100 or more cases consulted, going back forty years, in which the trocar was the principal agent employed in evacuating the toneum following septicæmia—besides the dietetic pus, in only two or three has this been noted as a errors during treatment, which were so exasperating symptom. There was costiveness and digestive disturbance frequently Perhaps peristals is impeded markable how often errors are made by men of large in consequence of the effusion, the antiperistaltic motion, on the other hand, being increased, thereby I produces nausea and vomiting

The last point to which I desire to call attention is the use of arsenic in septicæmia. While a subject of this disease myself from a dissection wound about fifteen years ago, I was found roaming around aimlessly, half delirious, with my right arm seemingly twice its size, glazed and tender to the touch, and tion was for the treatment of diseases peculiar to the feeling like a leaden weight. I saw Dr Schafhirt, sex, and that there was nothing the matter with her Anatomist of the Army Medical Museum, who advised Fowler's solution in 10 drop doses every 2 or 3 hours, and free stimulation Before morning the change was remarkable fever and threatening symptoms had disappeared, and I steadily gained ground, so that within three days the ædema had subsided without developing into suppuration Having had several dissection wounds since, I have always as a matter of precaution taken arsenic for about forty-eight hours, without any untoward symptoms following

I am reminded, in this connection, of a case of acute suppuration of the knee-joint, with septicæmia, admitted to Providence Hospital about two years The œdema and suppuration of the thigh and I think Dr R S Sutton reflects the ad- leg were very considerable and extended above the

The following is a synopsis of the case furnished "In short, those who have acquainted themselves me by Dr D P Hickling, the then house physician, who said that as one of a similar character had died a short time before during his service, in spite of the most active treatment, and this seeming to be the worst, the prognosis was, to say the least, discour-

"W C, æt 22, white, male, entered Providence substituting an ante mortem for a post mortem ev- Hospital January 21, 1886, giving the following his-

On the morning of January 15, while wheeling a barrow up an inclined board, he slipped and in hospital and private practice, where Fowler's so fell to the ground heavily upon his right knee, striking a stick or stubble which caused a punctured success, but I will not longer detain the Society wound of the knee He had suffered considerably since, but had not been confined to bed When Tongue coated, seen his condition was as follows skin dry and hot, with general prostration and considerable pain, redness and swelling in joint, extending to the hip A brisk cathartic was ordered, and opium at bedtime also potass nitras for fever Milk punch, quinine and tinct ferrichlor were given liberally, and opium was continued to relieve pair

"January 21, evening temperature was 102 40, pulse 106, tongue heavily furred, symptoms of great prostration, wound discharging freely, and general redness of leg and thigh with excruciating pain Hartigan made several incisions for more thorough drainage of the joint, and called a consultation for

the following day

"January 25 Morning temp 100°, pulse 100, even ing temp 101 4°, pulse 100 Prostration still great, and for constipation brisk cathartic ordered sultation decided that no advantage could accrue from any operation, and suggested continuance of the treatment, and thorough drainage of joint

"January 26 Temp (morning) 99 4°, pulse 98

Evening temp 101 6°, pulse 94
"January 27 Morning temp 99 8°, pulse 92, even ing temp 102°, pulse 102

Morning temp 988°, pulse 100, "January 28

evening temp 100 4°, pulse 100

"January 29 Morning temp 99 4°, pulse 104, evening temp 102°, pulse 94 Patient's limb has incisions, and washed daily with solution of bromine age, necovery — George B, at 38 years, was ad been thoroughly drained under ether by numerous In spite of the most stimulating treatment and nourishing diet, his general condition was critical-seemed to be getting worse every day, when Dr H ordered 12 drop doses of Fowler's solution three times daily

"January 30 Morning temp 99 6°, pulse 98, evening temp 100°, pulse 96—the lowest evening tem-

perature since admission

Morning temp 99°, pulse 98, even-"January 31 Fowler's solution ining temp 100 8°, pulse 98

creased to 20 drops three times daily

"For two or three weeks subsequently patient's condition did not vary much, except a few evenings when the temperature rose to 103°, and further drain age was necessitated Dr H made altogether sixteen incisions from time to time, averaging from 3 to 6 inches long, with drainage-tubes of different sizes intercommunicating, the pus burrowed between the sheaths of the muscles of thigh and leg close to the bones, and a strong solution of chloride of zinc was substituted for the bromine and injected through the

"After the middle of February the patient comsınuses menced steadily to improve, although occasionally there was a temporary rise of temperature mained in the hospital until the first week of April, when he was discharged cured, with a useful limb, and no anchylosis of the knee-joint "

I could mention other cases of septicæmia, both lution was the chief treatment, with almost uniform 10- or 12-drop doses every four hours are not exces sive until the temperature diminishes, or other symp toms improve, gradually reducing according to indi cations

I believe, therefore, that, in closing, I am justified in saying that in all cases of septicæmia, or wherever there is pus, free drainage and arsenic are the key notes to success

Read before the Philadelphia County Medical Society, April 11, 1888

BY J M BARTON, MD, OF PHILADELPHIA

By invitation of your Board of Directors I submit some specimens, this evening, from cases of abdom inal surgery and present the following notes for your

consideration Case I - Abscess of liver Free incision and drain mitted to the medical wards of the Jefferson Medical College Hospital, July 29, under the care of my colleague, Dr Neff The patient was suffering with an immense abscess of the liver, extending the area of the percussion dulness to below the umbilicus and to the left of it At the request of Dr Neff, I removed by aspiration more than a quart of "brick dust" colored pus, with such relief that the patient was able to return to his home in the interior of the The abscess cavity rapidly refilled, and he returned to the hospital, when we decided to oper ate by the method of Dr Ransohoff, of Cincinnati Making an incision through the abdominal will, five inches in length, at the outer edge of the right rectus niuscle, permitting it to gap, fastening the edges of the wound by sutures to the liver, and when firm ad hesions had taken place, opening the liver by the galvanic knife When adhesions were found to have formed, and I attempted to divide the tissues of the liver with the galvanic knife it did not act well, at first, while white-hot, it would cut readily, but the resulting very free bleeding quickly short circuited the current and the knife became instantly cold After repeated trials it still proved so unsatisfactor) that an ordinary scalpel was substituted, with which the pus cavity was reached An attempt to check the bleeding from the margins of the incision, b) the cautery knife, was also unsuccessful, and it was only

by filling the wound with a number of rubber catheters, which happened to be at hand, that the hæmorrhage was controlled

The abscess cavity was washed out daily with various antiseptics, it gradually closed, and the patient When Dr Neff saw him the was discharged cured following December, his weight was 156 pounds, his pulse heat eighty to the minute, and he had no evi-

dence of hepatic disease

Case 2 - Epithelioma of the asophagus, gastrostomy, death - John T, et 42 years, a patient of Dr Joseph Lopez, of Philadelphia, was admitted to the Jefferson Medical College Hospital, December her house for a month 5, 1884 He had suffered with difficulty in swallowat the time of admission, he had taken no nourishlittle for the last two months emaciated with great force A bougie could be passed readily pelvis to within four inches of the cardiac orifice of the stomach, when it was suddenly arrested

I performed gastrostomy December 9, assisted by Drs S W Gross, Brinton, Pancoast, Hearn, and An incision two and a half inches long was made parallel to the margin of the ribs on the left side, and about one finger breadth from them, begin ning at the outer edge of the rectus muscle soon as the peritoneum was opened, the stomach the subsequent history of this case appeared and its identity was verified by those present, six sutures were used to bring the viscus in contact with the abdominal opening, two at each side and one at each end Each suture was made of them was carned between the muscular and mucous coats of the stomach for about one-third of carried through the abdominal walls about one-third between the menstrual periods of an inch apart with the parietal peritoneum some days later

The patient suffered no pain or other inconvenience from the operation, and had no evidences of her occupation as a school-teacher retained, he lost ground so rapidly and his exhausthe second day instead of waiting for the fourth or beginning to interfere with respiration fifth day as is customary Immediately on opening the stomach a rubber drainage tube was introduced, am anxious to have it on record, though the principal ounces of warm mill were at once given, and through this was repeated every few hours he con-

school-teacher, was sent to me by Dr James Graham in February, 1885 She had a large submucous fibroid causing the uterus to rise above the umbilicus The increase in size was first noticed one year ago She formerly had some irritability of the bladder Her menstrual periods which had now ceased The ergot which Dr usually lasted about ten days Graham had prescribed for her was continued and The hæmorrhage, however. operation not advised gradually increased until by the latter part of April, when I again saw her, she had been obliged to abandon her occupation, and been unable to leave

April 27, 1885, assisted by Drs Da Costa, Edward, ing for one year, which had gradually increased until, and Percy Graham, and Dr Koons, I made an exploratory incision in the median line, between six ment whatever into his stomach for a week, and but and seven inches in length The bladder was found He was greatly entirely above the symphysis, and in the line of the He could drink as much as three incision By pushing it downward and increasing ounces of fluid, which would be immediately ejected the incision upward, I was able to gain access to the

> The uterus was greatly and irregularly enlarged and everywhere adherent to the surrounding struc-The intestines were so firmly fastened together that we were unable to find or remove the ovaries The abdomen was closed with silk in the usual manner The patient made an uninterrupted recovery Full antiseptic precautions had been taken

There are some points of interest connected with Though previous to the operation she almost invariably bled for ten days at each menstrual epoch and at least twice between the menstrual flows, immediately after the operation the excessive bleeding ceased, and for by placing two needles upon a fine silk thread, one nearly two years she regularly menstruated but three or four days, she did not lose more than onefourth of the quantity each day that she had prior to an inch and brought out, both needles were then the operation and there was no bleeding whatever Her menstrual Traction upon these sutures periods have gradually and irregularly increased brought the walls of the stomach in close contact until now, nearly three years after the operation, I None was tied until find in my last note made this year, "No bleeding all the sutures were in place A silver wire suture between menstrual periods, menstruation lasts from was introduced through the outer coats of the three to ten days, when the latter the bleeding is stomach about the centre of the portion exposed, to slight most of the time " Her pains have ceased serve as a guide when the stomach should be opened since the operation, her general health has greatly improved, and she looks much younger the operation she has been, and is now, following Nothing was peritoneal inflammation, but notwithstanding that done at the operation to account for this improvethe nourishment by rectum was continued and well ment, which is great enough to have been considered quite a success, if the ovaries had been removed tion was so great that we opened the stomach on The tumor is gradually increasing in size, and is now

The next case is one of so much interest that I and by a funnel inserted into the tube several part of the operative treatment was not performed by myself The laparotomy was performed by my colleague, when I was a member of the staff of the tinued to sink and died two days later, or four after German Hospital, Dr F H Gross, during his term of service, the hermotomy by myself during my 3-Large uterine fibroid Exploratory incision, term, though we were both present, and took active of o aries, recovery—Miss Mary A, ret 36 years, Gross for permission to report this case

Case 1 - Strangulated herma Operation, loss fused until symptoms of suffocation appeared, when of 9 inches of intestine, subsequent lapar otomy, sev- I was hurriedly called upon to operate eral feet of bowel found obstructed by inflammatory defosits, bowel above the obstruction joined to bowel not present the typical diagnostic points of an ova below the obstruction, recovery - Frank F, set 18 rian tumor years, was admitted to the German Hospital on the evening of March 3 1884, with a strangulated right of Utahville, and two of their office students, were inguinal hernia of eighteen hours' duration opening the sac of the herma 9 inches of the bowel ing the peritoneum, at once the contents of the was found to be in a sloughing condition was nicked, the healthy ends of the bowel made to would not flow through a canula, and it was not until protrude, and the gangrenous portion incised proposed, on the next day, to freshen the edges of was able to draw the glucose-like mass out, even the healthy bowel and bring them together By the then it would not run, but had to be lifted and drawn following morning the patient had developed an in- out by the hand Of this substance there were in all tense peritonitis, with a temperature of 104°, and the about 60 pints operation was postponed. After a week of severe great difficulty, the material was adherent to every illness he recovered, the sloughing bowel having sep- thing and had penetrated to all portions of the cav arated in the meantime

Some weeks later, as he was slowly emaciating, and the discharges looked as though the artificial ruptured in many places, and had probably been anus was high up in the bowel, operative interference ruptured for a long time. It had but few adhesions, was decided upon The wound was enlarged directly and these to the omentum, its pedicle was long, upward, at first but slightly, but ultimately to the extent of several inches, for the purpose of joining the ture, it would have been quite a favorable case. The divided ends of the bowel

In the neighborhood of the artificial anus from 2 to 3 feet of intestine were found, strongly matted together with inflammatory deposits Small projecting the operation she did well for two days, some of the loops of a few inches in length were found free, with both ends terminating in the mass of the bowel, from which the slough had separated, could not readily be distinguished from any of the other loops, and it soon appeared that it would be useless to join it to the bowel which formed the artificial anus, as it was completely obstructed at many As the colon was free, and a few inches of the ileum, at the suggestion of Dr Weed, then one of the resident physicians, it was decided to join the bowel forming the artificial anus to the colon this purpose a small opening was made in the cæcum, and one blade of Dupuytren's enterotome introduced, the other being carried into the bowel forming the artificial anus, and the two blades clamped together A temporary ligature was placed around both intes- health tines while the toilette of the peritoneum was made, tected His temperature, though normal in the morn they were then fastened in position and the wound, |ing, ran up to 102° each evening It was now con about 6 inches in length, closed

The patient did well after the operation, though it was found necessary to reapply the enterotome twice before a satisfactory opening was obtained, three times in all The fæcal fistula rapidly con- house staff, I made an incision 4 inches long, begintracted, and when I last saw him he was able to wear a pad over it for a week without removal, his bowels acted naturally, he was free from pain, gaining flesh, and was working as elevator boy at the hospital heard afterward that another surgeon had attempted, though unsuccessfully, to close the fistula

Case 5 - Ruptured ovarian cyst Ovariotomy, death on the fourth day -Mrs D, set 54 years, a patient of Dr Hogue, of Houtzdale, Clearfield Co, Pa, had suffered for some years with a large ovarian ing the abscess, though in contact, were not adherent tumor, and though she had been advised by many A series of catgut sutures and some silk ones were physicians to have an operation performed, she re-introduced, fastening the two layers of pentoneum

The abdomen was enormously distended, but did

Dr Hogue, of Houtzdale, his brother, Dr Hogue, On present and assisted at the operation On incis The ring ruptured cyst appeared in the wound This material We the incision had been increased to 6 inches that I The abdomen was cleaned with Both visceral and parietal peritoneum nere thickened, roughened and nodular The cyst was and had the operation been performed before rup pedicle was tied with silk, dropped, and the abdomen closed The patient scarcely suffered from shock. though the operation was quite prolonged After cyst contents passing through the drain, but she per The lower end ished on the fourth day, probably with septic pento

> Case 6 —Encysted pelvic abscess Abdominal and visces al per itoneum stitched together, abscess emptied and drained, recover y -- Morris S, set 31 years, was admitted to the Jefferson Medical College Hospital June 17, 1886 He had a tumor about the size of the adult fist, deep in the right iliac fossa, just to the right of the median line It was regular in its out For line, not very painful, though tender on deep pressure and it was covered by the intestines

He stated that he had noticed it for two years, and that it was nearly its present size when first discov-He had lost flesh, but was still in quite fair ered No pulsation and no murmur could be de sidered as probably an encysted purulent collection, although there was no evidence of any disease of the spine or kidneys

With the assistance of Dr O H Allis and the ning I inch above and I inch to the left of the an terior superior spinous process, then carried it down ward and inward parallel to Poupart's ligament, about the same incision as is used for the ligation of the iliac After the muscles were divided, the trans arteries versalis fascia was separated until we were close to the growth, when fluctuation was readily detected Carrying our incision toward the mass it was found that the parietal layer of peritoneum and that cover

together and surrounding the proposed point of in | in April, 1886, for an attack of bronchitis, which was After verifying our diagnosis by the explor-| attended with some muscular debility the cause of the collection A large drainage tube was introduced, by means of which the cavity was daily irrigated with antiseptic solutions, the discharge gradually ceased, and he was sent out cured July 26, 1886

Case 7 - Double ovariotomy, multilocular cysts about 40 pounds in weight, recovery -Mrs Sarah Mc was sent to me by Dr James Graham She was 28 years of age, married, no children, and no mis-She always menstruated regularly previto this year, during this year she had bled two or After postponing the operthree times each month ation once or twice in consequence of unexpected bleeding, the third time it was performed, though she bled the night before and was bleeding during difficulty in micturition No cedema in limbs or abdomen, no nausea, and no vomiting She first no ticed the tumor one year ago in the right iliac fossa, the abdominal enlargement was characteristic, the veins were enlarged, the wave was well transmitted, the uterus was small and anteverted

Operation October 18, 1886 present Drs J C Da Costa, Fisher, Graham, Koons and Gardner The abdomen had been prepared the day before with turpentine and mercury, the latter being still on sponges and instruments The incision was 4 inches in length, there was some ascitic fluid in the abdommal cavity, the cyst was multilocular and had no adhesions Its contents were quite gummy, preventing the use of the canula, the pedicle was short and belonged to the left ovary, it was tied with silk, severed and dropped

Another cyst, springing from the right ovary and about 8 inches in diameter, was found lying posterior to the first, it was also without adhesion and was removed in the same manner The abdomen was cleansed with carbolic acid sponges and closed with silk as usual

The stitches were removed on the fifth and sixth days, the bowels were moved by enema on the eighth day, the recovery was uninterrupted, the temperature her breasts entirely a secret until that time never rising above 100° after the evening of the oper-The two cysts and their contents weighed about 40 pounds

The patient was able to walk about her room at the end of three weeks

CANCER OF SACRUM AND LIVER SECONDARY TO CANCER OF BREASTS

Read before the District of Columbia Medical Society, Febru ary 1, 1888

BI G L MAGRUDER, M D, OF WASHINGTON D C

ing needle, a free incision was made, giving exit to she promptly rallied. I did not have occasion to about 8 ounces of healthy, odorless pus A finger see her again until August of the same year. At introduced into the abscess cavity failed to discover this time she complained of great pain and pressure over the region of the sacrum and the left inguinal region, and down the left leg It was almost impossible for her to remain seated for any time in any one position. She was constantly endeavoring to ease herself by throwing a portion of her weight from one side to the other by placing her hands upon the Her sufferings were greatly augmented when she assumed the recumbent posture There was no position in which she could lie with comfort bowels were constipated and her movements generally accompanied with pain Her debility was very She gave no history of any preceding marked trouble, nor did she allude to the existing condition of her breasts She strenuously avoided any allusion to her actual condition, but spoke only of her pain the operation She had had no leucorrhoea, but little in the left leg, side, and the pressure at the lower portion of the spinal column She endeavored to attribute her symptoms to long, close and anxious attention to her daughter and grandchildren, who had required her constant services for several preceding months Her views at first seemed quite plausible, and a close examination was not insisted upon Anodynes and tonics were ordered without producing any improvement, save that the pain was kept under control in a measure

Being called away from the city toward the latter 2 per cent solution of carbolic acid was used on the part of the month, I did not see her again until the latter part of November In the interim Dr Busey had seen her several times Her symptoms were much In addition, about this time she had an aggravated attack of peritonitis She had frequently suffered before with these attacks of nausea and vomiting, and her digestion was very faulty Eructations of gas were decidedly troublesome, and it was at this time her abdomen began to perceptibly enlarge would not allow a more thorough examination, it was attributed to the indigestion As the disease progressed, and finding no improvement, Dr Busey was called in consultation To the surprise of Dr Busey and myself, and also her family, we found schirrus tumors in both breasts, and the abdomen greatly distended with fluid She had kept the condition of condition was such that operative interference was entirely out of the question She would not listen to even tapping to remove the accumulated fluid Then it was ascertained that about twenty-five years before she first noticed a small lump in one of her This did not give her any inconvenience until about five years ago, when she noticed a decided increase in the size, which was soon succeeded by the appearance of another tumor in the other breast, both of which were accompanied with a sinking in of the nipple About two years previous she had noticed that she was not able to undergo the same degree of fatigue as before Her back would give out, she also suffered intensely when she had a Mrs — was first under my care for a short time times a sensation of great fulness in the head movement of the bowels She experienced at these

After the date of the consultation and examination, which was in December, her decline was rapid The most distressing attacks of nausea and vomiting repeatedly occurred and resisted all efforts at alleviwas excruciating and required repeated doses of morplua and atropia, then again she would pass several days without having to use any anodyne. There was no paralysis at any time during her illness. Just before death there were involuntary discharges from the Death took place from exhaustion on February 18, 1887, eight months from the time of the placenta first appearance of these annoying symptoms There was no history of cancer on either side of her family

Post-mortem Examination by Dr Lamb -Mrs -(white), we about 48 Has had a tumor of the breast for about five years Died February 18, 1887

Body much emaciated, lower limbs cedematous, and hard cancerous tumor in each mammary gland The right one was small, movable, and lay to the outer side of the nipple, the left one was much nodulated ation of the baby, when poorly developed and pale, and included the nipple The right lung contained much serum, lymph and soft bands, the lung col The left lung showed old adhesions over almost the entire surface Heart normal There were 2 gallons of straw-colored fluid with flakes of lymph and soft bands in the abdomen, firm old ad-however, no unmitigated blessing hesions of the viscera generally, peritoneum everywhere dotted with small, flat, whitish deposits (chronic) peritonitis) and in places thickened Greater omentum contracted to a cord 1/2 inch thick Stomach Adhesions of intestines Liver small, contained an abundance of white cheese-like nodules of cancer, from very small ones to 34 inch in diameter Gill bladder distended with bile—spleen small Pan-Each Lidney showed some thinning ci eas normal Bladder normal Uterus short and broad, atrophy of posterior lip, ulceration around os uteri Right Fallopian tube distorted, fimbriated extremity distended into a serous cyst size of a pigeon's-egg Right ovary showed cicatrices of ovulation tube and ovary imbedded in a mass of chronic in-A tumor occupied flammation of broad ligaments the front of the sacrum, from the second to the fourth pieces (more in left side than right, and projected into pelvic cavity) It was as large as a walnut, very vascular and brittle, had a shell-like interior and large Microscopical examination of liver cavities within and sacral tumors showed hard cancer (Dr Gray, of) The primary tumor was that of Medical Museum) Those of the liver and sacrum were the breast secondary

MEDICAL PROGRESS.

TREATMENT OF THE CORD -DR A JACOBI SAYS The indications for the application of the ligature, and thereby the complete interruption of feetal circulation, appear to vary in the practice and teachings of the obstetricians When the baby has cried a few times, the majority apply the ligature and cut

the cord Others insist upon waiting for the col lapse of the cord produced by that of the vein, while the arteries are still pulsating and some will wait for the disappearance of the arterial pulse A At times the pain in the abdomen and sacrum few facts may be remembered for the purpose of guiding the practitioner in individual cases, for the amount of blood entering, or retained in, the body of the infant is by no means an indifferent matter

If the ligature be applied after the cessation of the umbilical pulsation, there are still six ounces of blood (192 grammes, according to Zweisel) in the If the latter be compressed by Crede's procedure that amount is reduced to three ounces (92 grams) Thus the difference between the two procedures means a difference of three ounces of blood in the circulation of the newly born, which is an enormous addition to the usual quantity of blood, which in the infant but little older is but little more than 5 per cent of the total weight of its After all, it appears that the deferred separ and the admission of more blood to its system, is deserving of recommendation, while, on the other hand, there may be an occasional indication for bleeding the infant 1

The introduction of a large quantity of blood is, The blood vessels of the newly-born are so thin and fragile that spontaneous hæmorrhages on serous membranes and into the nerve-centres, etc, are by no means un common under normal circumstances It is true that the destruction of superfluous blood corpuscles is very rapid, as rapid, indeed, as it is known to be after transfusion in the adult, but some time is re quired to accomplish that end, and during that time hæmorrhages may take place, and have been re This danger is ported by Neumann and Illing sufficiently great to counterbalance the alleged ob servation of Hofmeier, according to whom babies, after deferred separation from the mother, lost less weight and commenced to increase sooner than However, Violet those removed more speedily states that the former lost twenty ounces (619 grams), the latter but nineteen (585 grams)

Nor does Poral's observation, according to which congested babies exhibit a more intense degree of

jaundice, lack confirmation

If the ligature be thin, it is liable to cut through the walls of the blood-vessels prematurely, if too thick, it may not suffice to compress them satis It ought to be applied at a distance of from one and a half to two and a half inches from Not nearer, in order to avoid the abdominal wall the effect of the immense muscular power of the um bilical arteries inside the abdominal cavity second ligature is placed about an inch from the first, and the cord cut between them It is a good rule, which must surely be adhered to in every case of thick cord, to apply an additional ligature between the first and abdominal wall, to avoid hemorrhage from the insufficiently compressed arteries, which may take place after the cord has commenced to

CYSTIC TUMOR OF THE LARYNY -DR C W DESVERNINE, of Havana, reports the case of a man, æt 70 years, a Cuban, who came under treatment for chronic hoarseness and some symptoms referable to the digestive apparatus intense epigastric pain, paroxysmal, and regurgitation of food a few minutes after eating No family history could be obtained, the patient was neither alcoholic nor syphilitic

1888]

There was typical bitonal dysphonia, and dysphagia On laryngoscopic examination the vocal organ was normal in all its parts except the right vocal chord, the middle third of which was so enlarged as to present a general fusiform appearance Its bilateral excursions were performed correctly, General tension, on the contrary, was energetic During efforts at vocalization the appearance of the chord was not changed, and during the utterance of liquid sounds the corresponding arytenoid was dragged and forcibly inclined towards the centre of the larynx The color of the chord was a faded white, reflecting less light than the other determined that the chord was invaded by a dense and inelastic product, and the diagnosis of interstitial fibroma and diffuse chorditis made

The patient died of the carcinomatous infiltration of the esophagus Direct laryngeal inspection after death presented the same appearance as the ante-mortem examination The fusiform enlargement occupied the anterior part of the middle third the baby must be carefully watched of the chord, and measured 6 mm in its greatest It fluctuated on pressure, and a few drops of a clear mucoid liquid escaped chord was a cavity measuring 5 mm in transverse diameter, by 35 mm vertically

There is, thus far, says the author, no complete do still more harm than their medicines pathological and histological history of such a tumor, and he promises to publish the results of the examination of his case at an early date - Cronica Medico Quirurgica de la Habana, March, 1888

ments to determine the value of this compound should be a yellow-brownish powder, inodorous when recently prepared, almost insoluble in water, soluble treatment is in such cases the only safeguard in alcohol, ether, fatty oils, and crystallizable acetic 10dine

dusted over with iodol healed by primary union an excellent antiseptic, rapidly drying up all purulent secretion in large quantities without inconvenience highly probable that iodol destroys pyogenic organ-It is While it is an excellent dressing for indurated chancres, it gives variable results in soft chancres

When taken internally, in doses of from 40 centig to 2 grams a day, it does not cause functional troubles, even when continued for a long time causes slight congestion of the nasal and conjunctivil mucous membranes, but this disappears when large doses are taken albuminuria, but on the contrary, it has perhaps a curative action in some cases of albuminuma

Iodol may be used in powder, in a glycero alcofrom organic stricture of the esophagus in its lower holic solution, in gauze or iodolated collodion, in ethereal solution, or it may be incorporated with vaseline or lanoline -L'Union Med, March 18, 1888

ICTERUS IN INFANCI —DR A JACOBI SAYS certain degree of yellowish discoloration of the skin abduction and adduction being full, complete, and is the result of the normal changes of hæmatin deposited in the skin during the rapid transition from fœtal to post natal circulation. When by retarded separation of the newly-born from the mother, and compression of the placenta, the amount of blood in the circulation of the infant is unduly increased, this form of hæmatogene jaundice is rather more developed The simplest form of hepatogene icterus is produced by the sudden diminution of the blood circulating in the vessels of the liver, which encourages the exosmotic transition of bile into the adjoining blood-vessels All of these forms of jaundice require no treatment Duodenal catarrh will produce icterus in the newly-born, as it does in ad-Thus the feeding and the digestion of vanced age The routine administration of syrup of rhubarb is a mistake on the part of the female busybodies which must be dis-In the couraged Maybe some of them can be taught that acid cow's milk and indiscriminate feeding in general, and exposure, tight bandaging, and cold feet, can resulting from congenital obliteration of the large biliary ducts, or congenital cirrhosis, or acute fatty degeneration, or epidemic hæmoglobinuria is incura-Icterus during septic infection is a bad symptom, and rarely terminates otherwise than in death IODOL -- ASSAL1 has made a number of experi- Icterus depending on congenital syphilis of the liver It is grave, but I have met with several cases which re-A thorough and energetic antisyphilitic covered may prove unsuccessful, however, because the syphacid, and should contain from 85 to 89 per cent of litic process of the connective tissue is not confined to the liver, but extends to the rest of the organs In Assaky's hands, operation wounds that were Mercury must be administered for a long time, a In twentieth or a twelfth of a grain of calomel three sloughing and suppurating wounds it proved itself times a day, careful inunction of a scruple of blue ountment daily, or one thirtieth of a grain of corro-Since it is not toxic it may be used sive sublimate in a 2 of a per cent solution of dis tilled water for subcutaneous injection daily beginning of the treatment two of these medications isms. It gives excellent results when used in and on may be combined, or one of these together with the wounds with a tendency to ulcerate, and transforms internal administration of from three to five grains of iodide of potassium The internal administration of the bichloride of mercury is also well tolerated, one hundredth of a grain may be given in a teaspoonful of water, or food, every two or four hours, and continued many weeks -Archives of It | Pediatrics, April, 1888

WOUND OF THE LEFF VENTRICLE, RECOVERY -It does not cause A P KIAWLOFF reports the case of a Cossack who received a dagger-wound in the left side of the gives excellent results in tertiary syphilitic affectately found him lying on the ground, unconscious, It thorax A physician that saw him almost immeditions, and in surgical scrofuloses, acting more rapidly and with stertorous breathing. The chest was corered with blood, and in the 4th intercostal space, in

the mammillary line and parallel to the border of suffered for three years with symptoms of dyspepsia the ribs, was a wound 15 inches long, from which and anæmia, and with attacks of vomiting of glairy blood was still flowing The wound was cleansed, mucus a compress put on, and restoratives applied, after tumor in the epigastric region, and it had grown which the patient became conscious On the next more rapidly during the last six months She en day his general condition was good, pulse 90 and tered the Seraphim Hospital in Stockholm on May small, temperature 37 8 C Percussion showed the 31, 1887 upper boundary of heart dulness in the 4th inter-region, between the prolongation of the parasternal space, and the impulse was faulty. Lower percus-line and the left mamillary line, was a tumor as sion boundary at the upper border of the 7th rib large as the hand, with a concave upper, and convex Right boundary reached beyond the right parasternal lower border. It could not be displaced towards line, and the left boundary about 3 cm beyond the left mammillary line

On the third day the patient was taken to a hospital, which he left, cured, after four weeks days after leaving the hospital he suddenly dropped ture dead while trying to lift a heavy object tops, should the heart-wound completely closed, and the outer layer of the pericardium adherent to grams the chest-wall The pericardium was filled with sutures, in two rows dark blood, on the left ventricle was a gaping complete recovery wound 14 cm long, the edges of which were thickened, and the neighboring muscular tissue in a state of slight fatty degeneration, subacute endoof the left ventricle, but the patient died from too early strain on his weakened heart The cicatrix was too new, and the endocarditis had not passed The heart could not stand the strain of a sudden inrush of blood, and the cicatin raptured makes 7 per cent of recoveries of recorded cases -Centralblatt für Chirurgie, No 12, 1888

THE SOLUBILITY OF BORIC ACID —According to Schultz calcined magnesia has the property of forming with boric acid a salt composed of several molecules of the acid to one of magnesium oxide According to Mansier the solutions consist in a dissolution of polyborate of magnesium in the dis-The desired quansolved boric acid, or vice versa tity of boiling water is poured on a mixture of magnesia and boric acid placed in a covered vessel

> Boric acid Calcined magnesia

Distilled water q s ad 1 litre By adding 1 25 grams of magnesia to every 10 grams more of boric acid we have

> 120 grams Boric acid 10 Calcined magnesia Distilled water q s ad 1 litre

This solution remains clear at 15° C When 1 50 grams of magnesia are added for each 10 grams of boric acid there is no precipitate at 12° C

These solutions may be used for washing out the For some time bladder, and for general dressings Guyon has used a solution of 50 grams to the litre, maintaining this degree of concentration by the addition of 5 grams of borate of soda, provided the temperature of the solution does not fall below 18° C -Annales des Mal des Voies Gén-Urin, February, 1888

HAIR TUMOR OF THE STOMACH -- JOHN BERG reports the case of a married woman, æt 26, who had

For two years there had been noticed a In the epigastric and left hypochondriac the region of the kidney The spleen was in its normal position Laparotomy showed that the tumor was in the stomach, which was opened by an Five incision 6 or 8 cm long parallel to the greater curva The tumor was composed of hair, short and The au- long, forcibly compressed It was cut up and re moved piece meal The whole weighed about 900 The wound was closed by twenty three Union by first intention, and The mother of the patient said that when about 3 years old she had a habit of chewing hair, but the patient denied having done so since she could remember With the cases of The case, then, was one of healed wound Schonborn and Knowsley Thornton this makes three cases of operation, all successful, for hair tumors -Nordiskt Medicinskt Arkir, Bd xix, No 25

> SALOL IN DIARRHEA -DR O T OSBORNE, of New Haven, gives salol every two hours in acute diarrhœa, until the stools cease The indications for the drug in bowel troubles are vomiting, purging, cramps, "summer diarrhoas" of children, and Dr Osborne has found it useful in prolonged diarrhœa and in one case of dysentery He has used it most frequently in the diarrhoea and vomiting of children, and in every case with success, the stools becoming infrequent immediately, assuming their natural color, To a child under and losing their offensive odor 2 years he gives gram o5 (gr 3/4), from 2 to 5 years I gram (gr jss), 5 to 12 years 2 gram (gr 11) and to all above 12 years 3 (gr 1vss) -N Medical Journal, April 7, 1888

PALPEBRAL ECZEMA —LAILLER recommends the following

2 parts Crystallized acetic acid 50 " Glycerme Cherry laurel water (dist)

To be painted on the eyelid once a day brush should be slightly resistant, and the mixture carefully applied - Riforma Medica, March, 22, 1888

QUEBRACHO IN DYSPNŒA—Ellis has found the following formula useful

Syrup of prunes Syrup of tolu grams 30 Fluid ext of quebracho an gtt 25 Dilute hydrocyanic acid centig 3 Sulphate of morphia

One teaspoonful, to be repeated if necessary

SURGERY OF CEREBRAL TUMORS

One of the most valuable and exhaustive papers ever presented to an American society was read by DRS SEGUIN and WEIR before the Academy of Medicine, of New York, on April 5 It was entitled "A Contribution to the Diagnosis and Surgery of Cerebral Tumors," the surgical portion being supplied by Dr Weir, who successfully performed the operation in the very interesting case upon which the paper was based

The patient was a male, 39 years of age, who was sent to Dr Seguin by Dr Godfrey, of Bridgeport, Conn, last August He had good health until five years ago, when during an attack of malarial fever he had a spasm of the right side of the face and neck The next year he had another similar seizure, and later there were others, in none of which were any spasmodic movements of the hand or arm Two years ago the symptoms became more marked, and the attacks assumed the character of general epileptic convulsions Dr Seguin found that the lower facial power, with very slight tactile anæsthesia, in the right Speech was almost wholly suspended, but mental action was accurate The pupils and the that the lesion was a medullary one from the absence any convulsive seizures during the last six weeks

The symptoms were constantly growing more aggravated, and, an operation being advised, he came to New York in November and was admitted as a private patient at the New York Hospital where, on November 7, the operation was performed by Dr Weir under strict antiseptic precautions, including Before trephining a minute perforation was made in the scalp at the point indicated by Dr Seguin for the opening in the cranium to be made, and through this the place was marked on the skull by means of a colored pencil Flaps of the scalp were then reflected back, and the two buttons of bone, each about an inch in diameter were removed with the trephine, after which other pieces of bone were removed with the rougeur until the cranial opening was three inches in length and two inches wide, on the auriculo-bregmatic line Careful exploration revealed nothing abnormal at first, but afterwards firm pressure posteriorly revealed the presence of a small hard mass about 75 inch beneath the surface of the brain It was about as large as the end of the finger, and was scooped out by means of a Volkmann's spoon A smaller mass was then discovered and removed, and the dura mater was stitched The wound having been given a final washing with bichloride solution (1 5000) the discs cut with the trephine and other pieces of bone removed, which had been carefully kept, were replaced and the scalp sutured with catgut The operation lasted 1 75 hours, the time being prolonged by the difficulty met with in controlling the hæmorrhage incident to the procedure The tumor was found by Dr Peabody to be an infiltrating sarcoma after history of the case was given by Dr Seguin For a short time after the operation there was almost complete hemiplegia and aphasia, but afterwards these disappeared, and the general condition of the patient was about the same as before, although there was now no druling from the right corner of the mouth, which had been previously a marked symptom, and there was more power in the muscles of the cheek He had no convulsive attack from the day muscles in the right side and the muscles of the right of the operation to December 8, and after that he arm were parietic, and that there was some loss of had two others before his return to Bridgeport, on December 17 He came to New York on January 23, and stated that he had had no marked attack during the last two weeks In the latter part of optic nerves were normal. He made a diagnosis of a February an unfortunate complication occurred in tumor of the motor zone of that portion of the motor the shape of a very severe onset of malarial fever, zone of the left hemisphere containing the centres accompanied with marked jaundice, and but for this for the face and neck, and was inclined to believe Dr Godfrey believed that he would not have had

While we have been accustomed to attribute the

first conception of this operation to English surgeons, it seems that priority as regards the operation really belongs to Professor F Durante, of Rome, who published in the Lancet, of October 1, 1887, a communication presented to the Surgical Section of the Ninth International Medical Congress at Washington, in which he modestly reported a case in which he operated as early 18 May, 1884. Three months afterward he presented the patient, 1 woman 35 years of age, to the Chirurgical Society at Perugia, and she 18 now, four years after the operation, in perfect health

As may be seen by our New York letter of this week, Dr W W Keen, who was present at the discussion before the Academy, related some particulars of an interesting case in his own practice, and that he agrees with Horsley as to the advisability of administering morphine in these cases, in order to diminish the supply of blood to the brain

In regard to drainage in these cases, it will be re membered that Horsley says it should not be maintained for more than 24 hours. Dr. Keen thinks this rule correct save in exceptional cases, as in his case, on account of the large clot, and the discharge that followed it

THE NEW YORK QUARANTINE STATION

Mayor Hewitt has written a letter to the chairman of the Committee on Finance of the State Senate in regard to the future management and condition of the quarantine establishment of the port of New Having referred to the threatened outbreak of cholera last autumn, and the present madequate appliances of the station, he states that under the circumstances he feels it his duty to impress upon the Legislature the necessity for action and for the appropriation of a sum of money sufficiently large (estimated at about \$200,000) to put the quarantine establishment in a thoroughly efficient condition however, it is deemed wiser to transfer the responsibility to the city of New York, he feels sure that public opinion will justify the expenditure by the city of the amount required, in which case the quarantine fees would, of course, be paid into the city The city Board of Health, he says, is so situated at the present time as to be able to take charge of the establishment and to give it such direction and supervision as will protect the public With this timely warning, in addition from disease to the various reports that have been made to it previously in regard to the inefficiency of the present quarantine appointments, the Legislature ought certainly to be stirred up to take proper action in the

matter The quarantine bill recently passed, which has now received the Governor's signature, will have some effect in improving the state of affairs in the harbor, but it does not provide the financial means for at once placing the station in a thoroughly efficient condition

RAILROAD ACCOMMODATIONS TO CINCINNATI

We are assured that a large number of the mem bers of the profession in this city are intending to attend the annual meeting of the American Medical Association to commence in Cincinnati on Tuesday, The Chicago Medical Society alone May 8, 1888 is entitled to more than forty delegates, and members of the local societies will doubtless increase the num ber to fifty or sixty, without counting many perma nent members who can attend without special ap All the railroads have agreed to pass pointment physicians and members of their families for one full fare going, and one-third fare on returning over the same route, as stated in detail in The Journal of They will commence issuing the April 7, page 439 tickets with certificates three days before the meeting, and the return tickets will be good until three days after the close of the meeting on the 11th of May Since writing the above we have received the follow ing telegram from Drs Geo C Purviance and Wm Judkins, of Cincinnati

"Delegates attending meetings over railroads that are in Trunk-line Association will receive return cer tificates here Circulate above freely"

THE DEATH OF DR C R AGNEW

DR CORNELIUS R AGNEW, beloved by all who knew him, esteemed wherever his name was known, uniting, as few physicians have done, so much learning with so many noble and generous traits of character, so much modesty with such self sacrifice in the hour of duty, has left vacant the place in the profession that he has so long honored Whether in his home, among his patients, in the lecture room, be fore his colleagues, or in the service of his country, he was the same calm, dignified, learned, charming, Christian gentleman

SMALL-Pox —From the weekly abstract of Sani tary Reports, of the office of the Supervising Surgeon General of the U S Marine Hospital Service, April 20, 1888, we learn that sixty cases of small-pox and four deaths had been reported in Philadelphia up to April 18, seventy-nine cases reported on the 19th

in New York, forty one cases and seven deaths in Brooklyn to the 20th, thirty eight of which were in the county hospital, and three isolated in the City, and in Jersey City, N J, thirty-eight cases and two deaths had been reported up to March 30, since which date no new cases had been reported. It is evident from the repeated, though limited, outbreaks of this disease in a large number of the cities of Europe and this country, that the present is a genuine epidemic season for variola, and it becomes the duty of every physician to actively aid in extending the protective influence of vaccination among all classes of the people, and in exercising vigilance in promptly detecting and isolating any cases with which they may come in contact

M HIPPOLYTE BROCHIN, editor in chief of the Gazette des Höpitaux, and Dean of the medical press of France, as he was called, died recently in Paris in his 80th year In 1837 he began his editorial career on the Gazette Medicale de Paris, and left it in 1854 to take charge of the Gazette des Hopitaux contributed several articles to the "Dictionnaire Encyclopédique des Sciences Médicales," was active in sanitary matters, and was at the post of duty in the four cholera epidemics of 1835 in Marseilles, and 1840, 1853, and 1854 in Paris

THE FEMALE PHYSICIANS OF RUSSIA recently celebrated the tenth anniversary of their professional existence, by a banquet A large number of professors and eminent medical men were present Professor Botkin said that there was a sort of instinctive divina tion proper to the brain of women, and that this faculty should prove valuable in diagnosis Pro fessors Rauchfuss and Tarnowski also made remarks

TDITORIAL NOTES

An International Congress of Otology will be held in Brussels on September 10-16, 1888

Giraud Teulon, one of the best known of French ophthalmologists and optical physiologists, is dead

STADFLWAYN, Privat-docent of internal medicine at Heidelberg, has been called to Dorpat

GAZETTE DES HOPITAUL DE TOULOUSE IS the name of a new medical journal published in Tonlouse, France

PRINCE CHUN, father of the present Emperor of Monon Route appears on page 8 China, when very sick some time ago, called in Dr

Manson, of Hongkong This is said to be the first time that any member of the Royal family in China has ever consulted a European physician

REVUE PRACTIQUE D'OBSTETRIQUE ET DE L'HY-GIENE DE L'ENFANCE is the name of a new journal that has appeared in Paris It is edited by MM Varnier and Legendre

Professor Tito Vanzetti, the eminent Italian surgeon of Padua, died on March 6, aged 78 years He left \$20,000 and a magnificent library to the University of Padua

THE CRANIA OF MOZART, BEETHOVEN, GLUCK and Schubert are to be examined by Professors Toldt, Meynert, and Kundrat, and Dr Weisbach, a Committee of the Anthropological Society of Vienna

ASSOCIATION ITEMS.

THIRTY-NINTH ANNUAL MEETING To be held in Cincinnati, Ohio, May 8, 9, 10 and 11, 1888

PRESIDENT, A Y P GARNETT, MD, of Washington, D C

Papers and Discussions

The following additional titles of papers to be read at the approaching meeting have been received since the programme was published in the issues of THE JOURNAL for April 7, 14, and 21

Section on Ophthalmology, Otology, and Laryngology

"Report on the use of Jequirity," by J P Worrell, Terre Haute Ind

Section on Obstetrics and Diseases of Women

"Renal Tenesmus, its Successful Treatment by Kolpo-Uretro Cystotomy and Intra-vaginal Drainage combined with Uterine Support," by Nathan Bozeman, New York

Section on Practical Medicine, Physiology and Therapeutics

"Mullein in the Treatment of Malarial Troubles," by Geo Byrd Harrison, Washington, D C

Railway Arrangements

PAN HANDLE ROUTE -Attention is called to the advertisement of the Pan Handle Route on page 9 of this issue of THE JOURNAL The Pan Handle is the pioneer through car line to Cincinnati, and is a portion of the Pennsylvania lines west of Pittsburgh, which should be a sufficient guarantee that any one patronizing the Pan Handle will have a pleasant and comfortable trip to Cincinnati

Monon Route - The announcement of the

THE KANKAKEE LINE -This popular and direct

line has made arrangements to run trains for the men since then had increased rapidly in size, while meeting of the Association at Cincinnati The times | the rest of the body emaciated Her appetite had of departure and arrival are as follows Leave Chicago at 9 10 A M, arrive at Cincinnati 7 15 P M, leave Chicago at 8 PM, arrive at Cincinnati 7 30 and Reclining Chairs on night trains This is the only line from Chicago entering the Grand Central Depot at Cincinnati, which is situated in the heart of the City, and in the immediate vicinity of the hotels and business centre Rates of fare same as I or further information call at city ticket office, 121 R indolph St, Chicago, or address I C Tucker, Gen'l N W Pass Agent

and the second s

SOCIETY PROCEEDINGS.

OBSTETRICAL SOCIETY OF PHILADELPHIA

Stated Meeting, Thursday, April 5, 1888 THE PRESIDENT, T. M. DRYSDALL, M.D., IN THE

DK T M DKISDALE reported a case of

MULTH OCUI AR PAPH I OMATOUS TUMOR OF THE BROAD I IGAMENT PRODUCING OBSTRUCTION OF THE BOW-OPFRACION DI ATH I ROM URAMIA, AUTOPS) DISCLOSING ONE LIDNEY CON-VERTED INTO A CYST AND THE OTHER DISCASED

At the request of her physician, Dr A G B Hinkle, I was sent for January 7, 1888, to see Mrs M I K, a widow, set 54 She stated that she was the mother of seven children, and that her labors had invariably been hard and tedious, accompanied with The menopause ocviolent abdominal cramps curred when she was 46 years old She had always been strong, worked hard, lifted heavy weights, and had had no sickness in thirty-five years until last March, when she was seized with intense pain in the abdomen together with obstinate constipation continued to suffer for several weeks, and her physicians had great difficulty in getting the bowels moved, medicines had so little effect that her life was despaired of, but she was finally relieved by co pious purgative injections Her disease was at first supposed to be owing to sewer-gas poisoning, as her son suffered in a similar manner at the same time, and they were treated accordingly, but, finding they did not improve, a consulting physician made a more thorough examination and found well-marked blue They were then treated for lines on their gums The son had relead colic and soon recovered mained well ever since, but she had suffered from colic and constipation, while the abdomen had continued permanently swollen Her bowels never moved satisfactorily, as only a portion of the contents seemed to come away, leaving the upper part tines hard tumor low down in the right side Her abdo- and a loop of intestine were firmly adherent

been good and she had no pain after her meals, but felt too full to eat much tions but no vomiting Until recently she had a Parlor cars on day trains, Pullman Sleepers slight daily movement of the bowels, but for several days past she had had no evacuation During all this time she had suffered from what she supposed was colic and, in fact, was never free from pain Just before I saw her she had taken a dose of castor oil, and at my visit was in great agony at the disten

tion She was thin and anæmic, and her complexion had the cachectic appearance of malignant disease The centre of her tongue was red and smooth The ab domen was greatly enlarged, and resonant on per cussion everywhere except below a line halfway between the umbilicus and pubis, there it was dull and fluctuation could be detected. In the right iliac region I found a hard nodulated tumor which appeared to be moderately movable, but so rigid was the ab dominal wall that it was difficult to determine this with certainty The bladder was prolapsed and pro jected between the thighs, but the uterus remained within the shortened vagina and was held up, appar ently, by being fixed to the tumor The uterine sound entered 2 inches and passed to the right As well as could be made out, the uterus and tumor were closely adherent Rectal examination revealed a firm immovable tumor occupying the upper part of The examination, although made with the pelvis the utmost gentleness, caused great pair As fre quency of micturition was a prominent symptom, Dr Hinkle had more than once examined specimens of her urine but, finding nothing abnormal, concluded that the irritation was owing to the prolapse of the As usual before an operation, I also exam ined two specimens of the urine and found it free from albumen and sugar, with a sp gr of 120 She assured me that she passed the normal quantity

The oil operated and gave her relief for twentyfour hours, but after this she grew rapidly worse, the symptoms of obstruction of the bowels increased, and by January 17, just ten days from my first visit, I was again sent for, and found that she had been in such continual agony that she had concluded to submit to an operation The abdomen was extreme ly hard, and in place of being tympanitic was every where dull on percussion, and fluctuation was general, showing that a rapid effusion of fluid had occurred

In the presence of Drs Hinkle, James F Wilson, I Howard Beck and G B McCracken, and assisted by my son, I operated January 22, 1888 sion was followed by the escape of about a gallon of The peritoneum was slightly inflamed parts thickened The growth proved to ascitic fluid and in some parts thickened be a multilocular papillomatous tumor of the broad It filled the lower part of the abdomen and the right side and occupied the upper portion of ligament the pelvis Its color was not the opaque white of an ovarian cyst, but resembled in this respect the intes The main cyst extended upwards as high as Last August she first felt a the border of the lower ribs To this the omentum adhesions were detached and the cyst drawn forward As this was being done it burst and discharged a large thing large cysts below this were tapped, which greatly re- drawn She continued drowsy, but did not sleep duced the size of the tumor, but a mass of others vic brim, obstructed it Here it was difficult to sep- urine was obtained arate the tumor from the surrounding structures without injury to them, for it was adherent to the bladder, bowel, and everything it touched After freeing it from all its other attachments without doing mischief, save to some vessels on the floor of the pelvis, which culty owing to its depth in the parts with its capsule was then removed a set of bleeding vessels below the pedicle, which were secured after considerable trouble Before closing the wound the abdomen was thoroughly cleansed been boiled The operation was tedious, lasting over an hour, and through it all the pulse was well maintained, but it was followed by a profound shock, shown in the pale face and thready, almost imperceptible pulse As soon as she became conscious she complained of intense pain in the back Under the use of stimulants and the external application of heat she reacted in about an hour

At 5 P M, four hours after the operation, the nurse applied the catheter and removed 11/2 ounce of urine

At 8 PM Dr Hinkle and I visited her and used the catheter, but the bladder was empty Her pulse was 112, temp 100 2°, which was the highest it reached She complained of feeling sore all over mustard plaster, made with warm water, to be applied over the kidneys, and prescribed a tablespoonful of the following mixture, well diluted with water, to be taken every four hours R Potasu acetatis, 3ss, spiritus ætheris nitrosi, fass, aquæ distil, faijss

10 30 PM, she vomited for the first time

12 15 AM After an ounce of urine was drawn in the abdomen, which continued until Dr Hinkle it yielded and the patient died was sent for at 2 15 A M He found her with a pulse of 94 and temp of 100°, and gave her a hypodermic diseased kidneys, and wished to know whether Dr

tympunitic, but not tender on pressure tube was used, which permitted a large quantity of ligament on account of the large amount of solid flatus to escape After this the diuretic was used by matter connected with it injections and retained We directed I drachm of DR J PRICE said there was but one authority who

2 PM Pulse 130, temp 97° Had vomited every-1/4 gr of calomel and a tablespoonful of very quantity of red serous fluid, for, as usual, the cyst hot milk were then given every hour This quieted walls were very thin and easily ruptured. Two other her stomach. At 4 50 PM 1/2 ounce of urine was

9 30 P M One drachm of urine was removed remained, filling the upper part of the pelvis, to which they were firmly adherent. This was the portion cool and pale. The catheter had been used at 2 PM which, by pressing on the bowel as it passed the pel- and at 9 A M, and each time about a teaspoonful of The stomach continued quiet until 8 A M, then she vomited occasionally Stimulants were used by the rectum, but she continued to sink and died at 6 P M

The autopsy was made the next evening by Dr McCracken, who kindly furnished me with the followbled profusely, I found it was firmly bound to the ing note of it The wound in the abdominal wall uterus, which it dragged down and held close to the was firmly united throughout its whole extent A uterine wall of the pelvis, deep down on the right moderate amount of peritonitis existed, confined side, by an exceedingly short, firm and vascular at- principally to the lower part of the anterior abdomtachment or pedicle, which I ligated with great diffi- inal wall and the lower coils of intestines, which were The tumor covered with a thin layer of pus This was the por-This revealed tion of the peritoneum which was found inflamed when the abdomen was opened at the operation The pedicle and surrounding parts from which the tumor was detached were in excellent cordition by irrigating it with warm water which had previously The right kidney was sought for, but could only be detected after a prolonged search, when it was found to have been converted into a large elongated cyst, only a small portion of the upper part of the organ remaining unchanged It resembled a distended bowel so closely that it was difficult to distinguish it from the surrounding intestine

The left kidney was enlarged and intensely con-When the adherent capsule was removed the surface of the gland presented the rough granular appearance of inflammation There were a number

of small cysts in the cortical substance

This case presents several features of interest, one of which was the steady decline in temperature from 100 2° on Sunday to 96° on Tuesday morning, but I To relieve the suppression of urine we ordered a have brought it before you mainly for the purpose of showing how we may be deceived in regard to the condition of the kidneys, even when all signs of disease are absent in the secretions This patient's life was dependent upon the active exercise of one organ which itself was diseased and struggling under the load thrown upon it as the only eliminator of its kind It naturally followed, then, that when she became restless and complained of severe pains the toxic effect of the ether was added to its burdens,

DR PARISH spoke of the toric effect of ether on injection of 16 of a grain of morphia After this Drysdale had been able to determine the renal conshe slept until 5 30 A W, when the nurse drew her dition in his case. He had some years ago had a Monday, 10 45 AM Pulse 118, temp 98° Since parenchymatous renal disease and in which death 7 30 A M had been in pain and had vomited several resulted from acute suppression of urine. It was a times The catheter had just been used and about serious question as to what anæsthetic we should use The abdomen was under similar circumstances The tumor presented

Rochelle salt to be given every two hours, and to made any mention of the condition of the temper-

ature under ether taken the temperature of a large number of patients under the anasthetic, and found that there was invariably a depression from 1° to 2° due to cessation of combustion the howels as presented by Dr Drysdale's case were very characteristic some very trying cases of this kind, and pain was always present and very severe, in several cases shock and collapse had been marked symptoms of rence of morning sickness in the husband after the the obstruction

DR DRYSDAFF did not think that the decline in temperature was due to the anæsthetic, but believed it depended upon the uramia, as he had repeatedly noted a similar depression in advanced stages of weeks after the appearance of menstruation for the Bright's disease eral times and nothing found to indicate disease of not until it was time for the next menstruation had the kidneys, in fact, there was not a single symptom present to excite suspicion of trouble in these organs, except the constant inclination to micturate, for which the prolapsed bladder was sufficient to account

DR HAMILI read the following notes

Hæmorrhage into the placenta, or placental apo- both cognizant of the fact pley, is not of rare occurrence. In the earlier stages of placental development the maternal capil- Bacon had written some line on this subject, the sub lary loops thrown into a network around the chorional villi not infrequently rupture, with a consequent effusion of blood over a greater or less area, and at a later period of intra-uterine development the blood current in the intervillous blood spaces, at all times sluggish, may become so very slow that the blood coagulates and at birth there may be seen a clot of varying extent, more or less perfectly organized, and in some cases presenting just the laminated appearance that one sees in an aneurism undergoing oblitcration

Rupture of the umbilical vein in the cord, with a rather extensive effusion of blood, has also been noted, but here the quantity of blood that can escape is of necessity limited to the comparatively small capacity of the cord In the case that I would report to the Society the apoplexy of the placenta was of fœtal instead of maternal origin, the ruptured vessel was one of the large branches of the umbilical vein running across the fœtal surface of the placenta, and the quantity of blood effused must have left the fœtal body absolutely exanguine All these circumstances to the Society specimens of the garments recom make the specimen a rare one, the last two make it mended and worn by the women interested in dress quite unique as far as my knowledge goes An extended search through medical literature has failed fit the form throughout. Over this is worn a long Unfortunately I am unto show me a similar case able to find a cause for the rupture of the bloodvessel, there was nothing in the condition of the feetus, nothing in the history of the mother, that as the circumference of the waist, so as to avoid any would account for it

DR HIRST was greatly pleased to see the specimen, and thought it unique There was one somewhat similar described by Bandelocque

DR KELLY remarked that he had in his possession delivered, in which moderate traction on the cord, mended as by use of the corset This dress is almost after separation of the child, resulted in a large exactly like that of childhood hæmorrhagic extravasation between the placenta and the amnion

Some years ago Dr Burk had amination, to come from a minute rupture in the vein on the placenta part as it left the cord, about two millimetres in length and transversely to its axis

DR J PRICE had recently had a case in which The symptoms of obstruction of death to the fœtus had occurred from pure hanging The cord was twice wrapped around the child's neck He had lately been dealing with and there was a deep indentation in the foetal tissues The cord was shortened at least one-half

DR HAMH L also read the following "The occur fact of pregnancy is known or suspected, I have fre quently noted The case I would report is unique from the fact that the sickness appeared in the hus band at such an early period of pregnancy Tno The urine had been examined sev- last time, the husband had daily morning attacks and the woman any other evidence that conception had taken place, and then she failed to menstruate The husband continued having the attacks for two months During previous pregnancies the husband had suffered from the same attacks, but not until they were

> WM GOODELL remarked that Sir Francis DRstance of which was that "loving husbands so sympa thize with their pregnant wives that they have morn ing sickness in their own persons " A writer in the Lancet, of May, 4, 1878, p 666, also refers to a case in point which occurred in his own practice. In this case the husband's nausea and vomiting began and ended with his wife's

> > (To be concluded)

GNYECOLOGICAL SOCIETY OF BOSTON

Stated Meeting, December 15, 1887 VICE-PRESIDENT H C WHITE, M D, IN THE CHAIR DR HELEN L BETTS read a paper entitled woman's dress, its relation to the etiology and TREATMENT OF PELVIC DISEASE

(See p 509)

At the conclusion of the paper Dr Betts exhibited The undergarments are in one piece, and waist accurately fitted to the figure, to which are but toned the skirts by a distinct row of buttons for each The waist-bands of the skirts are of the same length Shoulder straps for supporting the skirts will not take the place of the full waist, as by their use the weight is brought upon two small points and they become intolerable

DR É C KELLER said that it was possible for a woman to look as trim and neat in the dress recom

DR L F WARNER said that the paper was a good This was found, upon careful ex- one, and should be of great practical value His experience had been that it was impossible to secure any change in the manner of dress among women The constriction about the waist interferes with the return of blood from the pelvis, and leads to congestion with consequent enlargement of the uterus and other pelvic organs The corset presses these organs out of their natural place and relation and adds to the difficulty Children are, as a rule, well and strong until their approach to puberty is supposed to demand the use of corsets dress ruin nine-tenths of our young women. Women, as a rule, dress to outdress one another, but the men are to blame because they do not lend their influence in behalf of a more sensible and rational system of dress

work to secure any radical change of dress simply on the ground that the present modes are deleterious to that the new style of dress will improve the form we may be more successful

DR W S Brown said that the subject of the paper was new and important. He believed that the great expense was one great objection to the new mode of dress The "union" garment and others recommended are three times as expensive in this country as in England The nearer any the better it will be Dr Brown would not strive to secure a change in the fashionable mode of dress, of all classes so that work can be done without loss of strength There are many elements influential in producing the common ill health among girls indi school, all have their permicious influence, and the intestines vicious habits of dress may prove to be the last straw which breaks the camel's back

and Europe in regard to manner of life and habits The working women in foreign countries, as Germany, do not wear any such dress as the rural population in this country Foreign women wear boots and short skirts supported by broad hips The habits of outdoor work by women in this country have passed away, and the class of women corresponding most closely to the foreign peasant has sought to assume the dress of polite society, with all its faults

Dr Cushing believed the corset to be a classical garment, and that women would always wear some The veins of the pelvis are valveless death

dress was a matter of education on with the children and continue their style of dress tion of the appendix The expense of the new style garments is an objection, but it can be avoided with is to open the abdominal cavity and inspect the parts

MEDICAL SOCIETY OF THE DISTRICT OF COLUMBIA

Stated Meeting, January 11, 1888 THE PRESIDENT, THOMAS C SMITH, M D. IN THE CHAIR

DR J F HARTIGAN reported

These vicious habits of A SUCCESSFUL CASE OF DOUBLE LAPAROTOMY FOR SUPPURATIVE PERITONITIS, AND ON THE USE OF ARSENIC IN SEPTICAMIA

(See page 513)

DR J FORD THOMPSON This paper brings up a very interesting subject Sometime ago he reported DR A P CLARKE said that it would be up hill a case of typhlitis in which he made an artificial anus and subsequently closed it and the patient recovered Since then he has operated three times for typhlitis health, but that if we could persuade our patients and peri-typhlitis He had a few remarks to make about Dr Hartigan's case which in some respects is very remarkable. In reality there was nothing in the case except the opening of three abscesses. The disease began as a peri-typhlitis and was followed by pyæmia, parotitis and, finally, two abscesses in the It was a very clear history of bloodabdomen poisoning but it has been reported as a case of lapar-It is remarkable that the child should have style of female apparel approaches to the trousers had a peritonitis on one side of the abdomen and sometime after present as a peritoneal abscess on the opposite side There is no other explanation for but would aim to radically change the working dress this except that both were due to septicæmia Both were circumscribed collections of pus and were not general suppurative peritonitis The peritoneum is hable to be attacked in septicæmia Dr H only gestion, lack of proper nutriment, over pressure in washed out the abscess cavity and did not see the

DR HARTIGAN said he objected to the term abscess as the pus was in the abdominal cavity and if Dr T DR E W Cushing called attention to the radical has listened to the paper he would have learned that differences between the rural classes of this country he performed a laparotomy, which meant exposure of the intestines

DR THOMPSON said he thought he had listened very attentively and that Dr Hartigan did not say that the intestines were either seen or examined, and that when a surgeon examines the intestines he says But even if the intestines in this case were both seen and felt, he would still claim it as a peritonitis which was circumscribed Dr Hartigan seemed to hesitate about opening the abscess but he did not know why for every surgeon opens collections of such garment to support the breasts The human typhlitis is very important. He would refer to a re-The question of race is not yet entirely used to the erect posture cent case of his in which there was perforation and and the erect posture renders the return of blood a small opening and both recovered In the third more difficult. When a tight waist still further inter- he did the same thing and the patient died in a few feres with the circulation trouble is likely to result days. A systematic examination of the parts in DR ESTHER HAWAS believed that the question of volved is the thing to do and not be content to ess was a matter of education. We should keep evacuate the pus. The autopsy revealed a perfora-

success by directing that buttons be sewed on the involved. The worst practice in surgery is to wait for fluctuation Pus is usually present by the fourth

or fifth day of the disease when the incision should be made, the evenum and appendix should be exammed-and if the latter is ulcerated it should be removed and the intestines sewed-and the abscess cavity washed Sometime ago Dr Busey asked him saw her, her condition was about as follows Neither if there had been any reports where typhoid fever tenderness nor pain, there was absolute ease and ulcers of the intestines had been sewed time he knew of no cases He would now state that Morton recently reported three cases operated on in The general impression of those which all died present at the discussion was that the operation was sweat and very clammy Her knees and feet were scarcely justifiable in a subject who was already reduced to an extreme degree of debility by the primary disease Greg Smith reports six cases of laparotomy for suppurative peritonitis, and all recovered Smith contends that not only should laparotomy be performed for suppurative peritonitis, but all intestinal adhesions should be broken up before the abdomen is closed For this purpose he uses a fountain syringe (to which the small nozzle is attached) and carries it into the cavity and the stream breaks up the rupture or as soon after as possible fine adhesions.

DR Bush said that it was possible that he may have misunderstood Dr Thompson in saying that all cases of typhlitis and peri-typhlitis should be oper-connected with the condition of death and would ask ited on on the fifth or sixth day or later

Dk I HOMPSON "No earlier"

I hen I am to infer that we must cut in order to look for pus, or that these diseases always terminate in the formation of pus? If so, I take can anything be done to avert it? He had seen a issue with Dr I hompson A large number of such similar picture in a case of suppurative peritonitis cases will get well without suppuration. It is not always easy to make a diagnosis of the presence of pus, but there are other symptoms to aid us in mak- remedies are of no value because they will not be ing the diagnosis Where there is reasonable sus picion of pus we should operate In Dr Hartigan's case there were symptoms of typhlitis and peri-typhlitis followed by collapse which did not last longer than a few hours, some weeks afterwards pus was discovered in the left iliac fossa, and laporotomy was performed, several weeks later a second collection of pus was detected in the abdominal cavity on the right side, and a second laparotomy was performed Was the collapse the result of the bursting of pus If one waits for fluctuation there is no question about into the abdominal cavity? But the collapse occurred some weeks before pus was discovered in the abdomen

DR HARTIGAN The collapse occurred in the third week of the disease, in the seventh week there was rupture of an abscess suppuration of the parotid glands, three or four weeks later pus was discovered on the left side, and about the twelfth week pus was discovered on the right side

DR BUSEY Then it is still more remakable that in the tenth week suppurative peritonitis should have occurred without any inflammatory symptoms gave the details of a case that was not so promptly He had seen the treated, and the result was death case in consultation on the 9th inst The lady, 20 years old, three weeks previously had attended a The case should be operated on before the detection party and eaten freely of such articles as are usually of pus by fluctuation The same night she was seized eral symptoms if not by local served at parties with acute pain, vomiting and tenderness over the The diagnosis of typhlitis was made the case of typhlitis or peri-typhlitis should be operated abdomen

next day by the attending physician and the case was treated as such cases usually are On the 8th she was seized with a darting pain which radiated from the right iliac region On the 9th, when he At that comfort, the temperature was 100°, respiration 36, pulse could not be counted Her intellect was bright and she was cheerful and remarked that she was "getting well fast" The skin was drenched with He expressed the opinion that she was then dying, but if not an operation was imperative There was no doubt in his mind that general penton itis or a ruptured abscess had existed from the even ing of the 8th when she felt the acute radiating pain extending over abdomen-most intense between en siform cartilage and umbilicus Opiates were freely used, which was followed by absolute comfort This would have been a case for operation at the time of This patient died This was undoubtedly a case where the evacu ation of the pus was delayed too long

He would call attention to a chain of symptoms whether the surgeon was justifiable in operating when he believed the patient was dying, or might die on the operating table or very soon after leaving it Can we determine when death has begun, and if so several years ago and later another of rupture of the gall-bladder When the process of death begins In cases similar to the one observed is it absorbed the surgeon's imperative duty to operate even if death has begun? In many cases the operation is delayed too long The difficulties are in making the Do not wait too long for pus But cases diagnosis He was glad are often cured without operations that Dr Hartigan's case terminated so favorably

DR THOMPSON If there has been any advance ment in surgical procedure it is in operating early the proper treatment In typhlitis and pen typhlitis we should operate early In Dr Hartigan's case there were symptoms of peri-typhlitis in the first week and then collapse that Dr Hartigan explains by the The early operation is the recognized surgical procedure of to-day Operations for fluctuation is not an early operation for there is no doubt about what to do The surgeon evacuates pus whenever and wherever he finds it In typhlitis and peri-typhlitis there is usually a circumscribed swelling and there is pus on the fifth day When there is any doubt aspirate Morton would not use the needle but would proceed at once to perform laparotomy If he found the vermiform appendix ulcerated he would cut it out and sew up the wound

DR Busey wished to combat the idea that every

He does not oppose an operation when it is necessary It may be advisable to operate before fluctuation but certainly not in every case When there is a liability to suppuration and there is an increasing intensity of the symptoms, whether fluctuation is detected or not, there is a strong possibility

DR THOMPSON The operation should be performed on the fifth or sixth day, and it is frequently demanded before there are any well-marked symp-

DR HAMILTON In inflammation there is during the first stage an exudation We may anticipate the suppuration by evacuating the exudate In cellulitis of the leg there is an exudate, and if free incisions philosophy of Dr Thompson's statement

DR HARTIGAN If Dr Thompson had followed me he would not have confounded his figurative case

with mine

Stated Meeting, January 25, 1888

VICE PRESIDENT, SWAN M BURNETT, MD, IN THE CHAIR

DR R T Edges read a paper upon and presented a specimen of

LARGE CELLED SARCOMA OF THE LUMBAR VERTEBRÆ

Attacks of supposed sciatica for some years Par-Extreme pain on movement aplegia dolorosa Curvature at level of last dorsal and first lumbar vertebræ Tumor in the back Vomiting Dilatation of the stomach Destruction of the bodies of the second and third lumbar vertebre by a giantcelled sarcoma which also formed a large tumor on each side of the vertebral column

A married woman, 35 years old, had a difficult labor with her only child, now 7 years old Soon after she had a tender spot in her back Four or five years ago she had some attacks of sciatica, lasting a few days, which early in 1886 began to be more severe and continuous In May she went to New York to consult a physician, but when she arrived the pain disappeared, so that she went shopping and to the theatre instead The pain soon returned, however, attended with numbness and uncertainty of gait

In September, 1886, she entered the Homeopathic Hospital in Boston Late in that year her husband was informed of a curvature of the spine which, however, the physicians said they had been aware of since September, but as it was not painful and was only slight, it was supposed to be congenital or due to an A fulness in the side was noted at the old caries

During a part of the time she was in the hospital she was able to walk about and ride out, but in No vember she had to get up very carefully On December 9 she was moved from one bed to another and

tions of improvement and the reverse, but with the In June last the swellbalance on the wrong side ing in the left back below the rib was punctured, but only a few drops of pus obtained Attempts were made to fix the spine by apparatus, but it could not

When first seen by me, in October, she had been in bed nearly a year She was greatly emaciated, but no more anæmic than would be expected from her condition, and there was nothing to indicate the socalled cancerous cachexia Her lower limbs lay almost motionless, supported and protected with the There was a little movement of the greatest care toes and feet possible There was great pain about the hips and running down the legs, which was greatly are made we can prevent pus formation This is the aggravated by the slightest movement and often by the slightest pressure, or even contact The sciatic, and sometimes the anterior crural nerve on the right side, were painful on pressure, and at times the whole surface seemed hyperæsthetic Movements of the arms perfect but often painful There was a bed sore over the sacrum, and to dress this and change the bedding she was several times etherized and raised, this procedure being followed by extreme pain lasting for hours

The functions of the bladder and rectum were sluggish, but there was no loss of control Appetite and digestion fair, but considerable trouble from con-

stipation and flatulence

The urine at times contained a large amount of phosphate and carbonate of lime, with mucus and no Once an excess of indican was noted There was at no time any fever

For several weeks she improved considerably and got a very good appetite, with less constant pain down the legs and less tenderness She used a little morphine, on one or two nights none at all, and some

On the night of December 20 she took antipyrin for the relief of pain, which gave her a good night and no nausea During the forenoon of the next day she began to vomit a greenish and brownish fluid which after more than twenty-four hours became stercoraceous in smell I found the bacteria of putrefaction therein The abdomen became tense and tympanitic at the upper part, the vomiting was relieved by nothing but morphine, and she died while partly under its influence

The autopsy showed the stomach to be greatly dilated, sagging down nearly to the pubis, half filled

with a brownish fluid and much gas

There was nothing remarkable about the appearance of the liver, spleen or intestines The ureters passed over the surface of the tumors soon to be described, but they were nowhere either strictured or dilated In the right kidney was a little turbid fluid, one stone as large as a small chestnut and a good many smaller ones, otherwise both were healthy

The specimen before us consists of the last dorsal and what remains of the three upper lumbar vertethen became almost completely paralyzed, and soon bre, sawn longitudinally The left side is preserved after completely so in the lower limbs There was, whole, with the exception of a little dissection to however, soon some improvement in the movements show the extent of damage done to the bone of the limbs Trom this time she had her alterna- right side has been macerated and cleaned

On both sides we have the last dorsal vertebra mtact

The first lumbar is little affected on the right side except two little spots of crosion of the body the left the transverse and articulating processes have disappeared and are replaced by this soft reddish The second lumbar has almost entirely disappeared, nothing remaining but a thin, gritty lamella between two fibro cartilages which are displaced is known to be present elsewhere, the existence of but not destroyed, and a little piece of the end of the spinous process connected with the supra-spinous ligament

The third lumbar is represented as to its body by this reddish pulp between two fibro cartilages, and by the whole spinous process and some fragments of the

articulating processes on each side

the first and fourth, the other two being represented

only by a few fragments

A new growth occupies the angles formed by the sliding back of the first vertebra, and similar growths between and croding the arches encroach on the bed, while at the same time no fever is present, is The narrowest point is just below the somal canal termination of the spinal cord, so that it was not pressed upon, and there was enough room left to permit the passage of the cauda equina, which appeared to the naked eye normal On each side and motion, reflexes, and so on, or to palpate more deeply closely connected with the bone is a large rounded the abdomen, which in this case would have undoubt tumor, as large as one fist on the right side, and two It is this latter which pressed fists on the left through below the rib and was felt during life Upon its posterior surface is a mass of inspissated blood, in its outer margin are calcified patches tral portion of the growth seems to be situated beneath the periosteum

There were no secondary growths found and no By madvertence the enlargement of the glands

liver was not incised

The structure of the new growth is that of a giant-

In the Boston Med and Surg Journal I published several cases of malignant disease of the vertebræ with painful paraplegia, of which I will here refer to only one, which was that of a man of 55 with many symptoms like those in the case just described great pain on turning in bed, pain in the legs, inability to walk, with no distinct paraplegia, but general loss of strength in the lower limbs

The growth was here also connected with the body of the second lumbar vertebra, implicating to some extent the first and third, though the tumors outside were much smaller than in the case before us

was a round-celled sarcoma with giant cells

In the other cases the disease was more extensive After malignant disease has invaded the vertebræ, usually the lumbar, the symptoms are about the same whether it be a sarcoma or a carcinoma, and the cases just described may be considered fairly typical

In another point, however, they differ, in that the of reported cases the starting-point has been the generally administers an emetic, preferably the mammary gland. A case which countries to be a starting-point of the starting-point has been the generally administers an emetic, preferably the mammary gland. ary to a similar growth elsewhere In a large number in this affection mammary gland A case which seems to be an ex- powder of ipecacuanha He then gives from 9 to

ception to the first part of this rule was reported by Dr Kempe, where a lady had had a cancer of the breast removed by a member of this Society (Dr Garnett), and afterward died after symptoms similar to those already described The secondary growth in this case was pronounced alveolar sarcoma

The diagnosis of this affection is likely to be ob scure, especially in its early stages When a cancer severe and persistent pain in the nerves of the lumbar or sacral flexures or both, is a very suspicious circumstance

When there is no primary cancer, the diagnosis between this disease and caries may be for a long time in doubt, and the existence of curvature, and even of a tumor, does not at once clear it up A In the macerated specimen the two vertebre are large flattened tumor without tendency to pointing would, as in this case, be in favor of a neoplasm Setting aside these, which may almost be called acci dental aids in the diagnosis, I think that the extreme and continued pain on turning over or sitting up in somewhat characteristic, as distinguishing it on the one hand from carres and on the other from any sim In some cases it may be pos ulated spinal disease sible to investigate more closely the condition of edly disclosed the presence of the tumors in the cavity

The explanation of the sciatic and crural pains in the pressure exercised on the nerves, both within and without the spinal canal, is too obvious to need more than mention, but it should not be forgotten that an actual myelitis may result from the pressure, as in This is not, how one of the cases reported by me ever, one of the most usual results, probably for the reason that, as the lumbar vertebræ are the place of election of the new growths, the narrowing takes place below the cord In other cases, even when the bones of the dorsal vertebræ are extensively dis eased, the softening proceeds with comparatively little encroachment on the calibre of the spinal canal

LETTER FROM NEW YORK

(FRO I OUR OW I CORRESPO . DEL T)

Diagnosis and Surgery of Cerebral Tumors—Therapeutics of the Upper Air passages, and the Use of Patent Nostrums and Proprietary Medicines-Complete Apnonia-Saccharinate of Cocaine

In summing, before the Academy of Medicine, up the results of the operation for cerebral tumor performed by Dr Weir on November 17 (the operation During the operation great trouble was expenenced is more particularly mentioned in the editorial article on "Surgery of Cerebral Tumors," p 525), Dr Seguin said that the man's life had been unquestionably prolonged by it, and that his general condition went to show that there had been as yet, apparently, no new growth of the sarcoma He thought that when the patient had completely recovered from the effects of the attack of malarial fever many of the symptoms would show considerable improvement as compared with the present

He then rehearsed the symptoms indicating whether a tumor was probably situated in the cerebrum or not, and gave the bases upon which a diagnosis of the topographical location of cerebral tumors Having called attention to the importance of the distinction made by Brown-Séquard more than thirty years ago between irritative and destructive lesions, as indicated by the symptoms, he stated that spasms resulting from cerebral tumors often involved at first but a very small area, although the attacks were liable afterwards to extend to typical It was therefore of great epileptiform convulsions assistance to secure, if possible, an exact account of the first spasm, which might properly be called the In the next place, it was desirable signal symptom to ascertain whether the tumor was cortical or sub-This was often extremely difficult, and little light was thrown upon the matter by the author-Deductions could be drawn sometimes, however, from the nature and location of the signal symptom, and the presence or absence of localized As to the evidence afforded by local temperatures, not much reliance could as yet be Whether an operation was advisplaced upon this able in any given case would depend largely on whether there were more than one, as indicated by The presence of dysphagia would go the symptoms to show that there was a lesion of the medulla obloncations of tubercle or cancer in other parts of the time, and in order to facilitate the process of healing body it was undesirable to operate

Dr W W Keen, of Philadelphia, who, like Dr Godfrey, of Bridgeport, was present on this occasion by special invitation, gave an account of a successful case of his own (referred to by Dr Weir), which has as yet not been published in full The patient, who was 26 years of age, fell from a window when 3 years old, his head striking on a brick A superficial wound was made, but no trouble was experienced from the injury until he was 23, when epilepsy developed This was associated with asphasia and paralysis of the right arm and leg No history could be obtained, however, of any signal symptom, such as Dr Seguin had spoken of Later there was complete recovery from the paralysis and aphasia The operation was performed December 15, 1887 Instead of marking upon the skull with a colored pencil the spot where the opening was to be made, as had been done by Dr Weir, he gouged out a little piece of bone at a point corresponding with a slight scar which was presumably left by the injury to the head received when the patient was 3 years old The tumor re moved measured nearly three inches in its long axis from hæmorrhage, due in part to the extreme friability Hæmorrhage was controlled partly of the vessels by hot-water, partly by ligation, and partly by pres In tying a vessel it was found that if one end of the catgut was pulled at all more strongly than the other the ligature would invariably cut through, 50 that absolute equality of traction was required in order to accomplish this successfully The hot water employed was of a temperature of from 120 to 130 Dr Keen said that he regretted that pre degrees vious to the operation he had not administered a dose of morphia, as recommended by Horsely, for the purpose of diminishing the supply of blood to the parts In another case he would also be inclined to give ergot and perhaps antipyrin, and he preferred to use cocaine locally if occasion required Such agents he thought afforded a much better chance of controlling hæmorrhage in this class of cases than the mechanical means commonly resorted to During the operation he did not use the spray, but made use of all the other ordinary antiseptic precautions

The patient did perfectly well for the first few nours after the operation On the third day marked symptoms of pressure showed themselves, and this was ascertained to be due to the presence of a large clot, of greater size than the tumor had been This was removed by careful washing, and all went well for ten days, when pressure symptoms were again There was also severe diarrhæa, and a observed Under the circum temperature of 104½ degrees stances the presence of pus was suspected, and the wound was accordingly reopened Afterwards Dr Keen regretted having done this, as it resulted in hernia cerebri, and he became convinced that the unfavorable symptoms noted were largely due to the Later the patient had two or three other attacks of diarrhoea (less severe than the first), which were also accompanied with more or less rise in tem The hernia remained for a considerable

effect upon the system, the diarrhoea in Dr Keen's the healing was going on the surface remained considerably elevated, but when the cicatrizing process had been completed it suddenly became concave, instead of convex, and had so continued ever since Photographs were exhibited of the hernia cerebri binated bones and of the wound when healed

In conclusion, he spoke of the importance of completely shaving the head, for purposes of examination, of every patient in whose case there was any braintrouble likely to call for operation, and said that in a case of epilepsy which had recently been referred to sary to produce a suitable psychical impression upon him two scars were discovered when the scalp had the patient been shaved

At the meeting of the Section on Laryngology and Rhinology of the Academy of Medicine, in March, a discussion was announced on "Therapeutics Applied to the Upper Air Passages, with special reference to the use of Patent Nostrums and Proprietary Medicines by the Laity and Profession" It was to be led off by a paper by Dr F A Castle, on "Facts and Fallacies in the Use of Nostrums," disappointment of the members of the Section, contented himself with mere general observations on reference to the special preparations employed in agents was sometimes required diseases of the nose, throat and chest, the discussion took a different turn from that contemplated, and the principal paper of the evening

In the course of his paper Dr Castle very truly ries or other organs remarked that so far as the relations of the profes was concerned, the less regular physicians had to do with remedies about which they knew nothing, the better would it be for themselves and patients So far as the laity was concerned, any repressing power were but few nostrums their use had been too much encouraged by certain members of the regular profession, and at the present time the public were apt to believe that physicians were prompted by a feeling of jealousy in condemning such remedies, so that there must be some good in them or they would not be so ready to disparage them

The Chairman of the Section, Dr O B Douglas, presented a case of complete aphonia, in which seventeen, apparently in robust health, and in whom death on that day at 2 45 PM

was drained by bichloride gauze for eight weeks, but During the last four months there had been gradthere was no evidence of its producing any toxic ually increasing aphonia, and this was now complete On making an examination of the patient Dr Dougopinion not being attributable to this cause While las found that the tonsils were enlarged, that there was a hypertrophied condition of the inferior turbinated bodies He had removed the tonsils, without any effect upon the aphonia, but had not as yet operated upon the hypertrophied ends of the tur-

Dr W B Jarvis thought that the case was perhaps one of functional or hysterical aphonia said he had met with three or four such patients, and that in this class of cases the prognosis was always good, as, in order to effect a cure, it was only neces-

Dr Beverley Robinson said that personally he should be somewhat loath to class what seemed to him paralysis following diphtheria, as a functional affection He had occasionally met with more or less aphonia, or rather dysphonia, as a result of diphtheria It was, however, usually associated with some difficulty of deglutition, which, according to Dr Douglas' account, was not present in this in-The aphonia here he believed to be due to stance but, owing to the fact that Dr Castle, much to the an impaired state of the nerves supplying the vocal apparatus, although we might not be able to distinguish the exact condition present. In such cases a patent and proprietary medicines, with scarcely along course of treatment with electricity and other

Dr Castle said that possibly some light might be thrown on this case by a paper published by Dr was confined to the legitimate means and methods Echeverria, about twelve years ago, in the New York employed by the regular profession in diseases of Medical Journal, and also by one that had appeared the upper au-passages, the ground gone over being later in the "Transactions of the American Gynecofor the most part much the same as in the discussion logical Society," in which similar conditions were before the Academy last year on the modern treat-recorded as being due to reflex paralysis, and as bement of these affections, when Dr Bosworth read ing relieved by making a decided impression upon the mind or by local treatment directed to the ova-

Dr Andrew H Smith then presented a specimen sion to patent nostrums and proprietary medicines of a new preparation of cocaine, which he had found of service for local use in the throat This was the sacchar mate of cocame, in which the sweetness of the saccharın disguised the disagreeable taste of the cocame, which made it especially applicable in the that the profession might once have possessed was case of children He said it was 25 per cent less now entirely gone. One trouble was that when there strong than the hydrochlorate of cocaine, and a 5 per cent solution of it would, therefore, be equal in strength to a 4 per cent solution of the latter

CORNELIUS REA AGNEW

After the publication of the editorial page conthe diagnosis was involved in considerable ob- taining the notice of the illness of Dr Agnew the The patient was a young woman of afternoon papers of last Wednesday announced his no local condition could be found to account for health until a little more than a week before his the loss of voice About a year ago she had an at- death On Monday, April 9, he was in consultation tack of diphtheria, and previous to this there was at in the case of the late Mr Conkling, and at that one time some enlargement of the thyroid gland time was not feeling well. When he returned to his

door recreation and protection from invalidism? Cannot the same skill contrive new designs for the upper and most salutary stories of our dwellings, playing 100ms and sunning rooms, especially adapted for the winter season, but so eleverly fashioned that too intense torrid beams can be excluded in summer? The "solvinum of the New York Hospital, made attractive with its plants, birds, and aquaria, is a potent ally of therapeuties in restoring the convolescents, and at the Hospital for the Relief of the Ruptured and Crippled, the contagious sparkle of the sunbe un is found shining in the eyes and lives of the young pa tients. Physicians not infrequently have occasion to observe the arrangements and conditions of the upper floors in our first class private dwellings, for if a servant is sick, the family physician may be summoned to attend. The conditions may not be abso lutely permicious, but the space on these precious stories might be utilized in a much more healthful and attractive way he ited and vitiated air from the lower part of the house rises to the top floor, with perhaps slight provision for its exit, and here are found servants' and storage rooms and also often a dark closet with precipitous ladder, leading to the scuttle, rarely en tered and ascended, except by workmen to repair the roof Apartments for domestics have to be provided for, but quarters for trunks and unused articles rather than occupying choice space, could be centralized in the building, be lighted from above, or religated to some special annex in the yard -Medical Record, April 21, 1888

THE MICHIGAN STATE MEDICAL SOCIETY will hold its twenty third annual meeting in Detroit, Thursday and Friday, June 14th and 15th, 1888, beginning at 10 o'clock in the morn ing Spicious halls for general Session and Sectional work have been engaged in the new and elegant Cowie building, which is centrally located, easy of access, and opposite the Public Li At the last annual meeting the following amendment to the Constitution was adopted
"To establish three sections in order to facilitate professional

and scientific work, viz A Section on Medicine

A Section on Surgery

A Section on Midwifery and Gynecology

These sections shall hold their meetings in the afternoon, and the Society shall meet in general session in the forenoon of each

day "

Members desiring to read papers are requested to communi cate with the Secretary of the Section in which he desires his paper to appear, sending him the title and abstract of the same not later than June 1st. This is necessary in order to group the not later than June 1st papers appropriately and secure their proper discussion names of the Secretaries are as follows

Practice of Medicine, H B Hemenway, Kalamizoo Surgery, F W Mann, 250 W Fort St, Detroit Obstetrics and Gynecology, C Henri Leonard, 18 John R

St, Detroit

and went to Europe for special study in order to fulfill the conditions of the appointment first to Dublin, he became a resident pupil of the p Lying-in Asylum, and attended the eye and ear clinics of Mr, afterwards Sir William Wilde Dublin he went to London, to be with Bowmann and Official List of Changes of Stations and Duties Of Medical Officers of The U S Marine HOS OF MEDICAL OFFICERS OF THE U S MARINE HOS OF MEDICAL OFFICERS OF THE TWO WEEKS ENDING APRIL 21 1888 Velpean and Ricord, in the eye and ear clinics of Surgeon W H H Hutton, to proceed to Biloxi, Miss, on special duty April 21, 1888

MEDICAL WOMEN IN LONDON —A Miss Macdonald, having completed the recognized course of a medical school, has been dmitted by the Society of Apothecaries to examination for its liploma in medicine, surgery and midwifery

NOTES ON A FEW CASES IN WHICH THE ELEC-TRO-STATIC REMEDY WAS USED

Read before the Medical Society of the District of Columbia, February 1, 1888

> BY IRVING C ROSSE, M D, OF WASHINGTON D C.

My apology for naming static electricity in connection with the desultory remarks about to follow, must be the fact that the use of Franklinism in neurological therapeutics is comparatively recent, and that the physicians of Washington have not given the failure subject the attention it merits The simple reason more perfected machines has yet brought the matter before this body in such a manner as to elicit dis-

More than one medical man has said to me "Oh, I don't believe in electricity, I have tried it and can get no results" Further conversation revealed the fact that these skeptics had, to say the least, but differential calorimeter, and static electricity was to to the delectation or benefit of such a grade of deinterpretation of any medical fact, and it would be an insult to your intelligence to presume for a moment that any of you are so lacking in this regard, or that most of you are unfamiliar with the current literature of static electricity, more particularly as it has appeared in the journals for the last few years

My attention was first directed to this subject while pursuing a neurological course under the tui tion of Prof William A Hammond, when my friend Dr W J Morton, of New York, kindly gave me the benefit of an experience that was subsequently extended at the Post-Graduate Medical School Morton's admirable paper, read before the Academy of Medicine not long ago, is a great advance and development of the ideas of Franklin, and it did much to give vogue and therapeutical standing to this valuable agent Since then numerous writers and experto bring this form of electricity into disrepute—has and vesical and rectal disturbance now been so far improved and perfected as to secure

the maximum of tension and quantity, and at the same time the machines are so little hygroscopic as to work in all conditions of the atmosphere As I do not wish to occupy time and attention by further reference to details that are doubtless familiar to you, I shall confine myself to the brief mention of a few cases selected at random from a considerable number that I have treated, and if the comments thereon should appear rambling and disconnected, I must anticipate the criticism with the excuse that I have merely noted the thoughts that were uppermost and most engrossed my attention at the time the cases were under observation

Those mentioned in the first group are recitals of It may not be pleasant to record one's failures, but in the interest of truth and wisdom it must for this neglect is that no one skilled in the use of the be done, since the interpretation of a negative is often more instructive than that of a positive result

In September, 1885, there came under my notice a man of 38, who during five years had been treated for rheumatism, impaired eyesight, and general de-The symptoms were first noticed in China, where his tabetic walk often subjected him to the imputation of being drunk, though perfectly sober He cloudy notions of the difference between a galvanic complained of sharp darting pains, from the small of and a faradic battery, they had never heard of a his back to the soles of his feet, in which were sharp tingling pains and a feeling as if the toes were too them a sealed book My remarks may not accrue large for his shoes, of a sense of tightness around the waist, of dizziness, of trouble with his throat, velopment, for it is one not likely to make a correct and occasional spells of vomiting The patient had a history of syphilis, and his alcoholic and nicotinic habits were bad

There were no objective manifestations of rheumatism, but the patient was unable, on closing his eyes, to touch designated points of his body with the index finger, or to stand or walk without staggering, and the knee jerk was absent In brief, he showed the typical sensory, motor, and cerebroscopic signs of that form of dorsal tabes generally known as progressive locomotor ataxy

Treatment availed but little in this case, and the patient went on from bad to worse

The same may be said of a case of antero lateral sclerosis which was left under my care in August, 1886, for a month, during the temporary absence of another physician In this case the symptoms, both sensory and motor, were most apparent in the lower imenters have taken up static electricity The style extremities, being manifested by exaggeration of the of machine-tormerly so defective in construction as patellar tendon reflex, the presence of ankle clonus,

Negative results were also obtained in the case of

a woman of middle age, who consulted me in Febrnary, 1887, and who for several years had suffered from the effects of an obliteration of one of the cerebral arteries, one of the results being left hemiplegia

Another patient, past the meridian of life rather from physiological than chronological cause, and suffering from impotency, was taken in hand on February 23, 1887 materially improved

On October 1, 1886, I began the use of static electricity in a case of ovarian insanity After a month's treatment I was obliged to admit to the patient's standing at only 60° friends that I could do her no good

married woman, who came under my care in December, 1886, I also used the static current She ultimately recovered, but I attribute the cure rather to tended by serious results in a more southern latitude the means taken to improve her general health and to removal of the constipation and menstrual irregularity from which she suffered

For fear that further recitals of the foregoing character may convey the impression that failure is coextensive with success in the matter under consideration, I will now mention a few other cases in which the results of treatment were of a happier nature

In March, 1887, I was consulted by a delicate woman, the mother of a family period of the menopause, but complained much of fort her general health and of insomnia Her principal trouble was a disturbance of the thermogenic function, the sensation of cold in the extremities being so severe at night that she was obliged to resort to various artificial means in order to bring about sleep

This sensation in reality was not accompanied by loss of heat, the symptom being purely subjective, and one of evaggerated sensibility to cold owing to inability on the part of the nervous system to make an instinctive comparison between two mesological conditions, or, in other words, a disturbance of the Even in a state of health an thermic sensibility mability to make a correct comparison of this kind, as we know, gives rise to the incongruity existing between heat and cold as experienced by the human body and the actual temperature as revealed by the Travelers and experimenters having thermometer often noticed that these sensations are not absolute, it is proposed to differentiate the phenomena as physical cold and physiological cold, the former indicating that revealed by the thermometer or calorimeter, the state of the organism and other individual conditions latter that of a purely subjective nature and not indicated by instruments

If not straying too far away from my subject, I shall ask your indulgence to relate some personal experiences in which these relative sensations were observed by me in different latitudes I have seen the decks covered with snow and hail, pernicious fewer or the lowering of temperature durvoyage to the Siberian Arctic in the middle of July, that was accompanied by a bitter cold wind that pen- ing the sensation of heat that accompanies the reacetrated one's winter clothing, and a few days after- tive stage of a cold bath. On the other hand, in wards, when the thermometer registered but 45 F, locomotor ataxy with greatly diminished sensibility, the heat was extremely uncomfortable the latter part of June at St Michael's, Alaska, the sun was almost overpowering, although the thermom- | 1011 Sciences

eter registered but 60° F In striking opposition to this is the piercing cold that I have experienced on being exposed to a "Levanter" in the vicinity of the Mediterranean Straits off the coast of Morocco, and to Texas northers, during the continuance of which the cold is felt more acutely than it would be in the Arctic regions This phenomenon is also noticed After a month's treatment he was not among the Andes in Peru A disagreeable sensation of cold not indicated by the thermometer is one of the experiences of travelers in that part of the world, the cold being keen and penetrating with the mercury

Numerous instances might be cited in which Arc In a case of religious melancholia in a young un- tic travelers have noted such relative sensations, as well as the impunity with which they have exposed themselves to a low temperature that would be at After supporting cold of — 47° F the sensation of — 29° or 24° is an agreeable one Dr Hayes relates that in Greenland he went swimming in a pool of water on the top of an iceberg. The captain of a New Bedford whaler has often gone swimming off the coast of Siberia On one of the physiologically warm days that sometimes occur in high latitudes, I plunged in the icy waters of Kotzebue Sound, and after the momentary sideration that accompanied the She had passed the shock had passed away there was no great discom The swim was, moreover, followed by a pleas urable reaction

The physiological action of cold upon the nervous system deserves a more prominent place, since it is through the nervous system that results the instinct ive comparison of heat and cold Moreover, sensa tion as regards cold is not always accompanied by That it may be purely subjective, not loss of heat only in disease but in health, it is the object of this digression to set forth "

The second case coming under my observation in which there was a more marked subjective sensation of cold unattended by any objective manifestation, was that of a neurasthenic theological student who complained of a feeling of icy coldness in the right hand and lower half of arm Why such a sensation should exist without the appreciable subtraction of In the human species heat I am at a loss to explain the sensation caused by the absence, loss, or diminu tion of the mode of motion known as heat does not follow the oscillations of the exterior temperature as a grapevine or a marmot, but is dependent upon the A common instance of this condition is seen in the cold stage of intermittent fever, which shows an ele vation of temperature much above the normal, not only during but preceding the appearance of the The sensation of cold in other cases is not On a polar produced, in spite of real and progressive cooling of the body, such as is noticeable in the algid attack of Again, in patients have been known to be unable to wash in

I See writer's article on Cold in the Reference Handbook of it- Med

cold water without experiencing the keenest pain, a piece of ice placed on the skin of the trunk causes or cirrhosis of the liver and chronic nephritis subjective chilliness following doses of aconitia abolishment of the sense of cold occurs in some swimmers accustomed to passing long hours in the indirect or quite accessory fact water, and the mind also makes the body less sentions, or derangement religious devotees, in delicate women who, through vanity, forget their habitual sensibility to cold and expose the neck and shoulders to freezing temperatures, and in the insane, who often go stark naked in winter without being affected by the cold

I shall leave it to others to trace the relativity of the foregoing remarks with the cases in question, and will state that the perverted thermic sensations were the electro static remedy, the immediate effect of which was to cause increased sensation of heat and slight diaphoresis when applied by insulation and

sparks

Other cases in which static electricity acts with a promptness not procurable by any other remedy are those of myalgia, subacute or chronic rheumatism, gout, and inflammation of the neurlemma of the sciatic nerve I have in mind numerous cases of such that she has nothing to complain of what are popularly known as stiff neck, crick in the malady to cold, the morbific influence of which, by the way, is greatly exaggerated not only by the laity but by physicians themselves, who attribute so many almost be to repeat the nosological table Many this agent in reality takes no part or is only an ac-Many old and even some contemporary authors rank under the head of maladies from cold such general diathetic diseases as gout and rheumatism, and speak of the latter as a prominent disease of cold countries, when, as a matter of fact, rheumatism in India and Egypt, but not in the polar regions nearly all over the globe, show the truth of this as- discharged cured Take a single instance At Nova Scotia a proportion of 30 cases of rheumatism to the 1,000 the Cape of Good Hope there were 57 in the 1,000 On two successive voyages to the Siberian Arctic I have not met with a single case of bronchitis or rheumatism or even a common cold except among Eswell as white men During the last tew years circumpolar parties have escaped all sickness, and difficulty in evacuating the contents of his bladder sledging expeditions have been exposed to continuous cold of -50° with no great inconvenience

but to speak of it as a pathogenic cause is just as and subsequent discomfort Sometimes in myelitis absurd as to say that cold causes typhus and scurvy, a disagreeable burning sensation I know of a case cause of disease or of death cold no doubt brings us of neuritis in which the application of hot water pro- into the presence of a great number of affections, duced a sensation of cold Most of us know of the yet we may eliminate many diseases, the origin of An which is improperly attributed to the effects of cold upon the organism, this agent in truth being only an

A circumstance that sometimes arises in connecsible, as in the case of ecstatic thoughts, lively emo-tion with the application of electricity is one con-Familiar instances occur in cerning the doubts and fears of patients with heart This feeling seems to be inspired through trouble the popular mistake that they are to be shocked, or have a thunderbolt hurled at them An illustrative observation is that of a matronly person who consulted me in August, 1886 She was anæmic and neurasthenic, and had the cardiac symptoms usual to such conditions A short stay at a Southern seaside resort had proved of no benefit, and she had promptly relieved by no other treatment than that of been particularly counseled by her physician to avoid sea-bathing and electricity After two weeks' treatment I allowed my patient to go to Atlantic City, with instructions to take a dip in the surf of a minute only at the first bath, and gradually prolong the time a few minutes each day My directions being faithfully carried out, inured to the ultimate benefit of the patient, who stated on her return that she had not felt so well for years At present her health is

Every physician knows how tedious and difficult, shoulder, and lumbago, all of which promptly disap- and barren in results, is the treatment of copodycinpeared after one or more applications The patients esia—an affection that appears to be more observed in all these instances attributed the origin of their of late than formerly. We now find it as one of the common neural disorders in artisans of various classes, such as the hæphestic palsy of boiler-makers, the "loss of grip" of telegraph operators, and the ailments to this cause that to enumerate them would affection known as "Charlie horse" among professional base-ball players I have also lately seen a morbid conditions are attributed to cold in which case in a woman whose occupation for a number of years has been counting greenbacks in the Treasury Department Another case worthy of mention is one in which the disorder was most apparent in the muscles concerned in writing It occurred in an adult male whose vocation necessitated a sedentary and monotonous life The treatment, begun January belongs rather to temperate climates, being met with 23, consisted of daily applications of electricity by insulation and sparks, relaxation from work, and a The returns of the English Army, which is stationed Sunday ramble in the country On March 4 he was

I now finally call your attention to a case of paraplegia that I have treated with the happiest result occurred, while under the more temperate climate of It is that of a man of 51, who was brought to my office in a rolling chair in May, 1886 He stated that he had been paralyzed from the small of his back downwards for more than a year, that formerly he suffered from severe pains in the limbs, but at Limo-who, by the way, appear not to stand cold so present slept well and enjoyed a good appetite, although suffering from constipation and occasional

The patient's general history was good, but having been a soldier in the late "unpleasantness," he had That cold does occasionally provoke an attack of an attack of dengue fever in 1863, and suffered subone of the forementioned diseases may be admitted, sequent privation as a prisoner of war, which left him with what was supposed to be sciatica and rheumatism

On examination I could find no outward, visible or tangible manifestation of rheumatism, and no appreciable cardiac lesion, the heart's action being normal and but slightly excited

I immediately applied the actual cautery to the lower dorsal spine, and continued the treatment by drawing long sparks from the back and paralyzed Rapid improvement took place tient now walks without lameness and is, in fact, well He has been good enough to come here this evening, and I shall show him to you presently

If I chose to incur additional risk of being tedious, these remarks might be prolonged by further reference to considerations of a therapeutic, physiological and mechanical character, but this is not the time or place for a more extended exposition however, add that former objections to statical electricity have been done away with, owing to the construction of superior machines in which the tension and quantity are within the control of the operator The one that I use consists of six 26 inch plates driven by a Tuerk water motor It does all the work of the best Faradic machines, and is more serviceable than ordinary galvanism Removal of the patient's clothing is unnecessary, and the current may be so regulated as to range from an agreeable sensation or an almost imperceptible tingle up to extrenie muscular contraction

The manner of applying is by insulation, sparks, shocks, and the induced current The patient being placed upon a tabaret and electrified, a difference of potential takes place, his body being raised one potential higher than that of the earth, which is zero By means of an umbrella electrode an equalization of potentials is provoked, giving the effect of spray or electric wind, and if an electrode be approached or placed in contact with the patient's body, a more vigorous equalization takes place, manifesting itself in the form of sparks, which become more violent as the patient's potential is increased The application of the statical induction current to the human body with physiological results is among the latest novelties, and the nerve and muscle reactions produced thereby are now admitted by all physicians and elec-It is difficult to tell just what the trical experts ultimate molecular disturbance is that takes place in the cure of the myriad manifestations of hysteria, nervous exhaustion and hyperæsthesia when statical Every physician knows how comelectricity is used mon and how perplexing such cases are But if, at the right moment, the proper agent is applied, we get a result that forces upon us the conviction that static electricity has therapeutic effects peculiarly its own, and it is no figure of speech to say that the lightning which Franklin drew down from the heavens has become the physician's most useful handmaid 1732 II St, N W

MERCURY IN BLOCK-TIN -A large mortality among workmen in a tin smelting place in Nuremberg caused an investiga tion, which showed that the block tin contained 3 per cent of mercury

SOME POINTS IN THE MANAGEMENT OF TYPHOID FEVER

Read to the Thirty first Annual Meeting of the Missouri State Med Association, Kansas City, Mo , April 19, 1888

BY I N LOVE, MD. ST LOUIS, MO

I shall not fatigue this body with a labored paper on typhoid fever, giving in detail its history, etiology, clinical characteristics, etc., for being, as you are, busy workers in the profession, you are in no need of an exhaustive and exhausting elaboration of the I feel safe in taking it for granted that you subject are all familiar with the literature

Through the researches of Koch, Eberth, Meyer, Friedlander, Gaffky, and later of Frankel and Simonds, the typhoid bacillus has become an entity that must not (and cannot safely) be lost sight of during the progress of a case and after its termina

The points I propose to present are the result of observations made in hospital and private practice during the past sixteen years, some of them being more particularly emphasized during a series of cases occurring within the past six months

I think we are too much inclined to be on the lookout for classical representations of this disease, I have had a number that I as of many others placidly considered simple continued fever, temperature not ranging higher than from 101° to 103°, no rose spots, no tympanites, no special evidence of intestinal irritation, nothing leading me to suspect typhoid fever until suddenly aroused to an appreciation of the fact by dangerous and repeated hæmor rhages from the bowel, and in one instance (in 1877) the bleeding continued until it proved fatal occurred in a boy of six and was convincing proof to me of the fallaciousness of the idea that formerly obtained, that young children were not susceptible In this connection, I recall the cirto the malady cumstance of a consultation visit made to a young man who had been ailing for some weeks, though he was up and about until a few minutes before the family physician was summoned and found him suffering great agony An investigation developed an intestinal perforation, which caused death in a short The clinical history and the post-mortem rev elations evidenced an illustration of "walking typhoid

We know that we frequently have scarlet fever so mild as to be entirely overlooked, until the attention is aroused by grave nephritic trouble, and so in all diseases, the artistically perfect specimen is the exception and not the rule

It has, no doubt, been the observation of all, that the course and complications of typhoid fever are as varied as the individual victims, but it was not recognized till lately (by Griesinger) that numerous light and rudimentary attacks (typhus levissimus) be longed to typhoid fever at all, they used to have all sorts of names applied to them, as suggested by Strumpel, the favorite being "gastric fever

The diagnosis is of course difficult in proportion to the scanty development of typhoid symptoms, and it is best established by demonstrating an etio logical relation between them and others that are plainly typhoid fever Apropos to this mild class of cases, I remember a case under my observation last December, a five year old boy, in a family where three other cases developed, (one fatal) of a violent character, the child was sick only about twenty one days, and under ordinary circumstances his case would have been diagnosticated simple continued, or remittent fever

As the individual manifestations may vary, so, too, do entire epidemics One season the type is vio During the past six or eight lent, and another mild months I have had under my care an unusual number of typhoid fevers, and these, together with nearly all that I have observed for two or three years past, have been much more favorable in their results, due possibly more to the mildness of the infection than to the character of the treatment, though I am persuaded that the latter had something to do with the favorable showing

Since about July 21, 1887, I have kept a record of 36 cases, and of that number 2 died-of those one really died of acute mania superinduced during the period of convalescence by sudden shock and grave domestic sorrow, she being a nursing mother, of intensely neurotic temperament—the other was a delicate, over-worked girl of 16 years, with tubercular diathesis, and sick for ten days before a physician was called, she having been six days and nights without sleep, and in fact died from meningitis as a com-

plication There are those who believe that, by active interference, typhoid fever may be aborted, though I am not ready to endorse this proposition, I am sure it may be modified and abreviated. I cite briefly the following as an illustration July 21, 1887, J T C, taken with violent vomiting and intense ab dominal pain, examination revealed a lusty, plethoric youth of 18, red tongue heavily coated, pulse full and 140 a minute, temperature 105 5°, acute tenderness over abdomen, with constipation Remedies were ordered for opening the bowels, soothing the stomach, and reducing temperature lapse of twelve hours an action of the bowels had been secured, but no improvement of the general conditions At once ordered 1 gr of calomel every hour, and the application of ten leeches over stom ach and the ileo cæcal region, at point of greatest tenderness, followed by hot fomentations leeches abstracted five or six ounces of blood, giving marked relief, at the end of ten hours the ro grains of calomel had produced active purgation, and this, together with the local abstraction of blood, had mitigated all the symptoms, the temperature was down to 102°, the pain and tenderness almost gone, no nausea, no vomiting The patient was in every way more comfortable, and jogged along for four weeks with a mild form of typhoid fever instead of dying during the first five or ten days, as I believe he would have done had a temporizing course been

it upon the antiseptic plan, aiding elimination by stimulating the excretory organs, sustaining the strength by diffuse stimulation at the proper time, and the furnishment of an abundance of nutrition in

a form for prompt assimilation

Since the introduction of antipyrin, the dangers of high temperature are much less than formerly, as we can certainly control that feature, however, I favor the very careful administration of the drug, until full opportunity is given for the ascertainment of sus-There have been recorded already a ceptibility number of unfavorable results, even death itself, owing to some peculiar idiosyncracy I prefer small doses (5-10 grains to adults) at short intervals, keeping up the effect continuously, rather than large doses, and sudden and excessive falls of temperature I think a sudden reduction, no matter how obtained, is not so likely to be maintained, sudden reductions are depressing, and endanger heart-failure, and prompt While antipyrin is of great value return elevation as a febrifuge and tranquilizer of the nervous system, and at the same time diaphoretic, I feel that in the cooling bath we have an agent equally or even more By cooling bath I do not mean the sudvaluable den immersion in cold water, that is uncalled for, undestrable, and brutal The temperature of the water at first should be about the same as that of the patient, and may be gradually reduced down to 85° The bath may be prolonged five or ten I doubt not you have all seen, as I have, patients wildly delirious, go calmly to sleep during the progress of the bathing The advantages of the bath, I take it, are

I The reduction of temperature is accomplished gradually and comfortably to the patient in accordance with nature's plan of putting out fire by water

2 The water acts primarily as a soother of the peripheral nerves, and secondarily calms the disturbed nerve centres

3 It stimulates the secretory glands, allays thirst by being directly absorbed into the heated and dry tissues, hungering and eager for drink, encourages diaphoresis as well as diuresis

4 It influences favorably the respiratory organs by energizing inspiration, and thus aids in the securement of expectoration, and as a result, bronchial

complications are less frequent

5 The hygienic effect upon the skin is of great value, removing, as it does, the foul-smelling products of the sweat and sebaceous glands, aiding in the procurement of strength and elasticity to the cu taneous and adjacent tissues, conditions antagonistic to bed sores

Of course it goes without saying that the bath should be administered with due regard to the comfort of the patient, drafts should be avoided, and immediately following the bath a thorough drying and brisk rubbing should be instituted, and warm covering, with hot water bag to the feet if need be, and a nice cup of hot broth or a little wine or toddy would be in order

I think antipyrin and bathing or sponging may be Recognizing the disease as an infectious one de- used conjointly to good advantage. As an antipypendant upon a specific virus, it behooves us to treat retic, quinine should be ruled out altogether, in doses sufficiently large to reduce temperature it is demoralizing to the nervous system as well as to the digestive tract, and when we recall the fact that the sheet-anchor of hope in typhoid fever consists in good digestion and nutrition, and tranquil nerves, we can see that the objection to quinine is well founded If well defined malaria presents itself, as a complication, an antiperiodic is of course indicated, and quinine should be given, but very carefully

In this connection permit me to express the opinion that the so called typho-malarial fever of Woodward is a misnomer, being probably nothing more than a modified expression of typhoid fever plus ma-Certainly the coining of new names for every modification of a disease is confusing, and the prac-

tice should receive no encouragement

What has been said above need not be interpreted as an objection to the use of tonic doses of quinine during the period of convalescence, but as against the administration of quinine to an unadulterated case of typhoid fever In the earlier, middle, or later stages of the disease, there may come a time when the necessity of the situation demands the removal of the patient from one section of the country to another, I desire to place myself on record as being strong in the opinion that the danger of removing a person seriously sick has been much overrated, that with due care and a guarding against the chilling of the surfaces, and the interruption of the proper other wasting disease, should not be permitted to amount of sleep, typhoid fever and other dangerous cases may be safely transported hundreds of miles I have a record of four cases successfully and advantageously removed from one hundred to one thousand miles on sleeping cars, which justify this conclusion

As the administration of the calomel purge in the beginning is satisfactory, so the renewal of 1/8 grain doses every other day, to the number of a half dozen, is an advantage in the direction of keeping the bowels open, as well as serving as an intestinal anti-If an additional aid is required to evacuate the bowels, an enema of a teaspoonful of glycerin En passant, I desire to emphasize will be efficient the value of one dram injections of warm glycerin (as suggested by Anacker) into the bowel as a ready means of securing a prompt evacuation

Permit me to emphasize the most salient points I

desire to make by summarizing as follows

1 Typhoid fever varies in intensity, severity, and length of attack, as do other infectious diseases, and while it has not yet been established that any of this class can be aborted, yet typhoid, with all the others, may be mitigated and abreviated, and unfortunate complications and sequelæ prevented

To the securement of this end I think that which is of paramount importance, is management, rather than medication, though there are many dangers that can only be tided over by the prompt and proper

exhibition of drugs

The administration of remedies that are antiseptic and stimulate the excretory organs is important, and for this purpose small doses (1/5 grain) of bichloride, or the mild chloride (1/8 to 1/4 grain), as often as is necessary to produce an effect, is of value

4 Nutrition, by the administration of food in a blanched

form for prompt assimilation, is a necessity, and to this end the diet should be limited to pentonized milk, beef peptones (Rose's), bovinine (Bush), etc, bearing in mind that the stereotyped home made beef tea is of no more value as a food than a weak toddy, being a mild stimulant, and nothing more

5 Freedom from pain, tranquility, and perfect rest should be insisted upon, and remembering that this disease of all others has a wrecking effect upon the nervous system (it having been called by some German writers fieber nervose, or nervous fever), we should see to it that our patient obtains not less than twelve to sixteen hours sleep out of the twenty-four, and the remainder of the time be saved from the meddling, mis-directed kindness of over zealous friends

6 For the obtaining of sleep and the relief of nervousness, the administration of antipyrin, chloral, paraldehyde, urethan, and the bromides, is preferable to opiates, though occasionally the latter are de manded

7 When the conditions surrounding a patient are unfavorable, and a change is desirable, even to a dis tant point, the removal, under proper precautions against chilling and unrest, may be permitted or even preferred, the danger of the same not being as great as it is generally considered to be

8 As a rule, a patient with typhoid fever, or any have bed-sores, they are an expression of starved tissue and neglected skin, and are preventable, the means for their prevention being proper nutrition

and bathing

Read before the Philadelphia County Medical Society, April '11, 1888

BY J M BARTON, MD, OF PHILADELPHIA

(Concluded from page 519)

Remoral of Case 8 —Large fibroma of the uterus uterus and ovaries by abdominal section, death on the fourth day —Mrs S, at 32 years, a patient of Drs Skilling and MacOscar, of this city, had been ill for two years, and had been bleeding for sixteen months During the last six months she had never been free from bleeding more than a week at any one time, and for the last ten weeks, she stated, she had bled daily from two to sixteen ounces, the latter amount only after exertion, this confined her constantly to her bed or lounge She had a good appetite, good digestion, and was well nourished though exceedingly

The diagnosis of large submucous fibroid was made when I first saw her, six months before, and full doses of ergot had been taken constantly, during all that time, without effect

At the time of operation, the enlarged uterus

regular in its outline and quite movable

On December 9, 1886, with the assistance of Drs J C Da Costa, Porter, Skilling and Fisher, the operation was performed I made a long median incision from the pubes to some inches above the umbilicus, there were no adhesions, the uterus was readily elevated and a short "Thomas" clamp placed upon its neck

After the broad ligaments had been tied and divided, the body of the uterus was removed about an

inch above the clamp

As the abdomen was quite deep and its walls quite thick, it was utterly impossible to bring the pedicle outside, a strong silk ligature was passed through the neck, below the clamp, and tied on each side

When the clamp was removed the parts above the ligature were found to consist of uterine wall, enclosing a section of the tumor, on removing the latter the uterme walls required but little attention to make very perfect flaps, they came together without tension and were held in position, with their peritoneal surfaces in close contact, by a continuous catgut suture The toilette of the peritoneum was carefully made and the abdomen closed

The uterus removed was about seven inches in diameter and contained a submucous fibroid, attached to nearly the entire inner wall, in size and attachments it is nearly identical with one, also removed by abdominal section, which I presented to reduced

this Society some years ago

The patient rallied well from the shock of the operation, and by the following day was quite cheerful, with good pulse and temperature, but she had secreted very little urme On the third day some regurgitation of bloody fluid occurred from the stomach, the temperature increased and the urine There was no abdominal tenderwas still scanty ness or distention By evening delinium occurred and death ensued the following day The nurse assured me that only three ounces of urine had been secreted during the four days

On post mortem examination there were no evibowel lying in contact with the uterine stump ureters and the bladder were uninjured, no bleeding had occurred, the uterine stump had remained well The uterine wound was quite clean, no decomposing or offensive fluids were present small portions of the very edges of the flaps looked Some as though they were beginning to slough, though very much less than I feared would happen when I dominal wound being kept closed by sponges

Case 9 - Stricture of the ileo-cacal value, chronic obstruction of the bowels Laparotomy, digital dila- patient was kept slightly under the influence of mor-

Pennsylvania, was admitted to the Jefferson Medical College Hospital in May 1887 She had been in good health until the birth of a child in May, 1886 Since then she had had repeated and increasing attacks of obstruction of the bowels, during which reached to the umbilicus, was perfectly smooth and there were entire loss of appetite, obstinate constipation, constant vomiting, great abdominal pain, and tenesmus, similar, she stated, to labor pains Lately there had appeared at these times a tumor in the lower part of the abdomen about the size of the adult fist, these attacks occurred about once a month, and as they lasted three weeks she had but a short interval of comfort between them When free from the attack, she stated that the tumor returned to the right iliac fossa, where she thought she could distinguish it by palpation and its tenderness on pressure I was unable, at this time, however, to recognize any unusual mass in this situation

I kept her under observation until an attack should On May 21, an attack began, and her sufferings fully verified her statements The tumor appeared between the umbilicus and the pubes, it was about the size, and very nearly the shape, of the

adult kidney

On May 2, 1887, in the presence of Professors Gross, Parvin, Brinton, and several other physicians, I made a median incision about four inches in length and exposed the mass, it proved to be an intussusception of the ileum into the colon with a thickened and contracted ileo-cæcal valve forming the apex of the intussusceptum

There were slight adhesions between the contiguous layers of peritoneum covering the bowel, which were readily broken up, and the intussusception

On examining the ileo-cæcal valve by a finger invaginating a fold of the colon, it was found to be hard and contracted A longitudinal incision was made in the colon about one inch in length, and three from the valve, through which I passed my finger and found the valve contracted to about the size of a crow's quill (one-fifth of an inch) slightly thickened, quite hard, white in color, and did not bleed during the examination or subsequent manipulations It was considered by all present to be a case of cicatricial stenosis due to some previous inflammatory action, and certainly not malignant It was dilated, with considerable difficulty, by the dences of peritonitis except slight adhesions of the introduction of the little finger, the index finger was The then carried through its entire length

The wound in the bowel was closed by a continuous silk suture, including only the mucous membrane, the peritoneal mucous coats were brought in apposition by a continuous silk Lembert suture

All the operative procedures upon the bowel were performed outside of the abdominal cavity, the abligated the neck I think, in future, I shall content portion of bowel outside was thoroughly washed and myself with ligating the arteries of supply and omit returned, the abdominal wound was closed in the usual manner

tation of the stricture, recovery—Mrs Ann H, et. phine for a few days, and on a milk and broth diet 37 years, a patient of Dr D S Jones, of Plymouth, The bowels opened naturally on the eighth day, the

stitches were removed on the fifth and sixth days, the temperature never rose above 100° She returned to her home entirely free from all her previous symptoms, and remained free for several months

[Her subsequent history appears later in this

Case 10 -Obstruction of the pylorus Digital dilatation by Loreta's method, death from cahaustion -George II, German, et 58 years, blacksmith His health had always been good until the last year At the time he came under my care he had the typical symptoms of complete pyloric obstruction, with a well marked tumor at the usual situation, it was not very large nor hard, had no marked outlines, and presented the characters of pyloric thickening more than those of a malignant growth The microscopical examination of the matters vomited gave no evidence of malignancy, and no vomiting of blood had occurred He was greatly emaciated, and so feeble that at first I refused any operative interference, the operation had, however, been explained to him, and its performance promised before he came under my care, and he insisted so strongly on having a chance for prolonging his life that I consented

The operation was performed at Jefferson Medical College Hospital May 22, 1887, in the presence and with the assistance of Professor Brinton, Dr Wirgman, and quite a number of others

interference than mere dilatation of the pyloric orifices, and as the usual incision to the right of the greatly prolonged median line would have exposed the stomach nearer to the pyloric orifice (as shown by the position of the tumor) than I desired, I made the incision directly in the median line, and about three inches in length, beginning an inch and a half below the ensiform cartilage

The stomach was readily exposed three inches from the pylorus The examination of its exterior threw no new light on the character of the growth, though the stomach at this point was found to be slightly adherent to the structures beneath An incision, a little over one inch in length and three inches from the pyloric orifice, was made in the stomach, parallel to and directly beneath the abdominal incision, the coats of the stomach were Complete stenosis of the pyloric much thickened orifice was found when the finger was introduced, this was readily dilated with the little finger, while the tumor was supported outside the abdominal walls with the left hand, the orifice was then further dilated

by the index finger The thickening and infiltration of the walls of the stomach at the point of incision prevented the use of the Lembert suture, their softened condition evidently required the suture to pass through all the As the abdominal wound was directly over that in the stomach, the latter was closed and brought in contact with the abdominal wound, so that the visceral and parietal peritoneum might adhere, and if any of the contents of the stomach should escape or any pus form, they might readily drain outside and not into the general peritoneal was free venous bleeding

Fine silk with two needles were used, these cavity were carried from within outward through all the coats of the stomach, one needle through each lip, then crossed and one brought through each lip of the abdominal wound, a few were carried direct without crossing These sutures were tied and the abdomen closed

Nothing was given for the first twenty four hours by the stomach, the rectal nourishment upon which he had relied previous to the operation being con-No vomiting occurred during the four days that he lived, on the second day milk and hot water were given in small doses at regular intervals, and as they were well borne they were increased in quantity and frequency Notwithstanding the fact that he took over a quart of milk per day, besides rectal nourishment, he sank and died exhausted on the fourth day after the operation There had been no elevation of temperature

At the autopsy the stomach was found firmly fastened to the abdominal wall, there was no evi dence of any peritonitis. In the interior of the stomach it was difficult to find the point at which the incision had been made, the sutures being com pletely buried in the folds of the mucous membrane The pyloric thickening was inflammatory in char acter, and not due to any malignant growth

There was complete obstruction previous to the operation, there was none after, and had the patient As the patient's condition warranted no further been subjected to operative interference earlier there is no reason why his life might not have been

Case II -Ovarian tumor Removal, recovery -Miss A, at 38 years, had noticed a painless ab dominal enlargement for a few months On exam ination I found a small ovarian cyst, lying in the median line and rising slightly above the umbilicus On May 23, 1887, with the assistance of Drs Da Costa, Edward Graham, Sweet, and Fisher it was The incision was about three inches in removed length, the tumor was non-adherent It was tapped, drained, and removed in the usual manner, its pedi cle was tied with silk and dropped

The peritoneum was brought together with chro micized catgut, the interrupted silk suture being The patient made an un used for the other tissues interrupted recovery, her temperature never rising above 99° The tumor weighed about fifteen pounds

Case 12 — Two penetrating stab-wounds, one punc turing the liver and one the transverse colon Lapar otomy, necovery - Michael H, at 25 years, was ad mitted to the Jefferson Medical College Hospital at 3 PM, of September 9, 1887 About three hours previously he had been stabbed twice with a small and pointed amputating knife, during a quarrel in a house of ill-fame

There were two wounds, both penetrating the abdominal cavity, both at the outer edge of the right rectus muscle, and both running diagonally toward the median line, and penetrating the peritoneum at The upper was one and a quarter inches long and was just below the edge of the ribs, it that point terminated in the left lobe of the liver, from it there

The lower wound was three quarters of an inch perceptible After hurried epitheliomatous above the level of the umbilicus antiseptic preparations, I opened the abdomen in was closed by the continuous silk Lembert suture The suture failed to control a small artery in this wound, but a separate stitch carried under it and disease than the centre tied secured it

oozing, and as its lips were in fair contact no suture The abdomen was cleansed, the wound was used closed and dressed in the usual manner

The following morning his temperature was 1010 and in the evening 100°, after that, though it kept quite low, varying from 98½ to 99½°, he had a long rectal tube to relieve him The stitches were removed on the fourth and fifth days, and the abdocharged cured on September 29, having been in the hospital twenty days

Case 13 - Epithelioma of the ileo-caecal valve Resection of three inches of intestine, recovery —Mrs H, æt 38 years, the same patient whose ileo cæcal valve was dilated seven months before (see page 547), came complaining of a return of her former symptoms, her sufferings were slight, but were evidently of the same character as before the first operation

November 1, 1887, with the assistance of Drs Allıs, Kendıg, Stillwell, and the resident staff, I again opened the abdomen A straight incision parallel to the median line was made, it was three inches in middle of Poupart's ligament. made at this point as the nearest to the portion of bowel I wished to attack, because I feared ad hesions might have formed after the last operation, rendering it inaccessible from any distant incision, and, further, if it became necessary to form an artificial anus, it wound be a convenient point

I had decided that if it should prove to be a incision about two inches in length carried through passage of feces from the natural outlet ends of the wound together and sewing it up transversely, this would best be made on what would be the under surface of the bowel when the patient stands erect. I tried this on the cadaver and found it practicable, and that it increased the circumference of the bowel, at that point, about two inches

first operation there had been slight bleeding at a precisely similar result number of points where adhesions were torn The

At the ileo cecal valve, however, there long, it was three inches below the upper and just was now a decided tumor, and it was now evidently

An incision was carried into the mass verifying the median line from the ensiform cartilage to the the diagnosis, the entire valve had become an irreguumbilicus, and found an opening about five eights of lar mass of epitheliomatous tissue varying in thickan inch in length in the transverse colon parallel to ness from a half an inch to an inch, entirely ob its length and near its mesenteric attachment, this structing the gut except an aperture in the centre, about one third of an inch in diameter The circumference of the valve was less thickened by the

The abdominal wound was now closed by sponges, The wound in the liver was small, it had ceased leaving the diseased parts outside, three inches of the bowel, including the disease, were removed, no clamps were used, the bowels being held in the hands of an assistant, a few vessels were tied

As the mortality is very high when the separated ends of the bowel, in these operations, are sewed together and returned, I had decided if it became sharp attack of peritonitis, lasting three days, during | necessary to excise, to establish a temporary artificial which time there was constant regurgitation of bloody anus and begin at once the proceedings for its cure The abdomen was painful and greatly dis- With this end in view, immediately after the removal tended with gas, requiring the constant use of the of the diseased bowel and the ligation of the bleeding vessels, one blade of Dupuytren's enterotome was introduced into each portion of bowel, viz, one men supported by adhesive plaster He was dis-into the ileum and one into the colon, the two blades were brought together and the screw run A strong ligature was placed on the down firmly ends of the bowel, including the enterotome, to prevent the escape of feces during the subsequent The bowel was washed, placed in manipulations position at the lower angle of the wound and fastened there with a continuous silk suture The abdominal wound was closed, covered with cheese cloth saturated with mercurial solution, and this in turn with patent lint soaked in sweet oil This is the best method that I have found to protect abdominal wounds close to an artificial anus

The heavy ligature around the ends of the bowel was now removed A ring of cotton soaked in oil length terminating at a point one inch outside the placed around the artificial anus, the outer extremity The incision was of the enterotome supported by oakum, and a wide bandage pinned over it Morphine was used hypodermically during the first forty-eight hours and then discontinued, vomiting occurred during the first two days and then ceased Some feces appeared on the evening of the operation, and full quantities two days later

On the eighth day the enterotome was found loose, recontraction of the stricture, to make a longitudinal and was removed, its removal was preceded by a ileum, ileo-cæcal valve, and cæcum, bringing the two stitches were removed on the third and fourth days, and the wound supported by adhesive plaster the removal of the clamp the patient was permitted to rise, and all restrictions removed from her diet

The bowels acted naturally for a few times, when all the feces came again from the artificial anus The clamp was again applied on the 17th, and came The head of the colon was readily found, there away on the 28th Its removal was again followed was no return of the intussusception, no adhesions by a few natural passages. As these ceased in a few had formed, though in reducing the intestine at the days the clamp was applied for the third time with a

As this had proved ineffectual, the method of Mr scar of the original intestinal incision was scarcely Banks, of Liverpool, was used A strong ligature was fastened to the middle of a heavy piece of rub- inal tenderness and other evidences of a slight ber gas tubing about six inches in length, one end of attack of peritonitis, which disappeared in fortythe tube was passed into one bowel, the other end eight hours. On the 28th he passed wind by the of the tube into the other bowel, the middle of the penis, and again on the 30th tube pressing against the spur The position of the bowel in this case was such that the rubber tube was Allis, Nancrede, Robinson, and the house staff, I retuined with difficulty After trying it for ten days without success, I substituted the apparatus which I here show, consisting of two pieces of very heavy rubber gas tubing joined together like the letter T The upper part of the T is about one and a half inches long, and presses directly against the spur, the other tube is three inches long, and merely serves to keep the first in position The large hase is circular, is three inches in diameter, and serves as a pad to prevent the escape of feces from the arti-The three pieces of rubber are joined ficial anus firmly by a strong wire running from the first to the last piece, and twisted tight. This method proved at once satisfactory, and a large proportion of the feces began at once to pass by the natural outlet, The patient is now in the and continued to do so hospital, but I shall make no attempt to close the fistule until it is seen if the bowels will continue to act naturally

During this prolonged treatment, fearing that the colon, from disuse, might contract, I directed that she should be given an injection of a quart of water daily, and I was surprised to hear that when a pint had been given it appeared at the artificial anus By continuing these injections the capacity of the colon was rapidly increased, and when last tried it held three pints, of course, when the bowels began

to act naturally this was discontinued

Case 1.4 - Chronic obstruction of bowels by encephaloid tumor Exploratory laparotomy, artificial anus established, recovery from the operation, death fourteen days later from obstructive peritonitis arising from tumor Francis O B, set 38 years, Irish, carpet porter, a patient of Dr James Robinson, with whom I saw him January 18, 1888 He was in perfect health until June, 1887, when he began to have slight cramps, once or twice daily, and occasionally at night, in the left iliac fossa tinued working until December 24, 1887, and has His attacks had not inbeen confined to bed since creased greatly in seventy, but he was getting much He had lost fifty pounds in weight, he vomited once or twice a week, it was not stercorace-He suffered greatly with tenesmus, which produced from ten to fifteen passages during the night, each being a small, hard, white mass about the size

The left iliac fossa was slightly tender The pulse was 104, domen was distended with gas and the temperature normal His pain was unin-He had never passed blood by fluenced by food The rectum was found empty and unthe bowel

Later I removed him to Jefferson Medical College Hospital, by which time his pain was nearly constant, and he was unable to sleep without large doses of Some days after admission his temperature increased to 103°, there was increased abdom- same day

On January 30, 1888, with the assistance of Drs opened the abdomen A median incision about four inches in length was made, and a lobulated tumor the size of an orange was found in the angle between the bladder and the spine The sigmoid flexure of the colon was tightly adherent to and partly buried in the tumor The cæcum was carried toward the median line, and was also adherent to The lower end of the ileum was closely the tumor adherent, and its calibre nearly obliterated

The colon was contracted and collapsed, all the bowels above the point of obstruction in the ileum

were greatly distended

As nothing could be done with the growth, a fold of the ileum a few inches above the point of obstruc tion was brought out of the wound and fastened in its lower angle by a few silk sutures, a rubber drain was introduced, as a glass one failed to reach the desired point, and the abdomen closed The drain was removed about twelve hours later, as I feared to have it remain in such close proximity to the arti Twenty-four hours after the operation ficial anus the fold of bowel in the wound was opened, and the artificial anus established

On the second day the patient was placed upon The stitches were his usual food, stimulants, etc removed on the fourth and fifth days, the wound It was successfully kept from healed promptly contamination by the fæcal discharges, by the method described in a case reported above

At the operation a fold of bowel was brought en tirely out of the wound, this was adopted as a modi fication of the method of entirely cutting off the bowel, closing the lower end with sutures, and using

the upper to form the artificial anus

The method here adopted has the advantage of rapidity, less danger of contaminating the cavity with fecal matter, as the opening of the bowel may be postponed until firm adhesions have formed It permits any gases or other material that may be im prisoned in the lower bowel to escape, and quite as effectually prevents any material passing the artificial anus into the lower bowel

The patient was relieved of his pain, the vomiting ceased, and he slept well, had a fair appetite, and All fæcal discharges, and improved in appearance they were very copious, came from the artificial anus, and none by the natural outlet after the first twenty

On the thirteenth day there was a slight elevation of temperature, and all fecal discharges suddenly ceased, injections of warm water carried some distance above the opening by a soft catheter were without effect, by evening vomiting and other symptoms of acute obstruction occurred, and he died twenty four hours later, or fourteen days after the

The post-mortem examination was made on the The abdominal wound was solidly healed, the bowel, at the artificial anus, was firmly attached to the abdominal opening. The abdominal cavity contained quite a quantity of opaque serum, the opacity was greatest near the tumor, and on pressing the tumor, thick, purulent-looking fluid exuded from it. This was probably the origin of the fatal peritonitis. The bowels were but slightly congested, and at one point only, about twelve inches above the artificial anus, were adherent. The bowel at this point was sharply flexed upon itself, and adherent for about three inches, causing complete obstruction. This adhesion was readily broken down by the finger, and it would probably have yielded to an active saline.

The condition of the bowels, as found at the time of the operation, was verified, the tumor was broken down, and had ulcerated into the sigmoid flexure, a large number of secondary nodules were scattered through the liver The microscopical examination was made by Dr Longstreth, the tumor and the nodules from the liver were reported by him to be encephaloid

FIFTY CASES OF SCARLET FEVER

Read before the Suffolk District Medical Society, Section for Clinical Medicine, Pathology and Hygiene, February 8, 1888

BY HENRY JACKSON, M D,

I wish to present to the Section a short account of these cases, as an epidemic of this size always gives one an opportunity of making some interesting observations

These cases occurred in the North End of Boston during the months of April to October

April 4
May 3
June 5
July 3
More severe
August 10
Much more severe, with throat trouble
September 24
March 2
Total

Of these cases thirty may be characterized as of a Prodromal period short, usually twelve to twenty-four hours, vomiting almost always present, headache and malaise, usually more or less complaint of sore throat In cases where an examination at the early stage was possible, I did not find the appearance of the throat sufficiently characteristic to warrant a diagnosis of scarlet fever merely from this In no case were convulsions seen The period of efflorescence lasted from twenty-four hours to four days, rarely longer Temperature not high Many of the children wished to be about the house, and were with difficulty kept in bed, even during the height of the eruption Vomiting ceased in most cases on the appearance of the eruption, occasionally it continued until convalescence was established

As the other cases presented some points of more particular interest, I will give them more in detail. In two cases there was no eruption and yet the diag-

nosis of scarlet fever seems to be fairly well justified

(1) Katharine McC, 15 years Slept in a bed with two children who had well-marked eruption She had a moderate fever, headache, malaise, and pharyngits and tonsilitis (not follicular) Well on fifth day No sequalæ

(2) Annie McL, 11 years Lived in the same flat that three children lived in who had scarlet fever No eruption, slight pharyngitis, mild febricula of a few days' duration. Or course scarlet fever would not have been considered except for the other wellmarked cases. Under the circumstances it seems to me highly probable that her symptoms may have been due to scarlet fever.

Raphael B, 4 years Acute lobar pneumonia on seventh day Course of the scarlet fever mild and of no special interest. In four cases convalescence was delayed by suppuration of the parotid gland.

One case was complicated with measles

Mary McC, 2 years Well-marked eruption of scarlet fever, severe catarrhal pharyngitis On the fifth morning the eruption had faded, and the temperature was normal, that night temperature 1020, and body covered with a very fine punctate rash Next day an abundant and well marked eruption of Catarrhal inflammation of eyes, nose and measles bronchi Child very sick for a week Pulse 160, temperature 103° to 104°, respiration 45 Lobular pneumonia in right front. In the latter part of the attack of measles the skin presented a very curious appearance, as the bright red papules of the measles were covered by the dried scales left by the scarlet fever Urine showed a small trace of albumen and a few casts Complete recovery

One case only had very high fever

Nettie McC, 6 years Eruption well-marked, temperature 104° to 105° for several days, pulse 140, stimulants ordered Disease was followed by leucorrhea of several weeks' duration, and one month after the attack of scarlet fever she had articular rheumatism

One case had cedema during convalescence with-

out any apparent renal disease

Nellie C 6 years Mild fever, no vomiting, slight pharyngitis, during convalescence very marked anæmia, slight cedema of face, hands and feet Careful and repeated examination of the urine gave a negative result as to the existence of renal disease I attributed the cedema to the anæmia, but found that Strumpell spoke of cedema as occurring after scarlet fever dependent upon molecular change in the walls of the bloodyessels.

Two cases of acute Bright's disease In the second and third weeks respectively, after the onset of the scarlet fever, urine smoky in color, contained 1/4 per cent of albumen, large numbers of casts of various kinds In each case headache, vomiting and general ædema Complete recovery in each case

The following case is one of great interest, and I fortunately have complete notes of the case, as the child was under the care of a trained hospital nurse R F, 9 years November 4 Eruption appeared,

¹Third edition. Vol I p 63

very light, pharyngitis marked For three days pulse and temperature very high On tenth day temperature normal, and pulse 100 During convalescence pulse very slow and irregular, frequently intermittent, no murmur detected Under small but frequent doses of tincture of digitalis and brandy pulse became rapid, regular and of good strength

November 20 Sudden rise of temperature, with swelling of the glands of the neck Examination of

the urine negative

Passed very little urine, vomited several tion times, slight ordema Rise of temperature smoky, 1/4 per cent of albumen sediment that of acute parenchymatous nephritis Gradual improvement in general symptoms and in the character of fourth day, or during the stage of desquamation the urine until December 1

After having passed a remarkably good day, the child woke on the night of December 1, and complained of severe frontal headache Vomited several times during the night These symptoms continued through the forenoon of December 2 Small dose of morphine $\binom{1}{16}$ given on account of headache

In the afternoon became somnolent, and soon completely unconscious At 4 PM, respiration 20, pulse 130, pupils not noted by the nurse Diagnosis of opium-poisoning was made by physician, and

treatment ordered accordingly

I saw the child at 5 30 Found respiration 18, irregular in rhythm, pupils normal. He was inclined to sleep but when aroused answered questions intelligently An hour later, roused with difficulty, when addressed, did not answer the question but counted 26, 27, 28, 29, 30 He never counted more than 30, always began with 26, and sometimes repeated the number 26 several times without counting further

At 8 P M, perfectly unconscious, respiration stertorous, irregular, two to four respirations being followed by a long pause, etc , pulse 120, pupils regular and of normal size, convulsive twitching of the right side of the face and right arm, which lasted for about three quarters of an hour, no paralysis

Next morning perfectly conscious, showed no symptoms, and had no remembrance of the events

of the previous day

For several days the urine was very scanty, contained a large amount of blood and albumen, and many casts From this time on gradual improvement, until convalescence was completed The distinctly localized convulsive twitching seemed to point to some lesion of the cortex, but I think that the rapid recovery makes it more probable that all the cerebral symptoms were dependent upon uræmia There was at this time a slight systolic souffle at the apex, but no enlargement of the heart

January 25 Boy stout and well, no murmur

Eight cases had severe diphtheritic inflammation of the throat, that is to say, there was extensive ulceration, with membranous exudation on the tonsils and uvula, or pillars of the fauces Cases in which several small gray patches were seen on the tonsils are not included in this list

Flint, Henoch and Strumpell say decidedly, that though the disease is anatomically identical with the condition usually found in diphtheria, the disease is etiologically distinct Eichhorst considers it at least possible that the condition is due to true diphthena implanted upon the already existing scarlet fever

The chief arguments that the disease is not diph theria are clinical in nature, namely, (1) Invasion of the larynx is rare, (2) paralysis rarely follows, (3) the disease is not so fatal as true diphtheria

So far as any conclusions can be drawn from so small a number of cases, all of these arguments are November 23 Three weeks after the onset of the refuted by the cases which came under my observa

> In only one case did the diphtheritic inflammation appear early in the course of scarlet fever, in the others the membrane was observed on the third or

> One case died from invasion of the larynx by the diphtheritic membrane In a second case there was probably membranous laryngitis, as evidenced by hoarseness and embarrassed respiration The child died apparently from asthenia I doubt if tracheot my would have been of any avail, even if the par ents had assented to the performance of the opera

> Two cases died of paralysis of the heart, one when convalescence was perfectly established, and one when the child was apparently improving rapidly

The mortality was large, as four out of eight (50

per cent) died

Cases of especial interest are the following

Millie H, 3 years When first seen remains of a rash of scarlet fever, on both tonsils and uvula a dirty gray membrane, which spread in a day or so to the pillars of the fauces Parts bled if touched Another physician was called, as my prognosis was On the eleventh day I saw the child playing in the street No ulceration in the pharynx twelfth day, sudden death from paralysis of the heart, according to the account given by the family

Johanna M, 21/2 years Brother of the patient had had a mild attack of scarlet fever eleven days previously Patient had mild attack without marked pharyngitis Fifth day tonsils much swollen In a few days both tonsils and uvula were covered with membrane, lips and edges of nostrils ulcerated Thirteenth day, voice hoarse and and bleeding almost maudible, respiration somewhat embarrassed Fifteenth day, death, without any preceding dyspnæa. Trace of albumen and a few casts in the urine

Daniel S, 5 years When first seen desquamation was going on, emaciation extreme, voice whining, ulceration of the edges of hps and nostrils, mem brane on both tonsils and uvula, abscess below right ear that contained thin, bloody, foul-smelling pus Treatment locally, 10doform, internally, corrosive sublimate (gr 100 every hour), whisky and eggs Perfect recovery

Three cases occurred in one family by the name of

Hygienic surroundings good

September 14 Louisa, 11 years Malaise, slight pharyngitis, rash, which lasted twenty four hours Second day, perfectly well No sequalæ No des quamation

September 14 Mary, 9 years Eruption very full

In the course of a few days, ating and bleeding foul ulcer on right elbow, ulcer of genitals and perineum Sixth day, right kneered, swollen and tender Next day same symptoms in left knee and left wrist The disappearance of the latter symptoms in two days, under the use of sodu salicylic made the diagnosis of rheumatism probable Sudden death on fibula is about 21/2 inches above its lower extremity tenth day

sick September 17 In both cases eruption intense, face much swollen, so that the eyes were partially closed, cedema of hands, urine contained a trace of and deformities existing with these fractures albumen and a few casts On third and fourth days and uvula Both recovered completely

The ædema in these cases was apparently due to the intensity of the eruption, as in neither case did the examination of the urine warrant the diagnosis of Two other children that slept in Bright's disease the same room were not sick It is an interesting was confined, and convalesced without having any increased mobility are present is patent and easy peuperal fever She had no doctor or nurse

SUMMARY

Of these 50 cases, 4 died (1 in 12), all of diph theria These 4 cases are the only ones that died in my district, of scarlet fever, from April to January, the total number of cases being 88 This gives a suffering mortality of 1 in 22

It has been interesting to me, and very satisfactory, to find that I have not been called to a single case of scarlet fever in a family which I had attended previously for any other disease Of course it was impossible for me to think of changing my clothes, or even disinfecting the hands, before attending other cases

district 200

The eight and only cases of diphtheria all occurred in three weeks, and represented one third of the total number visited in the three weeks

Treatment -In mild cases, expectant In cases with high fever, tepid sponge baths and antipyrin In cases with diphtheria, brandy and tincture ferri chloridi

THE MEDICO LEGAL ASPECT OF POTT'S FRACTURE

Read b fore the Chicago Medico Legal Society, March 3, 1888

> BY L L McARTHUR, M D, OF CHICAGO

In venturing to call your attention to so common a fracture, it has been rather with a desire of impres sing, by repetition, what is already known, than to submit something new To do so let me, as briefly

Third day, membrane on uvula and pil- presenting a characteristic deformity It is not as lar of the fauces, mucous membrane of lips ulcer- many without reflection might think, a fracture of fibula simply

First, recall the fact that astragalus is so mortised between the malleoli that (except in extreme flexion or extension) little or no lateral movement of that bone is possible

Second, That the thinnest, weakest point of the

Third, That one of the lateral ligaments of the James, 3 years, and Anne, 4 years Both taken ankle are torn in about all the fractures of the lower extremities of tibia or fibula from indirect violence and you have explanation for the location, causation

Pott's fracture is always the result of indirect viorespectively a membrane appeared on the tonsils lence, occasioned by a forcible turning outwards of the sole of the foot The history would seem to be that fracture (from the great strain) of the tip of the internal malleolus occurs, the strain then falling suddenly upon the fibula that bone fractures also at its weakest point, leaving the deformity which characterizes the case in question The diagnosis when crefact that during the height of the disease the mother pitus at fibula, loss of tip of inner malleolus, and

> But though the fibula be fractured crepitus can in many cases not be obtained because the smallness of the broken ends tends but little to hold them together and as they generally overlap none can be felt, hence the too frequent treating of such an injury as a "sprain," with its subsequent weeks or years of The poor function of that ankle, and a possible suit for malpractice What then will be our best aids in arriving at a correct opinion?

First—Remembering the fact that the astragalus is practically immovable laterally when half way between flexion and extension, if we find the latter freely movable in such a position we may be pretty sure of To do this best the palm of right hand our case The new cases visited each month average in my should rest against the sole of foot, while the left grasps the leg just above the ankle, with the fingers tips and thumb of right hand grasping the astragulus (not as calcis and tarsus that are freely movable) one can try a lateral rocking movement, when if the bony supports on either side have given way the astragalous will move with it, otherwise not

Secondly -Since fracture of fibula can in but about half the cases be determined by crepitus, it is necessary to decide by some other means Recalling the fact that the lower tip of the external malleolus extends below the line of the articulating surface with astragalus, we can see how direct inward pressure upon that tip will determine the case for us For if it be not fracture it certainly cannot be budged, but if on the contrary there be a fracture above, the tip acts like the short arm of a lever, the fulcrum being at the articulating facet, and the long arm the lower end of shaft of the fibula, hence a decided teeter or rocking of the lower fragment can always be induced and be best perceived when the right thumb of the as is consistent with clearness, present the subject physician corresponds with the patient's right exter-by reviewing its surgical and anatomical aspects nal malleolus, his left with the corresponding left of nal malleolus, his left with the corresponding left of Pott's fracture has been defined as a fracture of the patient, while the finger-tips of the opposite hand fibula, combined with a fracture of tip of internal rest upon that portion of the fibula about its articumalleolus and laceration of internal lateral ligament, lating facet By alternating pressure at these two points, a fracture of fibula can always be determined though crepitus be absent

Finally, to be sure that we have the true Pott's fracture to deal with, comparison of the tip of the internal malleolus is necessary

Now the medico legal aspect which cases of this nature may assume is dependent wholly upon the subsequent treatment, and since proper treatment can only then be applied when a correct diagnosis has been made my emphasizing the means of diagnosing this fracture can be the more readily pardoned for a fixed medico-legal aspect in any case can only but few deaths can be laid to the use of iodine, and differential diagnoses we have to distinguish this from (1) laceration simply of the lateral ligaments (2) from simple tracture of the fibula (3) from simple fracture

Simple laceration of lateral ligaments is, according to authorities, comparatively rate When the tips of both internal malleoli correspond in shape, when there is no rocking of the fibula at its lower end, nor but little of the astragalus when pressed firmly into the mortise made by tibia and fibula it is fair to conclude that the ligaments have been torn

When both the tip of the internal malleolis is missing, rocking of astragalus and lower end of fibula is present a fairly sure diagnosis of Pott's fracture may be made (3) when with normal contour of internal malleolus tip, rocking of lower end of fibula over the fulcrum made by its articulating facet, and increased mobility of astragalus inwards is present a simple fracture of the fibula can be asserted to be present with reasonable confidence Now, since nature shows us a bony mortise normally present in the ankle, if we do not restore in so far as lies in our power the same close apposition of the articulating surfaces when these have been disturbed a medicolegal, with accent on the legal, phase soon presents itself. To accomplish this best the treatment recommended by Velpean is certainly the best either for fracture of fibula simple, Pott's fracture, or fracture of internal malleolus This consists of a long internal splint padded to fit the inner aspect of the leg, and extending (here is the important feature) several inches below the foot The sole of the foot is then made to face inwards against splint by bandaging, thus restoring 1, internal malleolar tip, 2, drawing bandage upon fibula, 3, relaxing internal lateral ligament

In conclusion let me reiterate,

- That the astragalus will not rock laterally
- 2 That the normal mortis be restored in so far as possible
- 3 That diagnosis of fibular fracture must not be dependent upon crepitus
- 4 That these chronic, long-lasting ankle sprains are most often accompanied by destruction of the normal mortise
- 5 That with laceration of univascular ligament or tissue there is far less hæmorrhage and consequent ecchymosis

MEDICAL PROGRESS.

RADICAL CURE OF HYDROCELE BY EXCISION OF TUNICA VAGINALIS - DR W W KEEN reports a successful case, in the Medical News of April 7, 1888, and says

Until recently various methods of injection, espe cially by iodine or carbolic acid, have been the chief and almost the only means employed in the treatment none, I believe, to carbolic acid But they have several disadvantages

First, that of recurrence In over eight percent of the cases treated by iodine, recurrence takes place, and this misfortune sometimes even occurs a second time Carbolic acid has been much less widely used, but its promise as to freedom from re currence is much better than iodine, and if injection be the method chosen, this would seem to be the preferable one

Secondly In a large number of cases additional lessons are found besides the hydrocele, lessons which in the majority of cases cannot be cured by any in Jection In 123 cases reported by Juillard and Senz mer, cysts were found in 43, enlargement of the tes ticle and epididymis in 23, thickening of the tunica vaginalis in 54, false membranes in 26, and free or attached foreign bodies in 3

Thirdly There is generally great pain

Fourthly Not seldom severe inflammation and swelling, sometimes suppuration, and occasionally even gangrene of the scrotum occurs

Fifthly Even if no such untoward results occur there are great induration, weight, and tenderness in the scrotum, such that the patient is usually laid up for three weeks, and sometimes longer

Three somewhat different methods of open anti septic incision have been proposed as substitutes for injection, and especially with a view to a more per manent radical cure Volkmann incises the sac, and after syringing it out with a three per cent solution of carbolic acid, unites the edges of the tunica vagi nalis to the skin, and, after drainage, dresses the wound with an antiseptic compressing gauze and

Juillard took a step further After incision of the sac, and removal of all pathological products by the scissors or spoon from the sac, cord, or testicle, he then resects the superfluous tunic, leaving only enough to cover the cord and testis The edges of the tunica vaginalis are then sutured with catgut and the external wound closed independently, drainage and antiseptic gauze completing the dressing

Bergmann (reported by Bramann, Berlin klin Wochenschr, April 6, 1885, p 209) went a step fur ther, and proposed the total extirpation of the free part of the tunica vaginalis only leaving that portion Of course, any attached to the cord and testis other concomitant lesions are appropriately treated Bramann reports twenty cases, at the same time with rapid cure in eleven days, without fever or sup puration Bull has reported two cases (hydrocele

of the cord) thus operated on, one of which had been twice injected with carbolic acid, and the other once Both rapidly recovered with iodine Southam (Lancet, September 10, 1887) reports four cases, one of which had recurred after carbolic acid injection. cured with an equally speedy and happy result

To these twenty-six cases I add but one, but it is an excellent illustration of the slight reaction following the operation, and of the quickness of the cure

It would seem, first, to be almost an impossibility that recurrence should take place, for practically none of the sac is left, and in so far it would be a priori the ideal radical operation

Secondly This method facilitates the proper treatment of any additional lesion above described as

not uncommon

Thirdly As is usual after antiseptic wounds, there was little or no pain

As again is the rule in wounds so treated, there was little inflammation practically no fever, not a drop of pus, and no seeming possibility of gangrene

Fifthly There were only moderate induration, weight, and tenderness, so that the patient was up and about on the seventh day, and was ready for discharge on the eleventh day entirely cured and comfortable

Sixthly Although a more radical operation than that of Volkmann, it is less painful and less danger-In 254 cases collected by the writer, recurrence is noted in three, and two died of septicæmia and pyæmia, while abscess, sloughing, and orchitis have all occurred Induration, weight, and tenderness have persisted from three to four weeks conditions after resection of the entire tunica vaginalis and immediate closure of the wound, with drainage, and antiseptic dressing, are such as to favor the speediest and safest recovery, without any of the dangers above noted as following antiseptic incision

The case is also a good illustration of "the conditions conducive to the earliest possible healing of operation wounds," to which I have called attention in a paper with the above title, read before the Surgical Section of the New York Academy of Medicine (Medical Record, January 28, 1888), especially the method of drainage by horsehair instead of rubber, wound, and the change of dressing on the day after the operation, recovery being complete in seven days

How to prescribe Digitalis -In an article on this subject HENRI HUCHARD gives the indications for digitalis in a number of affections, among which may be mentioned

i Cardiac Hypertrophy of Puberty and the Menopause -At the age of puberty, he thinks, the cardiac hypertrophy is consecutive to exaggerated arterial tension, and it is this that must be combatted attributes the cardiac hypertrophy at the menopause to arterio sclerosis, so that the cardiac hypertrophy at these two periods of life have practically the same pathogenesis both are consecutive to increased arternal tension In these cases digitalis should be pre

ing preference to depressors of arterial tension and to cardiac sedatives, such as the iodides, nitroglycerine, and preparations of aconite and arsenic

2 Nephritis and Asystolism of Renal Origin —In chronic parenchymatous nephritis digitalis should be prescribed with reserve, and the same may be said of all active substances that may be retained in the organism and cause intoxication by reason of faulty But as digitalis is not eliminated renal elimination naturally by the kidneys, albuminuria is not an absolute contraindication to its employment course and at the beginning of interstitial nephritis the arterial tension is considerably increased, and there is cardiac hypertrophy often associated with myocardial sclerosis, and diuresis is normal and often very abundant In these cases digitalis should not be prescribed, but arterial depressors, such as the iodides and nitroglycerine, should be given afterwards there comes a period—in parenchymatous, and especially nephritis-when the heart fails, or its contractions become feeble, or visceral congestions and peripheral ædemas cause lowered arterial and increased venous tension, and the kidneys are inac-The albuminum patient has now entered the cardiac stage, and is to be treated as a cardiac patient for asystolism Such simple diuretics as milk, squills, and nitrate of potash are insufficient, and preference must be given to the cardiac-vascular diuretics, among which digitalis occupies the first place In such cases "the conservation of the circulatory equilibrium and of the forces of the heart should be the object of the physician's constant attention," as Lecorche and Talamon say in their recent excellent work "Traite de l'Albuminuric et du Mal de Bright " They add, with reason, that cardiac tonics should not be reserved exclusively for advanced stages of Bright's disease, and they advise them at the time of the acute growth of the affection, when the heart tends to be enfeebled by the obstacle created by the renal affec-"We have obtained," they say, "remarkable results from digitalis given from the beginning of acute Bright's disease, the patient being at the same time subjected to an energetic antiphlogistic treatment The combination of the two methods, the diuretic and the antiphlogistic, seems to us to be the best means, in cases of this kind, to combat inflammatory glass, or bone tubing, as is suited best to so small a renal congestion and asthenic dilatation of the heart, and of preventing the necessary consequences, general anasarca and uræmic toxæmia"

In these cases, also, as in all cases of asystolism of renal origin, another cardiac-vascular diuretic, caffeine, must be used, and this sometimes acts with a promptitude superior to digitalis, has no cumulative effects, and is eliminated more rapidly and more The pure caffeine may be given, as by the surely following formula

> Distilled water 300 grams, Benzoate of soda Caffeine aa 5 grams

S Take 4 to 6 tablespoonfuls a day

3 Digitalis in Aneurisms of the Aorta -Most scribed as a sedative in small doses, and always giv- aortic aneurism, that it calms palpitations, diminishes

86 parts.

dyspnoa, and is indicated as an agent having a seda- the mouth of the follicle tive effect on the circulation it moderates the blood impulse in the arteries the effect is just the opposite, for digitalis increases the blood wave through the aorta, and raises the arterial tension, already heightened by the aneurism

Bouilland has rendered great service to medicine by first indicating good effects obtained in aortic aneurisms by the use of the iodides These have not only a modifying action on the arterial walls, but also, and especially, as depressors of the vascular Huchard uses iodide of sodium, which is just as active as the potassium salt, is better supported by the stomach, is more assimilable, and does not as the potassium salt, cause toxic effects on the heart and general system, by means of the renal insufficiency to which all patients suffering from arterial affections are exposed Huchard uses the following formula

300 grams Distilled water Iodide of sodium 20 o os centig Ext thebrie

Take from 2 to 4, or even 5 tablespoonfuls a day before eating in a little beer (to mask the taste) Continue this during 20 or 25 days every month

It is for the same vaso-dilating action that he gives nitroglycerine

Alcohol solution (1 100) nitroglycerine 300 grams

Take from 3 to 6 tablespoonfulls a day Or give the 1 100 alcoholic solution of nitroglycerine, 6, 15, or 20 gtt a day in 2 gtt doses. The dose must be diminished or suspended when the medicine causes headache

The principal indication in aortic aneurism is to The principles of treatreduce the mass of blood ment announced by Albertini and Vasalva, Kirby, Beatty and Stokes, show that digitalis must be given very cautiously, and in small doses, if we wish to obtain only a sedative effect Preference should be given to doses of 10 to 20 gtt of the tincture, or 5 to 10 centig of the infusion, and Huchard recommends that it be given in slightly increasing doses, since if the effect be got suddenly rupture of the aneurismal sac may be caused

But later, when the arterial lesion is propagated to the coronary arteries, and the cardiac muscle is more or less altered, the malady is no longer simply aortic, Then digitalis is indicated in but is now mitral large and decreasing doses, to relieve the failing action of the heart muscle, and to combat imminent asystolism - Revue Gen de Clin et de Therap, March 29, 1888

THE TREATMENT OF ACNE -When UNNA takes up even an old theme we expect him to treat it in a new way, nor are we disappointed in the paper now before us ("Monatshit f p Dermat," 1888, No 1) He divides acne into two chinical divisions i The process of closing of the follicle and formation of the 2 The process of suppuration of the fol-Comedones are to him only the evidence of the abnormally close coherence of the corneous layer The corneous layer becomes thickened and closes chronic metritis—Centralbl für Gynäk No 8, 1888

The comedo forms on Luton even says that account of the continuance of the parakeratosis on the inside of the follicle Suppuration only succeeds to the comedo formation in those follicles which con tained Staphylococcus aureus et albus before they became closed, or into which they have entered on account of some subsequent irritation, as from tar, chrysarobin, or the like, permitting their breaking through the walls of the glands The indications to be met in the treatment of acne are two 1 The loosening of the corneous layer of the skin 2 The killing of the staphylococcus We can fulfill the first indication in public practice by the use of green soap, acetic acid, a 5 per cent caustic potash solution, and salicylic-acid plaster In private practice these are too rough procedures, and it is better to use sulphur with carbolic acid, or resorcin with corrosive subli Two or three times a week it is well to scrape off the whole diseased parts with the curette, open all the pustules, and squeeze out all comedones The patients should wash with warm water and soap, and follow this, if their skins are tender, with a powder of oxide of zinc and flour During the night the medi cament is best applied in a paste, during the day in a watery or spirituous solution, two or three times daily Thus at night we might prescribe after washing

R Benzomated zinc ointment Precipitated sulphur Siliceous earth	86 parts. 10 " 4 "
nd by day R Resorcin	2 to 5 parts 1 part
Glycerin Orange flower water Alcohol	20 parts. 80 "
r by night R Benzoinated zinc ointment Resorcin Siliceous earth	So parts 10 " 10 "
nd by day	
R Corrosive sublimate Glycerin Orange flower water Alcohol	0 05 to 0 2 part 1 " 20 parts 80 "

After the acne is pretty well overcome by these means, it is well for some time to use a resorcin paste, or a resorcin-sublimate-spirituous solution, or simply sublimate soap -N Y Med Jour, April 21, 1888

Hypodermatics of Arsenic in Chorea - Make a mixture of equal parts of Fowler's solution and distilled water Begin by injecting one drop into the subcutaneous cellular tissue, and increase the quantity one drop a day until eight or ten drops are being injected, when the quantity is reduced one drop a day If necessary repeat - Gazette Med de Montreal, January, 1888

CORNUTIN -LEONIDAS LEWITZSKI (Inaug Diss, St Petersburg, 1887) after a number of experiments, concludes that Kobart's cornutin is one of the most certain means (when administered by the mouth) of causing contractions of both the pregnant and non pregnant human uterus, and is especially useful in hæmorrhage after abortion, and in menorrhagia from

THE

Journal of the American Medical Association PUBLISHED WEEKLY

THE EDITOR OF THIS JOURNAL would be glad to receive any items of general interest in regard to local events or matters that it is desirable to call to the attention of the profession Letters written for publication or containing items of information should be accompanied by the writer's full name and address, although not necessarily to be published All com munications in regard to editorial work should be addressed to the Editor

TRANSACTIONS OF THE NINTH INTERNA TIONAL MEDICAL CONGRESS

The first two, and perhaps three, volumes of the Transactions, will be ready for issue at the Cincinnati meeting of the American Medical Association, to such members of the Congress as shall notify the Chairman of the local Committee of Arrangements, Dr W W Dawson, of their desire to receive them at that time and place To insure delivery notice must be immediately given

> JOHN B HAMILTON, Late Secretary General

PUERPERAL MASTITIS

Not the least significant outgrowth of the Semmelweiss doctrine of puerperal fever is presented in modern views as to the causation and prevention of puerperal mastitis Olshausen¹ has given at a recent date an uncommonly clear and concise summary of intelligible and entirely efficient the more important facts in connection with this sub-In the following note, free use is made of this essay, not only on account of its authoritative source, but also because it is adequately representative of the state of our present knowledge

Every case of puerperal mastitis is due to infec-Now, it is necessary to distinguish between the physiological turgescence of the mammæ and

1 Deutsche Medicinische Wochenschrift No 14 1985 Schroeder's Lehrbuch der Geburtshulfe 10 Auflage von Olshausen und J. Veit

The former occurs parenchymatous inflammation usually on the second or third day of the puerperium, and is characterized by symmetrical enlargement and rotundity of the organs, while the latter commences during the second or third week-seldom earlier than the sixth day-and begins in a circumscribed spot This proposition shuts out at once from consideration the operation of such agents as retention or impeded flow of milk, exposure to cold, mental disturbance and the like, as primary factors We are all of us familiar with the important rôle formerly assigned these agents in the etiology of mammary abscess Indeed, traces enough of this erroneous and pernicious belief may still be found in many of our best text-books Investigation proves that infection may occur through two channels through the lumina of the milk ducts and through abrasions, cracks or fissures of the nipple Experience and clinical observation teach that the former is the more frequent mode of infection cherich and Bumm have demonstrated the presence of pathogenous bacteria in the milk before any inflammation of the gland was noticeable The invasion consists, as a rule, of staphylococcus Cohn found a peculiar streptococcus in cases of non suppurative, parenchymatous mastitis When the infection takes place directly through nipple lesion, the materia peccans gains access to the connective tissue spaces and phlegmonous mastitis is the typical result coccus pyogenes is the potent microorganism under these conditions

While retention or impeded flow of milk is not a primary etiological factor, either certainly may play an important adjuvant part Under the influence of the bacteria, the secretion is decomposed, loses its alkaline reaction, and free acids-lactic and butyricare developed Galactostasis favors in this manner the settlement of bacteria

Kucher aptly says "The chapter on prevention 1. the crowning glory of Semmelweiss' theory," and so it is in the case of the modern doctrine of puer peral mastitis Prophylactic measures are simple,

The nipples must be carefully cleansed every day during the latter weeks of pregnancy with some antiseptic fluid, such as a saturated solution of boracic acid or alcohol, and then they must be protected from contact with the clothing by sterilized gauze

During lactation, they must be similarly cleansed and protected after each nursing The child's mouth must also be kept perfectly clean of the nipple, which the preliminary treatment during pregnancy will largely prevent, must be observed

as soon as they appear strict antiseptic treatment

The same absolutely antiseptic condition of the fingers of the attendant is requisite when the nipples are handled, as when any operation in connection with genito-urinary apparatus of the puerperal Much the same responsiwoman is undertaken bility attaches to the physician and the nurse with reference to mammary abscess, as in the case of That is the physician and the puerperal fever nurse, provided the care of the patient has been completely in their hands, are responsible theoretic-Either they have ally for the unfortunate accident neglected to institute the precautions, plainly indi cated, or they have themselves infected nipples This is not at all a pleasant doctrine for the practitioner, but is a very wholesome one for the patient

When mastitis actually begins, the child must be removed from the affected breast immediately, and not at a time when the inflammation has already at-"When this pretained considerable proportions caution is neglected," writes Olshausen, "or when it is not observed within the first twenty-four hours after the chill, which almost always characterizes the beginning of the disease, suppuration almost always If the child is at once removed from the affected breast, in three-fourths, or more, of the cases, the mastitis will be cut short " In addition to the cessation of functional activity, the breast ought to be suspended, an ice-bag applied, and a purgative exhibited

Olshausen has observed that when the fever continues longer than thirty-six hours, suppuration This limit seems to us too almost invariably results brief, as certain cases of undoubted parenchymatous mastifis have come under our observation, in which resolutions has occurred even when the fever lasted as long as forty-eight or even seventy-two hours

w w J

TWO NEW TFREBINTHINATES

The revival of interest in the terebinthinates of late has resulted in the extensive use of terebine in bronchial affections DR PROSSER JAMES has recently called attention, in the Lancet, March 10, 1888, to two other allied products, and more particularly to their use in These are diseases of the respiratory mucous tract the essential oil of the mountain pine, and hydrate of

Lambert, is the tree from which exudes the Hungarian taken in lozenges or on a lump of sugar, just as tere balsam, once so highly prized

They demand at once young branches with water a volatile oil is obtained. which has been known for a long time as "oleum templinum" or "Krummolzol," and is the most po tent agent in the so-called "pine cure" of Reichen hall and other German spas As the vapor of the water escapes into the inhalation rooms it is medi cated with the volatile oil By an improved process and apparatus, and care in selecting the material, a much finer product is now obtained—a very pure essential oil, oleum pini pumilionis, which has been imported into England under the name pumiline It has the odor of the most fragrant variety of the pine, and is less irritating than other fir oils When sprin kled or sprayed about a sick-room, says Dr James, it imparts a lasting and grateful fragrance to the air, which is not oppressive, and seems to be disinfectant, or it may be thrown into a little warm water and allowed to evaporate, or it may be diffused by a steam inhaler, or a hand-ball atomizer

This oil can be taken internally, and is admirable When prolonged inhalation is desired for inhalation a few drops may be put in a suitable respirator, and patients frequently prefer it to other inhalants short steam inhalations from 10 to 20 drops may be put into any common inhaler half full of water at 150° to 160° F, and the vapor inhaled, but it is better to diffuse the oil through water by magnesia, powdered silex, or prepared talc in the proportion of 40 to 60 minims of oil to 20 grains of magnesia and 1 ounce One teaspoonful of this mixture added to of water 8 ounces of cold water is stirred in the inhaler, and when 8 ounces of boiling water are added a con venient temperature is obtained, as it cools a little more boiling water is added, if it be desired to pro This is milder than the B P long the inhalation vapor olei pini sylvestris, and may be used when that "It is a very mild stimulant to the is too irritating mucous membrane, and an agreeable remedy for inhalation in relaxation, congestion and chronic catarrhal affections of the respiratory tract pini pumilionis is also an excellent addition to other inhalations, such as creasote and various essential It disguises the disagreeable odor of some and imparts its own fragrance to others" Dr James has used it to disguise the smell of iodoform, but the mixture should be freshly prepared, as after a few days decomposition takes place with the liberation The oil mixes well with eucalyptol of free 10dine and other inhalants

For internal use the dose of the oleum pini pumil The Mountain Pine, Mugho, or Pinus pumilio of ionis is from 1 to 5 minims, and small doses may be By distilling the bine is often taken, or a tragacanth mixture may be

made, or larger doses may be given in capsules When taken internally the drug acts as a carminative It is easily and quickly absorbed, and in the blood and tissues probably behaves like other terebinthinates "It is its action on the bronchial membrane during excretion that renders it valuable in disease of this surface, being a stimulant, expectorant, and disinfectant, hence indicated in chronic bronchitis, dilatation of bronchi, bronchorrhœa, some states of phthisis, and other affections The effect on the kidneys, however, should not be forgotten The violet odor of the urine is produced as with some other terebinthinates, and small doses seem diuretic, but its use in diseases of the unnary passages manifestly requires care" It may be used externally sprinkled on flannel, or on spongio piline It is said to be a cleanly, prompt, and useful stimulant and counter-irritant, and sometimes appears to have slight anæsthetic properties

The second terebinthinate, terpin hydrate, is very different from the oleum pini pumilionis It has no odor, but little taste, is rather insoluble, and is solid When crystallized spontaneously from a mixture of turpentine and water it appears as small needles, or it may be obtained in large rhombic crystals by allowing 3 parts of alcohol, 4 of turpentine, and 1 of nitric acid to stand in shallow dishes for 3 or 4 days It is only sparingly soluble in cold water or tupentine, but more soluble in hot-water, alcohol and ether, on account of its slight solubility it is best given in pill or wafer It may be dissolved in warm glycerin and then an equal quantity of some syrup may be added, which makes a suitable linctus From 16 to 24 grains to 1 ounce gives 2 to 3 grains to the teaspoonfull, a dose that can be taken every 3 or 4 hours Small doses, such as the above, should be used at first, since they are often sufficient for the bronchial affection, and may affect the hidneys, for large doses given to animals have caused hæmaturia. The effects of terpin hydrate are similar to those of other terebinthinates, and it is useful sometimes as a substitute for them on account of being tasteless and odorless

It restrains the cough and secretion of bronchitis, stimulating the bronchial membrane to healthier action and Germain See has found full doses restrain the copious sputa of some cases of phthisis, and had no case of gastric disturbance after long use of the drug, though others have been less fortunate. In some cases small doses seem to increase the bronchial secretion. It has been used successfully in hæmoptysis, and in some cases it is mildly diuretic. Its alleged hypnotic property is probably due to the rapid relief to the cough.

RELATION OF SCROFULOUS GLAND DISEASE TO OTHER FORMS OF TUBERCULOSIS

MR FREDERICK S Eve has recently published a series of experiments (in the British Medical Journal, of April 14, 1888) undertaken for the purpose of determining the relation of scrofulous gland disease to other forms of tuberculosis It will be remembered that some experiments by M S Arloing appeared to prove that inoculation with material from scrofulous glands was innocuous to rabbits, while it produced general tuberculosis in guinea pigs From his experiments he inferred that either scrofula and tuberculosis were nearly allied affections, but caused by different agents, or they were derived from a single virus, of which the activity was modified in the scrofulous form

Mr Eve's experiments were made with small fragments of the glands prepared with sterilized instruments, "and the possibility of infection of the animals with true tuberculosis was negatived by the precautions taken " In his experiments the inoculations uniformly caused tuberculosis While he shows that the virus of strumous gland disease produces visceral tuberculosis in rabbits as well as in guineapigs, he admits that the disease in rabbits is not so acute and rapidly fatal as that following inoculation with acute miliary tubercle "The difference is one of degree, not of a kind permitting us to infer, with Arloing, that struma is a specialized form of the tuberculous virus We must therefore fall back on another explanation of the clinically innocent course of strumous gland disease, and we find it probably in the locality or soil in which the virus is implanted Taking cervical gland disease, if the virus is not inherited from a consumptive or strumous parent, it may be surmised that the common bacillus of phthisis is implanted in the lymph follicles of the pharynx or tonsils, in one of the adjoining mucous membranes on the skin, and is carried direct to the These, acting as filters, arrest its progress permanently, except in some cases in which suppuration and ulceration take place, when the surrounding textures may become implicated, and general dissemination ensue The malignancy of the virus may be somewhat attenuated under the local influence of the lymph-cells and leucocytes in the gland, but to admit that the virus producing the disease is ab initio specialized, would be to infer that the strumous disease could only be produced by the virus of struma, and no other" Mr Eve emphasizes the objections to the terms "scrofula" and "struma" for lesions resembling tuberculosis The evidence that tends to connect strumous gland disease more

closely with general tuberculous affections should encourage the practice of early operation, whenever possible, with the view of completely eradicating the

THE MONUMENT FUND IN HONOR OF DR BEN-JAMIN RUSH

Two years since the American Medical Association adopted resolutions in favor of having a suitable monument erected in Washington to the memory of Dr Benjamin Rush, of Philadelphia, who died in Preeminent as a physician, a medical teacher and writer, a tried patriot and statesman, actively participating in the struggle that gave birth to the Nation and one of the distinguished signers of the Declaration of Independence of 1776, and an example of the purity of private and social life, no other name could have been chosen that would so appropriately represent the medical profession on an enduring monument among the many that adorn the parks and lawns of our National capital

A Committee was appointed to receive subscriptions for the purpose in sums of one dollar and upwards, from members of the profession in every part of the country It was ascertained that the contribution of the small sum of \$1 by each active practitioner of medicine in the United States would aggregate a sum amply sufficient for the purpose intended, and it was thought that very few members of the profession would hesitate an hour before sending their mite after the way had been prepared for them to do Dr A L Gihon, U S N, was made Chairman of the Committee, Dr G H Rohé, of Baltimore, Secretary, and Dr J M Toner, of Washington, Treasurer

The report of the Treasurer at the last annual meeting of the American Medical Association showed only a fair beginning in the receipt of contributions, and we have received intimations recently that much less progress has been made since that meeting than the Committe had reason to expect This is not so much from reluctance to give the \$1, as it is neglect to enclose the amount in a note and mail it to the address of the Treasurer of the Committee or to any one of the sub-treasurers appointed in the several This is illustrated by what recently took place at the annual meeting of the California State Medical Society when, after Dr Gihon had briefly directed the attention of the Society to the subject, every member present, numbering 106, cheerfully contributed his \$1 at once If the subject was properly presented at any regular meeting, with some one present authorized to receive the money, an equally country will subscribe for at least one copy

ready response would be obtained in every regular medical Society in the country We earnestly invite the immediate attention, not only of the members of organized medical societies, but of every member of the profession, and ask them to contribute their mite to so worthy an object without delay

EDITORIAL NOTES

LECTURES ON INEBRIETY -Dr T D Crothers, of Hartford, Conn, is to deliver a course of lectures on "Inebriety as a Disease and its Medical Jurispru dence," before the medical students of the University of Vermont at Burlington, May 21, 22 and 23, 1888 This is the second course of lectures on this important subject delivered to medical classes in this coun try, and indicates progress in the right direction

UNIQUE REMOVAL OF THE UTERUS -DR B B Browne, of Baltimore, applied a saturated solution of chloride of zinc to a cancerous uterus by means of a tampon which was held in place by absorbent Below the cotton he placed a second tampon which was saturated with bicarb soda and glycerin On the seventh day the tampons were removed, and on the tenth day the uterus in its en tirety sloughed and came away The specimen was exhibited before the Clinical Society of Maryland

Dr D Hayes Agnew's Fiftieth Anniversary -On the occasion of Dr Agnew's fiftieth anniversary in the profession recently a reception was given him by a number of professional men in Philadelphia On April 23 the alumni and students of the Medical Department of the University of Pennsylvania gave him a reception At the coming Commencement of the University of Pennsylvania its highest academic honors will be conferred upon the distinguished sur geon and teacher

DEATH OF DR J FORD PRIOLEAU -Dr J Ford Prioleau, of Charleston, S C, died at the residence of his son in Beaufort, on Wednesday, April 11, aged He was born in Charleston, and was graduated from the Medical College of the State of South Car olina in 1847 Since 1871 he has been Professor of Obstetrics, and since 1881 Dean of this College He was a member of the American Medical Associ ation

THE INDEX MEDICUS —The generous publisher of this most valuable periodical has sent out a circular stating that the Index is not self supporting not too much to ask that every medical society in the

unquestionably the most valuable medical periodical published in the world, and is indispensable to a literary worker

Porro Operation in Queensland—Mr H C Garde, Surgeon to the Maryborough Hospital, Queensland, reports, in the Australian Medical Gazette, March, 1888, a successful Porro operation for rachitic pelvis, 15 inch antero-posterior diameter, on a woman 23 years old, primipara The stump was treated in the abdominal wound The child, a son, survived

THE ITALIAN SOCIETY OF HYGIENE will hold its second congress in Brescia, on September 1, 2, and 3, 1888 There will be an exhibition of publications on hygienic and alhed subjects, of hygienic instruments, apparatus, and appliance, and of chemical and pharmaceutical products related to hygiene

DR HERMANN KRAUSE, Privat docent in the University of Berlin, who has been in attendance on the Emperor of Germany, has been made Professor of Laryngology

THE ROCKY MOUNTAIN MEDICAL ASSOCIATION will hold its annual meeting on Wednesday evening, May 9, in the parlor of the Burnett House, Cincinnati, at 8 o'clock

DR August von Rothmund, Professor of Ophthalmology in the University of Munich, celebrated his 25th anniversary as a teacher on March 20

An International Exposition of Hygiene and Life Saving and Preserving Apparatus will be opened in Ostend on June 3

DEATHS OF FOREIGN MEDICAL MEN—DR ROB-ERT DE LATOUR, of St Cloud, on April 4, aged 86 Dr Nikolai Ritter, of St Petersburg

ASSOCIATION ITEMS.

THIRTY-NINTH ANNUAL MEETING

To be held in Cincinnati, Ohio, May 8, 9, 10 and 11, 1888

PRESIDENT, A Y P GARNETT, M D, of Washington, D C

PAPERS AND DISCUSSIONS

The following additional titles of papers to be read at the approaching meeting have been received since the programme was published in the issues of The Journal for April 7, 14, 21 and 28

Section on Dermatology and Syphilography

"The Galvanic Current as a-means of Inducing the Penetration of Parisiticide Remedies to the Inaccessible Parts, as Hair Follicles etc.," "Report of an Unusual Case of Nervous Pigmentosus, with Illustration," "Report of a Case of Tinea Favosa of the Forearm, with Illustration," by Henry J Reynolds, Chicago

Section on Surgery and Anatomy

"A New Method of Treatment of Diseases of the Urethra Bladder, Uterus, and Rectum, Dry Medication, Dry Syringe Illustrated" By Elmer Lee, St Louis

Railway Arrangements

MONON ROUTE —Those unable to go by the special train of the Monon Route on Monday night may go on any day train on Saturday, Sunday, or Tuesday See advertisement on page 8

PAN HANDLE ROUTE—Attention is called to the advertisement of the Pan Handle Route on page 9 of this issue of The Journal. The Pan Handle is the pioneer through car line to Cincinnati, and is a portion of the Pennsylvania lines west of Pittsburgh, which should be a sufficient guarantee that any one patronizing the Pan Handle will have a pleasant and comfortable trip to Cincinnati

The Kankakee Line —This popular and direct line has made arrangements to run trains for the meeting of the Association at Cincinnati The times of departure and arrival are as follows Leave Chicago 9 10 A M, arrive at Cincinnati 7 15 P M, leave Chicago at 8 P M, arrive at Cincinnati 7 30 A M Parlor cars on day trains, Pullman Sleepers and Reclining Chairs on night trains This is the only line from Chicago entering the Grand Central Depot at Cincinnati, which is situated in the heart of the city, and in the immediate vicinity of the hotels and business centre Rates of fare same as on other lines For further information call at city ticket office, 121 Randolph Street, Chicago, or address J C Tucker, General N W Pass Agent

SOCIETY PROCEEDINGS.

MEDICAL AND CHIRURGICAL FACULTY OF MARYLAND

Ninetieth Annual Session, held at Baltimore, April 24, 25 and 26, 1888

TUESDAY, APRIL 24-FIRST DAY

The Medical and Chirurgical Faculty of Maryland convened for its ninetieth annual session in the hall of the Faculty, Tuesday, April 24th, at 12 30 PM, the President, DR I E ATKINSON, in the Chair, and Drs G L Taneyhill and Robert T Wilson, Secretaries

The President's Address was then made, on the subject of

MEDICAL CHARITIES

He began by speaking of the evil effects of indis-

criminate alms giving and poor relief, and its tendency to pauperize the recipients Much of such charity does a small fraction of good, but intensifies the munity. We should work toward the perfection of very evils that it is intended to arrest Fortunately | there are many with wealth, kindliness of heart, clearness of brain, and energy of hand, who realize that the bestowal of alms is not always true charity, that assistance to the unworthy may prove unjust to the deserving and meritricious to the recip-1 large class also does good by distributing The outcome of all such the bounty of others united efforts at systematic charity resulted in the formation, in several cities, of Charity Organization They have done immense benefit to the It may be profitable to considthe deserving poor er the administration of medical charity—a subject Generally those worthy of attention, and not trite who stand most in need of assistance are those whose misfortunes are the more or less imminent results of Two classes receive charitable their own actions (1) Those who from disease, age or infirmity are made to work for a livelihood, and (2) those who, suffering from neither of the disabling causes mentioned, live in idleness All in the first class need help, and not all in the second class should Able-bodied paupers exist now since be excluded the days of strikes The well and healthy laborer may find, as a result of his toil, enough compensation to supply his daily wants, but when sickness appears he appeals to charity for support In 1872 London, with four million inhabitants, treated gratuitously at the various hospitals and dispensaries about 1,100,000 sick, 58,382 as in-patients, and 1,083,674 as out-patients, and in this year £994,388 were contributed to this object, that is three persons in every ten of London received medical charity in 1872. The stress of work on the medical attendant in these dispensaries is so great that in one hospital (St Bartholomew's) dispensary 120 patients were seen and dismissed in 70 minutes, that is 35 Pauperism often begins seconds for each patient Patients able to pay are daily seen in in this way The competition of our dispensaries and hospitals medical schools for clinical material, and the desire of medical men for clinical experience, encourages The "Provident Dispensary Plan," started by Smith, of Southam, England, in 1837, has not been the success it should be In 1874 there were only 11 such dispensaries in London & O R R Relief Association is a good example of an excellent organization for medical relief In all such institutions membership must be compulsory The American laborer and poor man is less willing to go to hospital in this country than in England Our hospital arrangements are defective and their equipment and management inadequate York there are 3502 public free beds, and 1418 private free beds, while in Baltimore there are only 868 free beds, of which 365 are in the almshouse ganized charity would soon weed out the undeserving sacs there is doubt cases, and the saving would more than compensate for the expense of investigation by paid officers of the amount of good which the medical man does importance of making the operation radical, and the

Even the Johns Hopkins Hospital, with 120 free beds, cannot fulfill all the requirements of this comour medical charity, and strive for improvement in the future

DR CHRISTOPHER JOHNSTON, SR, as Chairman of the Section on Surgery, then read a paper on

TETANUS AND ERYSIPELAS

The great cavities of the body are boldly visited by the surgeon both for cure and diagnosis Laparotomy has passed through many different stages, and Sanger's operation is now performed at the right time with good results Two young surgeons in the city have recently done it Diagnosis, pathology, and the means of cure march hand in hand Brain surgery is enlightened through the discoveries of physi Tetanus and erysipelas are ology and pahthology described both as idiopathic and traumatic Most writers believe now that the disease cannot originate Cold and damp seem to have much to do with the causation of tetanus, but a causative injury cannot always be found Gross says it is a peculiar The dualists believe in the affection of the nerves two forms, and the unicist in the single form of tet Nicolaier and Flugge believe in the bacillus of tetanus as a cause, but think that other agencies, Verneuil is a dualist such as damp and cold, help Certain localities seem to favor it There is a tetanic district near Baltimore, and one on Long Island Experiments made with the soil of these districts have not been convincing It is infectious, and may be conveyed from man to rabbit, and from rabbit to Some veterinary surgeons have had a succession of cases after operation for castration, and this was evidently due to infected instruments, which can retain the materies morbs for a long time Those who have much to do with horses seem to be more exposed than others Rosenbach also discovered a microbe, and Brieger several ptomaines called tov-In erysipelas there is little doubt as to its causation by a microbe Fehleisen has done the best work here

DR ROBERT W JOHNSON made a supplementary report on

THE TREATMENT OF THE SAC IN HERNIA

After dwelling on the danger of hernia and its im portant place in surgery, he gave a short historical sketch of the early manner of operation Some think that if a truss can be comfortably worn in non stran gulated hernia, an operation is not justifiable thought there were times when an operation should be performed to cause a radical cure, for, as in the case of a sailor at sea, a broken truss would give much pain and do immense harm of cases are

- Those under easy control of the truss
- 3 Strangulated cases, about the contents of whose

If a truss be worn it should be fitted carefully by

DR J EDWIN MICHAEL called attention to the the physician

fact that there was not so much risk of an operation for non-strangulated herma if done carefully The patient should be instructed before of this risk He used silver sutures, and did not find that they cut the tissue

DR J W CHAMBERS had done three such operations of late, and had little rise of temperature in one case He used catgut

WEDNESDAY, APRIL 25-SECOND DAY

The Annual Address was then delivered by DR RICHARD GUNDRY, Superintendent of the Maryland Hospital for the Insane He announced as his subject,

SOME PROBLEMS IN MENTAL ACTION

In a scholarly and chaste address he traced the various causes of insanity There are three causes to which it is referable, inheritance, environment and personality Each of these influences was considered As methods of prophylaxis and at some length treatment he urged the importance of manual training as a means of mental diversion and training Those predisposed to insanity, he asserted, should early be taught the lesson of self-control hibitory power of physical exercise may be seen in various ways A noisy, blasphemous boy was quiet all the week while at work, was noisy on Sunday until made to work on that day when he became quiet The inebriate, the vicious can all be reclaimed by methods of substitution provided they themselves seize the idea and do not let it slip away

Character may be largely formed by circumstances but our own desires have much to do with shaping

these circumstances

DR P C WILLIAMS, Chairman of the Section on PRACTICE OF MEDICINE made the following report He called attention of the Faculty to several important points

1 We should recognize the meeting of the International Medical Congress held at Washington last year as and event in the medical history of the world and of our country

2 Several clinical points are of great interest

a The peculiar epidemic of measles in Baltimore this year It was widespread, severe, showed unusual nervous symptoms, and unusually high temperature at a late period of the disease with no inflammatory trouble in the lungs and few cases of secondary pneumonia.

Extreme mortality and gradual increase of cases of measles in Baltimore during the past winter From October to March, included, there were 149 deaths from measles, beginning with 3 in October and ending with 49 in March A serious result for a disease disease

usually considered trivial

b Prevalence and mortality of pneumonia in Bal-From October to March, included, there were 485 deaths from pneumonia in Baltimore, begin ning with 33 in October and ending with 133 in March There were many cases among the young Before 45 single pneumonia is not usually considered dangerous It is a question whether it is an inflammatory or contagious disease

c There has been a great prevalence of serous diarrhœa, apparently due to climatic changes and not to bad water

d Fifteen years ago he read a paper on the use of yellow jessamine in supra orbital neuralgia. Believes it now almost a specific, next to ergot, in cerebral congestion The tincture is used, and a stronger tincture is used than usual He stops it when ptosis

DR GEORGE J PRESTON then made a supplemen-

tary report on the subject of

PERICÆCAL INFLAMMATION

After speaking of the ease of opening the peritoneal cavity without danger, he said that the terms perityphlitis, perityphlitis and appendicitis were cumbersome and probably not correct, as it was doubtful if one occurred alone in man The best division is into 1 Typhlitis stercoralis, 2 Perityphlitis, 3 Appendicitis After reviewing the anatomy he said that appendicitis was not easily recognized during life He enumerated the number of objects found in the cæcum The symptomatology is quite It is not easy to speak of its duration Occasionally the sacruptures, and again it sometimes takes on a chronic form After speaking of the etiology, he said that cases of perityphlitis and typhoid fever were not seldom confused The prognosis of simple typhlitis is good if all obstruction be removed Sulphate of magnesia is dangerous with inflammation An operation should be avoided, but pus should be evacuated, and the evacuating needle as an aid to diagnosis is not so dangerous as was supposed cited two cases from his own practice, in one of which an operation was performed with good results

DR WILLIAM B CANFIELD, in referring to Dr Williams' paper, spoke of the part which intemperance played in the large mortality from pneumonia among the younger adults, and also of the contagious element of the disease, as well as its inflammatory

DR JOSEPH T SMITH spoke of bad and unfiltered

water as causing diarrhœa.

DR P C WILLIAMS replied that intemperance increased the mortality of all diseases About 70 per cent in hospital die of diseases in which intemperance played an important part In the first quarter of 1887 there were 199 deaths from pneumonia in Baltimore, and in the first quarter of 1888, 335 He believed in the inflammatory theory deaths

DR WM RICKERT approved of recognizing the International Medical Congress He thought that climate had much to do with the causation of pneumonia, diarrhœa and dysentery He thought that supra-orbital neuralgia was a symptom and not a

DR RICHARD GUNDRY recalled treatment by bleed-He thinks little of treatment, but prefers small doses frequently repeated He fully believes that diarrhœa and dysentery are due to climatic changes

DR L E NEALE then read a paper comparing CÆSAREAN SECTION AND CRANIOTOMY ON THE LIVING

CHILD

After reciting two cases he proceeded to mention

the best possible treatment of contracted pelvis by

Removal of the uterine appendages before con- should be paid for it by the Government ception occurs

2 Induction of premature labor at a period of or private houses

extra-uterine feetal viability

After speaking of delivery by version forceps and other means in contracted pelves, he said the last resort was Casarean section, or craniotomy motomy destroys one half of the human lives at stake, while Singer's operation as now performed saves almost all mothers and children He does not believe that pelvimetry on the living subject at term is always sufficiently accurate to be a guide, for we have no means of measuring the head of the unborn It does not seem as if, the natural passages being 215 inches conjugate, the line of natural delivery should be drawn there Craniotomy does not seem right when death is certain for the child, while Casarean section gives them both a chance

DR J H BRANHAM thought too little was said about the mortality to the child The operation should be done at the time of election, and this is not at full term

DR GEO W MILLENBERGER said that a week or two before full term was an equally favorable time The uterus was just as capable of contracting, and it had no effect on the mortality of the child

DR J H BRANHAM thought that a week or two earlier made a great difference in the viability of the child, he also thought that we could judge of the

arrival of full term by the cervix

DR GEO W MUITENBERGER did not agree with Dr Branham at all In a large proportion of primipara, children are delivered one or two weeks before the time with no harm to mother or child was not possible to make such hair-splitting distinctions in the condition of the cervix

DR WILMER BRINTON thought that more stress should have been laid on pelvimetry, and the result would decide as to craniotomy or Cæsarean section He did not think that foreign statistics of operation could apply to this country

DR L E NEALE, in conclusion, said that he operated as near full term as it was possible to find He does practice pelvimetry, but it does not always

seem free from difficulties

THURSDAY, APRIL 26-THIRD DAY

DR GEORGE H ROHÉ, Chairman of the Section on Sanitary Science, read a paper on

RESTRICTION OF CONTAGIOUS AND INFECTIOUS DISEASES

Of the deaths in Baltimore during the past five years, 43 2 per cent were due to infectious diseases, in which are included pneumonia, consumption and Many of the diseases may be prevented diarrhœa Diseases are imported and by sanitary measures There are many defects in quarantine in domestic There are three ways of preventing dis-Baltimore eases, by

r Compulsory notification of contagious diseases

2 Isolation

3 Prompt disinfection

1 The physician should report such diseases and

2 Isolation is very important, whether in hospital

3 Disinfection may be effectually carried out by mercuric chloride (1-500), chloride of lime, 6 ozs to 1 gallon, and a solution of the hypochlorite of sodium Soluble phenyl is also excellent

Dr John Morris read a paper on

UNSANITARY AGENTS IN COMMON USE

This included trees, ice boxes, refrigerators and He pointed out the dangers of too many trees about a country house and enumerated the healthy and dangerous trees and their soils He spoke of the danger of preserving foods, etc., in ice boxes, and the advantages of using refrigerators through which there passed a current of cool, dry air, laden with the vapor of the chloride of sodium and permanganate of potash He referred to im pure drinking-water and to the fallacies in many filters

DR JOHN S CONRAD, in referring to Dr Rohe's paper, thought that quarantine should be under the control of the Government as a part of the U S Different degrees of strictness at Marine Service different ports did harm to commerce Crowding in quarantine sometimes spreads disease He felt doubt ful about the decided germ destroying power of all the remedies mentioned

DR JOHN MORRIS referred to three recent cases of small-pox in Baltimore and the efficiency of the city Board of Health in preventing the spread of this He did not think physicians should think disease

of taking pay for such noble work

DR WILLIAM B CANFIELD said he had arrived at the port of Baltimore from Europe in 1886, and, al though there was a case of small-pox on board, there was a delay of about fifteen minutes only at quaran A few weeks later small pox tine, and all landed broke out in a Western town, and it was traced to this steamer

DR GEORGE H ROHE could bring evidence of the efficacy of the disinfectants mentioned by him He thought householders objected to reporting cases of infectious diseases on account of the inconvenience and expense of disinfecting The Government should

do this

DR THOMAS S LATIMER read a paper on REFLEXES,

in which he referred to the fact that reflexes were rarely absent in health, and often absent or evagger ated in certain diseases He thought their study had grown in importance since the elaborate work of Lombard

DR John S Conrad read a paper entitled HALLUCINATION, AND ITS ALLIED STATES, in which he ably discussed hallucinations, delusions,

illusions in the sane and insane DR WILLIAM B CANFIELD read a paper on THE MICROSCOPICAL EXAMINATION OF URINARI SEDIMENT,

in which he dwelt more particularly upon blood, pus,

epithelium and casts in all their varieties, not omitting the details of the technique of searching for sediment

DR SAMUEL THEOBALD read a paper on

THE INFLUENCE WHICH THE DISCOVERY OF COCAINE HAS EXERTED UPON OPHTHALMIC SURGERY,

in which he referred to its advantage in cataract, squint, and other operations on the eye, and as rendering more bearable applications of strong astringents in granular lids

DR W R MONROE then read a paper on

ONYGEN AS A THERAPEUTIC AGENT

He reviewed the advantages of the use of oxygen in different diseases, and advocated its more general use by the regular profession

DR CHARLES G HILL read a paper on

ALCOHOL IN ITS RELATION TO INEBRIETY

After considering the number of drunkards in this country and the fact that 20 per cent of all cases of insanity could be traced to inebnety, he treated the subject of alcohol as a food and as a narcotic, and then discussed the different diseases caused by inebriety and the necessity of physicians paying more attention to guarding against this in their practice

DR. WHITFIELD WINSEY read a paper on Some Thoughts on Blood letting, in which he advocated the

revival of this mode of treatment

DR CHARLES O DONOVAN, JR, read a paper on A Case of Urethral Stricture with Severe and Unusual

DR HENRY SALZER read a paper on Dietetics in Febrile Conditions

DR J H BRANHAM one on Excision of the Larynx,

DR J H DEWOLF one on Urgent Needs of the Medical Profession

The following were elected

OFFICERS FOR 1888-89

President—Dr John Morris

Vice-Presidents-Dr J Edwin Michael, Dr Thos

B Evans

Recording Secretary-Dr G Lane Faneyhill Assistant Secretary—Dr Robert T Wilson Corresponding Secretary-Dr Jos T Smith Reporting Secretary—Dr William B Canfield Treasurer-Dr W F A Kemp

CHICAGO MEDICO-LEGAL SOCIETY Meeting of March 3, 1888

E J DOERING, M D, PRESIDENT

DR L L McARTHUR read a paper on

THE MEDICO LEGAL ASPECT OF POIT'S FRACTURE

(See p 553)

DR JOHN E OWENS I am glad this subject has ment

long splint to which the author of the paper has just The splint is technically Ducalled your attention puytren's splint, the leg being protected with a wedgeshaped piece, the thick portion of the wedge being below and reaching to a point just above the inner malleolus, serving for a fulcrum The portion of the splint which extends a few inches below the sole of the foot is not necessarily padded, it may be covered with some thin cotton, the foot being bound to the lowest portion by a bandage or adhesive plaster The plas ter of Paris treatment is one which I think has surprised more doctors in general practice and surgeons in their special practice of surgery than any other one splint that has been brought to bear upon Pott's fracture, or analogous injuries, like fracture of the fibula itself, without other complication In reference to the point that the inner malleolus is broken in Pott's fracture, I have seen as well-marked cases of deformity without any fracture whatever of this portion of the tibia as could possibly have occurred with such So I think that, while this is often a complication a complication of the fracture under discussion, it is not so in the majority of cases I remember that about twelve or fifteen years ago a case came to Rush College clinic with great deformity Prof Gunn said nothing before the patient that would create trouble between her and her medical attendant, but after she left the room he explained fully the defect in treatment which induced the result He suggested, in this case, cutting down upon the fibula, dividing it, and bringing the bones into their proper relation to The reason the deformity exists is because the broken fragments are closely approximated to the outer surface of the tibia, and having united there it is impossible, without some operation, to remedy it The operation was not performed at that time, but it is one that is well worth thinking of It is quite practical and I think would remedy some, at least, of the deformities The rupture of the internal lateral ligament is perhaps the worst feature in Pott's fracture, as union is usually defective

DR E W Andrews I differ from the last speaker I should advise every practitioner in one matter who handles surgical cases never to allow himself to diagnose a fracture by an inference from tenderness, or absence of fracture by absence of tenderness One who practices surgery and treats fractures must, for self-preservation, in every case make a positive diag-I should never treat a fracture where I could not obtain authority to anæsthetize the patient if I thought best, and make an examination so thorough as to satisfy myself whether the bone was broken

The uncertainty in terminology which the reader has referred to, in Pott's fracture, as having caused many physicians to employ a looseness of expression, runs through the books also Several of the standard works on surgery speak of Pott's fracture, with or without fracture of the inner malleolus

The author says the medico-legal aspect of the case will depend largely upon the physician's treatbeen brought before the Society So far as my own legal aspects of the case are quite different from the practice goes I never trust myself, in the treatment purely medical ones, and I should say they depend of a fracture of this kind, with any other than the upon about three things careful progrosis, good witnesses and careful records In the first place the medico legal aspects may depend upon the nature of senting this paper, it was necessary to dwell consid the prognosis which you have given to the patient, as this will largely influence him in his desire to bring the matter to trial It is often suggested to the paient that the doctor has been incompetent or negligent in his treatment when he is disappointed at the results of a fracture He has not obtained the same result which some friend has obtained Too often the doctor has not given an absolutely correct prognosis, masmuch as no one can promise a good result from any fracture The physician may expect a good result and may so promise to the patient, but if he is wise he will not do so, he will not fail to let the patient know in the case of any fracture the many possibilities of bad results that hang about the case-of lower fragment of the fibula to the tibia exists and non-union, of an anchylosis in putting the worst before the patient, not with the idea of winning any greater credit for ourselves, but Secondly, I think the as a matter of protection medico-legal aspect of the question will depend not alone upon the physician's skill in treatment, but upon his ability to summon witnesses when it comes Every physician who treats a case of fracture, easy or difficult, whether he thinks it is sure to fracture of the lower portion of the fibula, it is not so result well or not, should have his witnesses physicians, in handling such a serious matter as a fracture, do have witnesses They require assistants, and it is seldom any one attempts to set a fracture without having some one else by, but there are times when you are tempted to do so, and my advice is, never do it As Mr Punch said to those about to marry, "Don't" You will find that your ability to bring witnesses will deter lawyers from bringing suits against you, and the facilities they may have for finding out that you have not witnesses will enable them to push claims for blackmail In the third place I would say, be careful of your records Records diagnosis, the date of the occurrence and also the taken to prevent the entrance of micro organisms should include the details of your examination and names of witnesses present In this way you can served the letters you have received in regard to the fluid and destroy the micro-organisms thereon, and another physician, and, if you send letters, keep a must render thoroughly antiseptic all instruments copy of them. You may have received letters in used in the process of delivery. The lower part of used in the process of delivery. return stating that the patient arrived in a certain These and all similar papers should be tiseptic preserved, they may be worth thousands of dollars to inations you any time for about two years, after which I believe, in Illinois, the statute of limitations protects you

I do not know of anything DR CLARK GAPEN to add to this discussion unless it would be to reiterate the care with regard to which records should be I have noticed the moral influence of this upon an adversary time and again I came face to face with a case of that kind about three years ago, in which, when the fact was presented to our adversary that the most thorough and careful records of the case had been kept from the beginning, the entire suit was abandoned Bacon says that "Writing of writing acquires that habit of exactitude that is a ter from lesions of the genital tract, and that the mile warning, at least, to one's adversary warning, at least, to one's adversary

DR L L McArthur I am aware that, in pre erably upon the technical points of the case in question, and in doing so it naturally gave to the paper rather a more surgical than a legal aspect, but I trusted to the development of legal questions

The suggestion of Dr Andrews that the proper name be given to the fracture, and his emphasis of the fact that all simple fractures of the fibula are not to be included as Pott's fracture, I think a good one

I am glad to learn, simply as a matter of valuable information, that in the State of Illinois books and treatises on surgery and medicine are not matters of evidence

That the interosseous ligament which binds the I think we are justified that it is of about the dimensions Dr Hoadley men tioned, I, of course, am ready to admit, it is a self evident proposition But that the ligament situated at the point at which the fulcrum acts prevents rock ing of the lower fragment after fracture has occurred, with its attendant laceration, I decidedly object to I emphasize this point, as my attention was called to it by Dr Miculicz as a simple way of diagnosticating easy when the fracture is above the middle of fibula

DR J H ETHERIDGE read a paper on

THE MEDICO-LEGAL ASPECT OF UTTERANCES MADE IN MEDICAL SOCIETIES

A few months ago the retiring President of the Chi cago Gynecological Society delivered the customary address upon relinquishing his office to his successor In that address he advocated the extremest antiseptic treatment of parturient patients He took the ground that disasters after delivery arose from micro organisms gaining access to the uterine cavity and Hence the attending physi there producing larvæ cian must see to it that all possible measures are into the vagina and uterus of the lying in patient To this end he must wash his hands in an antiseptic thus avoid conveying them into the vagina He used in the process of delivery The lower part of the parturient canal must be rendered thoroughly an He must make few, if any, vaginal exam

At another meeting of the Chicago Gynecological Society the discussion of puerperal infection was The doctrine of Semmelweiss, first enun ciated in 1847, that puerperal fever is caused by a continued poison introduced into the genital tract from without, was accepted by some of the Fellows in toto carrier of the poison is the hand of the physician of nurse, or some of the appliances used by them in the course of the labor or soon afterwards, as obstetrical instruments, sponges, syringes, etc The pith of the discussion was enunciated by one speaker in the " The belief that every case of puerperal feet arises from the absorption of decomposing organic mai

nurse Provided the patient has been surrendered entirely to their control, and she becomes the subject of puerperal fever one or the other, or both, have directly infected her The atmosphere, as a bearer of infection, may be excluded in the majority of cases?

In response to these assertions I raised the question of the medico legal bearing of such teachings, expert witness in a case of alleged malpractice wherein the usual course of managing a case of labor had ob tained, and puerperal fever had killed the patient subsequently, and he were asked the question, "Do you consider the practitioner responsible for that woman's death?" what his reply would be? His reply was "If the physician's fingers were the only objects that had come in contact with the genital to act of the woman, and if he had not observed the precautions already men tioned, and if the atmosphere, as a bearer of infection, could be excluded, it would be consistent with the facts in the case that the physician infected the woman"

As a practical bearing of this subject I desire to state that I received a letter from a physician in an Eastern town, after the publication of the discussion in question, wherein he gave an instance of the medico-legal interest of this subject A man, whose wife had recently died of puerperal fever, took the initial steps of bringing a malpractice suit against the attending physician He was incited thereto by a conscienceless Ishmaelite in the local medical profession, who assured him that he could win his case on the strength of opinions and articles published in the current medical literature

DR JAMES H ETHERIDGE (oral continuation of You may go through the whole of therapentics and you will find that very little is absolutely settled in regard to the treatment of diseases An at peral fever, to establish in the range of fixed subjects proceed at once to the operation it is convenient to put on and to take off and again, where women have been taken care of by rosive solution, in order to prevent this danger of incompetent midwives or slovenly physicians, and contamination to the patient yet these women do not take on the puerperal infec-The most dreadful obstetrical operations have directions in regard to the management of the vagina

mendous weight of responsibility on the physician and terial influence, and in that way the patient escapes That is a convenient loophole We know that if we have an abrasion upon the finger, we are extremely careful to avoid any infection while dressing wounds, showing that in such emergencies we have a constant and persistent belief in the theory of infection

By the advocates of the Semmelweiss theory, the physician is directed, before attending to a lying-in and asked the speaker, if he were called upon as an patient, to wash his hands thoroughly with soap and a 2 per cent solution of carbolic acid, but he wipes his hands upon a towel that is in the room while they are exposed to the atmosphere of the room cording to the advocates of the germ theory the atmosphere is loaded with micro organisms, hence his cleanliness is not perfect. If he wish to be perfectly aseptic he should slide his hands up out of a bowl of carbolized water into the vagina Between the time of the antiseptic hand-washing and the time of making a vaginal examination as commonly carried out, there is an abundance of time to acquire three or four layers of micro organisms from the air on the obstetrician's hands Right here I would like to make a quotation from Dr Merriman While this subject was under discussion at a meeting of the Chicago Gynecological Society in July last, Dr Merriman made the following remarks, and I think they should be included in every discussion of the Semmelweiss theory of puerperal infection

"It strikes me that the vagina itself is not a very clean place in the majority of women, and that there is as much liability to sepsis from the vagina itself as from the physician's hand or finger I should very much dislike to take a sponge or anything that contained a portion of the fluid of a woman in labor and bring it in contact with a wound where I wanted to guard against sepsis and against poisoning I should be very much afraid to take any of that vaginal fluid tempt is being made at the present time, by believers and bring it in contact with the wound in an ovariin the micro-organism theory of causation of puer-otomy, or to make a vaginal examination and then that of puerperal infection, but it seems to me we passed my disinfected finger into the vagina and then, should be slow to accept this The Semmelweiss without any new disinfection, proceeded to an ovaritheory is subject to many fallacies, like an overcoat, otomy, I should expect trouble It strikes me we When a have more danger from an unclean vagina than from pattent gets puerperal fever, and we find there has the hands of the physician I do not imagine that been unclean attendance on her, we may come to in the majority of instances the finger of the physithe conclusion that she has died from infection, but clan is such a contaminating source of trouble as is we will find a great many cases where this explana- claimed If this is the case, if it is all brought in tion will hardly answer, cases that have been taken from the outside, we ought to insist that there shall care of in the most careful manner We may, with be no sheet used on the patient, no garment brought out using instruments or making a vaginal examina- about the bed, no old quilt or anything of that kind tion, determine the position of the child by external placed in contact with her that has not been just manipulation, and yet have puerperal fever follow washed and disinfected, and we should insist upon it There the Semmelweiss theory does not suit our con- that at the beginning of labor the vagina should be We all know of, or have seen, cases time thoroughly disinfected by being douched with a cor-

How is it be no uncovering of the wound in any way lest the possible to bathe all of the vaginal surface by douch-microorganism got in there. So with iodoform, no ing in the ordinary way? How long will it be before body thought we could treat a wound without cov the Semmelweiss theory will be modified or before ering it with iodoform Five years ago the Pansian something better will take its place? We find all surgeons all used iodoform lavishly in surgical dressthe way through medicine and surgery that theories ings are taken up and abandoned istry will answer the purpose of illustration A few iodoform in surgical dressings. And so with antiyears ago it was a great point for chemists to be able septic precautions generally, the belief existed only to give a test for artificial bitters introduced into A gentleman named Allen, the author of "Allen's Comparative Analysis," said that all bitter principles of beer could be precipitated by using a certain preparation of lead, a solution of the subacetate He wrote upon this and it went out in the this way the carbolic acid must be kept constantly journals and books and was looked upon as author- in contact with the instruments itative, it was something tangible, it could be these operating rooms of an advanced gynecologist weighed, seen, felt, in this way they could test for was almost like going into a museum, it was very in aloes, quassia and the different bitter principles that teresting, and the scientific accuracy with which the original hop has failed to give in large quantities In those days Professor Allen was an authority on Suits were lost or won on his testi such subjects But this same gentleman subsequently abandoned that idea and said it was still possible to he does not believe in killing microorganisms with get a bitter taste, after using this test, and that he antiseptic drugs, all that he uses is cleanliness was unable to dissolve out, with the sub-acetate of The antiseptic man will say that this is antisepsis in Let us suppose that somebody another form had gone into the courts and brought suit against why the terrible, death dealing microorganisms so lead, all the bitters one of those great manufactures of malt liquors for adulterating his malt liquors in the old country, he drugs do not destroy this gentleman's patients? Another inwould have won without a question have a strong hold upon the world, is the subject of iodoform, it is claimed, is not a reliable destroyer of It was taught for a long time that fermentation fermentation was caused through the means of contact with oxygen it was unquestioningly taught in the medical books Oxygen was the only thing necessary to fermentation as being illustrative of the complete changes than The scientific world, for years, considered that medical opinions so often undergo in a few than the scientific world, for years, considered that medical opinions so often undergo in a few than the scientific world, for years, considered that medical opinions so often undergo in a few than the scientific world, for years, considered that medical opinions so often undergo in a few than the scientific world. chemical experiments, und found that oxygen from ing our consideration. It is so firmly believed in, that point settled tation, and that led to the question, is there the witness stand as an obstetrical expert, that a oxygen and oxygen? mentation went on still further, while he was working on his germ theory of disease, and he made, finally, an important discovery which revolutionized the theory, viz, it was not oxygen, but micromore, he demonstrated that we can get fermentation is so possible to have, a few years hence, another, without ox voen. In the range of surgery there are a great many theories accepted and abandoned from theory of the causation of puerperal fever, that I time to time Not many years ago the man who opened time to time Not many years ago the man who opened am astonished that anyone can utter such words the abdomen without having a spray of carbolic and the abdomen without having a spray of carbolic acid as were quoted early in my remarks, while the playing upon it. was guilty of criminal neglect. preparations made for a large spray to be thrown on introduce this subject. I have brought it before the the operator and the patient, it was looked upon as playing upon it, was guilty of criminal neglect the operator and the patient, it was looked upon as society, and it seems to me that until we have a sine and non in all surgical operations. In open have all been in hospitals where we have seen a sine qua non in all surgical operations. In open-theories and treatment of cases that are reliable and ing an abscess it was directed that it be covered with ing an abscess it was directed that it be covered with accurate, and beyond attack, the utterances I have gauze, a bistoury slipped under it and used in order gauze, a bistoury slipped under it and used in order | quoted from the Gynecological Society of Chicago,

We that the abscess might not be exposed to the air Wounds were so buried in this drug that An instance in chem-they were invisible To-day not one of them uses a few years ago that any one who opened the abdo men must undergo the most careful preparation of the hands, instruments should be washed in a 95 per cent solution of carbolic acid, then thrown into a 2 per cent solution during the operation, and in To go into one of everything was done was astonishing Now we go to the other extreme I know a gentleman who avers that he has done laparotomies for years, with out the slightest antiseptic drug precaution, because Admitted, but will he kindly explain constantly in the air and undestroyed by stinking

Only a short time ago, carbolic acid and iodolom were regarded as reliable bacteriacides germs—hence, it is going out of use as a germicide Carbolic acid, some one now claims, is so defective Liebig first brought this out, and in germicidal properties that microorganisms gambol sportively in its solutions These points are men tioned as being illustrative of the complete changes Here is the Semmelweiss theory now claim that at least one young man is willing to swear, on His investigation of fer- death from puerperal fever can be laid at that door of the attending physician! Let this theory depend on an alleged microorganism that no one has seen, excepting Pastuer, who thinks that he once saw it, and all other possible causes, which are certainly fully as rational are coughed down and ignored it

This closes what I have to say

brought to our doors kind I have quoted to-night will be laughed at tor was responsible for the woman's death rather than endorsed by the profession of this city

I did not expect to say a word DR C T PARKS I certainly am strongly an adupon this question vocate of the principle of not making positive assertions on any ground, certainly not on this ground of puerperal fever which always has been a source of annoyance to the profession, and never has been thoroughly understood or the cause of it explained there is no man who practices medicine, but does so attempt to have a clean patient, and a clean person as far as he can, true, there are some who do not expressed the true condition of affairs seem to go very far the care of patients in every way, and of themdays of acute peritonitis In that case the infection did not come from the doctor nor the nurse, and if of the patient's body

I have nothing special to DR D A K STEELE say on this subject, only to agree with what Professor, Parkes has said, that we should not be too hasty in putting forth dogmatic assertions in this matter am as firm a believer in the germ theory as any one, where it is difficult to trace the relation between cause and effect thought so much of as to-day, have never had a case get along without any septic infection But when we see a physician who is careless who did so

should be thoughtfully gone over before being given tious disease communicated to the lying-in woman Just as sure as we live, if we endorse by the physician, and yet I would be very careful in such utterances as these, we are going to have, in laying down an absolute law or making an absolute the next few years, a great many malpractice suits statement, I would hesitate to go into court in a In ten years, assertions of the case as clear as that and say absolutely that this docmay have been some factors other than that having a direct bearing on the case

I feel a little reluctant to speak DR I C HOAG on this subject, and yet feel that I ought to do so, as a portion of the discussion in the Chicago Gynecological Society was upon a paper which I wrote, but which I did not hear discussed I think such remarks as Dr Steele has made are worthy of all commenda-Personal experience is about the only thing I can tion, the point being this, that no matter what our depend upon I go upon the general principle that views may be, so far as public expression is given to them they should be free from dogmatism I entirely with a desire for his own good and the good of his concur, for the most part, in such expressions as Dr patient I do not think there is any man but will Earle has frequently given utterance to I think that Dr Etheridge, in his paper, has not by any means I think the Those who do not make an germ theory of disease is no longer a matter of theattempt to take care of the patient and themselves ory, but an established fact, in its principal relations, are blameless in the matter, I believe In my earl at least. If we are to find fault with hasty or illperience, I have seen cases of puerperal fever considered utterances on this subject we will presfollow, notwithstanding the fact that the utmost care ently be getting back to such conditions as obtained has been given by conscientious physicians who not alone in obstetrics, but the whole field of surgery, were thoroughly posted in antiseptic treatment, and eighteen years ago, the time when Lister made his wonderful discoveries To my mind the proof of the A few days ago a case of this kind hap- pudding is in the eating, those who advocate the pened in the practice of a gentleman who is well-germ theory of disease and follow out its logical known in this society, and who for several years has teachings are the safe surgeons and obstetricians evercised the greatest care in using antiseptic treat. That puerperal fever was one of the most destructive ment, even going so far as to use not only large of all diseases is proved by the Berlin Commission quantities of douches but as well large external who reported some years ago that the deaths from dressings. But notwithstanding all this care with puerperal fever exceeded those from cholera and reference to his patient, the nurse and himself, the small-pox combined. The most wonderful progress patient got puerperal fever and died inside of ten has been made by those who do believe in the germ theory of disease

In regard to the methods of prevention there is a it came at all, it was from the decomposing detritus difference of opinion, some in their zeal wish to use the most powerful antiseptic agents, and some do not believe that they are at all necessary My own opinion in the matter is that, for the most part, the vagina is to be regarded as practically in an aseptic condition That germs are present there there is no possible doubt, because they can be found at any and yet every once in a while cases come up that time by a little investigation, but that they are very puzzle us, cases such as referred to by Dr Parkes, infrequently the source of puerperal infection is quite as certain, witness the result of labor cases that are On the other hand, some of us left enturely to nature It has been proven again and who have practiced for years, before antiseptics were again that where women are left entirely alone they In the V₁of puerperal fever occur in our obstetrical practice, enna Hospital it has been often noticed, and in Semso that the Semmelweiss theory seems sometimes not melweiss' time, that patients who gave birth to their to explain these cases, they don't all seem to be due children on the street and were brought into the hosto infection from without-from the nurse or the doc- pital escaped infection and were often the only ones I remember of seeing, a few days ago, and slovenly, who will go from a case of erysipelas a reference to the statement of Credé that he did not to a lying in woman, and following that the woman believe in making vaginal examinations. At the time is taken with puerperal septicemia, the relation seems I wrote my paper in which I expressed myself as so direct that we say it lies at the door of the doctor favorable to limiting the practice of making vaginal Such a case has come under my observation during examinations, I had seen no reference to this Every the last month, where it could be traced to an infec- now and then an epidemic will break out, and the

source of infection can usually be traced to some careless student or physician, and I must say that in Vienna they trace most of these to Americans has happened that little epidemics have started up there directly traceable to examinations made by American physicians

So far as my own treatment of these cases goes, I regard the patient in an aseptic condition and only liable to develop the poison from poison brought to There is no doubt that we can her from without make out position by external palpation, but that per cent, and in Lombardy, one year, every woman this will entirely supersede the vaginal examination The matter of vaginal douches I do not believe has been carried to too great an extent, I believe the vagina before labor and during parturition is in an aseptic condition unless something is brought to methods that were tried in early years have been it from without, that following labor there is no special indication for douches

Dr Merriman's remarks to see such expressions as CredC's given the widest publication

There are so many things to be said on this subject that I scarcely know where to begin or stop, but I cannot find in my own mind too much praise for those men who have brought this matter prominently to the front, and while some of us may make statements that seem too dogmatic and would perhaps stand a little modification, yet I think such plans of treatment as suggested by these men are the safer ones to follow

DR C W EARLE I did not know that the honor had been assigned to me of being the chief advocate of the Semmelweiss doctrine However, it it is accredited to me I accept it and thank you for the compliment I am exceedingly sorry that Dr Etheridge has taken us back and given about the same argument that must have been given 45 years ago, when the illustrious Semmelweiss, in the face of ridicule and scorn advanced his new ideas regarding If it is true, as it was stated in the puerperal fever Gynecological Society some weeks ago, that certain remarks regarding the responsibility of doctors and nurses as carriers of contagion should not be made public, I hope for the credit of this Society that many of the remarks made against the Semmelweiss doctrine will never be given publicity We have been carried back-far back among the antiquities I suppose that Dr Etheridge refers to some remarks that were made in the course of which it was stated that in the majority of cases puerperal infection Now, it is not comes from some source without denied by those who urge this most strongly that there are occasional cases where it comes from within, at least it is impossible to explain some cases on any While a great deal has been done other hypothesis by those who advocate this doctrine to bring it almost to perfection, it is not claimed that perfection has been reached but that much has been done to prolong life and prevent deaths from puerperal dis-I am very sure that the time has come when yet fully received by a large majority of the profes- tiseptics, with a mortality of less than I per cent It just such discussions as we are now having are needed,

It is to influence those who do not believe. sion those who have never attended a case of labor with It clean hands, that it is necessary for us to take ex treme ground in this matter to prevent a dreadful mortality

In making examinations for life insurance, in one company I find over 17 per cent of the applicants whose mothers have died from puerperal fever In another company the mortality was over 12 percent In Semmelweiss' time the mortality was from 15 to 20 confined, died Is it strange that Semelweiss ev claimed that it was time that this murderous mortality was stopped? It has been stopped in a very large degree by antiseptic precautions, and while some found to be useless, other methods have come up to The matter of spraying, which I supercede them Dr Etheridge has expressed his admiration for have never used or ordered, but which I would use For my part, I should like if I believed the air particularly infected, has come in for its share of abuse Lister stated to me several months since when I said to him "Some of my coun trymen say that you have departed from your original ideas of antiseptics in that you discard the spray "You may say," he said, "if you honor me by men tioning my name in connection with antiseptic meth ods, that we have discarded nothing stopped doing certain things because we have found other methods which are better " There is nothing in Lister's practice or sayings which demonstrates that he has departed at all from his antiseptic methods It is by carrying out these methods that the mortality has been brought down from the terrible percentage it had several years ago I believe, and am consci entious in the belief, that if we could bring the entire medical profession up to a fair standard of antiseptic obstetrics we would do more to prolong life and save more people than are saved in all other departments of surgery and medicine Not many of us are called upon to do laparotomies and hip-joint amputations, but almost everybody must attend cases of labor, and I maintain that we can reduce a mortality which has exceeded 10 or 20 per cent down to 1 per cent by these methods I think it is quite probable that puerperal fever may come from an old suppurating point somewhere, which is lighted up afresh by the It is probably possible that process of parturition infection may come through the respiratory or diges tive passages, but in the majority of cases it is heterogenitic, and if everybody will go to cases of labor with clean hands, will employ clean nurses, and see that the atmosphere of the room is not tainted, he will bring the mortality down to almost nothing few months ago Lawson Tait visited the hospital of Tarnier, who exhibited to him a chart on which was recorded the mortality for many years past Are duction in deaths from 12 or 15 per cent to less than per cent was demonstrated By carrrying out antiseptic methods He divides the whole period into three stages The stage of maction, with a mortality of 15, 16, and 17 per cent, the stage of hygiene against infection and contagion, with a mortality of 4 to 6 per cent, the stage of an

is worth while to imitate it saved

In conclusion, I have only to add, that it appears to me that the time is coming when one will not have used ordinary care, skill or judgment in obstetrical practice unless the usual (to say the least) antiseptic methods have been employed

(To be concluded)

STATE MEDICINE

Action by Missouri State Medical Association regarding National Quarantine and State Sanitary Affairs

The special committee appointed to consider and report on the suggestions and recommendations of the President's Address at the recent meeting of the Missouri State Medical Association, reported through their chairman, Dr H C Dalton, of St Louis,

WHEREAS, The experience of the past has shown that existing means rehed upon for the protection of the people of the United States against the introduction of dangerous epidemic diseases from abroad are entirely inadequate to accomplish the desired object,

WHEREAS, It being highly desirable, in order to insure such protection, that the measures employed shall be uniformly and systematically applied, there-

Resolved, 1 That, in the opinion of this Association, external quarantine measures should be under the control and direction of Federal authority to afford the highest degree of protection to the people of this country

2 That this Association favor Congressional action looking to this end, as, in their judgment, there is

present urgency for such legislation

3 That copies of these resolutions be promptly forwarded by the Secretary to the Members and Senators of this State in Congress

Also the following were passed unanimously

Whereas, Recognizing the importance and value to the people of this State of a body clothed with signed to secure the sanitary welfare of the people have already of this State, therefore

Resolved, 1 That, reposing confidence in the wisstances, this Association approve the course and roneous and contrary to fact conduct of the Board, and pledge to its support in its work the influence and authority of this body

themselves to actively evert their influence in their of his letter respective localities, during the coming year, in favor

We cannot, probably, of legislative action in support of the Board, and to bring it to perfection in private practice, but we can enlighten their representatives in the General Ascome so near it that the lives of hundreds will be sembly regarding the wishes of the Association in this respect

> 3 That a special committee of three members on sanitary affairs be appointed by the President, with power to sit during the ensuing year, and advise with the Board in all matters concerning needed legislation for the more perfect protection of the public against disease

> Dr F J Lutz, of St Louis, Dr J E Tefft, of Springfield, and Dr B G Dysart, of Paris, were appointed members of the committee created in the last resolution

DOMESTIC CORRESPONDENCE

DR CUSHING AND THE MURDOCK LIQUID FOOD HOSPITAL

BOOK REVIEWS.

THE PRESCRIPTION, Therapeutically, Pharmaceutically, and Grammatically considered Ву Отто А Wali, MD, Ph G, Professor of Pharmacy in the Missouri Medical College, etc 8vo, pp 184 St Louis Aug Gast Bank Note and Litho Co,

Every one will agree with the author that a theoretical and practical knowledge of the construction of the prescription is of great importance to both physician and pharmacist Dr Wall seems to have gone more thoroughly into the subject than any previous In regard to weights and measures he is particularly full and explicit, 36 pages of the book being devoted to this subject

We cannot agree with the author, however, when he says "It is wrong, for instance, to write o 2 centigram, because many readers accustomed to using the metric system, would be apt to overlook the word centigram and read the above as 0 2 gram, which it would be if the figures stood alone without any designation The above should be written o ooz gram, or 2 milligrams," or when he says "Fractions of these values (centigrams and milligrams) should be evpressed in prescriptions in common fractions, and not in decimal fractions, thus ½ milligram, and not o 5 milligram, ¼ centigram, or 2½ milligram, and not o 25 centigram. In writing prescriptions to be filled by a druggist not entirely familiar with the decimal system it may be safer to write as the author suggests, but the other method is still correct. It is suggests, but the other method is still correct a serious question whether the world and literature would not be better off if common fractions were consigned to oblivion The mixing of common fractions in the metric system is about as bad as using dollars, shillings,kopeks,and pfennige in the same bill Germany tried to improve on the metric system and failed, the system, as it stands, is better than any other, and no so-called improvement that has been suggested has any particular ment As regards the mistaking of o 2 centigram for o 2 gram, it may be said that error is practically impossible if we write o 2 centig

But Dr Wall has written a good book on prescriptions, and one that we can highly recommend

MISCELLANEOUS.

VITAL STATISTICS IN ILLINOIS - The report of the meeting of the Illinois State Board of Health, held on April 19 and 20, For the first time since the collection of vital statistics was begun all the counties have made returns of births and deaths. These, which are for the year 1887, show a general improvement and increased fullness. A total of 32,164 deaths and a total of 62,337 births are reported for the whole State, being an increase of 2,762 death returns and 3,144 birth returns, as compared with the returns of the previous year While there is noted this general improvement, a few counties still show a laxity of interest and consequent comparative imperfection of

"THE AMERICAN ASSOCIATION OF OBSTETRICIANS AND GYNECOLOGISIS" was formed at Buffalo on April 19, it is said with a membership of 34. It will meet in Washington on Sep tember 18-20, 1888

DETLCTION OF DAMPNESS IN WALLS -J Ness'er say, in the Chemiker Zeitung, that a sheet of gelatine placed against a wall suspected of being damp will curl away from the wall if dampness exists

PRESIDENT'S ADDRESS

THE MISSION OF THE AMERICAN MEDICAL ASSOCIATION

Delivered at the Thirth ninth Annual Meeting of the Ameri can Medical Association, Cincinnati, Ohio, May 8 1888

BY A Y P GARNETT, M D, OF WASHINGTON D C

Gentlemen of the American Medical Association

Unlike my distinguished predecessor of the past year, who presented you with an able address replete with speculative interest and scientific research, I shall leave the abstruse problems of our science to be discussed and elaborated by the different Sections into which this Association has been divided with special reference to such themes and such discussions

In casting about for a subject more concrete in its nature and directly useful in its application, I have determined to submit for your consideration a few practical reflections upon the mission of the Amen can Medical Association

I am especially moved to select this subject at this time by the fact that at no period since the formation of the American Medical Association have its ene mies been so bold, so reckless, and so unscrupulous with the medical men of this country

The paternal relation held by this organization to the entire medical profession of the United States est and sincere love for our noble profession imposes upon it duties and responsibilities of the gravest character It stands out before the world as the chosen custodian of all that pertains to the preservation and advancement of professional interests, as well as to medical science per se, it is intrusted with the delicate and difficult task of elevating and maintaining the medical character of this country upon the highest moral and intellectual plane

Taking a retrospective view through the almost half century of its existence, we have no reason to be discouraged when we consider what has been accomplished, indeed, we have cause for congratuladue directly to its influence, important results which could only have been achieved by combined and cooperative effort The crystallizing at its very birth of the hitherto segregated elements of medical strength into one compact organization gave to it a power and authority recognized and felt by the en tire medical profession of this country

But while we may well feel gratified by a contemplation of the fruits of our labors in the past, it is obviously important that we should not be flattered into the belief that we have accomplished our mission, and permit ourselves to lapse into supine indifference with regard to the preeminently important object which yet remains to be worked out, I trust, through the instrumentality of this body I refer, gentlemen, to a radical and thorough reform in the present medical education of the United States-the subject which, at this moment, presses itself more urgently than all others upon our attention

Until this has been worked out we can never hope to see realized the grand designs of those wise and conservative men who, inspired by a true love for the profession of medicine and actuated by a high and honorable ambition for its success and commanding influence in this country, conceived and perfected the machinery which they considered adequate to the duty of achieving such a noble purpose

Have we, gentlemen, who followed them, so controlled and directed this machinery as to fulfill their anticipations? Have we as yet fully tested its capacity to meet such expectations? Have we exhausted with unavailing results all the means at our command? To me it seems not

In directing your attention to this apparent derein their efforts to destroy its influence and power liction on the part of this Association, I trust that I may not be regarded as a sensorious pessimist, or that I am actuated by any other than the most earn-

> It is but natural that those of us who have at heart the true interests of the medical profession, and who desire to encourage such progress and effect such reforms as must permeate and influence each section of our country, should make every endeavor to elevate our system of medical education to a standard equal in dignity and attainment to that which obtains in Europe, and hopefully look to this great representative body as the only central, dominating power through which such reforms are to be accomplished and perfected

Our annual meetings must not be regarded solely tion as we recognize the many evidences of progress for the purpose of considering the science of medicine either in its theoretical or practical aspect and supplemented by the pleasures of social intercourse While we have ample cause to be gratified with the rapid progress made by some departments of medicine in this country within the last decade under the direction and stimulus of this Association, we are still confronted by the fact that very little has been effected in the direction of a general reform in the medical do the records of the American Medical Association

We all know that this subject of medical education and medical license has been an almost endless theme for discussion, cocval, indeed, with the establishment of medical schools in America, and more particularly has it been earnestly and ably considered since the organization of this Association, yet the question still presents itself, What can the American Medical Association do to further raise and promote a higher standard of medical education in the United States, to curtail the number of medical schools, and thereby gradually restrict to a conservative limit the annual hosts of graduates turned loose upon the public by those institutions? It will be borne in mind that in order to effect these desirable ends the initial step must be taken by this body in some mandatory form—experience has demonstrated that separate State societies and individual college regulations looking to such reformation have so far proved conspicuously futile For a long period all measures brought before this Association having for their object an interference with or material modification of the systems pursued by the medical colleges were met by a determined and successful opposition on the part of those members who represented such institutions

So manifest did it become that no important change could ever be effected in this direction while these schools were permitted to be represented as such in this body by their own officers that an amend ment to the constitution was adopted abolishing this feature of representation in order, as it was hoped, that the proceedings of the Association might not be trammeled or embarrassed by the misguided efforts of such delegates

Whilst the purpose and intent of this move was, as already stated, to free the Association from the predominating power of the schools and permit it to legislate in a fair, unprejudiced, and conservative spirit upon this important question, it has so far unquestionably failed to do so. It occurs to me that an explanation of this may be found in the fact that a large proportion of those who now attend our annual meetings are directly or indirectly connected with medical institutions, and no doubt are to a large extent, unconsciously, perhaps, influenced in their conduct on this floor by the supposed interest of their respective schools

Permit me to disclaim here any purpose or desire to impugn the motives or loyalty to our profession of these distinguished representatives of our medical colleges. From my standpoint alone do I offer this hypothetical criticism upon their conduct in this regard, and while I cheerfully concede to them the honor and merit of having largely participated in laying the foundation of this Association, and having subsequently sustained its character, influence, and power as an agent for the general welfare of the medical profession in the United States, I can not permit myself to ignore the fact that they have not, collectively and unitedly, cooperated and wielded the power which they indisputably possess to advance and elevate our standard of medical education. Nor

do the records of the American Medical Association at any period of its past history show that unselfish and honest effort in this direction on the part of those who control and direct the educational movements of our profession which can either challenge our admiration or command our unqualified approval

While it can not be denied that there are medical colleges in this country unsurpassed by those of Europe in their essential appointments and facilities for the education of medical students, the equally undeniable fact remains that we fall far behind them in the systems of study pursued

This is more unfortunate and baneful when we consider the radical difference in point of education between the mass of students in this country and those of Europe Contrasting the two from this standpoint, we find, as a rule, when the European student aspires to become a professional man, he recognizes the fact that in order to pass the ordeal of a college course successfully he must have the basis of a preliminary education, in most cases including a classical one He is confronted at the very threshold by the rigid requirements of a fixed collegiate standard He knows and appreciates that unless he possesses some educational capital or mental training to build upon he can not hope to master the complex and difficult work before him

On the contrary in this country the multitude of medical schools scattered throughout the land, to be found in almost every town and village, offening in ducements to the uneducated as well as the educated by low fees and short terms of study to enter the profession, added to the almost universal desire pre vailing among the working classes to become doctors and lawyers, have not failed to work incalculable mischief The half educated artisan, ambitious of becoming a professional man, meeting with no obsta cle in the way of a preliminary education, throws aside his implements of trade and walks into the halls of some medical school to emerge therefrom after two short courses of lectures a full-fledged M D, h censed to go forth as the accredited representative of a so called learned profession This, gentlemen, is no exaggerated picture resting alone upon some 10lated or exceptional instance, but a practical fact of frequent occurrence, and one for which the schools are directly responsible, since they alone have the power to correct this evil I am not unmindful of the many labored and specious arguments which have been advanced in defense of the schools, and the efforts made to relieve them of all censure in this re gard by placing the responsibility on other shoulder We have been reminded of the fact that all great resolu tions move slowly, that we must not expect to accom plish radical reforms in our system of medical educa tion in a few years, we must patiently wait for the seeds of reform, which, having been sown in rich soil will in good time and season be sure to spring up, tion, State and county societies have been organized upon a firm basis, engaged in active and efficient work, and destined to prove the direct instruments

We have waited, and nearly half a century has rolled by in anxious expectation of seeing these educational centers take the initiative in pushing forward this great object, an object which in reality dominated all other considerations at the very birth of this Association Have those expectations been realized? On the contrary, with a few notable exceptions, they have turned a deaf ear to the repeated suggestions and earnest demands of this body, and stubbornly pur sued that course which they selfishly believed would secure to them the largest patronage through the shortest route from the hall of the matriculate to the We are further told that platform of the licentiate colleges should not be held responsible for graduating illiterate and incompetent students. It was not reasonable to suppose that the faculties of those institutions would ignore or disregard the certificates and letters of recommendation presented by students applying to enter a college, when such letters were furnished by preceptors who were, perhaps, personal friends of some one or more of the professors determine the student's fitness to receive a diploma and authorize him to present himself to the public as States Commissioner of Education a competent person to practice medicine rests entirely with those who issue such diplomas Can they so far disregard their duty to the profession and to the public as to accept the partial judgments or recommendations of irresponsible or prejudiced preceptors?

Almost all institutions of learning that possess the authority to grant licenses require preliminary exam mations to determine the qualifications of students before accepting them as such, notably the two national academies of the United States-the Army Why should not the medical schools, and Navy imperatively demands it, also require such examinanons? The catalogues of many colleges state that certificates of educational acquirements are required of all students before matriculating, but I have the strongest grounds for believing that this rule is far more honored in the breach than in the observance

Again, it has been alleged, by way of explanation for the recognized and unfortunate educational deficiences pervading many medical communities, that it proceeds from a lack of study on the part of the general practitioners, especially those residing in rural districts, who find more congenial occupation in disof medical works, that the schools should not be held to this apology by asking if such members of the pro academic and medical, that would stand by them only 38 both sexes, and I everbody of suitable age through this rust of negligence and decay of interest, than to commence in ignorance, progress in ignor- of instruction prevailing. One, the older, requires a

this country from the responsibility of the obvious defects in our system of medical education, and the odium of a failure by them to reform that system must, like the shirt of Nessus, ever cling to them

That the professions of law and medicine are overcrowded in this country, no man of common observa-The ratio of professional men in tion will deny the United States to the population exceeds that of any other country in the civilized world, so that any legitimate means of checking this evil which can be devised and carried into practical effect must be hailed by the medical world, as well as the general public, as an inestimable boon The statistics recently published by the Illinois State Board of Health tending to show the annual number of graduates in medicine within the last three years, and the conclusions based upon those statistics published by the medical journals of the country, I have reason to believe, are not entirely accurate. In support of this opinion and the views expressed in the foregoing part of this address I shall take the liberty of directdoes not seem to have occurred to the authors of ing your attention to a résumé of statistics bearing such arguments that the final judgment which was to upon this subject, furnished me through the kindness and courtesy of Hon N H R Dawson, United

> These will, no doubt, exhibit in a more forcible and impressive manner to your minds the especial subject under consideration than any individual argument, however logical or conclusive, that could be presented, particularly when it is remembered that they are prepared under the immediate authority and direction of the United States Government, having at its command far greater resources than any one State or county could employ

"Total number of medical schools in the United States, 126, of these 95 are regular, 11 are 'eclectic,' whose vast and comprehensive field of study more 13 are 'homeopathic,' 3 are 'physio-medical,' and 4 are too indefinite for accurate description

> "Of these, 2 regular, 1 'eclectic,' 1 'physio medi cal,' and 4 'indefinite' schools are not recognized by this Bureau, by State boards of health, by medical licensing boards, etc Four other schools have been established or organized so recently that they reported no students or graduates for the year 1885-86 There remain 89 regular, 10 'eclectic,' 13 'homeopathic,' and 2 'physio-medical' schools from which statistics were obtained and tabulated in another part of that letter

"Proceeding thereto, the list of medical schools on cussing politics, hunting, and farming than in the study pages 5-11 showed that 63 regular, 2 'eclectic' and 4 'homeopathic' schools admitted male students only, responsible for this condition of things I would reply that I 'homeopathic' and 4 regular schools admitted female students only, that 19 regular, 8 eclectic, fession are, by reason of their surroundings, to lapse 8 'homeopathic,' and 2 physio medical' schools adinto this state of indifference and ignorance, is it not mitted both male and female students, and that 3 the more important that they should, before comple-other schools, all regular, admitted colored pupils, ting a collegiate course and receiving a diploma, be one of these admitting both sexes and both races required to lav a solid foundation of education, both As a whole, 70 schools admitted males only, 5 women

"Studying this table further, we find two methods ance, and, like unto the man to wnom only one talent student to attend substantially the same course of was given, go and hide that in the earth? No, gen- lectures twice before his examination for a degree, tlemen, there is no escape for the medical schools of the other requires him to attend three distinct and

graded courses of lectures before his final examinar course of lectures, 86 require 2 courses, these 87 part of the success of well-educated homeopathic I group together as following the older, or repetition method, 26 schools require 3 graded courses, and 1 school i such courses, these 27 I group together as prescribing the newer, or graded, method, with the following result as regards numbers

Graded method			Repetition method			All			
Designations	Schools	Students	Graduates	Schools	Students	Graduates	Schools	Stadents	Graduates

an designations	27	2,177	501	87	9 125	3,392	114	11,302	3,893

tabular summary is not introduced in order s it, but in order to furnish a basis of conumbers, upon which the percentage numbers given below may be verified

"The percentages are calculated so as to show for each kind of medical school the proportion preferring each of the two methods I give first those relating to the 'graded' method

Designations	Percentage of—				
~ ~	Schools	Students	Graduates		
"Home pathic Regular - Eclectic Physio medical	38 5 23 6 10 0	29 6 19 2 4 0	II 9		
All designations	23 7	19 3	12 9		

"Next those percentages relating to the 'repetition' method

	Percentage of				
Designations	Schools	Students	Graduates		
Eclectic Regular Homeopathic	90 0 76 4 61 5	96 0 80 8 70 4	93 0 88 r 77 l		
All designations	76 3	80 7	87 1		

"The foregoing percentages are instructive in two We may compare the proportion designated 'regular' with the others in its own group, or with the proportion similarly named in the other group

"The percentages of 'regular' schools, students, and graduates following the 'graded' method of instruction was less than the corresponding homeopathic percentages in that group This would indicate that the regular schools, as a whole were less that in many instances the catalogues of colleges do careful in the method of their instruction, so far as not correctly represent the practical operations of

the grading of studies is concerned Of the 111 reporting schools, 1 requires only of less care in other ways? Does it explain any physicians in modern times? I do not draw this as a conclusion, but submit it as a query

"Upon comparing the percentages designated 'regular' in both groups, we see that those in the 'repetition' group exceed those in the 'graded' group 52 8 as to schools,

61 6 as to students, 76 2 as to graduates

"This indicates that regular schools following the older, two course, or 'repetition' method admit students more readily, and confer degrees more copi ously, than regular schools prescribing 'graded' courses of instruction Do the schools in the 'repe tition' group admit and graduate more readily because they have, as a whole, a lower ideal? I do not assert this I ask the question

"Returning now to the tabular summary on page 2 of this letter, I extract and summarize yet further the statistics relating to 'regular' medical education, and give percentages of graduates to students in each group, as follows

Method of Instruction	Number of students	Number of graduates	Per cent of grad uates to students
21 'graded' colleges 68 "repetition" colleges	1,839 7,752	383 2,826	20 B 36 4
89 All methods	9,591	3,209	34 5

"This indicates a possibility that the requirements for graduation from the 21 colleges prescribing a graded course are more severe than those of the larger group If the per cent of graduates from the 'repetition' method colleges had been 208 instead of 36 4, they would have graduated only 1,612, instead of 2,826 On the other hand, if the 'graded' method colleges had graduated as many in proportion, 36 4 per cent, as the others, they would have granted diplomas to 669, instead of 383 these schools had graduated 20 8 per cent of their students, those graduates would have numbered 1,995, if they had graduated 345 per cent, the They actugraduates would have numbered 3,495 ally graduated 3,209, or 34 5 per cent"

For the present year 1888, upon the basis of a population in the United States of 61,420,000, the ratio of practitioners of medicine to the population will average about 1 to every 580 In the city of Washington we have I practitioner to about every

485 inhabitants This very carefully prepared analysis of the niedical schools of the United States, it will be observed, like that contained in the statistical report of the Illinois State Board of Health, rests largely upon the cor rectness of the catalogues put forth by these schools, and, though possessing some additional sources of information, can not be regarded as conclusively accurate, for the reason, as I have elsewhere stated,

those institutions lates during the past three years of 31/3 per annum, or 10 for three years—making a be abolished total of 113% matriculates per annum divided be age, sex, color, or previous condition With these figures before us, gentlemen, no fears, it seems to me, always be found equal to the demand Even as far back as the days of Addison, more than a hundred years ago, when the facilities for obtaining a medical education must have been greatly restricted as com pared with the present time, you will find the follow-"Spectator" in speaking of the learned professions He says

of physic, we shall find a most formidable body of men, the sight of them is enough to make a man serious, for we may lay it down as a maxim that people This body of men in our own country may be described like the British army in Cæsar's timesome of them slay in chariots and some on foot"

If they are to continue to augment, through the reckless conduct of the colleges in this country, in the same ratio as they have done in the past ten years, let us at least endeavor to place them beyond the reproach and ridicule which at present so often attach to the name of doctor

Entertaining the views above expressed, based in part upon these tabulated expositions, and inspired direction of educational reform, I respectfully submit for your consideration the following suggestions

Proposition 1 That a standing committee, to be called a committee on legislation, be appointed for each State, Territory, and the District of Columbia, in good standing, three of whom shall have no regular profession official connection with any medical school or colpossible the following instructions

duties may require, for the purpose of using all honof medical schools in the United States, and a congraduates, that as a practical measure to this end responsible position to which you have elevated me they urge the passage of a law requiring that in the future granting of charters for creating medical to the recent successful meeting of the Ninth Interschools, there shall be a clause in every such charter, requiring that all schools or colleges thus created capital of the United States in September last

In the city of Washington, with granting a diploma to any student thereof, and that a population of 180,000 inhabitants, we have four no student shall be admitted to matriculate who has medical schools, with the following list of matricu-Inot passed a satisfactory examination, both oral and One school of written, in the ordinary branches of academic 412/3 per annum, or 125 for the three years, one study, and, further, that any college failing to show school of 30 per annum or 90 for three years, one of a greater number than fifty matriculates annually for 21 3/3 per annum, or 65 for three years, one school three consecutive years shall forfeit its charter and

Second That they use all diligent effort to se tween four schools Three of these require a three cure an ordinance creating in each State and Terriyears' course of study, one requires that the student tory where no such board at present exists, and the must belong to the genus homo, without regard to District of Columbia, a board of medical examiners, which shall have no connection with any medical school, and which shall be required to examine all need be entertained of limiting to too small a number applicants for license to practice medicine in their the professional men in this country, the supply will respective States, Territories, and the District of Columbia, and that any person who may be detected in practicing any branch of the healing art without a license granted by said board shall be subject to such penalties as the law may provide this committee may be authorized by statute to seing language used by that celebrated author of the lect and nominate to the governors of the States, Territories, and the District of Columbia seven competent and learned members of the medical profession to "If, in the third place, we look into the profession | constitute said board of examiners, who shall have the exclusive power to issue licenses to practice the art and science of medicine and surgery

Third That the chairman of said committees of when a nation abounds in physicians it grows thin in five be required to submit at each annual meeting of this association a report embracing a full statement of what has been accomplished by each

Proposition 2 That the faculties of the several medical schools within the limits of the United States be once more urgently requested to call a convention at some central point for the purpose of consultation, and adopting some general and uniform system of medical education more comprehensive and rigid in its requirements, and more in accord with the spirit of the age and the advanced progress of medical science, suggesting a four years' term of by the hope of initiating some practical move in the study, the requirement of a preliminary education, including some knowledge of the classics

That any college or school which shall refuse to enter into such an arrangement as may be decided upon by said convention shall be excluded from all connection with the American Medical Association, to consist of five members of the medical profession and its alumni not recognized as members of the

I am aware that these suggestions embrace some lege, whose duty it shall be to carry out as far as very radical and seemingly impracticable changes, but as they point, in my judgment, to the right direc-First That each one of said committees, or a tion, I trust that they may not prove to be seeds majority thereof, shall attend the sessions of their sown upon barren soil Be that as it may, I shall at respective Legislatures, or from time to time as their least enjoy the consciousness of having honestly, conscientiously, and fearlessly met the great and orable means looking to the reduction of the number pressing issue of the day within the domain of our profession, and of having executed, to the best of sequent diminution in the annual number of medical my ability, the most important duty imposed by the

It is with no little satisfaction that I can here refer national Medical Congress which took place at the shall demand a full term of four years' study before To my lamented and distinguished predecessor as

president of this Association, the late Dr Austin ness, and justly proud of her achievements in all Fint, belongs the credit of having suggested in his address at the meeting of the Association in 1884, that this congress of eminent scientists, embracing eminent in science We, her honored guests, offer distinguished and renowned representatives of the medical profession from almost every civilized nation of the world, should, through the authority of the American Medical Association, and in the name of the entire medical profession of this country, be invited to hold its ninth meeting in the United States, and that a committee, appointed by this body, to attend the eighth meeting of the Congress at Copenhagen, be charged with the duty of conveying to that meeting this invitation

Through the personal influence, ability, and diplomatic tact displayed by the judicious gentlemen intrusted with this delicate mission, the invitation was gracefully accepted by our foreign brethren, and Washington City selected as the place of meeting for the Ninth International Congress It was a source | jectors of this undertaking and justly responsible for of deep regret to those upon whom the duty de volved of arranging the preliminary work for this important gathering, as well as to the profession at large in this country and abroad, that so many of those who were identified with the movement at its jamin Rush inception should have subsequently disassociated philosopher, and a physician, stands out as much themselves from all connection with the Congress, and thereby limited, in some degree, its influence, importance, and scientific value

Notwithstanding this defection, however, we have abundant reason to congratulate the medical profession of the United States, and especially the members of this Association, upon the gratifying outcome of this fraternal reunion, and while contemplating with pride the fruits of our labors, we entertain no misgiving, now that a large portion of the scientific work has been submitted to the verdict of the medical world, as to what that verdict will be -equal if not superior, to the work of any preceding Medical Congress

I should be recreant to the dictates of my individual feeling, as well as to that which, I doubt not, animates this entire assembly, were I to omit here any allusion to the particular occasion which at this loved his whole country for his country's sake, who moment awakens such widespread interest throughout this magnificent city It is meet that we should loved mankind through the divine attributes of his avail ourselves of the opportunity to give expression to our sympathy and participate in the common rejoicing which greets this centennial year of her exist part of this body appropriate, when it is remembered tion that just one hundred years ago this city of Cincinnati was founded and named by a member of our own profession, Dr Arthur St Clair, a native of This spot, occupied by a fort in 1788, was selected this country—to-day more powerful, more self by him as the seat of government, which he named reliant, more progressive, and stronger in the affect of the country o Scotland, and first Territorial governor of Ohio Cincinnati, after the society of Cincinnatus, of which he was a prominent member From this humble beginning, in the comparatively brief period of one its seven hills, and claiming to be the mistress of the long so subordinate the discrepancies of individual world, she now majestically reposes upon her many judgment and impulses of resentment to the fraternal hills the queen of the West—conscious of her great-lagencies of a common calling, and the pacific de-

that constitutes a progressive and perfected civiliza tion, esthetic in art, potential in physics, prethe tribute of our admiration and our praise

At this point, gentlemen, I deem it my duty to revert to a subject which has occasioned me a profound feeling of regret, and which, I trust, may awaken in your minds a responsive sentiment. I refer to the mortifying position in which the Rush monument committee has been placed by the apparent lack of interest and liberality on the part of the medical pro fession of this country When we are reminded of the fact that this enterprise was inaugurated under the auspices of this Association, and the committee, authorized to raise, by voluntary subscription, a sufficient fund to proceed with the work, derived its power to do so from this body, it will be seen that we stand committed before the world as the proits execution

I shall make here no appeal upon the merits of the case, nor do I propose to attempt a euology upon o eminent a citizen and distinguished physician as Ben The record of his life as a patriot, a a part of the history of his country as that of Wash ington himself

We owe it, then, to ourselves to recognize the fact that in honoring the memory of such a repre sentative of the medical profession we do honor to Let me exhort you, therefore, to avert ourselves this impending shadow of reproach which now hovers over the medical men of our land

All over the capital of our country we find statues erected in memory of statesmen, warriors, philoso phers, and patriots, nor has the ever-active and ignoble sentiment of sectional prejudice failed to find there its expression in monumental brass and intended to perpetuate the bitter memories of a fratricidal strife Let us, as members of a liberal and humane profession, set the example of seeking a higher moral plane to do honor to the man who loved science for the sake of science, and who nature

In concluding this address, I desire to offer to you, gentlemen, my congratulations upon the proud Especially is such a manifestation on the and enduring position now occupied by this Associa Resting, as it does, upon the solid foundation of a moral, intellectual, and scientific basis, it has steadily from its birth gained in strength and influ ence and won for itself the support and approval of our brethren throughout the length and breadth of tion of its members than at any former period of its Let us indulge the hope that those of our earlier friends whose allegiance and interests existence have been temporarily alienated from us may ere

once more uniting with us in our efforts to maintain of this wise, conservative, and philanthropic organi-ZHIOD

THE PRESIDENT'S ADDRESS TO THE MEDICAL EDITORS' ASSOCIATION, 1888

Delivered at the Annual Meeting in May, 1888, BY WILLIAM PORTER, M D, OF ST LOUIS

Brother Editors

It was your good pleasure to elect me your President for the year that closes with this session has been a year of anxiety and of work, a campaign year, and a year of achievement I thank you all the support which accompanied that choice, yet I have greater satisfaction in remembering what you have done in 1887 to strengthen our National Asso-Congress

Through the success which has crowned both of these enterprises, a new dignity has come to the profession of our country, and you, gentlemen, as watchful guardians of what is rightfully yours, will see

have so richly earned it

Two things have been clearly demonstrated during the year that has gone 1st, the power of the medical press, which has so large a part in this Associa 2d, the value of unity

It was, to a large extent, through the united efforts of the editors of medical journals here represented, that a once desperate possibility became a glorious certainty A heavy responsibility was lifted from your shoulders as in last September the world's representatives grasped your hands in hearty approval

Pleasant as is the retrospect, we must not yet rest upon our oars, satisfied with the progress already made The current of life bears us not onward but backward, unless continued effort is put forth

In our land with its ever new development, in our profession with its continued advance, there is no rest for the medical editor, no point of complete atpast, there is more to do in the future have had need of each other in the last decade, we have greater necessity for union in years to come

Fully impressed with our strength and our requirements, I have desired to depart from our usual cus tom to-night and to discuss with you plans for a stronger organization and questions of importance

in our work

It may be asked, why have we need of a well organized association? The clouds of '87 have rolled by and the peace of '88 is upon us, all is well.

Gentlemen, let me remind you that the God who our day means rivalry

I would not attempt to detract from the honor and gers

mands of a common science, as to feel justified in dignity to which many of our great institutions in the East have attained, nor would I undervalue the untold and perpetuate the power, influence, and usefulness influence of some of the few medical journals not represented here We are proud of their work, but we must not forget our part in life's struggle While the long years of advantage have given to the East the older and stronger universities, the new wealth and energy of the West is giving large promise of a most substantial harvest

Do not understand me that I would urge strife or sectional jealousy Not for a moment would I hinder the dove which returns to the grand old ark of our National Society But though science is cosmopolitan, personal interests may be local I love my city better than some other city I esteem my true and tried associates better than those of whom I appreciate all honest workers I know but little in medical journalism, but I especially want to see for the honor which your choice conferred, and for the success of those interests here represented This success we can accomplish if we are willing to labor with honest united effort

It is one thing, however, to work for individual ciation and to aid in the affairs of the last Medical advancement, it is another, yet not necessarily antagonistic, to do all possible for the largest general While it is right that men should form local attachments, and have preference for place and person, it is wrong if in so doing they ignore others who would exercise the same right, and deny that equalthat the prestige does not depart from those who lity which in this land is the birthright of every member of our glorious guild

> I am not an alarmist I have abiding confidence in the ability of this Association and of the great National body with which we are so closely related, to go onward, to preserve their identity and usefulness, and withal to represent the profession of the

United States

But I fully understand that this position can only be maintained by resolving to stand firm, determined that those interests which are the inheritance of each of us, shall not be narrowed by sectional lines, nor be endangered by personal jealousies — I believe in peace and harmony, but I prefer that peace which is made secure by strength, and that harmony the key-note of which is well secured right to meet those with whom we have differed should they so desire, but it may be that in advancing half way we should do so in solid column

The honest wish of every true American physician While there has been much to do in the is that we may have a united profession and that the While we sharp dividing lines so recently drawn may be oblit-Let me urge upon you that, in attempting erated to reach this end, we must not permit a process of absorption to go on which shall reduce one part of our land to the condition of an outlying province, controlled by and tributary to another part

Rather let us seek to cement the union of professional brotherhood which should everywhere exist, by being true to our own sense of right honor the proffer of fellowship by extending the hand of self-respect filled with the fruits of patient labor

If we would grow stronger and more worthy of the made men, made them ambitious, and ambition in trust which is reposed in us by the students of current medical literature, we must guard against two dan-The first is dissension in our own ranks, the second, attacks from without I do not fear the second, if we are careful to avoid the first

There never was a time when a full understanding with each other and strong, true, aggressive action has been more needed than it is now. If we would prevent this goodly kingdom of ours from becoming a mere dependency, we must stand shoulder to The Star of the East has reached its zenith, and "Westward the star of empire takes its way" The light of the former is bright and steady, but the imperial star of modern progress shines for Its brilliant rays reach every corner of our land. and its course is not stayed by mountain or river

But words are vain if they do not call forth action I would strengthen your faith in your mission, but "faith without works is dead" In this assembly is power, I would arouse it There is enterprise, let | needs it it be stimulated We have harmony of thought and unity of purpose, let us come closer together in a more definite organization for more effective work

A strong Association can accomplish much where individual effort may be futile There are many questions which demand attention The further advancement of our State and National Associations, legal control of quackery, the International copyright, the questions proposed for discussion to-night, the upholding of our best schools and journals, and the exposure of poor ones, these are some of the matters of vital importance which call for harmonious and well organized action by the medical press of the land

Do I overestimate the need of organization? Remember that in no other nation in the world are there so many medical journals, so many medical editors, ready to engage in any right enterprise for professional justice and advancement, and yet I do good not hesitate to say that in no other country is there twelve years ago, when she began to suffer in many so much needless friction, so much misunderstanding of men and their motives

of personal knowledge of each other, of a lack of a needed conference and plan?

of thought or speech, and only urge that which will the left hypochondrium, but extending both up and more firmly unite us, and make more potent such action as we can together endorse need, and let us have it

It has been charged that this Association is organ 12ed and conducted for purposes other than those of pure journalism

I need not not use this time and place to refute this slander, but it gives me the opportunity of asserting that if to band together to promote those inter to expose fraud in and out of the profession in the left was detected. I supposed it the remnant of the North or South, to insist that he who is worthy shall be esteemed whether he comes from the far West or the distant East, to build up our local and State Societies, to further the cause of our National Associaquestions before the profession be a conspiracy, then a dollar, tender on pressure, and nearly correspondare we to-night conspirators of the deepest dye

stronger and larger, till it shall include all who have plained of was vaguely placed hereabouts

the oath of editorial knighthood upon their lips and the kingly purpose of right in their hearts

In you, my seniors in years and experience, have I all confidence that the endurance and judgment which have enabled you to guide others through the wilderness of ignorance in the early stage of our professional history, will not desert you now, when keen adventurers and plausible dogmas are enticing the unwary at every turn

Upon you, my brothers younger but no less zealous than these, falls the mantle of the leaders who have passed up out of sight. It is your privilege to show yourselves strong yet considerate, aggressive yet gentle, ready each week or month to couch a lance in defense of professional honor, or to speak a word of encouragement and approval to him who

Indite such thought that men shall catch up the leaves which you scatter far and wide, and give you in return the garland of praise May your good deeds be known, and all your mistakes forgotten

A CASE OF HYSTERECTOMY

Read before the Philadelphia County Medical Society, April 11, 1888

BY W W KEEN, MD,

PROFESSOR OF SURGERY IN THE WOMAN'S MEDICAL COLLEGE OF PHILADELPHIA

The following notes of this case I owe to the cour tesy of Dr John K Mitchell, her attending physician

Miss X, set 42, American, author Family history Previous personal history good up to about ways, pointing toward a uterine growth After two years or more of treatment, Dr S Weir Mitchell Is not this, to a large extent, the result of a want recommended that the ovaries should be removed This was done per vaginam by Dr Wm Goodell in The tumor diminished, but the winter of 1876-77 I would oppose limitation of the utmost freedom she has never been free from pain since, chiefly in For between two and three years before I This much we first saw her (January 25, 1887), her general health had been steadily growing worse, and the distress in the side increasing to such a degree that she was utterly unable to work, and was wretched alike in body

and mind Status præsens, Jan 25, 1887 Slight woman, andmic, not emaciated, complexion pasty Heart and lungs normal On examining abdomen externally a slight abnormal increase in uterus upward and to the old growth, but the patient did not desire a vaginal exploration made and I was unable to examine it There was here no pain or tenderness An irch below the lowest angle of the ribs on the left side was situated a spot not larger than a quarter of ing in situation with a similar but less defined area I glory in such an alliance Aye, make the circle of tenderness posteriorly Most of the distress com-

The kidneys could be clearly outlined by percusalways slightly sluggish and the appetite poor, no digestive trouble She slept very ill, being unable to lie on the back or on the left side, as either position increased the pain in the side, and finally caused a suffocating sensation It is also greatly aggravated | separately one position, and by constipation It is now so conher grip," of inability to work to good purpose, and of great irritability

Treatment -In spite of the previous ovarian and uterine trouble, the situation of the pain seemed to me to be so far from the former site of the ovaries that I was doubtful of their having any share in the present difficulty, though the thought of a nerve caught in the stump left after their removal occurred slight lithæmia diet did little good, and I returned to the view of the rest of the abdominal wall body, with one pole on the posterior tender spot and the other over the one in front Miss X was for two or three months much relieved by this, and grew better when a tonic mixture of iron, quinine and strychnia was given The treatment was interrupted for a short time by a slight attack of acute articular rheumatism in the left foot and ankle This yielded read-For a time cannabis indica tincor twice afterward ture at night helped her to sleep, but did no permanent good

varied, but in October she was decidedly worsemore pain, more mental and physical disability, and, finally, repeated violent neuralgic headaches The fact that there might be a pressure on a nerve, and possibly on the bowel, from the cicatrix of the old wound, again occurred to me There was possibly, also, nephritic trouble suspected In order to determine the facts, a careful examination under ether was advised

Early in October, 1887, with the assistance of Dr J K Mitchell, I etherized and examined Miss X with great care I found the uterus small, the internal measurements 21/4 inches, normal position, freely movable, the posterior wall somewhat that side On each side of the uterus a distinct tumor was found about the size of an English walnut That upon the left side was movable independently of the uterus, and was thought to be the knobbed end of the stump resulting from the previous opera tion by Dr Goodell That upon the right side moved strictly with the uterus and was thought to be a ute-No other lesson was found in the pel behind which the chief pain was complained of

the patient an exploratory operation was advised

Operation November 9, 1887, Drs J K Mitchell sion, and showed no change from the normal in their and W J Taylor assisting An incision was made The urine was natural, but sometimes con- in the middle line, 5 inches in length, from the pubes tained a slight excess of uric acid formations, bowels upward As soon as the peritoneal cavity was opened the uterus came into view and the two tumors above described were immediately recognized so intimately incorporated with the body of the uterus that it seemed hopeless to attempt to remove them In view, also, of the other addditional by very slight physical evertion, by sitting long in myomata now discovered, and described later with the specimen, it seemed to be the more unwise to stant and severe that Miss X complains of "losing leave the uterus in place, accordingly, a Keeberle serre nœud was applied to the cervix, and the body of the uterus, with its attached tumors, after separation from the peritoneum, was removed by the scissors, the lateral attachments having been first ligated. The peritoneum was now stitched over the stump. Before removing the uterus a careful search had been made in the left hypochondrium, but nothing abnor-The abdominal wound was now mal was found My treatment was at first directed to the closed, first by a continuous suture to the pento-Alkaline waters and a regulated neum, and next by a row of stitches passing through The clamp was septhe implication of a nerve in the cicatrix, and for arated from the skin by small pads of sublimate dresssome weeks passed a galvanic current through the ing on each side, and a large sublimate dressing and a flannel binder were applied

Dr George Dock kindly examined the specimen, and reported as follows

The specimen consists of the body of the uterus with 35 cm of the right Fallopian tube and corresponding parts of the round and the broad ligaments, and 1 cm of the left Fallopian tube, the round and ily to salicylates, but returned in a less degree once the broad ligaments on that side being cut off close to the uterus and the tumors described below remains of the ovarian ligaments cannot be made out

The fundus is of average size (nullipara), and ap-Throughout a summer in the country her condition pears to be cut off just below the internal os anterior surface is of normal curve About the middle of the right border is a subserous fibromyoma, the size of a small bean The posterior surface bulges excessively, the projection being due to the presence of a mural fibroid tumor which makes up most of the bulk of that part of the organ cavity of the uterus (fundus) is flat from before backward, and is triangular in outline, the opening of the tubes being in the two upper angles, the os inter-The sides of the angles measnum in the lower ure right, 27 mm, left, 22 mm, upper, 25 mm The right upper angle is at a higher level than the left, the wall of the uterus being relatively thinner on The surface of the cavity is smooth, and presents three small polypoid growths, two on the anterior, one on the posterior surface The anterior wall is 8 mm in thickness, the posterior 2 cm

The tubes show nothing abnormal To the right of the fundus in front of its transverse axis, and i cm below the level of the insertion of the round ligament, is a tumor the size of a walnut $(36 \times 26 \times 26)$ It lies in the angle formed by the broad lig There was nothing detectable in the abdomen ament and the uterus, close to the latter, being sepin connection with the left kidney, in front of and arated by loose connective tissue and blood-vessels It is covered by peritoneum, the greater part of which In view of the extremely wretched condition of is that forming the anterior fold of the broad ligament

The surface of this tumor is irregular On section

it is hard, creaks under the knife, the cut surface is dark gray in color Around the periphery are whitish ing of the pain in the hypochondrium was, I could fibrous masses and extreme calcification

Microscopic examination of this growth shows it to be a myoma which has undergone partial necrosis,

with pigmentation and calcification

To the left of the fundus, behind the transverse axis, is another tumor, slightly smaller than the one first, that I was right But no enlargement had taken just mentioned $(33 \times 26 \times 28 \text{ mm})$ Its upper surface is on a level with the fundus. Its nodular surface is covered with peritoneum, and it is separated from the uterus at a distance of 5 mm by loose connective tissue in which lie two smaller tumors On section it shows a lobular structure of firm white tissue (fibro-In the upper part are masses of hard, calcareous matter (calcium carbonate) smaller tumors in the connective tissue are myomata

For the next three days the patient complained greatly of pain, which was relieved by considerable doses of morphia It should, however, here be stated that she bore pain badly Her highest temperature was 99 7° F, and the normal was reached at the end of the third day At this time, of her own accord, she declined any further morphia. The catheter had to be used for the first three days With the exception of a rather obstinate constipation, which caused considerable abdominal pain and sleeplessness, which with the possibility of the development of tumors on last was relieved by cannabis indica, her later history was uneventful, saving in one particular The wire was tightened to the utmost limit in the course of the week after the operation, but the stump did not slough nor did the clamp become loose As the clamp was producing ulceration of the skin, it was removed December 2 The wound, at this time, was reduced to a tubular sinus leading down to the stump last slough from the stump did not come away until Dec 26, wound completely healed Jan 6, 1858

Since that date the patient has been absolutely well, physically and mentally She eats and sleeps well, and takes active exercise with more satisfaction than at any time during the last twelve years, in fact,

she is thoroughly restored to good health

To complete her history, I will add the examination of her eyes by Dr De Schweinitz "Oval discs, rather too gray, retinal haze, both venous and arterial, lymph sheaths distended This low grade of retinal disturbance is, I think, purely accommoda-There is a high degree of insufficiency of the internal recti " He prescribed the proper glasses

REMARKS -The removal of the ovaries by Dr Goodell, which was done per vaginam, was one of the earliest of such operations done in this country It reflects no little credit upon his skill that, in so contracted a vagina, he was able so successfully to remove the ovaries Although this operation relieved her temporarily from pain, it proved of no permanent Her pains returned and, though located differently, grew worse and worse, so that, finally, all mental exertion, and all physical exertion as well, became greatly hampered In fact, writing, which was her vocation, became impossible She was willing to undergo any operation whatsoever which held out any chance of relief She preferred to die rather than to live in such wretchedness

The diagnosis was very obscure What the mean The two tumors on each side of the only surmise uterus were believed to be, one a uterine myoma, and the other an enlargement on the stump following Dr Goodell's operation

An examination of the specimen shows, as to the place on the pedicle on the left side, the tumor being one of a number of myomata developed in connec tion with the uterus Its situation at the cornu uteri very naturally misled me

No other operation than hysterectomy would, I think, have been advisable. Its performance was

easy, and its results have been perfect

Why the removal of the uterus, with its attached myomata, should get rid of pain in the hypochon drium, I am unable to say To say that it was reflex pain is simply to express our ignorance in different Certain it is, however, that the removal of the entire internal organs of generation has been fol lowed with the happiest results, whereas the removal of the ovaries alone gave but little relief

I have deemed it important to report the case, in consequence of the recent question as to the results of complete and incomplete removal of the tubes the stumps after incomplete removal of the tubes My first impression, upon examining the specimen itself, was that the tumors were such knobby stumps, but after section and microscopic examination by Dr Dock, this impression was seen to be erroneous

A CASE OF HÆMOTHORAX FOLLOWING AN INCISED WOUND OF THE THORACIC WALL

Read before the Chicago Medical Society January 3, 1888, BY NORVAL H PIERCE, MD,

OF CHICAGO

The patient whom I exhibit to you is 19 years old, of healthy parents, and was six months ago in good health

On July 13, 1887, at 3 30 PM, while cutting a piece of wood with the stick adjusted against his chest, he accidentally stabbed himself in the third intercostal space, half an inch to the left of the right parasternal line The knife, which I hold in my hand, presents a sharp blade two inches in length, and half After the accident he walked an inch in breadth to a neighboring surgery, thinking the wounds of little consequence, but when he arrived the loss of blood externally was sufficient to saturate his clothes, and caused syncope

The doctor prognosticated death in a few hours, and summoned the patrol wagon At 7 P M, or 3/2 hours after the stabbing, I was summoned He had received no treatment up to this time I found the man in the condition of one who has sustained a very serious loss of blood-pale features, pinched, eyes sunken, and pupils widely dilated, surface cold and clammy, impaired hearing, pulse nearly imper ceptible and very rapid, respiration sighing There ceptible and very rapid, respiration sighing was very slight external bleeding at the wound, which

was about an inch in length From an inch above the sternum to the lower border of the liver the right side was dull, but at this time the liver was not dis-No blood was expectorated I closed the wound antiseptically, ordered an ice bag for the chest, warm bottles to the lower extremeties, head lowered, whisky, half ounce every forty-five minutes, together with ergot, very little liquids, and absolute rest

For several days after this his life hung in the bal-The pulse improved gradually, but the anæmia persisted, dyspnæa arose, together with great restlessness and troublesome insomnia, and the right fered with the drainage tube pleural cavity remained flat on percussion, the lower border of the liver gradually descended and the heart was displaced to the left, indicating that the hæmorrhage was slowly progressing. At this time the ad visability of enlarging the wound and taking up the the left bleeding vessel, or searing the lung with Paquelin's cautery, was entertained But such a procedure entailed great risk and no small amount of uncertainty, the location of the bleeding point being unsettled These facts, together with that of the patient holding his own, even in a low condition, deterred operating

Because of increasing dyspnæa I consulted with Dr Fenger as to the advisability of aspirating, under the existing circumstances, and on July 27 a gallon of dark colored blood was drawn away This did not cause the dulness over the right thoracic area to disappear, but relieved the difficult breathing and lessened the restlessness and insomnia

On August 20 I again aspirated, the lower border of the liver being within an inch of the iliac crest Another gallon was drawn away Under the microscope the white corpuscles were not greatly increased Up to this time the temperature had ranged from 100° to 101° F Afterwards it fell to normal once or twice, but generally the thermometer registered self with one

On September 5 diarrhœa set in, and lasted two very offensive expectoration The liver dulness was gradually descending and extreme dyspnæa began As the fluid in the pleural cavity now contained a perform the radical operation of empyema September 23 this was attempted best to be as expeditious as possible of the seventh intercostal were therefore simply inthe opening plugged with iodoform gauze At the end the patient was in a state of collapse, brought on, I believe, by the too sudden escape of the fluid He rallied, however, and the next day a tube was inserted and the cavity washed with a saturated solution of boracic acid at 100° F, which was repeated every second day thereafter Fever and cough disappeared on the second day The washings grew less and less colored, and in a few days the tube was removed

The case sets forth not so much the innate good ness of conservative surgery, as it does the great tolerance of the thoracic cavity of effusions nearly if not quite equal to that of the abdomen shows what a great quantity of blood may be lost without death, over three gallons being taken away in as many tempos It likewise shows that the wound from which such a hæmorrhage could issue is capable of spontaneous arrest

As regards the place for the incision, I would say the seventh intercostal space is too low, as after the first week the movements of the diaphragm inter-

As you may see, this slight cut an inch in length, with its attendant disasters, has left its mark right shoulder is depressed one inch The external circumference of the right side is less than that of

MEDICAL PROGRESS.

MEDIATE AUSCULTATION -DR JAMES K CROOK I am not in favor of a multiplication of instruments in the practice of our art. We should make it our aim to be enabled to employ the implements with which nature has provided us in as ex tended a field as possible, as they are always at hand and ready for use The artificial pleximeter and hammer, for example, I would discard entirely, as they are in nowise superior, and in some respects inferior, to the fingers of the two hands we have in the stethoscope a useful and, in my opinion, oftentimes an indispensable aid in diagnosis, and I would urge every one who proposes to treat diseases of the thoracic viscera to supply him-

The binaural stethoscope has seemed to me to possess the following advantages I It is far more or three days Cough developed soon after, with convenient than the uniaural instrument, as we can employ it while standing or sitting erect in a natural 2 As the chest piece and unconstrained position is immediately in front of the face, we may keep it marked increase in white corpuscles, I decided to under constant observation and shift its position from On point to point with the greatest facility 3 By dı-At this time recting the patient to hold the distal extremity of the there was a marked lowering of his general condi-instrument between his fingers, we may have the free At the time of the incision I purposed remov- use of both hands for manipulation, as in performing ing one or more ribs, but on account of the alarming auscultatory percussion, etc 4 By closing both manner in which he took the ether we thought it ears it excludes all foreign noises. For the foregoing The tissues reasons I invariably employ this instrument, and recommend it to students of physical diagnosis cised, about a gallon of fluid allowed to escape, and cretion should be used in the selection of a stethoscope I fancy that many of the objections to the Camman instrument have arisen from the fact that the instrument employed was not at all suited to the auscultator's ears Always see that the aural extremities of the instrument are arched to correspond with the external auditory canal Do not have the earpieces too large, or, on the other hand, too small to fit the meatus of the ear The spring or rubber band which connects the ear-pieces should be just tight enough to allow the ear tips to adapt themselves

without discomfort to the ear Different heads are of different diameters, and an instrument which would suit one would perhaps be totally unfit for another See that your stethoscope is supplied with three chestpieces—a narrow, hard rubber piece for cardiac auscultation, a wide-brimmed piece, also of hard rubber, for the lungs, and a soft rubber piece, which has an occasional application in very thin patients with many bony prominences

Personally, I find the stethoscope of special im-

portance in the following cases

In auscultation of the veins and arteries of the The adventitious sounds produced in these vessels, as, for example, in chlorosis, are often very circumscribed, sometimes being limited to a small space on one side of the neck I have been able to detect these sounds and to map out their area with the stethoscope after they had altogether escaped the attention of the unaided ear In auscultating this region, direct the patient to cease breathing temporarily, as the respiratory sounds may give rise to confusion, and do not make too much pressure over the large arteries, as it is sometimes possible to generate an artificial murmur in this way The stethoscope is also of occasional service in making out and locating obstructions in the laryny and trachea

2 In auscultation of the heart A cardiac murmur can be heard with great distinctness by the unaided ear, but I believe it to be well-nigh impossible in many cases to locate it or trace it to its point of origin by this means It often happens that two or more murmurs are present at the same time in the heart, and it requires the nicest scrutiny to analyze them and refer them to their points of development In immediate auscultation, the entire side of the head comes in contact with, and receives the impact of, the cardiac impulse as well as the ear There can be no doubt that the angle of the jaw, the temple, and the zygomatic process may serve as conductors of sound, so that in immediate auscultation the sounds heard correspond, not to a space as large as the ear, but as large as the side of the head This view was advanced by Laennec, and has not been concurred in by many subsequent observers, but experience leads me to believe in its correctness Sometimes, also, the heart is acting so irregularly that we cannot even distinguish the systolic sound (the cardinal tograph and other "graph" compositions are made point in cardiac examinations) by auscultation using the stethoscope, however, we have the præcordial area directly before the eye, and we can thus often see the impulse of the heart against the chest, which corresponds in rhythm with the first sound In females, aside from the question of decorum, it is frequently almost a mechanical impossibility to adapt the ear accurately to certain portions of the præcor-Imagine, for example, the difficulty of dial region applying the ear to the mitral area of a female with a largely developed pendulous breast avoid using the stethoscope here if we wish to make to be irritated by the instrument anything like an accurate diagnosis

3 In determining the size, and sometimes the num- cases of the chest-piece (the narrow one should generally should not be introduced into it, the surgeon being be used here), we can often arrive at a very fair idea able to tell when the prostate is reached by the

of the size of excavations in the lungs and sometimes even of their number Auscultatory percussion is useful in such cases The patient may be directed to hold the chest piece in situ, which leaves both hands of the auscultator free Percussion may then be made in the usual manner with a radius of half an inch or an inch from the rim of the stethoscope By practice, the shades of difference in the percussion note may be appreciated with far greater distinctness by this means than through the medium of the ear I feel assured that all who give this method a fair trial will find it tar superior to the old-fashioned method of Drs Camman and Clark with the one ear wooden percussion stethoscope

In addition to the foregoing you will sometimes find other conditions in which the stethoscope will be useful, as, for example, in skin diseases and in contagious diseases generally, in which you may have occasion to auscultate the lungs or heart The ad vantage of this instrument in an examination for the

fœtal heart sounds needs no urging

Except as indicated, I seldom use the stethoscope for pulmonary auscultation It is of little special use in examining the posterior aspect of the thorax, for the reason that the physical signs of disease in this region, as, for example, in bronchitis, emphy sema, asthma, pneumonia, etc, are not apt to be circumscribed, and the unaided ear has the advan tage of being more rapid This is a point of special importance in weak and debilitated subjects, whom we frequently have to support in bed while this region is being examined — The Post Graduate, Janu ary, 1888

Treatment of Gonorrhæa by Antrophores — DR HUGO LOHNSTEIN, of Professor Zuelzer's poly clinic in Berlin, has found, as the result of observa tions on ninety-three cases, that gonorrhœa, both in its acute and chronic form, usually yields more read ily to systematic treatment by a kind of medicated soluble bougies called antrophores than to other meth These antrophores are made by Herr Stephan, a pharmacist in Treuen, Saxony, and consist of a nickel-plated metallic spiral containing a soft medi cated material, the basis of which is gelatine and glycerin—the same kind of thing, in fact, as the hel Before the introduction of the bougie the ure thra is well syringed out by a Zuelzer's apparatus with a 2 per cent solution of boracic acid Regard ing this Dr Lohnstein remarks that the mere passing of urine by the patient is quite insufficient to cleanse the passage from secretion, as anyone may easily convince himself by an examination with the endo As a rule, a single bougie is sufficient during Indeed, when the introduction twenty-four hours was repeated several times a day no better result was We cannot obtained but, on the contrary, the urethra appeared These bougles must be differently applied in acute and chronic In an acute gonorrhea, where the prostatic By a careful adjustment portion of the urethra is not affected, the bougie

der, which may bring on strangury and even cystitis The surgeon guards against this by asking the patient to tell him when he feels as if the instrument were in He then knows that it is in the prostatic the bowel portion The medicament mostly used by Dr Lohnstein is thallin. For the first and second day bougies ployed, even this strength occasionally produces a spirit method sensation of burning On the third and subsequent to introduce the bougies themselves, for they are liable to set up hæmorrhage and to push the instrument into the bladder. In an acute case the thick secretion is usually changed by the third day into a thinner and clearer fluid, during the next few days the quantity of this gradually diminishes, and the secretion has generally entirely ceased in from eight to fourteen days' treatment Complications such as are produced by injections very rarely occurred, epididymitis never, cystitis in two cases only, and in these it was probably due to faulty introduction of the bougies sisted other measures cases to treat is, of course, the chronic form it was often found that, though the secretion could be greatly reduced, any attempt to lengthen the in tervals of the introduction of the bougies was liable to be followed by a return to the original condition Where the prostate and its ejaculatory ducts are affected, it is often necessary to have recourse to bou gies of different kinds—e z, zinc, tannin, rhatany, nitrate of silver, quinine, or sulpho ichthyolate of Of course, where, instead of the muammonium cous membrane generally being inflamed, there is a small ulcerated patch, these bougies are useless, and the endoscope must be employed as a guide to special local treatment — The Lancet, March 24, 1888

ACETIC ACID AND STRYCHVINE AS AN ECBOLIC -MR G 5 MAHOMED, of Bournemouth, says

Since Dr Grigg called attention to the value of vinegar as ecbolic, I have frequently used it for that the strong acetic acid (representing nearly half a) been successful in bringing about contractions of difficulty saved from a burning house the uterus after ergot had failed seemed to be leaving her, and ergot had been exhibited (the waters having broken), I found acetic acid and strychnine produce sharp and effectual pains

Dr Francis, of the possibly good results of combin- ever

greater resistance caused by the circular muscular a menstruum, with a standard surplus of free acid In chronic gleet, where the prostatic portion In a short time I received from them two samples, is affected, the bougie should be made to enter it, one of ergot extracted by acetic acid, of which a but ought always to be kept from entering the blad- fluid drachin represented 60 grains of ergot with ten minims of free acid, the other, an alcoholic extract of ergot, which also represented 60 grains of ergot and to minims of free acid in each drachm preparations had the color of the ordinary extracts, but the acetic acid frothed when shaken, which, of course, the alcoholic extract did not do containing 2 per cent of this substance are em- acid process should be more economical than the

In a case where there was retained discharge after days a bougie with 5 per cent of thallin can usually labor I gave some of this extract, and when the be borne It is not found advisable to allow patients medicine was exhausted wrote a prescription for a similar dose of B P extract, to which I also added some bromide of potash, which is stated to aid the The case was still unre involution of the womb lieved on my next visit, the uterus being obviously distended, so, after syringing out the cavity, I told them to have the medicine made up again, when the patient said, "Oh, sir, the medicine you gave me at first brought away something every time, but this medicine has done no good" This seems like a comparative test in favor of the acetic extract

> In a case of flooding, due to a large fibroid, I Several cases were cured that had re- found that 20 minims injected deeply into the but-The most difficult class of tock gave rise to no local irritation, and there was Here no bleeding the night following, but there needs further experience before attributing this result to the drug Ergotine discs did not always control it -British Medical Journal, April 7, 1888

DERMATOSES FOLLOWING MENTAL SHOCK -DR Dubois-Havenith, writing in La Clinique, adds some further instances of dermatoses following mental shock to the case of purpura hæmorrhagica recently described by Professor E de Smet 1 An unmarried lady who had been present when a man armed with a spade violently attacked another man was much upset by the sight, and did not regain her accustomed composure for some days Three weeks later bullæ presented themselves on different parts of the body, and before long the entire cutaneous surface was covered with an eruption, having the characters of foliaceous pemphigus, accompanied by incessant pruntus Arsenic, quinine, and other remedies exer-And I have also found that four drops of cised but little effect, or at least only a temporary one for the patient succumbed after four years in a drachm of vinegar) combined with strychnine has state of marasmus 2 A little girl of 10 was with In one noteworthy time her appetite became bad, and she was haunted case where in a very weak and an emic woman the by constant nightmares and visions of houses on fire pains, after continuing feebly for a day or two, A month afterwards a pemphigoid eruption made its appearance on the nose It spread to the mouth and then disappeared Shortly, however, it again manifested itself, covering a large part of the body Iron and quinine appeared to be of but little service, for The same thought, therefore, occurred to me as to in nine months's time the eruption was as copious as Two or three drops of Fowler's solution of ing it with ergot, and, in addition, observing that arsenic three times a day soon worked a marvellous acetic acid could extract the active principle from improvement, which it was evident was really due to colchicum and ipecacuanha, I asked Messrs Corbyn the arsenic, for twice when the medicine was interto make a preparation of ergot, using acetic acid as mitted for a time the eruption returned 3 A married woman had a quarrel with her husband, who struck her on the cheek with a key Four days afterwards an cruption came out on the wrists, the hands, This eruption had the characters of and the feet Hebra's multiform usudative crythema, and was accompanied by intense itching. On the lips there was a vesicular, tumefied eruption, and patches on the tongue The whole disappeared in about three weeks -Lancet, April 14, 1888

DETECTION OF COTION SLED OIL IN OLIVE OIL -Ernest Millian, of Marseilles gives the following as a ready method of detecting cotton-seed oil in It is based on the power of reducing the fatty acids of cotton-seed oil In a porcelain dish holding about 1000 cc, heat 15 cc of the oil to be examined, to 110° C Then, the heat being continued, turn slowly into the oil a mixture of 15 cc of a solution of caustic soda in distilled water, at 40° Baumé, and 15 cc of alcohol at 92° After the mass has became homogeneous by ebullition, indicating complete saponification, add drop by drop, so as not to cool the mass nor form lumps, about 500 cc of distilled water After boiling for a few minutes the fatty acid may be separated by means of a r 10 so When the separation lution of pure sulphuric acid is complete, and the sulphuric acid is slightly in excess, collect 5 cc of the fatty acids with a silver spoon, and place in a test-tube—one about 3 cm in diameter and 12 cm long Now add 20 cc of alcohol at 92°, and heat slightly on a water-bath to dis-These being dissolved, pour solve the fatty acids in 2 cc of a solution of pure mitrate of silver (30 grams to 100 cc of distilled water), replace the tube on the water-bath, and heat until about a third of the mass is evaporated, take the test tube from the bath, and the operation is over

Whatever be the source of olive oil its fatty acids remain unaltered if the oil is pure, if, on the contrary, the oil contain cotton-seed oil, even as little as r per cent, there is a reduction, and the metallic silver set free gives a black color to the fatty acids of the mixture as they rise to the surface -Nouveaux Remedès, No 5, 1888

PERCHLORIDF OF IRON AND MILK IN DIPHTHE-RIA -M MOHAMMED BEN-NEKKACH, of Inkermann, reported to the Association Française pour l'Avancement des Sciences on March 30, that he had treated 21 patients with diphtheria with perchloride of iron and milk, with only one death, in the case of an in-Among the other patients were fant six months old All the patients were treated from the two adults beginning of the disease, before the period of as-Independently of the 21 there were six other patients, that could not be treated properly on account of indocility, or in which the treatment was not properly carried out, or because treatment was begun too late

In all the cases that recovered, and most of them were severe, the iron was given in doses of 25 to 30 The quantity of milk given was a litre mirably in drying up the new blebs, and preventing gtts in a glass of water (the solution being fresh for As adjuvants were prescribed emetics and their return each dose) a day

painting the pharynx three times a day with the iron -Semaine Medicale, April 4, 1888

ACETOPHENIDINE —M GUERORGUIEWSKY has em ployed acetophenidine instead of antipyrin It is a crystalline grey powder, insipid and inodorous, de rived from phenol, it is soluble only in 20 parts of alcohol, and is eliminated by the urine, wherein it can be detected by the red coloration with perchlo In typhoid fever, tuberculosis, erysip ride of iron elas and pneumonia, in doses of from 15 to 30 centigrams, he found it to act as an antipyretic in from twenty to forty minutes after injection, the pulse and respiration diminishing in frequency, and sweating being induced It also relieved pain, but doses of 50 or 60 centigrams are required to effect this end, as in migraine, cephalalgia, and tabetic pains It never upset the stomach, or modified any of the other functions of the body, in this respect it claims to be superior to antipyrin -The Lancel, March 24, 1888

PERRO'S METHOD OF REDUCING STRANGULATED INGUINAL HERNIA -G S PERRO uses the following After the pelvis has been raised on a method pillow, and the thigh flexed and abducted, the op erator grasps the scrotum and the hernial tumor, bends it slightly against the wall of the abdomen, and presses upon it in such a way that the index finger of the right hand is carried into the inguinal canal, and in the direction of the horizontal ramus of the pubes by a turning and boring motion, in a short time the strangulated part slips back into the abdominal cavity, and the other part follows By this method Perro has succeeded in reducing six cases of strangulated herma, after his colleagues had spent from twelve to thirty hours in vain attempts at reduction - Centralblatt für Chirurgie, No 12, 1888

ACETANILIDE-MONOBROMO -MESSRS BURGUYNE, BURBRIDGES & Co, have prepared a combination of antifebrine or acetanilide with bromine, which it is suggested may prove useful in facial neuralgia when the pains in the head are linked to nerve alterations, also in rheumatic, muscular, and articular pains The name given to the compound is acetamilide mono bromo, and its formula is (C₀H₁BrN < CO₁CH₂)

-Lancet, April 14, 1888

Infusion of Digitalis in Pneumonia - Prof PETRUSCO, of Bucharest, reports the very successful treatment of 142 cases of pneumonia by large doses of the infusion of digitalis-from one to two drams of the leaves in infusion in the twenty four hours In no case were any evil effects from these large While it does not appear that the disease was materially shortened, the mortality was much below the average—the death rate being only one per cent - Weekly Med Review, April 21, 1888

A PASTE FOR PEMPHIGUS —UNNA recommends 2 paste made of equal parts of linseed oil, lime water, oxide of zinc, and chalk, which is said to work ad

SATURDAY, MAY 12, 1888

THE PRFSIDENT'S ADDRESS

The able Address on "The Mission of the American Medical Association," delivered by President Gar-NETT, on Tuesday, should be read carefully, and especially by the teachers in those medical schools that have neither requirements for admission to their classes, nor systematic graded courses of instruction The opinion that students of medicine must have a good preliminary education before entering a medical school, and that public interest, and the welfare of the individual student as well as of the profession as a whole de mand systematic graded courses of instruction is becoming more general each year, and will bear good fruit when the colleges that are still out of line find that it is to their interest to put up the bars both for entrance and for graduation

It is useless to enter into any argument with those that assert that the American Medical Association has accomplished nothing in the way of medical re-The Association has always stood in the van of medical reform and high medical education, and high requirements for admission to medical study Obviously, however, not being a legislative or judiciary or police body it could go no farther than the making of wise suggestions-it has no compelling is the students' fees, regardless of whether they be compelling and police powers in such matters must palpation in obstetrical diagnosis

The effect of the passage of medical vidual States practice acts and the creation of boards of health and of medical examiners by different States has been felt in a large number of colleges requiring preliminary education for the study of medicine, longer terms of medical study, and graded courses have increased markedly during the last six or seven years, and the good work still goes on And even the colleges that had not sufficient regard for their reputation and for the welfare of the profession to raise their requirements, have, in some instances, shown that they recognized the justice of the requirements of State boards by specious and evasive announcements of new requirements—seemingly afraid that they would lose patronage, on one hand, if proper requirements were made, and that, on the other hand, some of their graduates would fail of admission to practice in certain States if improper requirements were shown to exist

Dr Garnett has a few words for the colleges that claim that the colleges should not be held responsible for graduating illiterate and incompetent students, that preceptors are supposed to send to the colleges only such students as are fitted for the study of medicine, and he is justly suspicious of the colleges that simply announce that certificates of educational acquirements are required of all students before matric-And he might have added some words regarding those institutions that make some such announcement as the following Certain States having passed laws requiring preliminary examinations, in order that students from this college may not be embarrassed the Faculty will grant preliminary examinations to such as intend to practice in the States requiring such examinations Can such announcements be regarded otherwise than as an evasion of the regulations of certain State boards?

The propositions suggested by the President do not require elaboration nor discussion While the second may at first seem harsh and impracticable, it is at least as fair for the one as for another

NE SUTOR ULTRA CREPIDAM

The most important work in midwifery performed by the Chicago Gynæcological Society, during the power over the colleges and teachers whose chief aim brief period of its active existence, has consisted in the frequent enunciation of the Semmelweiss doctrine qualified by nature or education for entering a noble of the nature and prevention of puerperal fever, and Under our system of government the the repeated discussion of the method of abdominal The Society is to be vested in the medical boards created by the indi- be congratulated upon the faithful execution of a

duty of vital significance both to the profession and to the community On general principles, one would naturally have thought that the numerous essays on both subjects were works of supererogation and unworthy of presentation before a body claiming to be constituted by specially qualified practitioners much of the same tenor has been ably and authoritatively written upon both topics within recent years Moreover, absolute unanimity of all opinion entitled to highest consideration has existed for a long period

But the outspoken skepticism, both as to the nature of puerperal fever, as expounded by Semmelweiss, and as to the value of abdominal palpation, displayed in the discussion of these essays, demonstrates their timely character, while it also suggests the melancholy fact that medical men do not always read so much, nor so attentively, as might reasonably be expected of members of a learned profession lwith a magnificent literature

It was urged by a very small minority of the members of the Society that formal indorsement of the view, that vaginal examination of the parturient woman ought to be discouraged, should be withheld upon the ground of possible medico legal complications, that papers suggesting the notion of the responsibility of the physician or nurse in case of puerperal fever, must be suppressed for the same reason —the danger of suits for malpractice

Here we have verily an old foe not even with a new face—an application of the doctrine of expediency at once curious and amusing, if the importance of the subject did not render the matter pathetic The vital moment of the issue is sufficient apology for making this local and relatively trivial protest the text of an editorial note

of the Semmelweiss doctrine is wholly irrelevant to The truth or falsity of the theory the discussion In passing, it may be remarked only concerns us that the plea of self-interest has never been very popular among medical men-probably on account of the native nobility of the science, possibly, also, because it is almost always the sign of a weak cause O: course, the belief that every case of puerperal fever arises from the resorption of decomposing animal organic matter through lesions in the genital tract, and that the materies peccans is invariably introduced from without, throws tremendous responsibility upon physician and nurse In the concrete case of puerperal fever, provided the control of the patient has been entirely given up to physician and nurse, one or other—or both—are responsible for the The woman is either infected directly by disease

contact through the fingers, instruments, and the like, or indirectly by the cocci within the vagina, on the skin surface, or in the clothing The doctrine is undoubtedly a harsh and unpleasant one for the attendants, and it is only "the hard evidence of facts, la brutalite des faits, which forces us to accept this theory" Our predecessors "were helpless in the prevention of puerperal fever, but they never had a sleepless night from remorse" The Semmelweiss theory, supported by "irresistible facts contributed by physicians in all parts of the world," constitutes an integral portion of medical science, and is no longer a legitimate subject for discussion tistics of Leopold, Freund, Credé, Carl Braun, Tarnier, Richardson, Garrigues, are interesting and valu able, but they are not necessary to the establishment of the fact That was fully accomplished long since

Is it not, then, remarkable that the Medical Stand ard, of October, 1887, takes up the gauntlet in an editorial entitled "Medico-legal Dangers from too Positive Assertions" From the general proposition, "Physicians cannot be too careful in stating a favor ite hypothesis as an established truth of science, one cannot withhold his assent, although one may tail to perceive the necessity for the repetition of a But in the case in question, the plea trite platitude of self-interest was urged against the indoisemententirely superfluous, it is true-by the Society of "an established truth of science" and not of "a favorite hypothesis" The writer of the note was unhappy in the selection of his illustration—that is Was he also ignorant of the present perfectly plain state of our knowledge respecting puerperal fever? If the note is the expression of irresponsible opinion, as it seems to be, we beg to suggest the fitness of It is perhaps needless to say that the expediency imitating the sobriety of the French cobbler Parisian bootmaker," the chronicle tells us, being asked his opinion of the respective merits of Turenne and the Grand Condé on the same stricken field, replied 'I made the boots of both gentlemen, as far as boots go there is not a pin to choose between them, beyond that I cannot go, for it lies outside of my profession,"

THEINE AS ANALGESIC

A contribution to the therapeutics of pain by an intelligent worker may be always welcomed as a step forwards in the treatment of disease little book that has recently appeared from the wellknown pen of Dr Thomas J Mays, of Philadelphia

¹ Kucher

"A physiological Contribution to the Therapeutics of Pain," as he calls it, being a reprint of a con tinued article that appeared in the Polyclinic, from Dr Mays' first last September to February, 1888 contribution to the therapeutic action of theme appeared two years and a half ago, at which time he thought that what was sold as theme was actually Since that time he has obtained pure specimens, and revised all his former work on the subject

Theme and caffeine are alike in first affecting the anterior extremities of frogs, and both diminish respiration and cause hyperæsthesia during the latter (later?) stage of the poisoning, although the supersensitiveness is much more marked in theme than in They differ in the following respects caffeine Theme principally effects sensation, while caffeine does not, theme produces spontaneous spasms and convulsions, while caffeine does not until very late in the stage of poisoning, theine impairs the nasal reflex early in the poisoning process, while caffeine does not, if at all, until the very last stage, the lethal dose of theme is larger than that of caffeine differences are sufficient to show that theme and caffeine are not identical in physiological action, though chemists describe them as being the same chemically—which it is not at least fair to question until further analyses are made, for while it by no means follows that two isomeric substances have similar properties, it may be doubted if two asomeric, or even metameric bodies would have such different physiological actions Of the purity of the caffeine and theine used by Dr Mays, it is sufficient to say that precisely identical results were obtained from two separate manufactures of both alkaloids by Merck, of Darmstadt, and from specimens made by Mr Wm C Harris, a Philadelphia chemist much by way of explanation of a number of supposed failures of theme in the hands of other physicians after the publication of Dr Mays' first article

The physiological action of theine on man, as deduced from a number of experiments by Dr Mays, may be summed up as follows Dose from 2 to 5 Numbness of the arm and hand below the seat of injection-"a feeling as if the hand had been steeped in a solution of carbolic acid," a feeling of coldness and an occasional disturbance of temperature of the member under its influence A slight reduction in the pulse rate, and no intoxication of No impairment of motion The anresthesia begins in a very few minutes, and is much more marked in some individuals than in others A relief to the sensation of fatigue Temperature dis- affections of the sensory nerves

In four cases in which the turbance not regular temperature was taken, the hand that showed the greatest depression of temperature was least anæs-The psychic disturbances caused by deep injections in Dr Castle's experiments upon himself (Medical News, Dec 15, 1885) were probably caused by the introduction of the solution directly into a vessel, since Dr Mays, even with five times the quantity used by Dr Castle, has never observed any It may be said, then that phenomena of the kind I Has a special affinity for the nerves of 2 It produces anæsthesia when administered subcutaneously 3 Its anæsthetic action is confined below the seat of its injection, te, its influence extends from the centre to the periphery, and not in the opposite direction

Its physiological action, then, shows that in theine we have an agent that paralyzes sensation without affecting motion, and that this effect is certain and without injury to any part of the body, even in large According to Dr Mays, in order to obtain the full effect of theme it is not necessary to inject it deeper than immediately below the skin, and Dr Castle's experience with it shows that deep injections may cause unpleasant symptoms Dr Mays says that the analgesic action of the drug is very prompt, and when a single dose fails to act favorably, it is ad visable to increase, even if this has to be done to a large extent-as much as gr 25 or more seen no prolonged irritation, and no inflammation at the site of injection, though there is some burning at first, which disappears in a few minutes, and is replaced by a marked area of anæsthesia The drug is more soluble when prepared with benzoate of A solution for hypodermatic use may be made of theine and sodium benzoate aā 31, sodium chloride gr 8, distilled water 31, \$\mathbf{m}\$ 6 contain gr 0 5 of theme Theme tablets for hypodermatic use are also made

Theme is solely a pain reliever, but in cases of obstinate and protracted pain it must be aided by other drugs that improve the nutrition of the affected nerve, or that may remove the persisting diathesis As regards the difference between theme and morphine, Dr Mays sums it up as follows necessary to narcotize the centres innervation in order to relieve a given pain, then morphine is indicated, but when it is not necessary to do this, theine will accomplish the work safer, better, and more promptly than morphine On general principles it may be said that morphine gives the best results in acute pain, while theine is most beneficial in chronic

DISTILLERY FLD CATTLE IN CHICAGO

For the second or third time the Mayor of Chicago now says that slop-feeding in Chicago must be dis continued, and he will have all the cattle sheds removed from the city limits This decision is based upon the report recently made by an expert who was detailed to ascertain the amount and cause of pollution in the Chicago River Strange to say, the head of the city government would not allow a reporter to see the expert's report To use his chaste and elegant diction, "It's too tough to be printed much worse than was expected " The Tribune suggests that the real reason for withholding the report is that it would furnish evidence for Peoria and other towns below Chicago on the Illinois River to use in the threatened suit against Chicago for not taking proper care of its sewage

This distillery feeding of cattle, which has been carried on for a long time in direct violation of the law, has been connived at, and in fact allowed, because "It isn't profitable to our distilleries unless they can feed cattle " "The distilleries will have to make some arrangement to feed their slop or lose The result of the enforcing of the order will be to make them move their entire plants to some other point " Then so much the better for Chicago and the worse for the other point If the Chicago brewers and distillers cannot make a handsome profit on the adulterated abomination they are selling to the public at an enormous advance on the cost of making, by all means let them move to some other point-or go into some honest business

EDITORIAL NOTES

DR EMIL BESSELS, the well-known physician, naturalist, and arctic explorer, died of heart failure at Charfreitag, Stuttgardt, on March 30, aged 40 Dr Bessels was well-known in scientific ciryears cles in this country, having come to America in 1871 to undertake the scientific direction of the North Pole Expedition under Hall, on the Polaris wrote the "Physical Observations" of the narrative In 1876 he settled in of the voyage of the Polaris Washington as Secretary of the Smithsonian Institution, until his house was burned, and he narrowly escaped with his life on Christmas Eve, 1885, when he returned to Europe and settled in Stuttgardt, where he remained until his death

THE USE OF VESICANTS—WYSS, of Geneva, has schoo published a veritable diatribe, in *Der Forschritt*, Facul against the use of vesicants, asserting that the use of ology

them is a useless cruelty, and that he has never had any good effect from them in pneumonia, pleurisy, sciatica, and other affections, that they interfere with the patient's sleep, act disagreeably on the unnary organs, and cause obstinate eruptions, and that they increase the fever, and may affect the general condition of the patient unfavorably That vesicants are abused in many cases there can be but little doubt, and there is scarcely less doubt that rubefacients or at most "flying blisters" would be of more service in many cases in which vesication is used as Wyss' experience with blisters in pneumonia are concerned, it is important to know in what stage of pneumonia they were used, since it is admitted that they are harmful in the inflammatory stage

BICHLORIDE OF MERCURY IN TYPHOID FEVER -GLASER, of Hamburg, gives the results of the use of bichloride of mercury solution, 1 4000 or 5000, in The interest that attaches to his evtyphoid fever periments is in the attempt to determine whether it is possible to kill the bacilli of typhoid fever-or cure the disease by antiseptics and germicideswithout killing the patient Glaser used the solution in 23 cases, and his mortality, 21 per cent, is suffici ent to make anyone at least extremely cautious in using it in the future, and as there does not seem to have been any positive gain from its use there seems to be no reason for repeating the experiments Certainly, his cases showed none of the improvement seen in the treatment by calomel, so much used by some distinguished German clinicians

DR MIDDLETON has, as was to be expected, been acquitted of the murder of a gypsy guide, who attempted to take his life in the cathedral of Cordova, Spain It may be remembered that when at the top of the cathedral tower the man seized Dr Middleton from behind, after having his stick wrested from him, the doctor drew a revolver he fortunately had with him, the first shot entered the gypsy's mouth, the second pierced his heart. The shots were fired at the assailant over the doctor's shoulder.

THE "WIENER KLINISCHE WOCHENSCHRIFT," the first number of which appeared on April 5, is to be published under the editorship of Dr G Riehl It is more pleasing to the eye than most Continental journals

A FACULTY OF MEDICINE FOR MARSEILLES— There is a scheme on foot for elevating the present school of medicine of Marseilles to the rank of a Faculty, and adding to the school a chair of Bacteriology

SOCIETY PROCEEDINGS.

MEDICAL SOCIETY OF THE STATE OF CALIFORNIA

Eighteenth Annual Meeting, held in San Francisco, April 18, 19 and 20, 1888

[Report furnished by the Sacramento Medical Times]

FIRST DAY-WEDNESDAY, APRIL 18

MORNING SESSION

The Eighteenth Annual Meeting was held at B'nai The Society being called to order by B'rith Hall THE PRESIDENT, R H PLUMMER, M D, of San Francisco

C G KENYON, of San Francisco, on behalf of the resident members, extended a hearty address of welcome to the visitors from abroad He alluded to the material advances which had been made in the State during the past year He directed attention to the exhibition in connection with the meeting and dwelt upon the importance of the new feature

THE PRESIDENT, R H PLUMMER, of San Francisco, then delivered the Annual Address The following subjects were recommended for the consideration of the Society vised that no body should be interred without a permit from a board of health, health officer or justice of the peace, upon a certificate from a legally qualiwritten statement of two reputable citizens The permit or certificate to be duly recorded connection he alluded to the necessity of the formation of local boards of health in the smaller towns and pointed out that no further legislation was needed as the supervisors have been armed with the necessary authority The necessity for the establishment of a quarantine station at the Port of San Francisco was urged and the existing deficiencies pointed out, together with the present status of the measure now before Congress appropriating the necessary funds for this purpose The importance of a State law compelling the vaccination of all children before entering the public schools was urged At present several cities have ordinances providing for compulsory vaccination within their limits, but are constantly exposed to infection from abroad A general enact ment would make this protective measure universal Regarding the existing law providing for the recording of births, marriages and deaths, which has frequently been mentioned as inoperative and impossible to enforce, he directed attention to sections 3075 and 3077 of the Political Code and sections 377 and 378 of the Penal Code, where adequate penalties were pro-The present condition of the Constitution advisability of appointing a committee to revise and codify the same was urged The recent action of course from every applicant for a license to practice trol of the superintendents

in this State was mentioned and the suggestion made that the Society heartily endorse the same necessity for a good primary education was dwelt on, and mention made of provisions in the bill now before the Society in which this had been provided The following committee was appointed to report on the recommendations contained in the President's address C E Blake, W W Kerr, S O L Potter, H S Orme and J H Parkinson

AFTERNOON SESSION

The Secretary, WM M Lawlor, read the

REPORT OF THE BOARD OF EXAMINERS

The number of meetings held during the year was 13, certificates granted, 265, duplicate certificates issued, 2, applications refused, 5 Amongst those receiving certificates were 37 graduates from Califorma schools The work of the Board was steadily increasing, the number of certificates issued being 59 in excess of the previous year

DR A L GIHON, on behalf of the

RUSH MONUMENT COMMITTEE,

made a statement of its object and purpose said When we determined upon erecting this monu-In accordance with a bill ment, it was resolved, as there were 90,000 physicians introduced at the instigation of the State Board of in the United States—there are now 100,000—to Heath at the last session of the Legislature, he ad-limit the subscriptions to one dollar, and we should at least get one-quarter of that number to subscribe I am quite sure that out of the 100,000 physicians in the United States we will find a quarter, at least, who fied physician, the coroner, or, in default of this, the will give us a dollar, and that will build a handsome monument A great many physicians wanted to In this give more, but we were satisfied that we would receive more funds than we needed

Drs Gihon, Tyrrell and W P Gibbons were appointed a committee to collect subscriptions from the Society

The report of the Committee on Mental Diseases and Medical Jurisprudence was read by DR W W MACFARLANE, of Agnew The speaker alluded to the barbarous treatment to which the insane were formerly subjected The insane in California were amply provided for He believed that the feebleminded and idiots should be treated in their own county hospitals, which would be more economical than sending them to the State asylums More than 60 per cent of patients in the asylums are of alien There has been an average of 152 Chinamen, and a cost of \$22,000 each year California is the only State having no Sunday law To this much of our insanity, which depends on drunkenness, is due He alluded to the prevalence of fœticide, which he thought had much influence on mental diseases, in consequence of physical deterioration resulting from Mental and moral treatment had much to do Here the number of inmates was so with recovery and By Laws of the Society was mentioned, and the great that it was impossible to give them much atten-He deprecated the custom existing in this tion State, whereby the management of the asylums and the Board of Examiners in raising the standard of the appointment of the officials was in the hands of qualification, and requiring a three years' graded boards of trustees, instead of being under the con-

DR J W ROBERTSON, of Napa, in opening the discussion, said The question, whether or not insanity is on the increase, had often been discussed There was no doubt that the number of the insane had increased opened they were looked upon as jails It was found tained there?" that but little restraint need be employed reception wards of the asylums were placed some of enough to be discharged there was no alternative the most intelligent patients, who understood the rules of the institution and were quiet Patients, on their way to the asylum, are frequently subjected to rough usage, and consequently arrive in an excited there should be no recurrence, and it was the same and exhausted condition, but on finding that they are thing in mental diseases surrounded by quiet and order they soon calm down There was not a single straight jacket in Napa or a Chronic and acute dozen patients under restraint cases should be kept apart. One violent patient would upset a whole ward It was desirable that the insane should be sent to the asylums early, as under the influence of strict rule and hygienic measures Theoretically there they were invariably benefited This, of should be an asylum for every county course, was impracticable, but there ought to be an asylum for every congressional district the question of increasing the number of physicians in the asylums—of the 1,400 cases in Napa, about Soo received very little medical treatment. In other States, where the staffs were numerous, the salaries were small The best men were therefore not attain-It required a able, and there was no permanency year's training for a physician to be successful with He believed that the existing system The suggestion that there should be was the best one law for the government of the State asylums was At Napa the Board had absolute an excellent one control over the appointments and dismissals

DR W H MAYS, of Stockton, said that insanity was not more prevalent in this State than elsewhere There were in Stockton 1,600 cases, in Napa 1,400 Estimating the population of the State at one million and a quarter, the rate would be one in four hundred now -a very low percentage In New York, the perce itage was i in 352, Massachusetts, i in 362, Illinois, 1 in 345, Great Britain, 1 in 348 The profession should endeavor to remove the prevalent belief that this State had more than its share of insanity In no State in the Union were the insane so closely There seemed to be an intolerance of sifted out any form of mental disease, and all cases were promptly sent to the asylums He believed that there was a crying need for more medical help was true that a large number of the inmates did not require medical treatment, but they required what was of more importance—care, employment, amusement and general surveillance He was glad to learn that the asylum for the chronic insane would soon be

DR H D ROBERTSON, of Yreka, said that it frequently happened that patients were discharged be-He was glad to know that fore they were cured there would soon be more accomodations for the insane, and he hoped the physicians in charge of the make an effort to hold these patients until they were ing the discussion, said that he regretted that the cured

DR MAYS thought that if the speaker was present in the asylums for a few months he would modify his statement that the authorities were hasty in discharging patients The question of discharging a patient When the insane asylums were first really was, "Is he so insane that he needs to be re-When patients recovered, to all In the intents and purposes, and when they became sane other than to do so, even if they again became in-Patients are said to have recovered from dis eases, as pneumonia, but that did not guarantee that

DR GROVER, of Berkeley, said that the overcrowding of the asylums was partly due to the fact that what are called "insane criminals" are sent there There should be a branch asylum attached to the State Prison at Folsom or San Quen'in for such cases

EVENING SESSION

DR W E TAYLOR, of San Francisco, read the report of the

COMMITTEE ON SURGERY

He had selected the subject of Operative Pro cedure in the Treatment of Internal Cancer He as sumed the existence of the disease called cancer in its usual acceptance, and he confined himself solely to the carcinomata, and their treatment by cutting He questioned whether modern op instruments erative surgery had not passed the bounds of pru He did not think that an operation should be performed unless with some hope of cure By this he implied a permanent recovery without further extension, and he did not accept the three-year limit or no recurrence within that period He wished to sound a note of warning—that we should pause and well consider before performing operations of this He believed that operations for internal can cer would, in the future, be less frequently done than The difficulty of an early, and even a correct diagnosis of internal cancer was extreme He cited Butlin in support of this position, that authority condemning too frequent interference He character ized the results of some of these operations as ghastly-in one series, a total of 364 operations and The necessity of diagnosis was dwelt on and instances of "cancer" cured by appropriate treatment mentioned in this connection The splendid results achieved in abdominal surgery encouraged these operations, but there was no com parison between operations for benign and malignant Complete removal in the one case was cure, in the other only a hope of ultimate recovery In non-malignant disease, where life is threatened or great suffering is undergone, the surgeon is justified in operating ease, it was unwise and unsurgical to use these facts as arguments in favor of operation advances in operative technique had been made, the clinical fact remained that a cure was impossible until a specific remedy was found

DR T W HUNTINGTON, of Sacramento, in open-

standpoint from that adopted by the author was glad that a halt had been called to indiscriminate operations upon neoplasms, regardless of their end It was true that some brilliant results had been obthe operations in all instances were justifiable lawgivers of surgery had not always proved to be previous experience surgeons He believed that the ambitious operator, seeking the greatest good of the greatest number, to the human race for the work he had done of great service to the Society and to the profession

a variable period of time had returned that it is simply an error of diagnosis We may put | Four years ago he had removed a breast off the evil day, but there is no such thing as cure ease was well advanced

DR L C Lane, of San Francisco, disagreed with moved The patient is now perfectly well had cured it a number of times by operation November 1876, he had operated 88 times calculate that one-fifth were living trouble is at first purely local, and therefore curable of pain and prolongation of life happens that cases are not seen until too late It completely remove the diseased structures was easy to talk and to give one's personal experithere could be no doubt as to the nature of the dis-In what might be termed a "cancer family" -the father and mother died of cancer, they were not operated on-a daughter had an unmistakable that other surgeons shared this feeling cancer of the mammary gland An operation was the disease Her breast was removed five years ago operation had been performed early A patient, deed of their diagnoses is invariably made followed this rule

subject could not have been reviewed from a different ence warranted operations on deep structures, as in He cancer of the uterus?

I believe I was the first to perform DR LANE that operation in the United States Nearly all the cases were seen too late They had been cauterized tained, and it had been claimed in consequence that and portions of the neck had been removed in every It case except two I believe the operation is justifiahad been said that the lawgivers of art were not ble if we could get the case in time, but I should always artists, and he was torced to admit that the carefully select my case and would be guided by

DR W F McNurr, of San Francisco, said the statistics of removal of the uterus for malignant dishad field enough and opportunity sufficient in which ease are much better in Europe than in this country to achieve honor and the greatest amount of service | Martin has had marvellous results—his cures being He wished to thank the author about forty per cent The secret of this is early di-He believed it would be agnosis, for which the microscope is relied on did not think that an American surgeon could be DR E B Robertson, of Jackson, had operated found who would operate on this evidence alone in several cases of malignant disease In each case Enlargement, hæmorrhage, pain, and all the physithe growth had been successfully removed, but after cal symptoms were deemed necessary Then when He there- an operation is performed the patient dies fore believed that where we are fortunate in one case | speaker had operated on a patient for cancer of the and the patient recovers and continues to do well, | lip thirteen years ago, and he is now perfectly well All the glands were re-Professor Taylor in the view which he had taken of thought that more attention should be given to early the incurability of cancer He was entirely satisfied diagnosis, and by that means we could expect to rethat cancer was curable, and he was satisfied that he lieve more of our patients, and fully justify the op-Since | eration

DR J D ARNOLD, of San Francisco, said that number of the cases had been kept under observa- where the individual experience of surgeons would Many of them had died, but he could safely put them either on the radical or conservative side The great of the question, he believed that the true pathology trouble was that the cases were not seen sufficiently of the disease should be made the touch-stone for From observation and study he was con- operation If the surgeon believed the disease to be vinced that in a very large number of cases the systemic, operation was only justifiable for the relief If, however, he There was a great prejudice against believed that cancer was a purely local disease, and operation from the dissemination of the notion that | could become systemic through actual extension, his the knife will not cure the disease, and it frequently decision would depend on whether or not he could

DR CHARLOTTE B BROWN, of San Francisco, He would, however, select one case, to show thought that the refusal to operate often exercised a disastrous effect upon patients by confessing the hopelessness of these cases She would operate even in the face of a large mortality, and she thought

DR C CUSHING, of San Francisco, said that his performed on her nine years ago She is, and has personal experience was limited to malignant diseases remained well ever since A granddaughter also had affecting the uterus He agreed with Dr Arnold as to the main principle which should underlie opera-There has been no recurrence In these cases the tive procedure In cancer of the uterus there were only two conditions which warranted active interwho had been operated on twenty-five years ago for ference One is that the disease shall be limited to mammary cancer, and in whom the other breast was the uterus not affecting the surrounding tissues The subsequently removed, is still living. With these other is where the disease has extended sufficiently facts before him he was compelled to disagree with to produce an amount of hæmorrhage and discharge, Billroth states that he has cured one- which seriously impairs the comfort and immediate third of his cases, and Germans are very careful in- health of the patient Cases in which the surround-A microscopic examination ing tissues are involved, but without serious dis-Personally he had always charge, are not proper cases for operation When the uterus was fixed it was unwarrantable to remove DR HUNTINGTON inquired if the speaker's exper it In the first place, it involved the danger of immediate death The only possible justification for surgical interference is to gratify the woman in making her think that something is being done, and thus keeping her out of the hands of the quacks lieved that these two propositions were sound portion of the growth should be subjected to micro-If this proved that it was canscopic examination cerous, an operation was justified under the limitations that he had laid down believed that interference was not warranted

DR J ROSENSTIRN, of San Francisco, believed that the position as to the advisability of removing internal cancer in strict opposition to the removal of external cancer was an erroneous one Why should we believe that cancer of the uterus would be more liable to affect the organism than diseases of the mammary gland? The real secret of success was early operation, and we should endeavor, where we can make a positive diagnosis, to have our patients Extirpation of the larynx had submit to operation been mentioned, and it was true that in the statistics quoted by Dr Taylor there was an alarming mortality, but if we look to the statistics of one operator, Eugene Hahn, we find that he has only two deaths following fifteen operations Of these, two are now well - one seven and the other three years Without advocating operation, he after operation thought that we ought to endeavor to improve our We could not cure cancer, but we were certainly able, in many instances, to relieve intolerable suffering, and to prolong life with freedom from pain for many months

DR TAYLOR, in replying, said that he did not wish to be regarded as considering these operations un-His object had been to call attention to indiscriminate operations for internal cancer, simply because consent was given, and because the patient Operations on properly may survive the operation Notwithstanding selected cases were justifiable what had been said he felt that true cancer involving an internal organ, was not curable by operation He did not consider that operations for external can-They were justifiable in cer were unjustifiable many cases, with a view to both physical and mental He questioned whether a microscopical examination was always correct, and doubted the competency of many in the use of this instrument vestigators often found what they expected to find The object of his paper was to call attention to indiscriminate operations, to ask for a reconsideration of the subject and greater care in the selection of cases

SECOND DAY-I HURSDAY, APRIL 19

MORNING SESSION

DR I E OATMAN, of Sacramento, read the report of the Committee on Diseases of Women He wished to notice particularly the subject of

ECLAMPSIA

While albuminuria invariably accompanied eclampsia, its etiology was uncertain He believed that if solitary confinement

In the next, there was no such thing | pregnant women would place themselves under the care of a competent physician during gestation, ec lampsia could in every case be averted If convul sions appeared, they could be combated by narcotics. but these required to be continued in full doses to maintain the effect In veratrum viride, in 10 M. doses, an efficient remedy existed Early and rapid delivery, under an anæsthetic if necessary, was indi cated Treatment should be continued after delivery Outside of these, he to maintain that degree of relaxation in which con-He included in his paper in vulsions never occur fantile convulsions during severe fever or from injury and gastric disturbance. In these cases treatment must be directed to the removal of the cause

DR WASHINGTON AYER, of San Francisco, in the report on Public Hygiene and State Medicine, di rected the attention of the Society to the subject of

EXPERT TESTIMONY IN CASES WHERE MENTAL DISEASE IS ADVANCED AS A PLEA OF DEFENSE

The course pursued by the courts, where such pleas as emotional insanity are advanced, is nothing but a hippodrome of justice, and by this means the testimony is made to appeal so much to the sympa thy of the jury that the ends of justice are more fre In addition to quently defeated than served by it this, it is an inducement for depraved persons to commit crime in the hope that such a plea will be The expert, although treated with cour advanced tesy while on the stand, is hampered by hypothetical questions, to which he is only allowed to answer yes or no, thus the jury is completely puzzled, while at the same time the value of the testimony, as an aid to arrive at a just verdict, is greatly impaired avoid such manifest injustice the defendant, in cases where such a plea has been advanced, should be ex amined by an expert committee of three, appointed for this purpose by the Governor of the State, whose report should constitute the only expert testimony in Dr Ayer also urged the separation of in sane criminals from other insane patients, either by providing a distinct asylum or by segregating them into different wards

DR W P GIBBONS, of Alameda, inquired the number of insane who had been sent to the asylums from the State prisons, and whether they were liber ated at the discretion of the authorities at the asy

When a criminal lums? DR GROVER, of Berkeley, said is deemed insane by the legally constituted commis sion connected with the State prisons, consisting of the warden, captain of the guard and a physician, When the authorities they are sent to the asylum at the asylum deem them to be sufficiently sane, they return them to the prison to serve out their term This subject has been frequently agitated, and has always been one of great importance Criminal insane are sent to the State prisons for murder have several of them in my mind who were no more insane than any person in this room time that I was at Folsom several were sent to Napa We had to send them, because we had no place to put them, unless they were kept in The subject of expert tests

mony is of the greatest importance The medical witness was frequently not examimined or given an opportunity to explain He was asked hypothetical cific effects questions, and required to answer yes or no could therefore be seen how valueless and misleading this class of evidence frequently was

DR J W ROBERTSON, of Napa, urged the importance of this question The criminal insane received at Napa were not segregated, as the institution was overcrowded There was no difficulty for a criminal to escape, if he had sense enough to do so deprecated the practice which existed of sending criminals to the asylums without the regular commitment, as they were thus in perfect ignorance of the cause of insanity or of its form

following resolution, which was adopted

Resolved, That this Society especially endorses that portion of Dr Ayer's paper referring to expert | no opium was used testimony, and that it oe referred to the Committee on Medical Legislation, with a request that they take active steps to have it incorporated in the laws of the State

AFTERNOON SESSION

The Committee on Organization of County and District Societies reported that during the year two societies had been organized the Sonoma County Medical Society, March 5, 1887, and the Napa County Medical Society, on December 5, 1887

The effort to establish a quarantine station at San Francisco was unanimously endorsed, and the representatives of the State in Congress telegraphed to

that effect

S Whitwell

The following were elected

OFFICERS FOR THE ENSUING YEAR

President-James Simpson First Vice President-Walter Lindley Second Vice-President-W J G Dawson Third Vice-President-W A Briggs Fourth Vice-President-J E S Baker Secretary-W Watt Kerr First Assistant Secretary-L M F Wanzer Second Assistant Secretary—H M Sherman Treasurer—G C Simmons

Board of Censors-G J FitzGibbon, C C Valle, S F Long, H W Dodge, E W King Board of Examiners-R H Plummer, C H Steele, C E Blake, C E Farnum, Jules Simon, W

EVENING SESSION

The report of the Committee on Diseases of Children was read by DR H M SHERMAN, of San Francisco He said that

ENTERO COLITIS OF CHILDREN

became prevalent when the minimum daily temperature is above 60° \(\Gamma\) Bacteria thrive in this condiof which tyrotoxicon has been chiefly studied

indigestion takes place, bacteria find a favorable culture medium, develop rapidly, and produce their spe-In accordance with these views, the It modern treatment has been modified followed by antiseptics, such as bismuth, salicylate, naphthaline, resorcin, nitrate of silver and bichloride of mercury, are the remedies most in favor

DR HENRY GIBBONS, JR, of San Francisco Summer diarrhœa is a disease which is almost unknown in this city We have diarrhoea, but nothing to compare with the summer diarrhoea of the East He inquired if, in the treatment of these cases with naphthaline and sodium salicylate, no other treatment is used in connection therewith? Is it to be understood that no opium is used, but that the treat-DR WALTER LINDLEY, of Los Angeles, moved the ment is conducted solely with one or other of these

In the case reported by Dr Holt, Dr Sherman

Without any knowledge of the DR GIBBONS probable bacterial origin of the disease, the older physicians were accustomed to use calomel initial treatment was, as has been mentioned in this paper, the exhibition of a dose of castor-oil, in order to remove the decomposing materials on which the disease depended This is the treatment specially advised by West In such cases both calomel and hydrargyrum cum creta were also used extensively for a like purpose, not only for the initial purpose of removing the defective secretions, but for the purpose of a continued treatment It seems, at the present day, that the older physicians had a little more practical knowledge of the value of some drugs than those of a later period supposed they had, for you will remember at one time calomel and similar preparations were almost tabooed Now it is discovered that they are germicides, and probably accomplish a great deal of good on that account, if we believe in the efficacy of the bacteria in the production of sum-The older physicians were also accusmer diarrhœa tomed to use creasote, which is of some value. It has been long my practice in the treatment of diseases of this character to commence with a dose of hydrargyrum cum creta, or calomel, often guarded, as the expression used to be used, with a certain amount of opium, and one dose will sometimes be sufficient to practically cure a severe attack of diarrhea I must confess that I have not arrived at a conclusion which would make me willing to discard opium in the treatment of these diseases Long ago I learned the efficacy or bismuth and opium in the treatment of children and adults, and have found it an excellent combination

DR J A ANDERSON, of San Francisco, would not attempt for a moment to criticise the paper that had been presented, were it not that it seemed to incul cate the idea of treating these diseases by the antisentic method alone That the diarrheea is occasioned by bacteria all will admit, but there are cases when the ptomaines and bacteria in the system have brought tion, and produce various poisons—the ptomaines, about a train of symptoms which the mere adminis The tration of germicides will not remove A child propagation of these bacteria is hindered by the an- whose temperature has run up to 104° or 105° I tiseptic properties of the gastric juice and bile, but if with cholera infantum may be filled up with germi-

cides, but unless you lower that temperature, your solely to antiseptics, it was stated by Holt that these removing the germs will not relieve the child Place were the only remedies used the patient in a cold bath, and lower the temper- of the case should be met either by sedatives or stimature as the doctor suggests, and also give opium ulants which decreases the secretions, and thus takes away sedative dose of morphia, or a stimulative dose of the food of the bacilli, and you will have greatly alcohol, or digitalis, or nux vomica, but the main aided your antiseptic treatment. The speaker said treatment was by antiseptics, and these others were he practiced south of Market Street, and saw true subsidiary and auxiliary cases of cholera infantum He recommended the use of the cold water bath, and especially opium

see that the general practitioner had at present a sufficient justification for abandoning older methods, and basing his practice exclusively upon the theory Until the battle between the microof bacteriology cocci and the ptomaines shall have been settled, until something more definite is ascertained, by which we can go to the bedside with more assurance and confidence, we will have to abide by the older methods Another point which struck him as worthy of note was that the preceding dose of castor oil is in many cases sufficient to cure a case of itself There seemed to be a direct conflict in the practice followed dose was given to clear out the bacteria, and then a dose of opium to lock up the bowels, and retain them In his practice, in many cases, during the hot in bed after extraction season and the fruit season, of children with a temperature of 103° to 105° b, the administration of 4 grains of calomel and a little sugar would often find the child on the next morning minus its temperature, plus an appetite, and virtually well

DR G F G MORGAN, of San Francisco, said that if the diseases mentioned by Dr Sherman were due to bacteria, we might hope to destroy their activity by the free use of alkalies He had understood Dr Rosenstirn, last evening, as stating that modern investigation had shown that bacteria did not thrive in alkaline media, if so, the employment of

alkalies was logical

Only those rem-DR SHERMAN, in replying, said edies which had been advised in the last year or so The older methods were considered in his report West, in his administration of were left untouched castor oil for the diarrhœa of children, gave it in connection with opium in very small doses, but frequently Its effect never was to clean out the bow-The speaker used it very often It always soothed the intestines, and gradually checked the Calomel is known to be a germicide Bismuth is also acknowledged to be a germicide, and is used in surgery for wound dressing, the wounds being douched during the operation with water in which bismuth is suspended Oxide of zinc is used in the summer diarrhœa of children, especially for its It has also been used as a control over vomiting One class of remedies much used, are the astringents, gallic and tannic acid, tincture wound dressing of catechu and tincture of kino But if we reantiseptics is at first a little puzzling member that they have the property of forming insoluble salts with some alkalies, it is quite possible that they may form such salts with the alkaloidal In regard to whether the treatment should be limited dure, excepting, of course, cases of ozæna

The true indications There is no doubt about the efficiency of a

DR GEO C PARDEE, of San Francisco, read the report of the Committee on Ophthalmology, Olology, DR GFO CHISMORE, of San Francisco, did not Laryngology and Rhinoscopy, giving an extensive re sume of the recent progress in these branches Among the subjects touched upon were the treatment of corneal ulcers by the galvano caustic and by corrosive sublimate, conjunctival blenorrhea and its prophylactic treatment, the occasions requiring eru cleation of injured and blind eyes, the cure of chorea, epilepsy, and other nervous troubles by correc tion of errors of refraction and accommodation, the treatment of glaucoma without operation, by eserine and pilocarpine, the treatment of choroiditis pigmentosa by electricity He mentioned the return to Daviel's operation, the irrigation of the antenor chamber and the use of antiseptics in cataract operations, and the abandonment of bandages and rest

DR A P WHITTELL, of San Francisco, wished to direct special attention to one subject mentioned in the report-blennorrhea at birth. It is something that must interest the profession in general, when we consider how much blindness is due to this one single cause It is in the power of almost every one attending a woman in confinement to prevent this sad result When it does supervene, by proper treatment total blindness will never occur, although Vision with one eye is the vision may be impaired To run the risk of losing a better than none at all good eye by temporizing with an eye which has been hopelessly injured, and already lost to sight, was, he

thought, exceedingly bad practice

DR J D ARNOLD, of San Francisco, wished to draw attention to one or two little points in rhinol-Dr Pardee adverted to the fact that a num ber of obscure reflex symptoms have been properly of late ascribed to some irritation in the nose, but he did not refer to the fact that a number of cases of asthma had been reported as thoroughly cured by cauterization of the hypertrophic tissues on the tur-Voltilini discovered that nasal polybinated bones pus was frequently the direct cause of attacks of asthma, and merely by accident he found in his first case that by removing the polypi an end was put to Since then it has been disthe attacks of asthma covered that not only the removal of the polypi, but the destruction of all the hypertrophic tissues in the nose will produce the same result, and that it will, in a great majority of cases, effect a cure He would have liked to have heard Dr Pardee refer more fully to the beneficial effect, which the introduction of the use of the galvano cautery has had in the treatment of catarrhal diseases, which drive so many patients into the hands of the charlatan, and which are in the majority of cases absolutely curable by this procethat when we consider the amount of blindness nurses and those having charge of infants experience, milder astringents than the nitrate of silver had been sufficient, and he thought that some or the clothing

DR H D ROBERTSON, of Yreka, said that in the country the general practitioner was sometimes com pelled to operate upon the eye, when the occasion was urgent and the patient too poor to obtain the services of an oculist He had recently met with a peculiar case The patient was a Kanaka, with double cataract He made the preliminary incision on the right eye, and gently grasped the iris, when, to his surprise, that structure came away in its en-When operating upon the left eye he was still more cautious, and grasped the iris with the greatest care, making no perceptible traction, but it also came away He had watched the subsequent progress of the case, and with this exception it had been most satisfactory On careful inquiry, he ascertained that there was no history of leprosy, but that the subject had had tertiary manifestations of syphilis

DR WM ELLERY BRIGGS, of Sacramento, had noticed the extremes to which some oculists have patient liberty in moving about was totally blind, and where a foreign body was probably present He recalled two patients who to enucleation, though advised to do so The other, having gone into the country for two days when ordered to remain under observation, returned with sympathetic ophthalmia and after brief treatment went to other oculists, but is now an inmate of the or to the Pacific coast asylum for the blind He often enucleated eyes use as an organ of vision When the physician is cure them gone the surgeon is justified in removing the eye, if there is a possibility of sympathetic ophthalmia

DR PARDEE, in replying, said that he would certainly enucleate an eye when there was any danger of its affecting the other eye He was also in favor of enucleating when vision had been lost

(To be concluded)

CHICAGO MEDICAL SOCIETY

Stated Meeting, January 3, 1888 THE PRESIDENT, W T BELFIELD, M D, IN THE CHAIR

DR HENRY GRADLE read a paper on MORBID NASAL IRRITABILITY Morbid nasal irritability, or irritable nose, is a con-

DR J H STALLARD, of San Francisco, believed dition of morbid sensibility of the nasal surfaces associated with hypertrophy of the submucous cavernous caused by the neglect of ophthalmia neonatorum, it issue The condition has been inadequately de would be judicious to issue simple instructions to scribed, and is confounded in textbooks mostly with In his chronic catarrh The best account of it is in Mackenzie's article on neurosis of the nose, in the "Reference Handbook of Medical Sciences " Most writers who simple remedy might safely be placed in the hands have described it in the periodical literature consider The use of these remedies should be it principally in view of the distant reflexes to which just as much a part of the first dressing as the bath it gives rise. The local reflexes form the basis of the present paper

There is first, the vascular reflex. The vascular or cavernous tissue normally developed to a slight extent at the front and rear end of the inferior turbinated bone, is enlarged and augmented, and may appear also on the side of the septum, on the floor of the nose and on the front end of the middle turbinated bone Through any irritation by dust or chilling of the surface this vascular plexus becomes engorged and if well developed in proportion to the size of the nasal cavity it obstructs the passage is the temporary or fleeting character of the obstruction which characterizes the irritable nose, not any permanent narrowing of the passage Almost invariably engorgement occurs on one side at a time and then may jump over to the other

Dependent upon this vascular dilatation is the second reflex, namely, sneezing This may attain such a degree as to annoy the patient steadily With the sneezing there occurs a third reflex, namely, cogone in doing away with bandages, and giving the pious secretion of clear mucous, indicating the ab-In regard to sence of any inflammatory condition This irritable enucleating eyes, having had sad experience in sev- nose may lead to reflexes in distant regions as to eral cases he now advised enucleation when the eye the eyes, ears, throat or nervous system at large The irritable nose may be a symptom of some other nasal disease such as catarrh or the presence of had lost their eyes, one of whom would not submit polypi, it can also be caused by large irritated ton-But in many cases it exists by itself without any other primary disease to which it could be traced It is very much influenced by the climate and patients can get relief by going to the mountains of the West

In the treatment any traceable causes such as tanwhich appeared well, but he did not think that he gible diseases of the tonsils should first be removed had ever enucleated an eye which would be of any Quinine relieves the attacks but probably does not No other drugs have seemed to the writer to be be of any service. Where the condition is not symptomatic of another disease of the nose the only cure is the destruction of the cavernous tissue by the galvano cautery, or in milder cases, by The latter agent is not as reliable as chromic acid the former A cure is possible whenever the extent of hypertrophied cavernous tissue is circumscribed, while where it is very diffuse, relief, but not an absolute cure can be promised

DR N S DAVIS, JR, reported a case of

RUPTURE OF AN AORTIC VALVE

From the appearance of the specimen I exhibit a diagnosis cannot be made with certainty, but from the history of the case, together with the appearance of the valves, it seems probable that sudden rupture in one of them has taken place

The history is as follows On the 17th of Novem-

ber the patient entered Mercy Hospital plained of illness for about four months, prior to that time he had been in good health Some years ago his hearing began to fail and he lost his employ- edge is considerably thickened and somewhat round ment as switchman on a railroad on that account After that he continued to work as a day laborer Four months previous to entering the hospital he roughened by verrucosities or otherwise. The part was carrying a heavy load of coal upstairs when suddenly he felt something give way in his left side, he experienced considerable dyspnæa at once, and symptoms of cardiac insufficiency date from that should be attached to the aorta. If rupture took At first the dyspnoa was noticeable chiefly on walking or on making rapid movements, but it was sufficient to necessitate his giving up all work The dyspnœa increased steadily and he became very markedly anomic, and in addition exhibited signs of general cedema At the time he entered the hospital there was evidently fluid in the abdominal cavity as well as extensive anasarca of the extremities was feeble and so short of breath that he was unable to lie with any degree of comfort, but had constantly to sit, and slept in this position. The pulse was exceedingly feeble, the heart movements very rapid

My father saw the patient the day after he entered the hospital and examined him before the clinical At that time his condition was a follows In addition to the dyspnæa, ædema and anæmia, a collection of fluid was found in one of the pleural cavi-The lungs were evidently cedematous There was probably chronic venous congestion of their The movement of the lower and posterior portion heart was considerably more rapid than normal, its action was feeble, the cardiac sounds were distant and it was suggested that probably there was some In addition there was fluid in the pericardial sac present over both the mitral and aortic areas a regur-The area of cardiac dulness was gitant murmur It was supposed greatly increased in all directions that the heart was greatly dilated and that regurgitation occurred in connection with a lesion of the There was no prior history of rheumatic valves trouble in the case It was noticed that the liver was considerably enlarged A little later in the same day the house physician noticed that the patient was sleeping almost constantly, and that the heart's action was very much more feeble and that the respiratory motions were only eleven to the minute arousing the patient the respiratory movements im-On the following morning the proved somewhat patient was more drowsy, stupid and sleepy In the afternoon of that day he exclaimed suddenly that he felt faint, and with a gasp or two was dead

The post-mortem was made by Dr Frank Andrews He found a small amount of liquid in one pleural The lungs were ædematous and quite firm in the lower and posterior parts from chronic venous The liver was enlarged, unusually hard and full of blood, the spleen normal, the left kidney normal, the right kidney had a slightly adherent cap-In the peri-The heart was greatly enlarged cardial sac there was an ounce and a half of fluid sule The heart on section was found to be very much di-The walls, as you see, are not thickened On the making traction on the string outside, it would have lated-both the left and right ventricles were dilated

He com- right side the valves appear normal, on the left side the mitral valves are normal but the aortic valves are seen to be thickened, especially one of them, whose Nowhere is ulceration or destruction of tissue from that cause to be seen. The valves are not of the valve where there is loss of continuity is also The break in continuity, here slightly thickened seen, occurs in the edge of the valve just where it place necessarily it took place four months before the death of the patient, and naturally thickening of the torn edges might occur There is also present in the aorta above the valves small areas of thickening and hardening, evidence of long prior inflammation of its Taking into consideration both the morbid lining appearances and the history of the case, it is most probable that four months before death, at the time from which the patient uniformly dated his trouble, a rupture of the aortic valve occurred The valve had prior to this been enfeebled by the changes that had occurred in it incident to an extension to the valves of older endarteritis

DR NORVAL PIERCE reported a case of OPERATION FOR HÆMOTHORAY

(See page 582)

There are some points DR A E HOADLEY about the case of hæmothorax that occurred to me while the history was being read, that I should like to refer to I should conclude from the history, that some large vessel was wounded—that would be the inference as the exsangumation of the patient was rapid and extreme, and I should also conclude that if that vessel was in the lung that there must have I do not see how it been expectoration of blood could have been avoided if the blade of the knife penetrated the lung sufficiently to wound a large ves sel-therefore I exclude wounding of the lung In the situation of that wound, immediately beneath the chest-wall, is the internal mammary artery, a The intercostal was suggested, good sized vessel but these are given off from the internal mammary, and in that situation are small, and could not ex sanguinate a patient so rapidly and so completely as this patient was in so short a time, so I conclude that the internal mammary artery was the one di Then again, it seems to me, that it would have been good practice to have endeavored to se cure that vessel, there was a straight cut through the intercostal muscles, and I think some kind of forceps could have been introduced with a view of compressing the divided ends of the internal mam mary artery After the thoracic cavity was full of blood no harm could have come from the introduction of the instrument designed to compress the divided ends of the artery by the admission of air, provided it had been done antiseptically. I think the hæmorrhage could have been controlled by in troducing a button into the wound, such a one as would go through the wound with a string attached to it, pushing it into the thoracic cavity, and then by

closed the bleeding vessels This accomplished the it certain they were taken at one time subsequent treatment would have been more satis-As far as the tolerance of the pleural cavity of blood is concerned, there is no difference be tween the two cavities, abdominal and thoracic The one can tolerate the presence of blood as well as the other, the one can absorb as large a quantity of blood as the other, they are both serous membranes, identical in character and powers of absorption

The case given is very interesting and certainly very remarkable I was very much interested in the The patient evidently has good vitality

to stand such a strain

I have nothing special to say in Dr Pierce closing the discussion Of course I might now do a great many things that I did not do at that time But the man was in such an extremely low condition that anything more would have been out of place Dr Fenger was not sure that it was the internal mammary artery The wound was a slight distance out of its course, about half an inch Indeed, the week, is against this as the source The position of the scar has changed with the sinking in of the chest

As regards the clot being removed, blood does not necessarily clot in the pleural cavity at all, but may

remain fluid indefinitely

DR W T BELFIELD exhibited a specimen of MUSCLE INFILTRATED WITH TRICHINÆ

It was a piece of gastrocnemius muscle from the amputated leg of a man now in the Cook County Some eighteen years ago this man, then a resident of New York, in company with a number of other individuals ate of some poorly cooked ham and sausage, nearly all of those who partook of this article of diet became very ill within a week, and a two months, and did not entirely recover his health for some four months In consequence of the curcumstances surrounding the case the difficulty was recognized as trichiniasis, and an examination of the muscles of those who died confirmed the diagnosis This man recovered, and during the succeeding 18 years has enjoyed good health, except that he has at various times, and more particularly during the last six or eight years, suffered from rheumatism in different parts of the body

This muscle, like all the other muscles of the amputated leg, is thickly studded with trichinæ he little white specks very closely set These are nown in the microscope to be triching iscle taken from all parts of the amputated leg are d as thickly set with the parasites as is this piece, d masmuch as these parasites are more numerous nber of trichine this man contains in his body s up into the millions Of course it is not un nal to find muscles studded with trichinæ in indi-

Very few individuals recover who swallow so many at one time as to produce so numerous a progeny are in the habit of taking uncooked pork can at different times take a few trichinæ without at any one time suffering from the invasion of so large a number as to produce the acute symptoms of trichiniasis

The amputation was for disease in the knee joint, and had nothing to do with the condition of the

muscles

CHICAGO MEDICO-LEGAL SOCIETY Meeting of March 3, 1888

E J DOERING, M D, PRESIDENT (Concluded from page 571)

Conclusion of the discussion on DR ETHERIDGE'S paper on

THE MEDICO-LEGAL ASPECT OF UTTERANCES MADE IN MEDICAL SOCIETIES

Dr Clark Gapin I must say I am pleased tocharacter of the hæmorrhage, at least after the first hear this subject presented so ably on both sides I think if the utterances on one side could be taken to the courts, the utterances on the other would certainly very neatly and effectually neutralize them, so I think, as far as this society is concerned, it has acquitted itself well in that respect. The subject is certainly an important one Only a short time since I was consulted and retained to defend a case of malpractice in which this was the charge I do not know that any case has been actually tried, but in this case the charge was made, the suit brought, and physicians assured the gentleman that he had a good case, that the literature of the subject, and the profession were with him The case went so far as to be brought up in the courts, but was abandoned, the medical gentlemen who proposed to support him large percentage died This man was very ill for having failed to make their appearance and sustain him during the trial That case impressed me with the fact that if we are not immediately upon this subject, in the law, we are very close to it I had occasion to go over the subject preparatory to that trial, and I have made up my mind to this, that the great discovery of antisepsis, or what we might call therapeutic cleanliness, has come and has come to I do not imagine, however, that it will remain in any very violent form, I think it will finally settle down to about what has taken place in other departments of the law, that what will be required of the practitioner in this respect will be the same that taking a fresh cut surface near the light you can see is required of him in surgery or the administration of medicines, ordinary care and diligence, and ordi-Pieces of nary skill in view of the knowledge of the profession at or within a reasonable time of the date of the occurrence of the supposed injury

Dr Ethendge, it seems to me, somewhat overrates the trunk than in the limbs, we may infer that the the importance of these utterances in societies No court in which I have practiced will admit, as evi dence, the transactions of a society, or surgical or duals who have been in the habit of partaking of which it is done, I think the courts of Iowa have adraw sausage or half cooked pork, but it is rare to mitted medical or surgical treamses, as evidence, but find them so thickly placed where the history makes I think it is not done in the courts of the State of

Illinois, and I know the same is true of the courts of clots in the womb of the case in question, although all Wisconsin any of these utterances will find their way into the courts, but I think there are members of the pro fession who are so positive in their belief of the necessity of this antisepsis, or therapeutic cleanliness, you may call it what you will, that if brought to the witness stand they will express their convictions in such a way as to convince a jury that somebody has not exercised ordinary care and diligence medicine and surgery there is no ideal perfection and little that is absolutely sure, but I will say that my own experience as a physician has been very favorable to antiseptic treatment of the puerperal state, and if called upon the witness stand I should be compelled to say that one who had been careless with regard to the cleanliness of the patient had not done his whole duty by his patient I think that what we should begin to do at once is to impress! upon the profession at large—especially upon the careless members of the profession, that sooner or later they will have devolve upon them this responsibility, and that it may assume a financial aspect that while Dr Etheridge's view is quite correct there is a word beyond, and although the profession possibly is not to-day in a position to condem a man for want of this care, it is coming to that We may pass antisepsis by as one of those fitful fevers of discovery which we have passed through before, but I take it that the antiseptic theory is one of the greatest discoveries of all ages, and that it will take its place beside those great discoveries which have The danger in the particular great a hurry come and remained respect under discussion is not so much from the literature on the subject as from the belief of the is of the character of the governor to a steam enprofession that the man who neglects this therapeutic cleanliness does not do his whole duty by his patient

DR L L McArthur Although one of the younger men, I have the tementy to use to this question, and trust that it will not be imputed to simply the enthusiasm of youth leading me to jump at the new, and abandon the old, that I accept what to my mind appears definitely proven Dr Etheridge in referring to old theories that have been abandoned, and new ones which have taken their place, spoke in rather a scoffing way, in the way of decrying them, that any progress which we seem to have made is not progress, but only the adoption of lustration of how this thing is working in the public the new for the old! He makes reference to the fact that fermentations were formerly supposed to be due to oxygen, then the last theory that the yeast plant was the cause of that fermentation He cannot but admit that alcohol is the result of the life history of the yeast plant, that whenever the yeast plant is placed in dilute sugary solution, we always get alcohol, it is a positive demonstration not theory From the yeast plant we get alcohol, we no not expect to get "scarlet fever" If the vinegar plant is put into sugary solutions we do not expect to get alcohol

The microorganism of puerperal fever may not have been discovered, but that some microorganism is present, even Dr Parkes admitted, in saying that the case had died from some decomposition of the Clinical Medicine in Leipzig

For that reason I think it is doubtful if infectious material had been kept from without! He practically admits this decomposition was from the influence of microorganisms, and that without them we can have no decomposition This has been demonstrated hundreds and thousands of times through the influence of the cotton plug in the gelatin culture If we seal up tin cans with fruit in them so that the microorganisms are killed, the fruit remains without decomposition And so with the microorganisms which may be in the vagina, and we all admit that there are plenty of them there, they may induce suppuration, and it is probable that suppuration goes on after every labor, as these white milky discharges contain microorganisms. If we admit a specific action for the larger microorganisms it is reasonable to admit the same for the smaller To prove these points and advance science the proper way is not by deriding them, but to take up the subject oneself and work at it All the ad vance that has been made in the whole theory of bacteriology has been made by the German, French and English Nations, Bastian and Pasteur making their advances in fighting each others theories Having theories to begin with they endeavored to demonstrate them, and finally came around to fall into the same line, as the result of their practical Without a sound foundation medically experiments we can obtain none legally And that is the way advance can be made in medicine, by investigating the theories advanced, and proving them false rather than to cry them down, saying let us not be in too Certainly conservatism is valuable, and the conservatism which Dr Etheridge advocates gine, it regulates and steadies it, but does not stop its progress

DR ETHERIDGE, in closing the discussion, said I have but little to say in conclusion, and that is this that puerperal fever is more discussed to-night than That was not the topic I have anything else nothing to say about puerperal fever, only incidentally as an illustration, and when the discussion brings out the remark that the conservatism of my paper is too conservative, I simply wish to say that everything of that kind is used as illustration

Dr Gapin came to the point when he gave an il-The Semmelweiss theory is good as far as it goes, but if we are to make a man's case in court stand or fall on the Semmelweiss theory it seems to me that we should be more accurate in our utter-If that theory is without an attackable side then the logical conclusions therefrom would be all right I am glad the subject has brought out some discussion, and I hope it may have its results in its bearing in the future upon the expressions made in these medical societies, where too much is uttered, perhaps, in the hastiness and ill consideration of youth, which would not be uttered after ten or fifteen years of practice

Professor W Leube has been appointed to the Chair of

DOMESTIC CORRESPONDENCE

LETTER FROM NEW YORK

(FROM OUR OWN CORRESPONDENT)

Treatment of Tubal Pregnancy

At the April meeting of the New York County years the associate of the late Dr Edmund R. Peaslee, read a paper on the Treatment of Tubal Preg- nancy or pus tube " nancy, in which he advocated the primary removal undertaken with the expectation of delivering the tube and its contained fœtus intact, and resorted to before the end of the fourth month of gestation a paper read by him before the American Gynæcoearly laparotomy, as a rule, in cases of tubal pregnancy in which hæmorrhage had occurred (instead of employing electricity, as was now commonly done), further hæmorrhage In December of that year he reported, at a meeting of the New York Obstetrical Society, a case in which he had diagnosed tubal pregnancy at the fifth week, and in which death had occurred at the end of the seventh week, from a second hæmorrhage resulting from a ruptured artery on the peritoneal surface of the sac, the first hæmorrhage, which was extremely small, having taken place from the same artery nine days previously, and galvanism having in the meantime been employed for the pur pose of destroying the fœtus

At that time he had become convinced, from this case and from three other similar cases, that the time to operate was when preliminary or partial rupture occurred, as evidenced by the first hæmorrhage, the primary collapse symptoms constituting an almost tions of chronic invalidism " certain indication both of the pathological condition and of the need of immediate interference speaking of the symptoms of tubal pregnancy he had

stated that he believed that it was easier to recognize this condition than hydrosalpinx, and that the presence of an irregular decidual discharge in a woman signs of pregnancy and an enlarging, fluctuating, and | inal cavity

as early as the fifth week

York Academy of Medicine in 1887, he had stated cided hæmorrhage from the sac wall

find but one case on record in which the operation was performed prior to a laceration, or partial laceration, of the tube, and before the fourth month of This was one by Dr Joseph Price, of Philadelphia, in September, 1887, reported in the Annals of Gynecology (Boston) for March, 1888, and in a recent letter to Dr Janvin concerning the case Dr Price had said "The history was simply case Dr Price had said Medical Association Dr Joseph E Janvrin, for many that of delayed bleeding two weeks and constant pain and nausea I operate for extra uterine preg-

Having referred to the cases of laparotomy in tubal by abdominal section of the tube and its contained pregnancy, after one or more decided hæmorrhages, fœtus before rupture of any portion of the tube has performed by various operators in this country and This procedure, he explained, was to be in Europe, he observed that all such operations, resorted to after there had been a rupture of some part of the tube, should be classed as secondary operations The advisability of enlarging this field, by removing the tube with its contained fœtus before any rupture logical Society in 1886 he said he had recommended has occurred, and during the early weeks of gestation, Dr Janvin said he had advocated on every possible occasion during the past year and a half Until very recently he believed that he stood almost, if not quite, for the purpose of removing all possible danger of alone as regards this point, but during the last few weeks he had found that other gynecologists also had come to the same conclusion Thus, in the American Journal of Obstetrics for April, 1888, Mr Lawson Tait said that, although he had never as yet been called upon to operate until after the sac had ruptured, if in any case met with by him there was a reasonable supposition of the existence of a tubal pregnancy which had not yet ruptured, he should recommend immediate laparotomy Drs Joseph Price and Howard A Kelly, of Philadelphia, he be heved were also in accord with this proposition a recent letter to Dr Janvrin, Dr Kelly had said "The history of fœtuses which have been destroyed by faradization has frequently been associated with protracted suffering to the mother, and with condi-

In speaking further of the bad effects sometimes In resulting from the use of electricity he quoted Dr Robert P Harris, of Philadelphia, who, in the American Journal of Obstetrics for August, 1886, had referred to several cases in which attacks of peritonitis had occurred several years subsequent to the death who had missed a period, associated with the normal of the fœtus, and due to its presence in the abdom-Mr Tait had also very recently (Amer exquisitely sensitive mass on one side of the uterus, and followed subsequently by symptoms of shock, danger of the placenta going on to develop enorcould hardly be referred to any other condition, even mously after the death of the fœtus Up to the In a case of this kind he present time, however, the weight of opinion among had also said that he would certainly perform lapar- American gynecologists was decidedly in favor of otomy whenever the first symptoms of internal hæm- destroying the fœtus by electricity in some form in Again, in a discussion at the Jan- cases in which the diagnosis has been made prior to uary meeting of the Obstetrical Section of the New the fifth month and in which there has been no dethat in any case in which, from the rational and phys- advocates of this measure stood Thomas, Lusk, Garical signs, he had become convinced that tubal preg- rigues, Munde and others, of New York, and M D nancy was present, even before symptoms of a rupture | Mann, of Buffalo, and each of these, as well as of the peritoneal covering of the tube presented them- other operators throughout the country, had had exselves, he would most earnestly urge laparotomy, and cellent results with it In the Annals of Gynecology perform it if he could obtain the consent of the pa- for February, 1888, Dr Mann had stated that Dr tient Up to the present time he had been able to Janvrin was able to find only three cases in literature,

including his own, where rupture of a vessel caused death without rupture of the sac Since the publication of his paper before the American Gynecological Society, however, he had seen one other case in which this condition was fully demonstrated at the Two other important specimens he had recently seen in cases in which abdominal section In one of these the feetus had died was performed from pressure of blood clots at about the end of the third month, and several other attacks of hemorrhage had occurred between this date and the seventh month, when the tube, fœtus, clots, etc, were In the second case, where laparotomy removed was performed at the seventh or eighth week, there was a history of slight hemorrhage from the sac wall and slight peritonitis for a week or ten days prior to its removal

In the paper referred to Dr Mann had expressed the opinion that if rupture has not occurred, electricity should take precedence of laparotomy To this proposition Dr Janvrin said that he would assent, provided no experienced laparotomist could be found to operate, but not otherwise With a capable oper ator at command he would urge abdominal section just as soon as the diagnosis had been made, and before any hæmorrhage from the sac, with its subsequent attacks of peritonitis, could take place These frequently recurring attacks of slight hæmorrhage were exceedingly dangerous to the life of the mother, and when they had occurred, and the time came when laparotomy must be performed, the patient was in bad condition for the operation, while the procedure itself was much more complicated than at an earlier period The same thing could be said in reference to waiting to perform laparotomy until serious symptoms had supervened, after the fœtus had been killed by elec-Here, too, there would be more or less adhesions to deal with, and the work to be done would be much more difficult than the removal of a simply enlarged and still unruptured tube containg the fœtus, with no products of inflammatory processes to interfere with its ready extraction

In the discussion on the paper the principal advocate of electricity, in preference to the radical operation advised by Dr Janvrin, was Dr Wm T Lusk, who said in opening that he wished he could be convinced by the arguments advanced that the time had come for the doing away with galvanism in the treatment of tubal pregnancy It would certainly be very gratifying, he went on to say, if one could always perform laparotomy as this condition was diagnosed, as the operator would thus secure an amount of eclat which was not possible when electrity was employed Destruction of the fœtus by the latter was a far less brilliant method of procedure, and when it was attended with successful results the operator was not infrequently subjected to insinuations that extrauterine pregnancy had never existed at all same time, he was so thoroughly convinced that these cases could be efficiently and safely treated by galvanism after the appearance of the characteristic colicky pains, that he did not as yet feel justified in abandoning so satisfactory a method The operation ence illustrating this point was a very simple one, requiring no special skill, so

that it could be practiced by any one, and, as a rule, the results were all that could be desired He then mentioned that he had had under observation two of his cases, occurring in private practice, for a long period of time, one of them for six years, and the other for four years At the time the first of these patients was operated on she was believed to be in a dying condition, but, after consultation with Dr Thomas, it was decided to employ electricity, and the result was entirely satisfactory. There had never been the slightest bad effect, and at the present time the mass remaining was about the size of a pigecn's In the second case the tumor was now about the size of an English walnut Since the operation the patient had given birth to a living child, and there had been no trouble whatever at the time of partu-

Now, if we had such an efficient method, which was perfectly safe in the great majority of instances, there did not seem to him to be sufficient reason for giving Even if inflammation, suppuration or ulcera tion should ensue, we could under such circumstances usually perform laparotomy with satisfactory results He was, therefore, convinced that, in the present state of our knowledge, treatment by electricity was the best mode of proceeding As to performing lap arotomy before rupture of any portion of the tube had occurred, the difficulty of diagnosis constituted a serious objection, and even Mr Tait had expressed to him his inability to make a diagnosis at this time In regard to the other five cases which he had treated with electricity Dr Lusk said that he could not speak with the same confidence as the two just mentioned The results were entirely satisfactory at the time but, as the women were hospital patients, he had not been able to follow up their subsequent history If he could feel sure that laparotomy was just as safe as electricity he should certainly be willing to join the ranks of those who advocated this procedure, but up to the present, as he had stated, he had not yet become convinced of this fact As to the danger of the growth of the placenta after the death of the fœ tus, this seemed to him to be very slight, and, indeed, he questioned very much whether such a danger really existed at all

Dr Andrew F Currier having stated that it seemed to him one of the inconsistencies of modern gynecology that operators should so frequently perform laparotomy for the relief of such conditions as hydro and pyosalpinx, and yet hesitate to do so in the graver one of tubal pregnancy, Dr Lusk replied that, in considering this matter, it was important to remem ber that while such conditions as hydro and pyosalpinx could not be removed by electricity, this was entirely possible in tubal pregnancy If, however, treatment by electricity were practicable in hydro and pyosalpina, gynecologists would hardly be likely to resort to laparotomy until electricity had first He then spoke of the imporbeen given a fair trial tance, in arriving at a correct diagnosis in many cases, of first making a thorough examination of the patient, and referred to two cases in his own exper-

Dr George T Harrison said that his experience

three cases he had certainly destroyed the life of the one of these patients two years after the operation, he had found the sack much sunken the woman had also given birth to a child in a nor Still, it was undoubtedly true that the mal manner tendency of modern gynecology was to advance in the line indicated by Dr Janvrin, and, while he was ber last not as yet quite willing to declare himself in favor of the general adoption of laparotomy in the class of cases referred to, he was free to confess that the re sults already obtained from this procedure, especially by some of the German operators, had had consider able weight in influencing him in its favor At the present time, however, it seemed to him that the experience of the profession was as yet too limited to enable us to arrive at any positive conclusions on There was one point in regard to the the subject diagnosis of tubal pregnancy as given by Dr Janvrin which he thought should perhaps be somewhat modified, and that was in regard to the extreme sensitiveness of the tumor, since he had himself observed instances in which this great tenderness did not exist

Dr A Palmer Dudley said that the all important matter in connection with this whole subject seemed to him to be the question of diagnosis, and that he should very much like to know how to make the diagnosis If this was ever established, the treatment was sufficiently easy, whether electricity or laparotomy was resorted to Under the circumstances referred to by Dr Janvrin laparotomy was a comparatively simple operation, and no more dangerous than when it was done for hydro- or pyosal-He then related a case of his own in which he had supposed tubal pregnancy to exist, but on opening the abdominal cavity he had found a parovarian cyst with displacement of the ovaries and pyosalpinx, while the fimbriated extremities of the tubes were attached in one case to the bladder, and in the other to the rectum He said that he would not hesitate to resort to laparotomy early in any instance where he was able to make out the diagnosis of tubal pregnancy, but in the case in question there was a condition other than tubal pregnancy giving rise to the simptoms described by Dr Janvrin as characteristic of the latter

Dr Dudley having stated, in reply to a question of Dr Janvrin, that he had not observed in this case an irregular decidual discharge, Dr Janvrin said that he regarded this as the most important point in the diagnosis of tubal pregnancy If the symptoms which he had mentioned, with the exception of those of shock (which were due to rupture), were noted in any case, he thought there would be no difficulty in making out the diagnosis before rupture of any portion of the tube had occurred As to Mr Tait's views on the diagnosis of tubal pregnancy before rupture, in the very last number of the American Journal of Obstetrics (April, 1888), he stated that he had never been able to make out the diagnosis at this time because he had never been consulted in

with galvanism had been very favorable. In at least by bad effects, certain cases had been reported in which there were evil results, and two such instances fœtus by means of this agency, and on examining were referred to by Dr Mann in the article in the Annals of Gynecology mentioned The German Since then cases spoken of by Dr Harrison were all secondary operations, and, as far as he was aware, the only primary operation which had as yet been performed was that of Dr Price, of Philadelphia, in Septem-

It would be impossible to criticise this book adversely, and when a work of its kind has reached its sixth edition it is no longer in need of favorable com-The most important additions to this edition are the phenyl hydrazin hydrochlorate, alpha-naph thol, and thymol tests for sugar A good deal has been added to the edition, while at the same time much has been omitted that was in the fifth, but only what is no longer required Dr Tyson is an acknowledged authority in urology, and his book is all that can be desired

THEIRE IN THE TREATMENT OF NEURALGIA a physiological contribution to the therapeutics of By Thomas J Mays, M D, Professor of Diseases of the Chest in the Philadelphia Poly-Sm 8vo, p v11–84 clinic, etc Philadelphia P Chicago W T Blakiston, Son & Co 1888 Keener

This little book, a reprint of a contribution to the Polyclinic, from September, 1887, to February, 1888, contains five chapters and an appendix, devoted to an introduction, the physiological action of theme, the special therapeutic indications for the use of the ine, neuralgia, and, in the appendix, remarks made by Dr Charles K Mills on a paper read by Dr Mays before the Philadelphia Neurological Society in December, 1887, on "Theine in Pain" As a contribution to the therapeutics of pain, from a reliable source, the little volume is well worth study

MISCELLANEOUS.

COUNTERFEIT MILL.-St Louis Republican 1 few days since a person representing himself to be the agent of an Iowa dairy farm called at the business office of R Gortner & Co ice cream manufacturers, at No 109 North Twelfth street, and desired to make a contract with Mr Gortner to furnish him any case until after rupture had taken place While named was low, and from this and other indications Mr Cortner became suspicious of the Iowa company's milk. He sewith the milk from which to make his ice cream

26

150

1 1

sured a sample of the milk and took it to the St. I ours Dairy Company's laboratory to be analyzed by their chemist milk was carefully analyzed, and the dairy company's chemist saw at once that there was a dangerous and unusual counter feit. It is a perfect imitation in every respect, and nothing but a chemical analysis would discover its true character. It is apparently rich and wholesome and pleasant to the taste amount and proportions of the solids that it contains are the standard test of the purity of milk. The following table give the component parts and the proportions in pure milk

AVELAGE PURE MILK

Water	S6 23
Solids	13 77
Casem	3 33
Albumin	ŏ 5ŏ
Butter	4.50
Milk sugar	4 93
Salts	o 6

The dury company's chemist's analysis of the Iowa firm's milk gives the following result

Water

I at supposed to be cottonseed oil or some similar sub-

Chemical substances corresponding to easeine and milk sugar, whose nature is not yet determined

Mmeral salt, supposed to be nitre or some other simi lar substance

Total 100 0 18 7 Percentage of solids

The difference between the Iowa company's product, and pure milk will be readily perceived by reference to the tables The chemist who made the above analysis states that he has every reason to believe the substances that in the Iowa "milk" take the place of butter fat, cascine, milk sugar, and ash are all mjurious. Exactly what these substances are the chemist is not yet prepared to say. He is now at work upon the analysis, however, and hopes to be able to determine the question in a few days

The Iowa company that is engaged in the manufacture of this spurious milk has an agent in St Louis who is busily en gaged in canvassing the restaurants, milk dealers, ice cream manufacturers, and others in the city who use large quantities of milk, and investigations have developed the fact that large quantities of the spurious product have already been sold here

A law passed a little more than a year ago fixes the standard of purity for milk in Missouri at 12 per cent of solids, including 2 S of butter fat, and of cream at 12 per cent of butter fat It will be seen that the Iowa product lacks a great deal of conforming to this standard, and for the sake of the public health it is to be hoped the proper authorities will enforce the law against the injurious counterfeit

Composition or Modie Nerve Food -Francis Wyatt, says the Medical World, has analyzed Modie with the following result One hundred parts by weight when distilled were found to contain three fourths per cent alcohol and one fourth per cent of the essential oils of sassafras, winter green and anise The residuum in the report was evaporated to dryness, and contained 7 880 per cent of extractive matter, consisting of

Sugar	3 S10
Glucose	1 250
Sodium carb	1 070
Sassafras	1 <u>8</u> 70
Gentian	1 870
Checkerberry	1 \$70
Quassia amara	1 870

PROPOSED NEW YORK LAW WITH REGARD TO THE EM BALMING OF DEAD BODIES - A bill has been introduced into the New York State Legislature which provides that "it shall not be lawful for any person or persons to introduce into or upon any dead body of any person or human being any poisonous substance, organic or morganic, for the preservation of the same, or any so called embalming fluids or materials of any kind, which will, in any manner whatsoever, interfere with chemical tests which may subsequently be applied or made use of by chemists in medico legal investigations."

INTERNATIONAL OPHTHALMOLOGICAL CONGRESS AT HEID ELBERG -The Committee announce that at this meeting, on August 9-12, 1868, discussions will be held on "G'aucoma," introduced by Priestley Smith, of Birmingham, and Snellen, of Utrecht, "Cataract," by Gayet, of Lyons, and Schweigger, of Berlin, "Bacteriology," by Leber, of Gottingen, and batt The ler, of Prague

MEDICAL Association of Georgia.—At the recent annual meeting the following officers for the ensuing year were elected President, J S Todd, Atlanta, First Vice President, J B S Holmes, Rome, Second Vice President E R Anthony, Griffin, Secretary, K P Moore, Macon, Censor, B R Doster, Blakely

SACRAMENTO SOCIETY FOR MEDICAL IMPROVEMENT — The following are the officers for the ensuing year President, J R Laine, Secretary and Treasurer, G. L. Simmons, Jr., Directors, the President and Secretary elect, W. R. Cluness, G. L. Sim mons and H L Nichols

PRACTICAL COURSES IN EMBRYOGENY—Dr Dareste, Di Si 3 rector of the Laboratory of Teratology at Paris, begin a cour e on normal and teratological embryogeny on April 10 The course, it seems, will be made permanent

NEW JOURNALS - The Bolletino della Poliambulanza di Mi lano, the Omaha Cliric, and the Journal of the N E Vir ginia Medical Society, are the latest new medical journals

MEDICAL ASSOCIATION OF ALABAMA —At the recent annual meeting Dr C M Baldridge was elected President, and Dr B F Cross junior Vice President Other officers hold over

EXPERT FEES -The Supreme Court of Texas has decided that a doctor is entitled to extra fee for testifying as an expert when summoned by the court to do so

OFFICIAL LIST OF CHANGES IN THE STATIONS AND DUTIES OF OFFICERS SERVING IN THE MEDICAL DEPARTMENT U S ARMY FROM APRIL 28 1888, TO MAY 4 1888

By direction of the President, Surgeon Remus C Persons, U S Navy, is assigned, temporarily, to the charge of the Army and Navy General Hospital, Hot Springs, Ark, during the absence, on leave, of Major Richard S Vickery, Surgeon U S Army, Surgeon in charge S O 96, A G O, April 26, 1888

Capt A A De Loffre, Asst Surgeon, granted leave of absence for six months on surgeon's certificate of disability, with per mission to go beyond sea SO 99, AGO, April 30, 1888
First Lieut Guy L Edie, Asst Surgeon, now under orders to report for duty to the commanding officer at It Douglas, U T, will accompany the Eighth Cavalry from Dept of Texas to Dept Dak, and upon completion of this duty will proceed

to Ft Douglas S O 99, A G O, April 30, 1888

First Lieut W D McCaw, Asst Surgeon, relieved from duty

at Ft Leavenworth, Kan, and ordered for duty at Ft Craw

ADDRESS IN SURGERY

A SKETCH OF THE PROGESS OF SURGERY

Delivered in the Section on Surgery, at the Thirty Ninth Annual Meeting of the American Medical Association, May 10, 1888

> BY E M MOORE, MD, OF ROCHESTER N Y

From the broad field of surgery there are many lines of inquiry which might interest its devotees, if properly followed But to treat of any one of them implies special study of the new developments that now abound in the great advances in the art, and the sciences whose discoveries it employs On a former occasion, your reader occupied the same relation to you that he does at this moment He then prepared himself for the occasion by a series of experiments in corpore villi, to illustrate the subject of blood in-He believes that he had the good fortune to add a thought to knowledge on this topic It seemed to him that a general view of the relation of surgery, and the surgeon, to the community in which he lives and has lived, might be of sufficient interest to justify the spending an hour in its review This must revive well known stories, and allude to present movements familiar to all, but they contain triumphs which always stir the heart of the true surgeon Pope, in his mellifluous couplet, which has pleasantly rung in the ears of every physician from his youth up, has interpreted the views of Homer of three thousand years ago, when he sang that,

> "A wise physician, skilled our wounds to heal, Is more than armies to the public weal."

Then as now, the surgeon was most prominently connected in the public mind with the treatment of wounds of accident, or those of his own making Notwithstanding Homer's complimentary opinion, the surgeon has always found an influence that overshadowed him, until very recent times He depends on his individuality, not upon his surroundings He has no motive to promote combinations of men In his thinking he is the exponent of the natural and not the supernatural. Ever watching the development of law in nature, he is her humble devotee, and believer in her me\orable ways But the progress of his knowledge was for long ages fearfully handicapped by the supernatural Indeed, this still holds firm in many minds But lately I was urged by a loving wife to ply my best

yield to the belief that recovery would not be likely to ensue, when earnestly asked in prayer, if the right kind of medicine was used We have accounts of Egyptian medicine 1,500 years before the time of But the physician was always also a Hippocrates priest, and must ever administer his services with a prayer to Horus A divided responsibility is ever enervating Restraint was upon him everywhere He could not examine the dead, for they were to be preserved Even the potter's field received no body until a cheap method of embalming was employed The body was to be reclaimed by its owner, in a period of time varying from 3,000 to 10,000 years, according to the moral and intellectual status of the individual Of course the body should be preserved with the least possible injury During the last twenty-five years there has been in this country an enormous increase in the development of specialties in medicine, as we all very well know, partly, perhaps, due to the large increase of knowledge, and partly to the rapid growth of cities But this is only the revival of a custom which prevailed at least 4,000 The subdivisions of the profession were years ago more minute in Egypt during the rule of the Pharaohs than with us to-day I may at once disclaim any intention of giving you a history of surgery The time is inadequate, and this you can draw from many sources It has been well and carefully studied, but would be a topic too trite at this time present status of surgery has had its exposition too well brought out to leave an opportunity for any interest in its restatement I must content myself with using only a few points that may touch its growth to illustrate its relations to science in general, with some criticisms on a few subjects that have come under my personal observation But I cannot pass by a notice of the Father of Medicine in his rôle of medical philosopher The practice of medicine draws its votaries to the recognition of the uniform bearing of physical law, and away from the easy solution of difficult problems by their reference to the supernat ural. So firmly has the latter explanation been regarded as the sole one by mankind in past times, that only the clearest intellects and boldest natures would stand out to the defense of the universal supremacy The physician attacks the problems of the of law Kosmos at their most difficult point, that of the laws governing the functions of living beings necessity, and is also his misfortune, to attempt the unravelling of the intricate crossing and contest of skill in a case of Bright's disease, for she would never physiological functions whose even balance permits

the continuance of life ments of science in astronomy and chemistry are into one those two classes of phenomena—the divine solutions of simple problems compared with those of and the scientifically determinable—which the latter as its greatest triumphs in the analyses of the ele- as at once both divine and scientifically determinable ments of animal tissues The aim of the medical In discussing certain peculiar bodily disorders found philosopher is to approximate the law which he can among the Scythians he observes 'The Scythians not clearly enunciate But there are explanations of themselves ascribe the cause of this to God, and the Kosmos that may be and are properly regarded as sciences, that show the operation of laws disturbed by others, which only allow approximate statements Meteorology furnishes a good illustration of such divine, no one among them is either more divine or The general controlling movement of conditions the storm centre can be predicted But a myriad obstructing forces interfere with the exact mathemat- has its own physical condition, and not one of them ical statement which, but for their intervention, might occurs without such physical condition '" be made Medicine has abundant illustrations of law whose movement is seen and predicted but, unfortunately, obscured by intervening forces An effort of this kind would never be undertaken by a physician who commended his work to the favor of Horus The pressure of the gods was more light upon the limb Greeks than upon the Egyptians, who were their Still, the practice of the art was complicated with much appeal to Apollo and Æsculapius I have quoted in a public address in another place tion and growth of the procedure to have begun less the relation that Hippocrates bore to his contemporaries upon the universality of law cannot be excelled at the present day by the most advanced thinker, it is one that would do honor to Her- line of demarcation in gangrene, but his plan was bert Spencer It must be recollected that the Father of Medicine lived at a time when Greece was at her highest pitch of greatness He was the contemporary of Pencles and Socrates, the two most extraordinary men of antiquity In the quotation that I make from Grote, you will observe at what an absurd conclusion Socrates arrived in attempting to part phenomena from the universal operation of law very magnificent topics which awed him are our best illustrations of the principle that governs all things Grote, in speaking of the division between the natural and the supernatural, says

"Thus Socrates openly admitted it, and assigned to each a distinct and independent province distributed phenomena into two classes one wherein the connection of antecedent and consequent was invariable and ascertainable by human study, and therefore future results accessible to a well instructed foresight, the other, and those too, the most comprehensive and important, which the gods had reserved for themselves and their own unconditional agency, wherein there was no invariable or ascertainable sequence, and where the result could only be foreknown by some omen, prophecy, or other specially inspired communication from themselves Each of these classes was essentially distinct, and required to be looked at and dealt with in a manner radically incompatible with the other Socrates held it wrong , to apply the scientific interpretation to the latter, or the theological interpretation to the former and astronomy, in his opinion, belong to the divine class of phenomena, in which human research was insane, fruitless and impious "On the other hand, Hippocrates, the contempo- tute

The marvelous develop- rary of Socrates, denied the discrepancy, and merged Chemistry finds its greatest labor as well had put asunder Hippocrates treated all phenomena reverence and bow down to such sufferers, each man fearing that he may suffer the like, and I myself think too that these affections, as well as all others, are more human than another, but all are on the same footing and all divine, nevertheless, each of them

Recurring to the subject of wounds we can perhaps at no one point get a better illustration of the move ment of discovery than in the changes with reference to their management, and especially of those that the surgeon inflicts in performing the amputation of a It would be idle in the few minutes at my disposal to follow accurately even this one line Hippo crates can hardly be said to have amputated at all, as we understand the operation We find the modifica than 300 years since At first slow of change, but His statement latterly made in almost every conceivable way Celsus, it is true, proposed to go higher up than the scarcely adopted No great modification can be said to have occurred until the time of Paré His ligature marks an era of movement But even this was slow He also was fearful of crushing the of adoption coats of the artery and protected it At length the simple plan of the present was confirmed by expenence, and as far as the ligature in relation to its ac tion on the blood-vessels is corcerned, leaves nothing It can hardly be believed that the to be desired primitive methods of amputation through the con timuity of the limbs could have been made, as they really were, by the mere chop of a huge chisel, or that the bones should have been broken by powerful Even after the osteoclasts preliminary to incision knife was devised, shaped like a cycle, the sweep was direct to the bone, which was sawed off on its line, thus making a stump in no wise different from that produced by the chisel One can hardly contemplate without a shudder not only the operation itself but the painful and ulcerating stumps, whose conical points would ever be sources of suffering As time went on, and we can hardly state the originator of the idea, it was found that the integuments should Then the form of the flap became the subject of endless variation It does not appear cover the bone possible to devise any line of cut that has not been proposed Moreover, it seems if almost every form has it special application For in the expectation of the future utility of the limb, by the aid of the me chanic, the result of our work has become varied We no longer make an amputation of the leg just below the knee to fit the sailor's peg, but assume that none so poor that charity will not furnish the substi We can choose circular flaps or oval ones,

single flaps, even triple flaps, anterior or posterior other ward to the form of the stump

surgeon had to meet the dangers of hæmorrhage plans but missing them for Esmark? Even in our own day surgeons have he upon the surface of the wound employed a common bandage tightly drawn for this whelps or moss grown upon the head of a thief hang-except in cases of gangrene cation of Galen, who had large experience in the amputation as we understand the process as surgeon to the school of gladiators water applied opinion during the middle of the present century He objurgated the method of covering wounds with knowledge, would be simply criminal ointments and charpie in phrase more emphatic than polite, and carried the surgical wound with him But until a late period the wounds of amputation were necessarily open ones The very form of the cut demanded it and when the arrest of hæmorrhage was made by hot irons or boiling oils or caustic buttons of sulphate of copper over the bleeding orifice, no other plan could be thought of But when the simple ligature upon the artery drawn from its sheath, became the fixed, final form of application, surgeons and thus the period of time for perfect closure short- living tissue not pressed into contact, and provision is made for periosteum, are apt to die Deep recesses following the drainage of the purulent material, but these surtice fluids. The amputation may be made as defaces were still, more or less, in contact with each tic fluids.

I do not hesitate to say, that one of our own ones, lateral or double or single We can make members who made the first declaration of his method curved ends or square ones and all having a right to in the Surgical Section of this Association, has placed be considered according to the condition looking for- the question of the management of open wounds upon a perfect basis It has been usually my custom But long antedating the form of the wound, the to employ it since its announcement, and never with regret There has been no failure, and little or no One is amazed that they came so near the modern constitutional disturbance. I refer to Prof Link's They learned to tie cords method, by which the bandage restraining the swellaround the limb and yet they were insufficient before ing causes the edges of the wound, which should be the invention of the tourniquet Why not a little circular, to rise like an erectile tissue and stand up tighter? Why not a compress over the pulsating open to the air, thus making the only genuine airvessel? But it is perhaps in the nature of invention dressing that I know of If left unsupported, flaps that simple things are passed by for a long time One will drop upon each other. If lint is put on the surof their methods also, was to use a series of bandages face there is the touch of a foreign body Even the to diminish the flow of blood? Why did they wait ligatures will increase the suppurating flow when they

As has been stated, the attempts at primary union purpose It must be confessed that from the earliest have seldom been other than partial, till the advent period down to the last few years there has been but of the modern antiseptic methods. In the early little improvement in the general management of part of this century experiments upon the encysting wounds A water dressing was the method of the of ligatures for closing the arteries, were tried and Father, but down through the ages every imaginable abandoned The movement from the open wound, device in the shape of ointments was used by sur-of necessity, to the closed one, antiseptically treated geons, as we find to be the case to-day among the with soluble ligatures and sutures, has been long and people The recipes are amusing reading, but not slow We had almost come to the definite conclu-profitable at the present moment We are not likely sion to make the open wound as the final judgment to be much instructed by those prescribing the oil of of the profession. Hippocrates avoided amputation In his day it was full ing from a gibbet Cold water was the favorite appli- of terror Indeed, there could not be said to be any treatment of wounds in consequence of his position that were crushed or injured by compound fracture The wounds were allowed to get well or to mortify When ganwere simply drawn together and a dressing of cold grenous, after the red line was formed, it was made This is the plan that was urged by at the border that nature had decided on as the place the famous Mr Liston, of London, who controlled of separation between the dead and the living Such delays in the treatment of severe injuries, with our But when gangrene has occurred, and we wait, as we must, except in certain rare conditions generally understood, I am in accord with the custom of Hippocrates This places me in contrast with a custom almost But singular as it may seem, an antisepuniversal tic dressing will complete the measure of safety incident to the amputation through the dead part Reasons for this belief are easily stated, and of course are not those founded on the fear of amputation through the living parts as a general measure began to close the flaps to make the cure more rapid when the red line has formed, nature has already by the process of adhesion This proved to be often made the amputation Following an irregular line. successful, as we all know, in modern experience which is lowest down in the integuments and bone, If the whole surface did not adhere most of it might, separation has been made between the dead and the The danger arises from the retention But we also know that at certain places the of poisonous fluids in contact with tissues now full mortality became alarming An old hospital in civil of vitality An operation of necessity can be made, and a crowded one in military practice, became char- closely following the line of demarcation, and it will Surgeons at different periods changed be found that the endosteum retains its vascularity their methods and open wounds were proclaimed as nearly if not quite as far down as the integument far more successful than those that were closed does. These are the two factors of an amputation But the word open wound as generally employed is indispensable to its success. The muscles, and esa misnomer The wounded surfaces, it is true, are pecially the fascia and aponeuroses, as well as the

scribed, with far better hope of success, than higher up through the living tissues The special dangers of amputation through them are avoided are no vessels to tie, there is no fresh absorbing surface to be poisoned by its own secretion, there is no danger from hæmorrhage, and more than all, in the enfeebled condition of the patient, there is no shock The deep recesses are now exposed, and can be Absorbent cotton, moistened with a solution of mercuric chloride, pushed into the open spaces, at once attracts, by capillary attraction, all the When the succeeding dressing is undertaken, it will be found that every part has the appearance and indeed the reality of having been washed clean The irregular surface is, however, a granulating one, and for this reason alone has become one that is essentially protected from the dangers of sepsis, as soon as a free escape of the fluids can be effected The periosteum, if destroyed, may result in necrosis of the outer shell of the bone But the endosteum will maintain it in its integrity, sufficient for the length of the stump The wound being necessarily an open It will be seen that the obserone, closes slowly vation which I urge upon your attention, is a return to the ancient method, with two thoughts added to it which, in my judgment, should change our prac-They are, as every surgeon tice in these cases knows, fraught with great danger when the amputation is made above, in the living tissue, for the shock of amputation in the enfeebled state is frequently the dead part and divide the bone high up They were anxious to disarticulate, if the line of separation One stands aghast at the had gone to a joint shapes their stumps must have assumed In recommending the open wound, in these cases, I only do so at points where a proper stump can be made Take as an illustration, gangrene commencing in the foot and stopping on the leg four or five inches be-According to our custom the ampulow the knee tation must be made through the thigh danger of such an amputation is vastly more than by the Hippocratic method, at the red line, and the The choice, in my opinlower stump is far better ion, should be made at the red line if possible

The advent of the gun-shot wound, appeared at a time when the practice of surgery was at a low point, and the effect of the "villainous gunpowder" was The terrible regarded with just grounds of terror results were ascribed to poison Both the lead and How could such the gunpowder were poison fatality occur unless from poison? Poison wounds should be treated with the hot cauterizing iron or boiling oil, to destroy the infected surface bullet must be extracted, if it be possible, its poisonous character could scarcely be borne by the constito complete the work of the soldier extracted, all foreign bodies should be removed, even to see a stream of distilled water, rendered properly with the present views of the innocuous character of pectation has been the practice for a long time But now we have antisepsis of the track and careful actually appeared?

covering of the wound, to guard against microbal in-How far this may be carried is yet unknown, There but great advance has already been gained. It is, however, of recent date that the greatest steps have been taken in the management of this special form Among the most notable are those an of wound nounced from this platform The facts are all known to you The great cavities of the body have here tofore been deemed unapproachable heved that the surgeon, if he undertook their explora tion, would render certain what was almost sure to In gun-shot wounds of the abdomen there happen might, perhaps, be one life saved, while ten were Why should this meagre hope be denied? But I do not report, but only allude all this is changed to the marvels that are detailed by Drs Parkes and Senn, marvels that we could only know by the use of vivisection, which fortunately has not yet been sub merged under a sea of maudlin sentimentality Here, again, we have the triumph of cleanliness A gun-shot wound of the intestine, will inevitably re sult in the expulsion of some of the contents of the bowels, the vermicular motions of the intestines will surely secure this result, even if after a while these motions are arrested, in obedience to the law of in flammation These cases of recovery were probably those where a fortunate apposition of the wound near the abdominal walls, circumscribed the area of pollution and nature's active efforts at repair com plete the line of circumvallation The case of the The custom of the ancients was to pick away insane woman in Utica Asylum, who punctured the abdomen and drew out a piece of the small intestine, fourteen inches long, and cutting it off with a pair of scissors, threw it on the floor, is widely known The physician in attendance knew of nothing but expec tation in such an emergency He drew the edges of the abdominal wound together and waited the event No remarkable symptoms supervened The recovery was complete. Many years after an autopsy revealed the fact that the edges of the intestinal wound But the had been fastened to the abdominal wall But such results are too rare to be guides of conduct The new methods are already accredited with improve ment, and as the courage and better diagnosis of the surgeon improves, we will inevitably place the treatment of these wounds by laparotomy upon Every surgeon has seen cases of a sure foundation strangulated herma where gangrene has supervened, and will bear testimony to the fatal character of the Now, for the relief of this condition, en teroraphy comes in to take its place as a recognized operation, with large increase in the saving of life Again, cleanliness is the pivot upon which the whole movement turns It seems incredible that the peculiar kind of filth that invades the peritoneum in gun-shot wounds of the intestine, can be removed The surgeon with such views would be apt sufficiently to secure even such results as have been immense surface are dangerous expedients This has always been accepted, and ex- long enough to insure cleanliness? Are we to im gate the surface after inflammatory exudates have The possibilities seem large

That these exudates, when extensive, will accompany depth of absurdity to me to be manifest. In the experiments by Dr. migration through the wound It has been my fortune to witness two deaths from rupture of the intestine by external force, without a wound of the three hours, and the man in twenty six revealed a fact exactly the same in each case The remotest corner its firmness many hours before death It is hardly rare exceptions to this plan Others advised reducoccurred during the latter hours of life be undertaken in the gun-shot wound, for it presents of the astragalus also intestines from end to end, merely to settle the diag- judgment of the practitioner has still shrank from the responsibility Now, tofoundation, literally purifying it with fire

Just fifty years ago, during my student days, I had the pleasure of an invitation from Prof Mutter to Philadelphia, and as I believe, on this continent was his second operation The antecedent one was upon the ham-strings Still a young surgeon, he was especially patronized by Dr John Ray Barton, who was so dangerous prospects in life pressed itself upon the surgical mind value of direct repair had acquired its recognition the result of course the subcutaneous cut was not appreciated marks one of the most magnificent of all surgical resume of my judgment in these very grave wounds The rationale was to be explained to The tenotome would almost elbow joint

But had he not seen tendons a fatal inflammation without the formation of the sloughing when exposed to the air? Had not cases dangerous ptomaines of microbal creation, it seems of accidental incision of the Tendo Achillis been reported often enough to prove, that if the life, Parkes on dogs, one fact is to be specially noted, always in danger, was preserved, the limb was likely the frequency of the existence of entozoa and their to be useless from the loss of its great tendon? The surgical world woke to a great fact, and strabismus, torticollis and all contracted tendons came under the surgeon's knife, until it became almost a craze when abdominal wall, not even a break in the parietal Guerin, for the relief of lateral curvature of the peritoneum One was in a child of 6 years of age, spine, cut every spinal-muscle and tendon that he the other in a man of 40 The child died in twenty- could define, until the chain of bones could be Autopsy moved like a serpent's back

At the meeting of the New York State Medical fibrinous exudate of a character sufficiently firm to Association last September, I led the discussion be lifted upon the handle of the scalpel had extended | upon the proper method of treating compound disover the whole surface of the peritoneum, even to its location of the ankle joint. I found the opinions of It is a little odd also that a single surgeons on this point very indefinite, with a strong, lumbricoid had crawled through the opening in both even an uncompromising judgment in favor of am-The fibrinous material had probably acquired putation, notably by Prof Gross who would make credible that much pathological change could have tion and a few relied on resection, some, of the tibia But we and fibula with removal of the ends of both bones were harrassed with doubt whether laparotomy should with their malleoli, while others removed the surface Even the most modern unusual dangers from the necessity of handling the writers left the whole subject in a vague way to the These authors were With all the improvements of the modern quoted to show their various opinions, but it would methods of making the abdominal section the surgeon | be out of place in this paper | For a long time I had been convinced of the great wrong inflicted by these day at the supreme moment, Dr Senn places the teachings, which were founded on the statistics of diagnosis of the gastric intestinal canal upon a sure hospitals in large cities before the day of antiseptic surgery Such advice was even then not applicable to the condition of life in the country and smaller towns where purer air and better constitutions exwitness the first operation on the Tendo Achillis in isted together I had used resection with good re-It results in three cases, and had seen two cases, in consultation, which had been simply reduced by the surgeon in attendance The latter made good recovery after a considerable constitutional disturbupon the then recent death of Dr Physic, was by ance, but by anchylosis But before writing my common consent recognized as the surgical chief of paper, I had the good fortune to see a case that had Dr Barton protested vehemently been treated by a young friend, (Dr P G Udell), against the operation and refused to witness it, being which seemed to mean almost ideal result The foot, unwilling to give his countenance to anything that movable through a little more than half its normal It would certainly blight Mutter's extent, and free from pain in walking, was enabled to Moreover, the interests of the pa- execute its function by the formation of a flail-joint nent should stand first, and he could not be a party after the resection of an inch and a half of the tibia to anything so contrary to good surgery The great and fibula. The novelty of the method, consisted in fact of the protected immunity from suppuration leaving the two malleoli attached to the astragalus when subcutaneous incision is made, had not yet im- and bringing their fractured extremities in contact The vast with the resected end of the bone Granulation was Drainage and carbolic acid under the guidance of John Hunter, but the value of solution were employed to secure antiseptic results This Permit me to quote my own paper, which gives a

"One of the greatest triumphs of surgery is the day Antisepsis is the legitimate descendant of the marvelous utility of the arm after resection of the This flail joint, as I have been in the surely be cleansed as it passed through the skin and habit of naming it, can execute all the motions of the minute wound would be washed by the few drops the normal one if we are careful in its training during of extruded blood This was clearly our antisepsis the period of its perfecting. The case I have cited, Was not Dr Barton justified by his experience? illustrates a possibility of a similar result in the ankle With our knowledge, his conclusions reached the Should we not then regulate our treatment with this

end in view? Let us for the present leave out of the application of the splint for permanent retention consideration any complications, such as may arise from rupture of the posterior tibial artery, proceeding with our plan even if there be a rupture of the an terior tibial great crushing force has compressed the soft parts as well as luxated the joint, which would almost necessarily produce gangrene The most common cause of this injury is a fall from a height upon the foot, as with the line of the leg need not be told to this audi jumping from a carriage when in quick motion foot coming in contact with the earth and then held, while the body is in motion, almost surely induces a spiral twist, which, with an inclination of the leg at an acute angle with the ground, produces the break of bones and rupture of soft parts The end of the tibia is thrust into the ground Two of these cases were from jumps from the carriage when the horses Bad as such conditions are, they are were running not apt to produce much destruction by gangrene Such a condition of the synovial membrane cannot be remedied but by suppuration, if reduction is attempted, no matter how much care we may use in cleansing or antiseptic dressings But there are cases where there is only a rupture of the soft parts and ligaments, and the joint is barely opened and point of contact at the centre moderately displaced

"I am disposed to lay down a formula thus for the of the astragalus at once comes in contact with it, cases of the mild character just mentioned the clothing be carefully removed At once apply granulations a sponge with a bichloride of mercury solution, i to that is so often the result of treatment by resection, eign particles, under these circumstances most likely monly attempted The tenacious synovia picks up at once the early period to be lint particles of what it comes in contact with can be removed with antiseptic sponges held in antiseptic fingers The edges can now be neatly apposed of the similar condition of the elbow joint A slight with fine sutures of carbolized gut, after the bones have been replaced It is not absolutely necessary to use a splint of plaster of Pans, but I confess to the process of repair my partiality to it on account of its immobility A double-inclined plane is a very good appliance before its application the leg around for several inches to extreme flexion should be shaved cotton, wrung out of a solution of the bichloride the foot and leg can be substituted for the rigid plas mentioned, and cover the surface, over which an antiseptic covering should be placed. This is a bid for adhesion, of course, though it is seldom to be follow as the rule from such a procedure expected

"But let us regard the more usual form, as described Let us assume that the malleoli are in place as far as the astragalus is concerned, but broken above, the end of the tibia thrust into the soil It is surely idle to hope that any amount of cleansing can prevent suppuration. The procedure, in my opinion, should always be resection and, if the astragalus be not broken, only of the end of the tibia and fractured end of the fibula whole inch of the bone should be removed course the most careful cleansing should not be There has been no doubt then of the propriety of be joined to the bones above by catgut carbolized we have before us? My advice is still for conserva The ends of the fractured malleoli should amputation This only for the sake of absolute apposition, which paratively trifling The fragments must be removed, might be disturbed in the necessary handling during the resection may be two inches or more, instead of

The edges of the wound can be brought together at what would be the upper part when the foot is at rest, while the lower is filled with a drainage-tube Also, leave out those cases where a I should scarcely be satisfied with any appliance for securing the proper position except the gypsum bandage, with a large opening for the requisite dress That the foot should be placed at right angles In consequence of the resection this is easily Where there has been reduction without re section, the position is painful by increasing the press ure upon the inflamed synovial surfaces The surface of the wound and surface of the skin for two or three inches around should be covered with some antiseptic dressing, of which absorbent cotton, saturated with the bichloride solution, is to my mind sufficient

"The drainage-tube offers an easy access to the depths of the wound, which should be washed by an antiseptic solution, of which carbolic acid may be the most safe, as well as sufficient Let us suppose the progress favorable, the rise of temperature mod erate, as well as the other constitutional symptoms We have a right to expect union, commencing at the The straight line of the saw-cut on the tibia applied to the convex surface Let while the surfaces on each side are to be filled by This condition permits the motion With a lens inspect the part to discover for- and should be cultivated more early than is com The stage of danger is during When the granulations are filling These up the spaces, change of position should be under This is my constant practice in the treatment taken change in the angle of the foot toward the leg could be made every second day, so slight as not to disturb This can be carried on until the extension of the foot is as complete as that of Slowly the foot can be carried down But the sound one To accomplish this purpose, a I would then apply absorbent splint hinged at the centre of motion and controlling ter of Paris

"I cannot but believe that a successful result would ger of resection with these appliances can hardly be more than a Syme's amputation The bone cut is the same, and is probably not more susceptible to the septicæmic infection than the synovial face of the astragalus If, however, the case is showing a dan gerous decline from excessive temperature and fever, with too copious suppuration, we have the resource

of secondary amputation

"But let us suppose that the conditions are not so From one-half to a favorable, the comminution of bones considerable, Of and the soft parts much lacerated and contused Must this sad resource be the only one The danger from bone communition is comone inch, from the end of the tibia, and yet pro duce the most splendid result. The great danger if there is hæmorrhage from an artery of some size My experience in the use of warm water to preserve the circulation in injured tissues has been so different from that which I had before warm water as a persistent agent had been so generally employed, that I am constantly astonished at its efficacy Even when I know that the tissue of a foot or hand is destroyed, I cannot always feel secure of my flaps at the point of car wheels had passed, but not injuring the heel and But as this cannot be absolutely known, the proper method is obviously to amputate above the But the great superiority of the stump after cases in warm water for six days. In each of them a sufficient flap was secured defined, and without alarming symptoms But it is supervened that I cite this experience, and I would not delay the use of the last resort a moment after the occurrence of gangrene But it is the marvellous effect of warmth to save the vitality of injured tissues, and as this can be used in connection with the antiseptic measures, the case would be a bad one indeed where I would employ amputation as a primary

"The introduction of the foot into warm water nedeprecated To avoid this inconvenience, an anterior metallic splint may be used for the first week, which, being raised from the bed, allows every convenience for the drip and avoids the painful droop of My habit in the employment of water for both the ankle and the knee is to envelop them with cotton, and then surround the whole with an elastic rubber sheet Upon the top of the cotton the water can be poured from a pitcher or fountain syringe at short intervals, avoiding fluctuations of temperature This water may be rectified with the bichloride of edge of good methods is expanding its application mercury, 1 to 5,000 If gangrene should supervene, for the red line of separation That there are cases of luxation so complicated with extensive laceration that no question of the propriety of amputation need be asked, is certain, but I urge the profession to lean to the side of mercy "

Six months' reflection and experience has induced a change of opinion I would, in nearly all cases, reduce and rely on the power of cleanliness and an-There are those, of course, where the crush is so severe that there can be no doubt But when the rupture is great better opportunities are given for the inspection of the surfaces than when the opening is small. The resection may be secondary and the amputation tertiary

The microbal discoveries of Pasteur and Koch and their disciples have placed all of our therapeutics on a new basis I will not detain you in speaking of

thread through the woof of all knowledge How can we measure the scope of a piece of glass ground to comes from the sphacelus of soft tissues, especially a lens? The spectroscope was a mere philosophic toy at first What now the analyst of the sun as well as of the blood No one can now measure the possible triumphs of surgery That which was excellent yesterday must be abandoned to day I confess, after long years of practice, to a delight that has the glow of youthful enthusiasm when making a resection of the knee under the use of mercuric chloride and closing up the wound with silk sutures, and ap-I recall two cases of boys over whose feet plying drainage-tubes in each corner of the wound, and then covering the whole with absorbent cotton saturated with the same microbal enemy, to remove the whole at the end of two weeks with complete closure, every suture encysted, and not a drop of pus Syme's operation induced me to keep the feet in both Of course, there was no fever, only physiological repair Or even to witness, perhaps, a more difficult The dead tissue was feat in a much more common condition, the neat apposition of the tissues of a hand lacerated by mawith no desire to obtain a flap after gangrene shall have chinery, while a stream of the antiseptic solution flows over every part, and the retention of these tissues in their proper position by sterilized catgut, the whole protected with absorbent cotton saturated with the solution At the end of a fortnight the sutures have disappeared, the repair is complete, without a drop of pus Such are now the experiences of all of you, and need no enlargement of statement surgical atmosphere is now antiseptic. Lister must take his place beside Jenner For the time, he has cessitates a dependent position, and this is one to be added a word to the language, and we do not mean merely carbolic acid and the spray, when we speak There is already a wide range of maof Listerism terial to choose from It is, however, obvious that there is a constant tendency towards the employment of the mercuric bichloride, notwithstanding the objection raised by Prof Billroth and his preference for 10doform Its accessibility, its inodorousness, and enormous powers as a germicide will easily account for this The natural fear of its powerful toxic effect has rendered us all cautious, but more knowl-

Who has not dreaded the care of a compound a secondary operation can be made without the delay fracture of the thigh? But now we have report by Prof McEwen of 1000 cases of osteotomy and no bad results Who a few years since could have accepted the statement, that the bone could be cut and crushed, the surface broken and driven into the texture of the bone above and below, and yet remain absolutely free from the danger of necrosis and ready for union? The operation is essentially subcuta-But Dr Hahn, of Berlin, boldly incises the soft parts and exposes the surface of the tibia under a stream of mercuric solution, regarding this operation as secure as the subcutaneous cut, and as the parts can be seen they are more susceptible of proper management. In all these cases merely the quiet necessary to physiological repair with its antiseptic covering comprises the after-treatment. Its simplicity and rapidity of result amazes one haps, however, the best illustration of the value of them, the subject is too trite. We hear now of little the treatment that renders wounds aseptic is to be else No one knows, when a real discovery is made, found not in those McEwen has made, but in those how far it will reach. It always seems to run like a that have resulted from accident, which we recognize

as compound fractures They are at the deepest part | tumor, notwithstanding McDowell's success, was stigof the limb and present every form of wound in the same case known as incised, punctured, lacerated and contused antiseptic surgery flows from every hospital would be burdensome to quote much, but the tables of Volkmann give at a glance the whole history of the modern leap in surgery It has always been the misfortune of old hospitals to be the places where the greatest mortality would ensue when a wound was to be treated It is not necessary to enforce this statement by any large collection of statistics, but I can- good result It, however, failed not pass by the consideration of this subject without proach have we arrived at the present simplicity of quoting the extraordinary tables of Volkmann has collected the facts from the hospitals of Germany beyond the necessities of ordinary surgery and England, and found that the results in all were difficult to apply what we call experience Surely similar in a very remarkable degree He found that of 885 compound fractures of the limbs, 339 deaths resulted, whether preserved or amputated, being 38 50 This in civil life In military hospitals the percentage was 236 The difference may be easily accounted for by the fact that many of these were recently constructed and often extemporized, and also that the average age of the subject was during the firmest periods of life The approximation in results in the various civil hospitals is shown very

Baum, in Gottingen, the mortality was 38 per cent Billroth, in Zurich, " 38 7 " 38 7 " A0 5 " A0 5 " A0 6 " A0 6 " A0 6 " A1 8 "

Since the adoption of an antiseptic method, Volkmann makes report of 75 cases in 73 patients with compound fractures and many with injury of the joint, and not a single death Of these there was the extraordinary number of 21, or 28 per cent of all Eleven of these were treated conservatively, and there was but one that resulted in anchylosis One was a shoulder-joint which was resected elbow-joint was opened six times, of which there were made one primary, and three secondary resections The knee-joint Two were treated conservatively was opened four times and treated conservatively The ankle was opened six times Two were treated by secondary resection One by amputation Three were treated conservatively The management was In the first place protracted drenching with water, the removal of spiculæ and trimming sharp ends of bones, enlarging the wound always enough to allow exploration with the finger, and then causing it to gap by retractors, while the drenching was going on, not stopping until the last coagulum was disposed Then completing the irrigation by a drench of carbolized water After the proper replacement of parts the whole was covered with abundant layers of carbolized gauze, and kept free from accumulation of fluids by drainage tubes Most of the cases were seen within a few hours after the injury ever, were treated after delay of forty-eight hours

The great achievement of the day, however, is by common consent the marvelous growth of laparotomy During my early career the removal of an ovarian

matized as murder, which indeed it seemed very often to be Dr Atlee was fiercely denounced for They have always been the terror of the his efforts to bring this operation into the ranks of At present the record of the triumphs of legitimate surgery, which he lived to see fully estab-But through what a valley of death have the It lished wonderful results been obtained It is now but 14 years since Keith electrified the whole surgical world with the report of 10 consecutive cases and only one Two years after Dr Atlee remarked to me, after performing an operation of this kind, that if it should succeed it would be the tenth consecutive By what slow ap The manipulation is simple, but delicate He operating every surgeon had seen enough of the danger of opening the peritoneum to fear its terrible inflamma tion which we have often seen sun over the whole immense surface, even to its remotest recesses, beginning at a wounded point Experience was ample How could we dare to defy the results of such knowledge? But from the recognized fatality of the tumor, and the distressing condition under which life was maintained during the latter period of its exis tence, we should have known but little of the dangers to be avoided and how to combat them How long a time it required to learn, that after all, it was not peritonitis that we were chiefly to fear We had to learn that the whole immense surface was but little else than the expansion of the lymphatic system, as the skin is of the nervous one And when the blood mixed with the contents of the sac, that have been left behind, excited first a secretion from the surface for their solution preparatory to their absorption according to the natural law for their disposal through the blood, we encountered on the autopsy the fearful Too much was to be done Even our red serum I still accept the correctness therapeutics misled us The of the opium treatment in genuine non traumatic peritonitis We owe a great debt to Dr Alonzo Clark for the careful development of its excellence in this condition But our pathology was a mistaken one, and I cannot but think that the mortality is increased in the cases first mentioned by the use of How much to unlearn and how hard in the face of our experience? Who has not looked into the peritoneal cavity during an operation and hardly dared to touch it, preferring to leave some blood and sac contents, rather than touch the inflammable sur-But the death of Keith's eleventh case struck The peritoneum must henceforth be face To our astonished gaze the membrane could the key-note be sponged and washed and dried, and then it quietly removed the small amount that the sponge could not From this time the death rate diminished in the hands of every operator, and the note has become universal that the basis of all antisepsis is clean-Even the exudates from peritonitis must be removed, according to Mr Tait, who has for this condition washed out the cavity with water that flowed from the city tap and which, according to a friend with microscopical knowledge, contained "thirty six different kinds of beasts" "You reject antiseptic tures, after having extirpated the mucous membrane water" Again it is cleanliness say that surgeons did not esteem cleanliness as going a long way before Godliness in operations was not of the precise and thorough kind that was dency to suppuration, than the peritoneum has given us out of our consideration They transcend those of all others who have undertaken to folfor the removal of an ovarian tumor is by common extraordinary triumphs of antisepsis consent, in its various conditions, at times the most of simplicity procedure intended to be similar. There is a preponderating opinion that direct antidotes to the protermination in cases that have been operated upon wounds accompanied by exposure of the peritoneum surgeons are not likely to omit proper antiseptic bone, and is also a valuable antiseptic measures We are still in the midst, of change, but know, has removed this operation from a mortality that seemed murderous to one that is less than any operation of a capital character That this result has natural law is too obvious to be denied

three inches from the vaginal junction This was ute, would be aught but useful and the blood was readily prevented from passing ed inch from its junction with the vagina, and at this linea alba. Thus peritoneal surface was brought with the proper antisepsis became comparatively against its congener The intestines had fortunately unnecessary been kept covered by the abdominal walls Union

medication," said I to Mr Tait, who replied "Yes, of the neck, and brought the abraded surfaces toit is all rubbish, there is but one antiseptic that I gether by a sort of autoplasty, and drops it back know of "Pray, what may that be?" "Soap and into the pelvis. As an operative procedure this It would be idle to seems to me to be final

But the exposure of a joint to the atmosphere is But it far more apt to result in inflammation, with a ten-I will leave the statistics that Mr Tait now we follow the nests of bacilli into the joint with the sharp spoon, and filling all nooks with an antiseptic solution, close the capsule with an assurance low in his footsteps, so as to lead one to believe that of freedom from any active inflammation, especially there are some problems unexplained The operation of a suppurating form. This is surely one of the most

I must not omit, in this sketch, the important step difficult one of execution that ever comes under the in advance that was declared in the papers of Prof. hands of the surgeon At other times it is the type Andrews and Dr Watson, delivered before this As-These circumstances give an oppor- sociation last year, on the treatment of carious tunity for a wide difference in the results of operative wounds by the use of a solution of hydrochloric acid 1 to 20 A priori, every one felt that such a strength of acid must be so irritating as not to be tolerated cesses that seem to control the poisonous results of But coming from such authority, I at once adopted suppuration, increase the percentage of favorable the method, and I desire to say that I regard it as one of the great advances in surgery, free from dan-Their use marks another step in the treatment of ger or even irritation, and replete with power Moreover, we have at the same time an agent that Mr Tait's results are to be regarded as unique, and removes the dead and does not injure the living

Neither must I fail to speak of one of the stages the splendid record of expert operators, as we all in the progress of research which is marked by the attempt to obtain sterilized air As we all know, Lister's spray has occupied the largest place for this purpose, with a reputation much waning, and enbeen obtained by constant attention to the action of tirely abandoned as worse than useless in laparoto-Let any one make the experiment of throwing Several years since I removed a uterus containing the spray upon a plate of glass for a few minutes, a fibroid weighing seventeen pounds The cut ex- and he will find, by the employment of a lens, that tended nearly the whole length of the linea alba, be- the rush of the vapor has drawn in and deposited fore it could be drawn through it The vessels were upon the glass every floating particle in the atmosligated on the sides and then I carried out my de phere, thus concentrating the minute foreign bodies vice for managing the stump, and guarding the peri- instead of dispersing them Independent of the toneum from the presence of the dreaded foreign poisonous carbolic acid, rapidly absorbed from the body in the shape of ligatures or sutures A slight large surface of the peritoneum, we would make a incision was made all around the huge mass about special deposit of foreign bodies, which, though mindissected down and all around to nearly the point Lister's time, a plan of enclosing the part to be opabove mentioned. The vessels were easily seized erated on in an atmosphere of nitrogen was attempt-The difficulty of executing the procedure to a into the cavity of the peritoneum by the cup like successful termination arrested the experimentation Amputation was made about an Many years since I myself entertained the hope that benefit would accrue from the pouring of carbonic point it had of course become small But little blood acid gas over the wound and into the cavity during flowed from this last procedure, for the vessels had a laparotomy, thus excluding the atmospheric air already been secured After hæmorrhage had ceased But without sterilized hands and other necessary apthe edge of the cup-like pedicle was pocketed in the paratus, the method was comparatively useless, and

We also find Dr Prince sterilizing the atmosphere of the wound in the linea alba was perfect A drain of the whole operating room, and a Boston hospital down through the neck of the uterus seemed to me supplied by air from the roof, which, being carried the most perfect of appliances I fondly hoped that to the basement, is passed over heated plates in winthis was all that could be desired But I had at this ter, and thence distributed over the building Burntime no means of antisepsis Now Pean, as reported ing sulphur is a common method of preparation with by Dr Senn, closes over the stump with catgut su- which all are familiar Perhaps we may yet choose a room whose air shall be purified by its passage through sterilized cotton, or through tubes in imita-

tion of Tyndall's glycerine box

It is the glory of the time that really great men among us are not so marked by a wide separation from their colleagues, such as prevailed one hundred Then there was but one John and fifty years ago Hunter, and he remained without peer, and with few followers Meeting one of his contemporaries when he was carrying home some pig's feet from the market, for the purpose of anatomical inquiry, he was sneered at for busying himself about pig's pettitoes To day, the pettitoes on such a mission would be enclosed in a nimbus We now have a Koch who leads, but there is a large following close at his heels We have Atlee and Spencer Wells, but almost at once their followers appear everywhere and outstrip their teachers

We sometimes hear pessimists declaim against the methods of the profession, and summing up their wild statements in the compendious anathema, that the world would have been better if the practice of medicine had become extinct Our modern methods have not been long enough in use, to attract the kind of folly, that denounces vaccination, but it will ap-When pointing to the vast benefits that man kind has received from the labors of the medical profession, we naturally place at the head the trifling This is a contribution of operation of vaccination Next to this stands the practical extinction of scurvy, which decimated the crews on long voy-This result ages, seriously crippling commerce must be placed to the credit of the hygienist Koch is credited with the assertion that the student will soon only know septicæmia by description, as he This is the addition to science now knows scurvy furnished by the bacteriologist But this is rendered the greatest boon of all by the surgeon It is the crowning achievement of modern science, that we have already returned two of the greatest scourges of mankind to the box of Pandora, with a reasonable prospect of adding a third to the list

It seems incredible that surgeons could have been at any time united in a guild with barbers connection in England was severed in 1742, while Mr Pott was in active life, a man of culture, who has left his mark permanently upon the art But the surgeon stood in rank far below the physician, and at one time was not allowed to make a surgical operation without the consent of the doctor present it seems as if the future of the profession With a single bound the must be largely surgical limitations set up by the physician have been pushed The surgeon opens the various cavities of the body, not only to repair injury, but to remove aside If the physician the results of morbid processes fails to rectify the abnormal chemistry of the enlarged spleen, the surgeon removes it and pyelitis with organic disease in one kidney is If disease obstructs the bowels, he cuts it out and sert the tube connected with the bellows, when a bearing the patient down, the surgeon takes it away If the brain has an abscess pressing on it and en- face, that violent coughing was set up, expelling with joins the healthy ends of his cut the seat of abscess he punctures and drains them

dangering life, he punctures, drains and renders the wound aseptic It is difficult at the present moment to define the possibilities of modern surgery It is a fit representative of the time we live in, the com bination of science and action

TRACHEOTOMY IN MORPHINE POISONING

Read before the St Louis Medical Society, March 21, 1888 BY BRANSFORD LEWIS, MD, ASSISTANT SUPERINTENDENT OF CITY HOSPITAL

About four months ago, I read in the Medical Review, a short account of the resuscitation of a physician of Vienna, from opium narcosis by means of tracheotomy and forced respiration with a bellows It seemed to me to be a rational and feasible pro cedure, and I determined to try it, should the op portunity present itself

On the afternoon of March 11, 1888, a young man was brought to the City Hospital in an unconscious It was reported that about an hour previously, in ending up a debauch, he had taken an ounce of laudanum with suicidal intent

His condition then was bad, cyanosis was marked, the pulse was proportionally weak, and fespiration, already shallow, was rendered difficult by the ac cumulating mucus in the trachea The pupils were minutely contracted and immobile, extremities cold The treatment usually carried out in the hospital in such cases was adopted, one-hundredth of a grain of atropia, and several syringefuls of whisky were ad ministered subcutaneously, the syphon-tube was passed into the stomach, and that organ was repeatedly washed out, at first with water, afterward with strong The flagging respiration was stimulated by douches of cold and hot water alternately dashed over his chest, and to the same end the Faradic current for a time seemed to be of benefit But not withstanding our efforts, narcosis became more pro found, cyanosis was intensified to a degree which I have seldom seen, and efforts at respiration on his part ceased entirely, so that artificial respiration was substituted, effectually at first, with much less suc It became evident that unless something radical were done, and that, too, immedicess afterwards ately, the patient could not last I bethought me of

the bellows method The patient was hastily removed to the amphi theatre, where, with the kind permission of our superintendent, Dr H C Dalton, I performed tracheotomy as rapidly as possible, during which only a gasp was taken now and then, probably two or three to the minute On separating the severed cricoid, a deep inspiration was followed, as is usually the case at this stage of a tracheotomy, by a consid erable interval of quietude We were about to in by the direct impact of cold air on their mucous sureach spasmodic expiration, mucus which had collected in the trachea to a considerable amount this means the tube was soon cleared of its contents Coincident with the violent coughing, of course, at, though attained in an unexpected manner, withgan almost immediately nance gradually paled under the more vigorous dogs action of the heart-however paradoxical that may appear at first thought-and efforts to speak evidenced returning consciousness. A piece of moist gauze placed over the tube, acted as a filter to the Injections of stimulants-whisky and inspired air ether-were continued at intervals, and another hundredth of a grain of atropia was given, after which the patient was removed to his bed and subjected to frequent and vigorous stirring up when respiration next several hours

Sleep was not prevented, and he was soon wrapped measure in its soothing embrace

On the following morning the tube was withdrawn and the incised membrane and cartilage were sutured. the rest of the wound being allowed to granulate

I should like to be able to close the record of this case a la mode with the statement that recovery followed without a bad symptom, but I am prevented from doing that by the fact that four days after his entrance into the hospital, the patient became subject to delinum tremens, from which he died thirtysix hours later The presence of pneumonia or cluded by post-mortem examination

It may be suggested that possibly the patient might have recovered even after several stoppages of natural respiration, such as the one which precipitated the operation, ordinary methods of artificial respiration being employed I, too, believe that demonstrated in cases of that kind

I have seen not a few patients with vastly less cyanosis, with at times stronger pulse and more vigorous respiration, succumb under the continued use of that treatment

And the procedure could add no complication to could only be of benefit, by allowing a free vent for tne cause of that ominous sign, the tracheal râle, and by shortening and simplifying the channel of communication between the lungs, and that all powerful life giver "fresh air" As hinted at above, the direct influx of unwarmed air would seem to be no mean factor in conducing to the desired end respiration not be reestablished, or fail after its repeated reestablishment, it would be easy enough to insert into the tracheal tube, a tube connected with a bellows, by which the lungs could be forced into activity as long as desirable

In searching for literature on the subject, the Index Medicus directed me to only one article refering to it, that of Dr G E Fell, in the Buffalo Medical and Surgical Journal, for November, 1887 In it the author reports the successful treatment by

means of forced respiration with bellows, etc. of a patient who had been poisoned by morphine for a longer time than the one to whom I have called The narcotism in the former case your attention deep inspirations were taken, just the object aimed seems to have pursued a course not so rapid as that of the latter The apparatus used was the one out the use of the bellows, change for the better be- usually employed in the doctor's physiological labora-The dark purple counte- tory in the performance of artificial respiration on

> The operation was done on July 24, 1887, prior to the one performed at Vienna, and was therefore, so far as known, the first on record Since then. Dr Fell has used the treatment with success in two cases, both of which required the prolonged exercise

of forced respiration

In view of the results of the hospital case, I believe that in morphine poisoning, where other means fail, even though it be impossible, on account of the was inclined to flag-and it was so inclined for the lack of apparatus, to supplement it with bellows respiration, tracheotomy is a wise and justifiable

CORROSIVE SUBLIMATE INTERNALLY IN PUER-PERAL AND OTHER SEPTICÆMIAS

Read before the Gynacological Society of Boston, February g, 1888,

BY C W STEVENS, MD, FELLOW OF THE BOSTON GYNÆCOLOGICAL SOCIETY, OF THE AMERICAN ACADEMY OF MEDICINE, ETC

I was first led to use corrosive sublimate internally other complication of that sort was definitely ex- in puerperal septicæmia by observing its beneficial effects in diphtheria. The principle on which I base its use was announced in 1884, at the Medical Congress in Copenhagen, by Dr Bouchard, who then made this statement "Medical antiseptic therapeutics does not propose to kill the microbe, but only to stay its pullulation Even slight modificapossible—but not probable, a fact but too often tions in the human infected organism may prevent the indefinite multiplication of certain microbes which have invaded it "

It was found by Roice, of Utrecht, that in any suppurating focus microbes are found in the blood and kidneys Dr H J Garrigues, in his paper on puerperal fever in the genital tract of puerperal women, the already critical situation, on the contrary, it has endorsed this view by recommending, in addition to local treatment, "carbolic acid, sometimes combined with the compound tinct iodine " If we can hinder the proliferation of microbes, or render them mert, is it not as important as their elimination from the system? Dr Macan, in his report of the Rotunda Hospital for 1883, declares that he knows nothing which will quicken the elimination of the poison from the system in hetero genetic infection In cases in which the source of poison is heterogenetic I am accustomed to attempt to sterilize the air in the patient's room by means of iodine vapor I place iodine sales in cups with a little alcohol and suspend them around the room The fumes are not disagreeable nor very irritating, and are well borne I have used bromine, but find it rather troublesome to the throat

My initial dose of corrosive sublimate is 12 grain,

and if any looseness supervene I diminish it to $\frac{1}{96}$ If there be a tendency to too frequent dejections the bichloride can be guarded by an opiate never had any sore mouth nor any unfavorable symptom except a slight relaxation of the bowels, which ficial effect was relieved by diminishing the dose

In connection with the internal use of bichloride, it may be used as injection, but I believe the cases | tenement of poisoning have been due to a too large dose Dr Ernst has pointed out that even 1 10,000 will stop formly show a diminution of temperature after its the proliferation of microbes uterus 1 5000 and in the vagina 1 3000 As to Dr W L Richardson's pad, I have used something more simple which I think equally efficacious the nurse wring a napkin out of lukewarm 1 2000 solution and apply it moist, it gives great comfort

There are certain cases of mercurial idiosyncrasy in which it is better to use injections of liquor sodæ chlorinat or of permanganate potassæ, the latter of which I have used several times with satisfaction

In cases in which chill or uterine colic follows intra-uterine injections, I think crayons or suppositories of todol are excellent. Apart from its danger-ously poisonous properties, todo form masks the lochial odor, which is a great di advantage Iodol, although having nearly the same per cent of iodine, appears to be innocuous, and is excellent in suppur-

ating surfaces

Case 1 — Mrs R, æt 18, primipara, was confined by me Nov 14, 1887, of a still-born child at term was obliged to use forceps on account of incompetency of uterine contractions and exhaustion of pa-There was no rupture of perineum, and but a slight unilateral laceration of cervix She rallied Her lochia were very well from the operation scanty from the beginning There was no trouble with the milk secretion She seemed to get along in a normal manner, and complained of nothing until Nov 23, or the ninth day, when she was taken with ngor and fever The next day I found in the morning pulse 108, temperature 103° F Severe frontal headache, nausea and fetor of the lochia panitis nor diarrhœa, and only slight tenderness over uterus and right ovary I ordered her 18 gr quinine and injected into the uterus a 1 60 sol carbolic A few minacid by means of Jennison's reflux tube utes after the injection she had a severe rigor, which lasted half an hour The next day the pulse was 100, temperature 103° I now injected 1 2000 hot bichloride sol, and applied tinct iodine over hypo-A few minutes after the injection she had gastrium a bad and long rigor and became much alarmed

The following morning her temperature had gone up to 104°, and she found it impossible to turn over The injections had evion account of soreness dently caused shock and had not relieved her in any way, in fact she was worse I now prescribed corrosive sublimate gr $\frac{1}{48}$ every two hours morning the temperature had fallen to 100 5° and She felt much better and less sore ride daily, and continued the same internally until the sixth day of the septicæmia, when she became convalescent the pulse to 92

Case 2 is that of a four-month abortion in which septicæmia ensued from retained placenta I re-I have moved it, washed out the uterus with permanganate of potass, and gave bichloride internally with bene-

Case 3 -Puerperal peritonitis of a severe type, with bad sanitary surroundings in a gypsy crowded The bichloride caused a fall of temperature and was beneficial Recovery My cases uni I have used in the use, and generally very quickly i

MEDICAL PROGRESS.

CASE OF COBRA-BITE CURE --- MR PERCY A RIGBY, Offg Civil Surgeon, Sonthal Pergunnahs, re

ports the following interesting case

On October 21, a Hindu, named Mohan Lal, aged about 30 years, brought a young cobra, two feet long to me, in consequence of a reward I had offered for a live cobra, for the purpose of experiment, at about 8 30 A M As I was not at the dispensary at the time he exhibited the snake to the Hospital As sistant, with the result that it escaped, and in recap turing it, he was bitten between the index and middle fingers, on the back of the hand He refused any treatment and went home to take native medicines At 12 30 PM, the Hospital Assistant was informed that the man was in a dying state, and he at once had him brought to the dispensary

On admission, the patient could not stand, his respiration was gasping, and he could not raise his head, but was conscious Saliva was flowing from his mouth, and mucous râles obstructing respiration Pulse full but soft, hand and forearm swollen, the palmar surface corresponding to the bite was livid

The Hospital Assistant gave a hypodermic injection of permanganate of potash (5 per cent) in the situation of the bite, rubbing permanganate powder into the wound, and a draught containing liq am-

moniæ m xx aqua oz 1/2

1 PM -Patient gradually becoming worse, saliva in great quantity pouring from the mouth, mucous râles very marked, convulsive spasms of body and especially of the extremities, respiration spasmodic, head fallen forward on the chest Pulse softer Re peat draught of liq ammoniæ

2 PM -Symptoms increasing in severity, mes

senger sent off to me

2 30 P M -On my arrival I found the patient as described, apparently sinking fast, the mucus threaten ing suffocation, violent convulsive spasms affecting the body, respiration spasmodic, pulse 60, respira tion 12 and abdominal, partial paralysis of the lower limbs, unable to raise his head, mind unimpaired I injected m xv liq ammoniæ, aqua m xv hypo dermically into the bend of the elbow body covered with a cold clammy perspiration A

large mustard poultice was placed over the heart more feeble, breathing very catchy, passed urine and fæces in the bed, apparently fast sinking peated hypodermic injection of hig ammoniæ

the râles seemed less, and the pulse had rallied in

quality, becoming firmer and being 68

Convulsive seizures less frequent, râles diminished and general improvement Gave draught of m ix liq Ammoniæ, swallowed with much difficulty At this point a man of his caste came to pray over him, and before I could stop him, placed his mouth to his ear and commenced blowing into it with great violence The patient at once had two or three violent convulsive seizures, all the improve- Medical Gazette, Dec , 1887 ment vanished, the pulse became almost imperceptible and respiration about 6, the jaw dropped, and he seemed in articulo mortis I left him at 4.20 PM expecting every gasp to be his last, and instructing the Hospital Assistant to inform me of the time of his death, and directed a repetition of the draught in case he should by any chance rally

4 20 PM —In statu quo The Hospital Assistant gave another ammonia draught Patient became

drowsy, spasms less frequent

4 30 PM — Respiration very shallow, patient seemed to become comatose, but suddenly he rallied and from this time improvement steadily continued, the pulse gradually improving, and at 6 P M was 78 Experienced great difficulty in swallowing, but by 8 PM this had passed

in the shape of oz 1/2 of country spirit every onehalf hour for two doses in a like quantity of water, the next day his temperature was 101 20, arm much swollen, saline mixture, and fomentations prescribed There was no ulceration from the hypo-

dermic injection of ammonia

Note -The bite was a genuine cobra-bite, the bitten in the presence of the Hospital Assistant patient, he was so rapidly sinking that I determined venous circulation of his jaws "

As an example of what may be effected through vouching for the correctness of every detail ammediately killed by another of the servants suspected the poisonous nature of the snake

amateur photographer) into the puncture, and 3 PM -- Convulsive spasms more severe, pulse tightly bandaging the leg in two places above the wound Three glasses of raw whisky were also ad-By this time a horse and trap had been ministered got ready, and the man was driven to the Bandora 3 30 PM —Breathing had almost ceased, although dispensary, where he was immediately attended to The wound has since shown no serious effects, and the malee is nearly well enough to résumé his work 3 45 P M —Respiration 12, pulse 70, and improved The snake has been sent to Mr Phipson, Honorary Secretary of the Bombay Natural History Society, who has written as follows "I am sorry to say it is undoubtedly a Russell's Viper, Daboia elegans" The malee, therefore, owes his life to the prompt measures that were taken on his behalf, and the manner in which fatal consequences were averted is worthy of being brought to public notice - Indian

INTRA-TRACHEAL SPRAY -DR A F MODESTOFF has published as a graduation dissertation an account of some investigations made by him in Professor Sushchinski's laboratory in St Petersburg on the administration of powerful drugs to dogs by means of spraying into the lungs from the trachea The instrument used was something like a hypodermic syringe needle with a lateral orifice, this needle was connected with a small spray apparatus, the reservoir being in the form of a test tube and graduated so as to show how much of the liquid had been used of course, it was difficult to prevent the animal's struggles from interfering with the operation, it was found advisable, after shaving the front of the neck. to expose the larynx and to fix it The needle was The treatment now consisted simply of stimulant then inserted into the trachea so that the orifice should look downwards When water or indifferent solutions were used no effect was produced on the respiration or blood pressure which was taken in the femoral artery When, however, solutions of active drugs-such as curare, strychnine, cocaine, and atropine—were employed, a very prompt effect was produced, frequently in about ten seconds wounds of both fangs being visible, and the man was found, too, that the effect was greater as well as more prompt than when the same doses were admin regret that Dr Richard's treatment was not more istered by the mouth, the rectum, subcutaneous inminutely carried out, but when I was called to the jection, or even than when introduced into the Of course Dr Modestoff does on hypodermic injection of ammonia Had not the not propose that under ordinary circumstances this untoward conduct of the native priest produced the method of administering medicine should be adopted desperate symptoms stated, I am confident the man for human beings, but he thinks that it may possibly would have recovered without the terrible convulsive be advantageous where prompt action is of the last seizures produced by this bit of fanaticism, the man importance—as, for example, in some cases of poisexplaining it was "to keep his teeth from falling out oning, and in hæmoptysis, where other methods of treatment have failed He quotes, also, the experience of Jousset, who, as long ago as 1874, saved the presence of mind in the case of snake-bite, a Bom-lives of two patients suffering from a very grave form bay paper gives an account of the following incident, of malarial fever by injecting a solution of quinine On into the trachea He also suggests that in cholera Thursday evening last the males of a bungalow at the physiological solution of chloride of sodium Bandora was bitten on the foot by a viper, which was might be employed in this way Again, in cases of His disease of the respiratory passages where tracheotomy master was fortunately standing by, and he at once is indicated, he thinks that perhaps the intra-tracheal He spray might sometimes serve One observation was took the most prompt measures, injecting strong am- made on a human patient, a man on whom trachemonia (which was at hand, as the gentleman is an otomy had been performed for Stoerck's blennor-

A single spraying of a fluid ounce of the dejecta were the only symptoms physiological solution of chloride of sodium, at a even the above were absent, and the diagnosis was temperature of 60° C (which previous experiments) not made ante-mortem. The prognosis of hæmatoma had shown to give a spray of about 38 5°, or a little is bad, the patient dies of hæmorrhage, or the in above the temperature of the healthy body), was creasing size of the tumor, or from pressure effects sufficient to cause a quantity of inspissated crusts to on adjacent viscera be coughed up, with the result of making the patient thus far (Thiersch and Gussenbauer) has consisted feel very much relieved several times, causing no inconvenience or unpleas-An interesting table is given by Dr ant symptom Modestoff, showing the change of temperature caused by the formation of spray Thus the temperature relieve the patient supposed at the time to be suffered the room being 20° C, that represented the only ing from strangulation of the gut Post mortem temperature for the liquid which underwent no change, or at which the temperature of the spray was 100 per cent of that of the liquid in the reservoir When the liquid was 15° C, the spray was at the first half-minute 17°, at the second 18 5°, and at the third 18 5°, the maximum percentage of the original temperature shown by the spray being 123 Of course, when the liquid was warmer than the air the process of atomization cooled it, so that a liquid of 40° C gave a spray of 32° during the first half minute, and laparotomy was performed for the relief of symptoms of 31° during the second and third half-minutes-1e, it was cooled to 80 per cent of the original cases of compression of the common gall duct by temperature, while a liquid of 90° C fell to 50 5°-1e, to 57 per cent This shows that care must be taken to ascertain the effect of the process of atomization on the temperature of the liquid before arranging the details of the operation - Lancet, March 17, 1888

COMPLICATED DISEASES OF THE PANCREAS AND THEIR SURGICAL TREATMENT -KARL HAGENBACH records two cases, one of hæmaturia and another of carcinoma of the pancreas The literature of diseases of the pancreas is studied at length number of operated cysts of the pancreas now reaches thirteen Of fifteen cases tabulated by the author eight were males, the ages varied from 16 to 46 years The duration of the disease is chronic, it was shorter by several inches and in some of the cases the symptoms extend over stand, the left knee would touch the right, and the a period of five to twelve years The prominent symptoms in all cases were oppression or pain in the epigastrium, eructations, vomiting, irregularities of the bowels, and extreme emaciation With all this there was a tense, elastic tumor in the upper abdominal region with pseudo-pulsation Kuster lays stress on the presence of a moderate amount of blood in the exploratory puncture of such tumors This last element speaks for the presence of pancreas In Kuster's case a venous hæmorrhage into the cyst probably followed the exploratory puncture Hæmatoma (Friedreich) of the pancreas is rela-

tively common (hæmorrhagic cysts of Senn) apoplectic cysts (Friedreich) (hæmatoma of Senn), are rarest occurrences The apoplectic cysts have, until now, been found only post-mortem

Closely allied to the apoplectic cysts both clinically and genetically are the diffuse hæmorrhages into of the hæmorrhagic panereas cysts is in no wise a time, and under chloroform. On the following mornvomiting of blood caused a fatal result. In another fluence of chloroform. We both examined the particle of the capacity and case the appearance of blood in vomited matters and tient. I thought that it was a case of unreduced

In other cases The most successful treatment The spray was repeated in incision, drainage or tamponade Stenosis of the intestine in diseases of the pancreas may result from pressure of the morbid growth in rare cases The alone reveals the true cause of death This rare cause of ileus has received comment at the hands of Gerhardt (Virchow's Archiv, bd 106, h 303) In the author's twelve tabulated cases, nine proved fatal through compression of the gut by the growth In another case the fatal result was caused by a hæmorrhage from an ulceration of the duodenum The diagnosis was not positively made in any recorded case before death. In all the cases where of intestinal obstruction (3) death resulted pancreas carcinoma, the author advises the formation of an artificial biliary fistula-Deutsch Zeitschrift f Chir, bd 27, heft 1 and 2 - Annals of Surgery, May, 1888

> REFRACTURE AND RESETTING OF BONES -- MR KAILAS CHUNDER BOSE, of Amraoti, records the following case

Pana Lall, an up-country man, æt 22, came down from Jeypore with a badly united fracture of the neck of the left femur When he came under my notice I thought his case was one of hopeless dislocation, rather than that of a badly united fracture On comparing the affected leg with the sound one, I found On making him thigh was considerably adducted On my attempt to abduct it, I found I could only do it partially, causing great pain to the poor patient On making him sit up on a charpoy the affected knee would keep four inches in front of the right knee The patient had lost all control over the hmb, he could When laid on his back, not flex or extend it at will the thigh was drawn over the abdomen, there was a considerable amount of lordosis, the interspace between the spine and the bed would be four irches, he could not he flat on his bed, would always prefer to lie on his right side I advised his friends to take him to the hospital, as I then thought that nothing less than resection of the hip-joint would be of any good to him I requested the favor of Dr K Mc-Leod's examining the patient, to find out, if possible, a remedy other than excision Dr McLeod kindly examined the patient, but did not like to give any decided opinion until he had examined him a second In one case the sudden onset of ing the patient was placed thoroughly under the in-

tors, whilst Dr McLeod declared it to be one of rise until the fever ended badly united fracture He would advise them to bring him to the hospital, but they begged of him to do something for the patient at his own house Dr McLeod instructed me to hold the limb firmly, and he himself tried to disunite the badly united fracture In our attempt to extend the limb the union gave way with a loud snap, and the shortening of the limb was at once removed, the knee was extended, and the limb placed on a long splint with a ten pound weight suspended to prevent contraction The joy of his friends was intense, the patient, when he returned to his senses, was happy to find his leg straight. In the course of six weeks I had to remove the splint seven or eight times to change the bandage ends united firmly After a month and a half he was allowed to stand up and try passive motion He regained full control over the limb, and in ten days after the splint had been removed he was quite able to walk with a stick, and in two months he left Calcutta for his country quite happy with the result -The Indian Medical Gazette, February, 1888

METABOLISM IN TYPHOID FEVER IN CHILDHOOD -The urine gives perhaps the best indications of the tissue changes proceeding in typhoid fever, as in any other disease Jacubowitsch (Archiv für Kinderheil, Bd 1x, Heft 1) has made an important contribution to our knowledge of the metabolic changes in typhoid fever in children He insists on the necessity for knowing the actual quantity of nitrogenous material daily ingested, and also the quantity of urine and other excreta, together with the daily loss of carbonic acid and water There is a considerable diminution in the quantity of urine passed during the pyrexial period, but no definite correspondence was noted between the elevation of temperature and week there was a loss which varied from 50 to being only one half of the normal twice the amount of the second week fourth week the normal was still not reached the quantity passed, but this did not always obtain, for in some instances the color was nearly natural The reaction was usually acid—sometimes, however, only slightly As was to be expected, the density of the urine was inversely proportional to the quantity Gerhardt states that albuminuma results from variations in blood pressure due to the pyrexia, but Jacubowitsch does not substantiate this, for he detected of the disease The estimations of the urea dis charged during the disease are very interesting, and appear to be ranged in two classes in one the urea

dislocation shamefully neglected by the local doc- with the continuance of the fever, and continued to The uric acid discharged was found to correspond with the elevation of temperature, and to be greater during the pyrexia of the first period than during the later stages of the disease A diminished excretion of chlorides was noted all through the morbid process The excretion of phosphates and sulphates also was grouped into two classes like the urea, in one the quantity being increased at first, but then lessening by degrees, and vice versa Jacubowitsch believes that the activity of the poison in the blood has more influence in altering the urine than has the fever or the febrile accompaniments — Lancet, April 21, 1888

> Anonalous Ducts of Exit from Parotid GLANDS IN FRONT OF EAR -DR D M CROSSMAN. of Lewisdale, S. C., reports the following case

> I was called to see the children of Mr D, a very wealthy farmer, six miles distant in the country examined his children (four in number), and found that three of them have a small orifice on each side and just in front of the upper portion of the external ear, and that one has only one opening in front of the left ear, and that there is a continous discharge going on through these orifices all the time On close investigation, I diagnosed these openings to be the mouths of small ducts leading from the parotid glands, and that, instead of the secretions being poured out through Steno's ducts at the proper place, they are discharged through these ducts externally, just in front of the external ear Mr D has three children that have not this abnormality, but he has a brotherin law (a brother to Mrs D), who has two children that have the like ducts discharging externallymaking in all six cases, four males and two females, in the same family

I find that whenever the excretions from the parthe quantity of the urine At the end of the first otid glands through these ducts comes in contact with the air, in very cold weather, and when the 200 cubic centimetres, and even to 500 cubic mouths of the ducts are not kept clear and open to centimetres in some cases, the quantity voided give free exit to the grandular secretions, the secre-These diminu- tions accumulate in the ducts and produce glandular tions were rather increased during the second week, irritation, and when opened externally, discharge a whereas at the end of the third week the quantity very purulent excretion I opened up two of the tended again to rise, and in some of the cases was ducts, in each of two of the children, which were During the blocked up, and these discharged considerably As a probed two of the ducts with a small silver probe, rule, the color of the urine was deeper red the less and found that they led directly into the parotid

> I advised the parents to keep the ducts open to give constant and free exit to the secretions, and they have no trouble when this is done, and the discharge, when constantly going on, is so small that it is seldom noticed when kept clean

The family record is unquestionably good through a long line of ancestry, and there is not a shade of no albumen in the urine in his cases at any period heredity in the etiology of these cases - Virginia Medical Monthly, April, 1888

BOROFUCHSIN AS A STAIN FOR TUBERCLE BACILLI discharge was large during the first week, but then -Professor Lubimoff describes, in the Meditsingradually lessened as the disease progressed, in the skoe Obozrenie, a new stain for tubercle bacilli, which other class the discharge of urea gradually augmented he calls borofuchsin It consists of-fuchsin, o 5

gram, boracic acid, o 5 gram, absolute alcohol. 15 grams, distilled water, 20 grams Prepared thus, it has a slightly acid reaction, it is quite clear and not liable to spoil by being kept, consequently it is always ready for use The sputum is dried on a cover glass, and stained by being heated in contact for chronic cases, average time 34 7 days with the borofuchsin for one or two minutes The stain is then washed out by treatment with dilute sulphuric acid alcohol, and subsequently immersed for half a minute | Remèdes, No 5, 1888 in a saturated, alcoholic solution of methylene blue After being washed in distilled water and dried, the examination of the specimen is made in oil of cedar In exactly the or in a solution of Canada balsam same way sections of tuberculous organs may be stained after hardening in spirit, only in such cases the steps of the operation must be somewhat more The main difference between this and other staining processes for Koch's bacilli is that, when borofuchsin is used, the process of washing it out with sulphuric acid is an almost instantaneous All other bacilli are, as when other stains are used, rendered colorless and invisible, the tubercle bacıllı being alone seen — Lancet, April 21, 1888

Cascara Sagrada — Some interesting pharmaceutical facts on cascara sagrada are communicated by Messrs H F Meier and J Le Roy Webber to The active the Pharmaceutical Journal (No 926) principles—the resins of cascara—are not bitter, and form soluble compounds with the alkalies and alka-The glucoside, though the parent or line earths source of the bitter tonic principle, is itself devoid of The glucoside is capable of undergoing decomposition in the normal gastric juice of the stomach, with the development of the bitter principle It is thus possible to prepare a comparatively tasteless product from cascara which shall contain the laxative and tonic virtues of the drug ment, belonging to the class of unorganized and soluble ferments like diastase, pectase, pepsin, papayine, etc, has been discovered in cascara brown resin is present to a much larger extent in aged than in fresh bark, and seems to possess the greatest laxative power The ferment seems to be identical with that existing in numerous other vegetable substances, such as cabbage, liquorice root, frangula, etc -Lancel, April 14, 1888

SCHINUS MOLLE IN BLENNORRHAGIA -- DR E BERTHERAND, of Algiers, records twenty-seven cases of acute blenorrhagia, of from five to twenty days' duration, and seven old cases, of from two to eight months, in which other measures had been used without success, and in which schinus molle was used The pods of the plant, after being stripped of the epicarp, are powdered as fine as possuccessfully sible, and the powder mixed with a very small quantity of syrup of gum This is a very simple way of preparing the drug, and masks its taste and odor, are easily taken with a swallow of water, and are and restores the skin to its normal condition easily borne by the stomach, causing no vomiting, lemainder of the treatment consists of hygienic no diarrhæa, no thirst, and no ardor urinæ, on the measures — Nouveaux Remedes, No 5, 1888

contrary, most patients say that the drug increases These effects make schinus molle very the appetite much better than cubebs Bertherand's table shows that for the acute cases the average time for cure was 11 8 days, average number of pills 26 to 27 a day, pills were given, half in the morning and half in the evening [Bertherand gives no indication whatever The specimen is then washed with of the contents (by weight) of a pill]-Nouveaux

> BOLDIN, A NEW HYPNOTIC -Boldin is the gluco side obtained from boldo leaves, and Dr Junanville highly praises it in a recent number of the Progrès Medical, as a hypnotic "far exceeding opium and chloral" This is saying a good deal for it We are told also that boldin is not disagreeable to take, has no unpleasant effects, increases the appetite, and has a "strengthening" influence on the patient Be tween 5 and 10 grams were given daily to various The sleep induced by this substance is of patients a natural kind, and the breathing is regular and Boldo leaves contain about 3 per cent of tranquil It may be given in capsules in doses of 02 boldin grams (3 grains), repeated as necessary, or diluted I in 20 in water) subcutaneously -British Medical Journal, April 28, 1888

PURPURA HÆMORRHAGIC AFTER A MENTAL SHOCK -DR ED DE SMET, of Brussels, has recently had a case of a young woman of a highly nervous tempera ment who, in consequence of a severe fright, ex perienced an eruption of purpura hæmorrhagica, though she had never had any eruption of the kind before Some four months subsequently, however, in consequence of a fall, a similar eruption made its The treatment was directed mainly to appearance the nervous system, which was evidently very much Dr de Smet refers to M Lenoir, of Lille, affected who has published cases of various skin diseaseseczema, psoriasis, herpes, pemphigus, and vitiligowhich have followed a mental shock - Lancel, March 17, 1888

ERYTHROPHLÆIN IN OPHTHALMOLOGY -M PANAS read a communication on this subject before the Académie de Médecine on March 6 clusions were that the drug, as a local anæsthetic for the eye, is of less value than cocaine, that its aniesthetic action is of longer duration, but the inflammation and the acute pain accompanying its application render it an improper drug for use in operations on the eyes, that if necessary, there is nothing to pre vent the prolongation of cocaine anæsthesia by re peating the cocaine instillations as often as necessary -Bull de l'Academie de Medecine, No 10, 1888

TREATMENT OF MILK CRUST —E BESNIER recom mends putting over the child's head a caoutchouc bonnet, which is removed twice a day to be cleansed and over the face is placed a mask cut out of a sheet This causes the crusts to fall off, THE

Journal of the American Medical Association PUBLISHED WEEKLY

THE EDITOR OF THIS JOURNAL would be glad to receive any items of general interest in regard to local events, or matters that it is desirable to call to the attention of the profession. Letters written for publication or containing items of information should be accompanied by the writer's full name and address, although not necessarily to be published. All com munications in regard to editorial work should be addressed to the Editor

SPONTANEOUS AND CONTACT INFECTION IN PUERPERAL FEVER

Much confusion has arisen in recent discussions of puerperal fever from ambiguity of terms tration of this fact is furnished in the various use of the words, auto infection and hetero-infection evident, however, upon critical examination, that the difference of opinion is only apparent, not real, and is largely dependent upon the fallacy just mentioned

Thus, Ahlfeld urges that the puerpena of the cases of precipitate labor-street labors-collected by Winckel, and the labors experimentally conducted by himself to settle the question, demonstrate that self infection does occur Under self-infection Ahlfeld includes those cases in which "the poisoning substances were on or in the parturient passages during labor, or are formed there during labor and the puerperium, and are introduced into the body of the woman in consequence of the manipulations of physician and nurse, or without these manipulations ' This is the original conception of auto-infection by Semmelweiss ("Innerhalb der Grenzen des ergriffenen Organismus") It is impossible, Ahlfeld believes, to draw a sharp boundary line between infection from without and self-infection, since the materia peccans may be constituted by microorganisms resident in the pubic hair or in the immediate environment He adds that the comparison of the genital tract of the recently delivered woman to a wound cut off from communication with the exterior has been productive of erroneous views It would be better to liken the parturient canal to a contused wound of the surface

Further, that the doctrine of self infecof the body tion does not rest upon the demonstration of the presence within the vagina of pathogenous bacteria, as asserted by Stumpf Every woman who, by reason of pelvic contraction, is unable to expel the fœtus and remains undelivered, dies of blood-poisoning or septic peritonitis, when the lethal issue is not precipitated by hæmorrhage or rupture of the uterus Herein lies the demonstration of the presence within the vagina of every woman of microorganisms which, under certain conditions, are sufficient to cause fatal infec-A demonstration of the same fact is found in cases of sepsis consequent upon abortion, in which no hand or instrument has been introduced within the genital tract

A few weeks since, Professor Heinrich Fritsche made a praiseworthy attempt to clear up this confusion in terms In this, and similar discussions, we beg to remind the reader that "names are to be valued as coins " Fritsch calls attention to the fact that materials capable of causing infection are not found in normal blood nor in intact tissues Solid tissues and blood removed from the healthy living organism by absolutely aseptic methods, and preserved under conditions of absolute sterility, do not decompose Self-infection, in the sense that the agent is resident in the woman's body without gaining access from the exterior, is impossible

Infection takes place in two modes 1 Cocci resident within the vagina or adherent to the skin surface gain access to the puerperal wounds, cause the decomposition of the wound secretions, form ptomaines and condition a resorption fever Infection may occur in this way with or without the intervention of physician or nurse But is this an example of auto-infection? If it is a case of auto-infection, then an abscess in the bladder wall from catheterization, a purulent periproctitis, an alveolar abscess, an infarct in pyæmia, a peritonitis following ruptured pyosalpinx, are all examples of the same process of self-infection Strictly speaking, all of these cases are examples of hetero-infection In every case the agent of infection is introduced into the body of the patient from without

II The other mode consists in the direct infection of the wound by the hands or instruments of the attendants It was this mode that Semmelweiss had chiefly, though not exclusively, in mind when he instituted his prophylactic measures Fritsch expresses the opinion that in these days of rigid antisepsis, the former is by far the more frequent mode of infection This statement may be true of Germany

¹ Berichte und Arb iten Bd. II u III Centralbl. f Gyn 1053

²Deutsche Medicinische Wochenschrift, No 11 1883 p 202

We are under the the case in the United States conviction that the doctrine of Semmelweiss must be enunciated, and enunciated again before this second mode of infection can be excluded in the explanation of the large majority of cases of puerperal fever occurring with us

Fritsch finds the boundary between within and without the body in any intact surface, covered with For example, whatever lies its normal epithelium within the vagina or upon the vaginal portion, but above the epithelial covering, is outside of the body, and constitutes an infection from without

To describe the two modes of infection, just mentioned, Fritsch years ago introduced the terms direct and indirect, primary and secondary infection words spontaneous and contact infection, suggested by Mikulicz and subsequently adopted by Billroth and other surgeons, are preferable

firmly established by modern research, that certain cocci always cause definite diseases, that there is always a definite tissue reaction upon infection with a definite coccus, now proposes the names non-pathogenous and pathogenous infection

But there are obvious objections to the new terms, and these have not escaped the attention of their author

It is possible in cases of non-pathogenous infection, in the absence of therapy, for death to occur, while pathogenous infection under appropriate treat-The criteria of ment may terminate in recovery harmlessness in the one case and fatality in the other are thus plainly false

Moreover, in the present state of our knowledge, it is impossible to draw a sharp line between pathogenous and non-pathogenous bacteria There is no such thing as a puerperal fever coccus in the sense that there is a typhoid fever bacillus Olshausen distinguishes between the coccus of sepsis and the active According to modern views, it is agent of pyæmia in a high degree probable that various species of bacteria may stand in causal nexus with puerperal fever It is well known that this disease has a protean character

Upon the whole, the terms spontaneous and contact infection as now employed in surgery, answer better the requirements of a philosophical nomenclature than any of the substitutes yet proposed tainly these words are less productive of confusion than auto-infection and hetero-infection

The recent discussion of self infection has been of great practical value, since it has again directed attention to the necessity for the disinfection not only

of the fingers and instruments of the attendants, but also of the body and genital tract of the partunent It has taught us to beware not only of the pathogenous bacteria clinging to the hands and instruments, but also to the bacteria, chiefly non pathogenous, adherent to the body or clothing of the par-The discussion serves to emphasize turient woman Credé's3 maxims of prophylaxis (1) not to wound the genital tract, and (2) to preserve from infection the wounds that are unavoidable or already present

THE CHICAGO HUMANE SOCIETY

The Chicago Humane Society held its annual meet-The | ing on May 5 The President, Mr John G Shortall, announced that a new Industrial School for Boys, entirely unsectarian, had been founded, and that since last June 143 boys had been committed to this school Fritsch acting upon the principle, believed to be A total of 224 children have been rescued from the probabilities of a vicious career, and placed on the During the past year the Soroad to self-support ciety has established two new branches in the State, The amount of fines imat Streator and Cairo posed was \$1,837, number of complaints and cases investigated 1,625, children rescued 1,252, children sent to charitable institutions 420, prosecutions for cruelty to animals 78, prosecutions for cruelty to children 17, horses found unfit for service 68, disabled horses removed 93, teamsters and persons reprimanded 560, abandoned animals de-In seven years the Society has rescued stroyed 157 6,715 children, placed 1,544 in institutions, rescued 6,342 horses from drivers, prosecuted 1,045 cases of cruelty to animals, and 314 of cruelty to children So much for the good work of the Society

The President referred to the charges against the employés of the North Chicago Street Railway for cruelty to the horses, and said none of them had developed anything demanding interference naturally, since the charges of cruelty have been made against the company, not against the en-The employes of a company are not responsible for the unfitness for service of animals But if none of these cases used by the company demanded interference, it would be interesting to know what is the Society's standard of cruelty, and Such miserable and totally of unfitness for service unfit horses as have been in use by the North Side company for two months past, and more, would not have been tolerated for one day had a Henry Bergh been at the head of the Chicago Humane Society The pathological horses that may be seen, any and

³ Gesunde und krauke Wochnerinnen, Leipzig, 1886 p 81

every day, attached to the licensed express wagons in Chicago would, under proper and efficient administration of the Humane Society, be permanently retired from service. A painful death would be euthanasia to them, as compared with their life. At almost every hour of the day, and every day, may be seen instances of cruelty to horses at the approaches to the bridges, where already over loaded horses are whipped to compel them to drag their loads over the viaducts. Yet in three years the writer has never seen an arrest or reprimand of a driver of such horses, nor has he ever seen an agent of the Humane Society at work.

Every day hundreds of horses may be seen driven or compelled to stand for hours with cruelly tight check-reins. Does the Society ever take cognizance of these matters? Almost as cruel is the driving of horses, when the mercury is below freezing or zero, with metallic bits, especially when the rubber bit is better at any time than a metallic one

With all this work confronting him, the President of the Society thinks it time that some move should be made against vivisection, and attacked Pasteur in his report, though, as this "attack" is not published in the report of the meeting, it is impossible to guess how much he knows of Pasteur's work. But it is to be hoped that the Chicago Humane Society will not stultify itself by an attempt to suppress vivisection. Wholesome regulation of vivisection, in order to preclude abuse, is undoubtedly desirable, but an at tempt to suppress it shows, to say the least, the presence of a biased and unequally balanced mind

A MISREPRESENTATION CORRECTED

Soon after the meeting of the International Medical Congress, in Washington, in September, 1887, the statement was made by a Washington paper, and subsequently copied into several other papers, and was even repeated from the pulpit, to the effect that \$6,000 of the appropriation of \$10,000 made by Congress to aid in defraying the necessary expenses of the meeting, were expended by the Local Committee of Arrangements for wines and liquors terms of the congressional appropriation required the money to be expended under the direction of the Secretary of the Treasury, that high officer of government has recently transmitted to the Speaker of the House of Representatives, a full itemized bill for the amount, which will be found in this JOURNAL under head of Miscellaneous matters If those who have been so ready to accuse the medical men of squan-

the trouble to examine this bill they will see that not one dollar of the money drawn from the *National Treasury* was spent for drinks or refreshment of any kind

THE CINCINNATI MEETING

The Thirty-Ninth Annual Meeting of the American Medical Association, recently held in Cincinnati, was one of the most pleasant and profitable that has been held during the last decade The arrangements made both for scientific work and social reunions, by the profession of Cincinnati, were all that could be de-The general morning sessions were well attended, and the addresses of the President and Drs Bartholow, Moore and Wallcott were listened to with unusual interest and profit All of the Sections were fully occupied, and some of them held two sessions a day on account of the number and value of the papers to be read and discussed The full official record of the proceedings will be given in The Jour-NAL next week, 26th inst, when it will be seen that the hasty and imperfect reports published by some of our contemporaries contain many and important That show of enterprise which sacrifices correctness in stating the doings of important medical organizations, for a few days of time, is far from being commendable

SOCIETY PROCEEDINGS.

MEDICAL SOCIETY OF THE STATE OF CALIFORNIA

Eighteenth Annual Meeting, held in San Francisco, April 18, 19 and 20, 1888

[Report furnished by the Sacramento Medical Times]

(Concluded from page 597)

THIRD DAY—FRIDAY, APRIL 20

MORNING SESSION

The report of the

COMMITTEE ON MEDICAL LEGISLATION.

which had been made a special order for this session, was taken up The Chairman, DR C E BLAKE, of San Francisco, presented, as the report of the committee,

A MEDICAL BILL,

ment has recently transmitted to the Speaker of the House of Representatives, a full itemized bill for the amount, which will be found in this Journal under head of Miscellaneous matters. If those who have been so ready to accuse the medical men of squandering the public money for strong drink, will take which he submitted for the consideration of the Society. The bill, which discusses the subject at some length, contains several important provisions, and in its general tenor conforms to a resolution introduced by Dr Plummer at the meeting of 1887, and which he submitted for the consideration of the Society. The bill, which discusses the subject at some length, contains several important provisions, and in its general tenor conforms to a resolution introduced by Dr Plummer at the meeting of 1887, and which was adopted by the Society. A board of seven members, to be known as the "Board of Medical Examiners of the State of California," is to be ap-

pointed by the Governor, the conditions of appointment, official tenure and expenses being provided for Every person intending to practice medicine in the State after the passage of this Act, must have a diploma or license from a legally chartered medical school or institution Such school or institution being defined by the Act, and a certificate from the Board of Examiners This certificate can only be obtained by examination of the applicant in anatomy, physiology, pathology, chemistry, toxicology, surgery The fee for the certifiand mechanical obstetrics cate will be \$20, and it must be recorded in the office of the Clerk of the county in which the holder is The certificate may be refused or revoked on the ground of unprofessional conduct, it produced painful tetanic contractions. In labor which is fully defined—the applicant being cited to he believed that it should never be given until the appear before the Board to be heard in his own de-The Act will be printed in full in the Tranfense sactions of the Society

DR H S ORME, of Los Angeles, concurred in the bill, with the exception of section 14, relating to fines, which, as well as the penalty, he thought were too He believed that half of the fine should go This would materially assist the to the informer working of the Act persons who are willing to do this work, and this will compensate them for the service that they rendered

DR H J CRUMPTON, of Sausalito, said that he had had some experience in the working of the medical law He regarded this Act as a decided improve-He thought that ment on that at present in force after the deliberate action of the committee, assisted by the legal member of the Society (Dr Taylor), that it would be unwise to attempt to tinker with it He favored placing it in the hands of the Committee on Legislation, for presentation to the Legislature, and would urge upon every member of the Society the necessity of earnest personal effort in its behalf The people demand that pilots, who bring ships into port, shall have a license, or that a man who takes charge of a locomotive must know something about it, but they seem willing that any irresponsible confidence operator may assume the rôle of doctor

DR G F G MORGAN, of San Francisco, said that several years ago he had attempted to enforce the If there had medical law, but he signally failed been a provision whereby half the fine would go to the complaining witness, there would have been at least fifty witnesses in that community

the fine imposed shall go to the informer, and the other half to the school fund of the State '

THE PRESIDENT suggested that the question might be put, "That it is the sense of this Society that such a change should be made, and that the matter be left in the hands of the Committee with power to act "

This was unanimously adopted

The Committee on

RECOMMENDATIONS OF THE PRESIDENT'S ADDRESS,

through its Chairman, DR C E BLAKE, of San Francisco, reported that the President be commended for the past year, and that the recommendations con- laid down in the report of Dr Lindley, with the poshis zeal and industry on behalf of the Society during to us all

tained in the address, particularly those relating to preventive medicine, be endorsed by the Society The Committee presented a draft constitution and by-laws, to be acted on at the next annual meeting

The report was adopted The report of the

COMMITTEE ON OBSTETRICS

was read by Dr. Walter Lindley, of Los Angeles Formerly, when hæmorrhage indicated the onset of abortion, he administered small doses of ergot He has found that a combination of ergot and morphia, in threatened abortion, had frequently prevented it In inevitable abortion he did not believe in ergot, as uterus was emptied In normal cases he did not deem it necessary, but in cases of flooding used it He believed that topical measures hypodermically After post-partum hæmor were more important rhage is controlled ergot may be advantageously given, but it should not exclude other measures He concluded ' certainly did not hasten involution that ergot should be used only as a hemostatic 1 In every community there are In abortion it can be given combined with morphia, to prevent or delay In labor it should be given only after the completion of the third stage subsequently

DR W A BRIGGS, of Sacramento, in opening the discussion, said that not more than 50 years ago a celebrated surgeon arose before the British Medical Association and exclaimed, "Thank God I know nothing of obstetrics" The retort was as keen as the exclamation, "If the gentleman is thankful for his ignorance he has much to be thankful for " He referred to this to show the position of obstetrics to-day as compared with its position 50 years ago, an advance that must be grateful to us all Pajot, as Dr Lindley has stated, as well as Charpentier, do not use ergot before the uterus is empty Many of our own obstetricians do the same One thing he regards as of extreme importance, because it con firms the conclusions naturally derived from our knowledge of the immediate action of ergot, and that is the result of the clinical studies made by Blanc and Ganzanotti, in regard to the influence of ergot in child-bed Ganzanotti has experimented on 31 cases, He administered ergot during the lying-in period and found that instead of hastening involution ergot really Blanc reports 82 cases DR ORME offered as an amendment, "That half of he administered ergot regularly for the first five days To 12 others he administered ergot for to days, and he found that in this series the uterus had attained a measurably greater involution in the 40 cases in which ergot had been withheld than in the 40 cases to which it had been administered for five days, and in these even a measurably greater involu tion than in the 12 cases to which ergot was given during the full ten days of the lying-in period is in accord with the clinical observations of such men as Pajot, Charpentier, Goodman, Reamy and numerous others whose names are perfectly familiar He was fully in accord with the principle

sible exception of the use of ergot in abortion had been his habit not to administer ergot in abortion The chief objection to its use in this condition is that it is so very likely to imprison the fœtus There are other subjects within within the uterus the scope of this committee which the Chairman has lest to other members, one of whom he believed would present a report on Electricity in Obstetrics There is one point which seemed to him of the utmost importance, and that is antisepsis in labor He believed the great progress in obstetrics within the last year had been accomplished in this direction, and as one who has strenuously advocated antisepsis not only in labor, but in surgery generally, he must confess to great satisfaction in the remarks made in his Birmingham address by that arch opponent of antisepsis, Mr Lawson Tait, who there confessed and asserted that it is the duty of every obstetrician to adopt antisepsis in labor. A very seductive term has been invented by those who, it seemed to him, want to get back into the fold without climbing the fence, and that is the word asepsis The object of antisep-If the believer in antisepsis is certain sis is asepsis of asepsis, his object is attained But those who talk so much about asepsis employ antiseptics for accomplishing their purpose for disinfecting, or, as they might say, "cleansing" their sponges, their hands, their instruments and even their patients. It seemed to him that this is rather quibbling, and that in obstetrics, as in surgery, we should adopt a strict anti-Let us have asepsis via antisepsis

San Francisco was selected for the meeting of 1850

The report of the

COMMITTEE ON MEDICAL EDUCATION

was read by the Chairman, DR J P WIDNEY, of Los The writer believed in the multiplication of schools, but would rigidly fix their requirements, demanding a three years' graded course, and granting only the degree of M B, which would not qualify for A medical department connected with the State University, well endowed, and providing only for the higher education, should be provided The result would would grant the degree of M D be the establishment of one standard of education, and that a high one He would allow any student of medicine, irrespective of his tenets, if well educated through a three years' course, to enter the higher course in the State department. This would result in a better working of the medical law by making the profession a unit

AFTERNOON SESSION

DR A M GARDNER, of Calistoga, read a paper on

Electrolysis in Stricture of the Urethra

DR W P GIBBONS, of Alameda, read the report of the Committee on Indigenous Botany He treated of the medicinal plants peculiar to the State, and mentioned the fact that some of the modern "new

vices of Dr Gibbons, both to the profession at large and to the Society, were justly recognized The report of the

COMMITTEE ON PRACTICAL MEDICINE AND MEDICAL LITERATURE,

was read by DR S O L POTTER, of San Francisco He alluded to the tendency in force to confine prescribing to a single drug, and remarked that the routine prescription of former days is disappearing mentioned the increasing number of coal-tar products and to the possibility, as expressed by Brunton, that these artificial products might ultimately replace the organic drugs He expressed the opinion that the germ theory of disease was at present not accepted The two objections were, first, that in experiments it was never absolutely certain that portions of the culture fluid might not be transferred with the microbe, it was also uncertain what the exact nature of the soil

on which the transportation was effected

DR W F McNutt, of San Francisco, in opening the discussion, said that he would allude to two points. the slow progress of the science and art of medicine. and the part that microorganisms play in disease The reason why the science and art of medicine has progressed so slowly, is probably not the fact that we run from one new medicine to another, as Dr Potter would make us believe, but that we have been trying to develop a science by merely developing the art, or the practical part of it. There is a science and art of medicine, and the application of therapeutics is The great suture for our science is largely an art preventive medicine, and the road along which the science of medicine must be developed is pathology The key note to preventive medicine and the study of pathology, is etiology, and etiology is a new science Etiology has been studied but a few years In our student days we heard nothing of etiology, yet we can say that it is absolutely impossible to understand or develop the science of medicine or to understand pathology without etiology Etiology, then, is the key of the scientific part of medicine No matter what we may believe about microorgan, isms, etiology cannot be advanced without taking them into consideration There is a fact in it that must be admitted or disproved, while the methods of investigation may, and ought to be, questioned, while much of it cannot be substantiated, yet, step by step, it is making way For instance the doctor mentioned actinomycosis What could the pathologist do for that without understanding its etiology? We find a few abscesses, perhaps, about the angle of the jaw, and we talk of blood poisoning, but the microscope shows us the microorganism—the spreading fungi and the actinomyces-and then we understand the pathology of that disease Take what we used to call endemic hæmeturia—How much did pathology and therapeutics do to explain it until the etiology of the disease was discovered. When we found that the parasites that produced it were confined to places remedies" had been in constant use for many years in Egypt, Mauritius, Cape of Good Hope and other DR M M CHIPMAN, of San Francisco, made a places, then we understood the pathology and the treatment of this affection Take uræmic poison supplemental report in which the long continued ser- What did pathologists do to explain it until we understood that uræmic poisoning did not depend upon urea in the blood or upon ammonia, but upon the fact that the epithelial lining of the uriniferous tubules failed to secrete urea from the excretions that were producing the symptoms? Then we understood the etiology and the whole thing was perfectly plain The path along which pathology must be developed and scientific medicine must be advanced, will depend upon our progress in the study of etiology

DR J H STALLARD, of San Francisco As the question before the meeting seems to turn somewhat on the advancement of medicine, I probably may be permitted, as one of the oldest members of the profession present, to take exception to the position of the Chairman of the Committee, and also to that of the gentleman who has opened the discussion When I look back, I am sorry to say, very nearly fifty years, since I was a student, it seems to me that in no profession, and in no department of science has a greater progress been made than in the art and science of the profession to which we belong I remember perfectly well seeing one of the most distinguished physicians in my native city under the delusion that he was suffering from congestion of the brain, the result of long and arduous work, with twenty-four leeches around his head, and a considerable number of empty bottles, the contents of which he had consumed himself have seen the time that that gentleman thought it his duty to prescribe a quart bottle of medicine for a child 4 years old, and when no physician visited a patient, whether two or three times a day, without writing a fresh prescription, and, I say, that in this particular, and in many others, there has been a vast It is forty-five years ago since I was the progress first practitioner in my native town to discard the principle of being paid by the amount of physic that I poured into a patient's throat, but it was the most unfortunate piece of business I ever did in my life, for I destroyed my practice for a considerable length People only desired to pay for what they swallowed, and physicians would prescribe four doses of medicine a day, two to be taken at night time, with an embrocation, a lotion and a blister that has now passed away In my opinion, there is a great advancement in the art of medicine, and I do not think we have anything to be ashamed of in the progress we have made in the last forty or fifty years

DR A ABRAMS, of San Francisco, believed that Dr McNutt had slightly exaggerated the benefits derived by practical therapeutics from our advanced knowledge of the etiology and pathology of diseases Uræmia having been mentioned, he would take this The etiology of uræmic intoxication as an example can, for all practical purposes, be explained by the ingenious mechanical theory of Traube, or the more The chemical theory ingenious theory of Frerichs of Frerichs supposes that the retained urea in itself does not produce uræmia, but only by its further conversion, by means of a ferment, into carbonate of ammonia There is much clinical evidence in sup port of this theory, and it is accepted by most authors tion of acids would at once neutralize the ammoniacal to be fully equal to that of any other medical college, condition of the blood and cure the disease How and the only point to which he would particularly

successful we have been with the acid treatment needs no comment To get rid of the retained products of tissue metamorphosis by the compensatory emunctories constituted the old treatment, and it would seem to be but little modified by the recent develop ments of pathology Because we know that the epi thelium lining, the uriniferous tubules does not prop erly secrete, is but little aid to our inefficacious Bacteriology has held out more seductive inducements to therapy than any other development of medicine, and it is a sad commentary on medical science to find how disappointed we have been Although we cannot deny the benefits afforded by antiseptic medicine, the good achieved belongs rather to prophylactic than to curative medicine course or duration of the infectious diseases, where pathogenic microbes have been recognized as etiological factors, have been but slightly modified by a practical therapy founded on bacteriological investi gations Our more recent knowledge of bacteriology relegates the microbes to a secondary place, attribu ting the pathogenesis to the development of ptomaines To oppose the virulent action of these ptomaines constitutes, then, the future basis for rational therapy The speaker suggested the use of the term ptomaine mia to designate that condition following the absorp tion of the ptomaines

On motion, the Society decided to subscribe for one copy of the Index Medicus, to be placed in the

hands of the Secretary

DR C Cushing, of San Francisco, read the report of the Committee on Gynecology, on the subject of the Condition of the Abdominal Organs Requiring This must sometimes be done Abdominal Section Cases of extra for purposes of accurate diagnosis uterine pregnancy required operation This was fre He reported a quently diagnosed at an early date case of suppurating pelvic hæmatocele which was not cured by drainage through the vagina, and re quired section Section should be performed in these cases, as it ensured thorough cleansing and persect drainage A prolapsed, fixed and tender ovary should, under certain circumstances, he re He ascribed many of the attacks following examinations by sound or other means to the expul sion of some of the secretions from the diseased He believed that tubes into the peritoneal cavity these cases required operation In uterine fibroids where hæmorrhage was serious, or if the tumor was He believed that large, operation was demanded with due precaution any intelligent practitioner was justified in an emergency in performing these opera tions

EVENING SESSION

Committee on Graduating Exercises -Dr 0 0 Burgess, of San Francisco, reported that forty four students had been graduated from the two colleges in San Francisco A thorough examination of the papers had been made, and he was satisfied that the diplomas were fairly earned The standard appeared

call attention, was the necessity for more thorough preliminary education. It was also recommended that in future one member of the committee be resident in Los Angeles, so that the medical college of that city might also be examined. The Society, by resolution, endorsed the recommendation

A Meateo Legal Board — The proposed amendment relating to the establishment of a Medico-Legal Board was brought up for discussion, and on motion was referred to the special committee on Constitution and By-laws Several members objected to the amendment on the ground that it involved the Society, hampered the Board of Examiners, and had proved a failure in other countries

INSTALLATION OF OFFICERS

The business of the session being concluded, the retiring President, DR R H PLUMMER, addressed He alluded to the responsibility and the Society the labor which the presiding officer necessarily as-To him it had been a source of anxiety, Two years ago the Society but also of pleasure numbered but 200 members, at the close of this The contributions had meeting it included 450 Three years ago the been numerous and creditable annual meeting lasted for two days only, and the evening of the second day was devoted to a banquet On this occasion it was found that three days were not sufficient, and the question of a four days' session would have to be considered He alluded to the number of visitors from the southern section of the State, and to the number of applications for membership which had been received from that locality, and expressed the opinion that the meeting of 1890 would be held in Southern California thanked the members for their hearty cooperation during the year and at the meeting In introducing the President-elect he alluded to his faithful services in the cause of the society, and to his conscientious and thorough discharge of the duties that had been assigned him

DR James Simpson, the President elect, in thanking the Society for the honor which it had conferred upon him, said that he fully realized its responsibili-He alluded to the reorganization of the Society in 1870, when it seemed more than doubtful that it would ever attain its present proportions He said that the officers elected were expected to sacrifice their time to the Society, and that they must give it all the attention that it demanded He concurred in the opinion of Dr Plummer, that the meeting of 1890 would be held in the South State was a large one, and members must expect to travel considerable distances In conclusion, he promised to use every effort on behalf of the Society, and to do good and faithful work

New Members —At the different sessions the following were duly elected members of the Society

Adams, George Alford, F. A. Anderson, A. Bailey, J. E. Barber D. C. Bicknell, 1. D. Booth, Jas. P.

THE EXHIBITION

A spacious room, adjoining the large assembly hall, was well filled by the various firms who were anxious to attract the attention of the Society. This feature was a great success—in fact it proved so attractive that on several occasions during the meeting committees were appointed to bring in the members who were sampling the junket and cocoa and stocking their pockets with pills and powder, baby food and concentrated nutriment for all ages.

OBSTETRICAL SOCIETY OF PHILADELPHIA

Stated Meeting, Thursday, April 5, 1888

THE PRESIDENT, T M DRYSDALE, M D, IN THE

CHAIR

(Continued from page 530)

Dr Parish presented the

SPECIMEN OF A STRANGULATED OVARIAN CYST

The patient was not aware that anything ailed her until one night she was seized with intense abdominal pain and, jumping out of bed, rushed about the house screaming with the suffering Dr J H Musser was sent for and gave her a hypodermic injection of mor-The dose had to be repeated frequently, and in two days the pain began to subside, it being altogether gone in five days The temperature remained nearly normal until the fourth day, when it was found to be 103°, and was the same on the next day, the day of operation A notable fact is that the temperature and pulse both rose steadily while the pain as steadily decreased after the third day I saw her on the fourth day, and agreed with Dr Musser that we had an ovarian tumor with a twisted pedicle to deal with Because of the absence of the husband the operation was not performed until the next day, January 17, 1888 The tumor was found to spring from the left ovary and was very black, in this respect differing entirely from an ordinary ovarian cyst The contents were those of an ordinary cyst with coagulated blood in addition The pedicle was twisted three times and was quite soft and black emptying the tumor he untwisted the pedicle and transfixed it below the point of twist, and the tumor was removed The recovery was very rapid, the temperature going down steadily The drainage-tube was removed on the second day The patient is now entirely well

Twisting of the pedicle is a well recognized accident to ovarian tumors, but the cases do not all present such marked changes as this case did specimen as it lay on the plate presented a marked contrast to the cyst lying beside it, and which had been removed a few days before from the broad ligament

In connection with this case he would report one operated on three months ago The woman had complained of sudden intense pain in the pelvis and was confined to her bed from that moment, she had remained in bed for over two months with general peritonitis A number of physicians had attended her, and one of them had introduced an exploring needle into the abdomen She was extremely exhausted and had a constant temperature of 103° or higher An incision was made above Poupart's ligament, and opened into a tumor It was found to contain pus and coagulated blood. Its cavity was cleansed out a consequent polyuna. And, in addition to this, the and the incision closed around a drainage-tube cyst walls were very thick. It was a blood cyst, but transudation of fluid through the amniotic covering it could not be determined at the time with certainty whether it was intra- or extraperitoneal, but it was believed to be intraperitoneal In three days strangulation of the bowels developed with fæcal vomit-The bowels could not be gotten open, and a second operation was proposed on the next day, but was refused by the friends On the day after, however, a second incision was made from a point under impossible task, so that the excess of liquid had to the spleen towards the old incision above Poupari's be gotten rid of by excretion and transudation into There was a distension of the abdominal the amniotic sac walls in the lumbar and hypochondriac regions Great pain under the spleen had developed intestines were found adherent in a mass, and three | sis large bands were found to extend from the region The of the spleen to the right inguinal region adhesions were broken up and these bands were No irrigation was used ligated and cut off whole wound was closed, and a large piece of adhesive plaster was placed over it to protect it from the discharges from the lower and first incision valescence was slow, but had finally terminated satisfactorily

DR BARTON HIRST reported

TWO CASES OF HYDRAMNIOS

The etiology of hydramnios is so obscure that, according to Bar 44 per cent of all cases admit of no explanation Every case, therefore, that can be a woman with an adherent placenta and post partum traced to a distinct cause must possess some degree of interest

Case I -A young primipara was brought to the maternity pavilion of the Philadelphia Hospital in the first stage of labor External examination showed been killed by the fall, they further asserted that the an enormously distended abdomen of a globular shape, afterbirth had not come away A vaginal examina giving distinct fluctuation Internally the os was about tion showed no trace of cord or placenta, the hand,

the size of a dollar An amniotic sac, very tense, filled up the greater part of the pelvis, to one side and above this could be felt a small feetal head, evidently macerated, covered by its membranes with no intervening liquor amnii The diagnosis was plain twin pregnancy, hydramnios of one amniotic sac, which was acting as an obstruction to labor by preventing the descent of the fœtus contained in the normal sac The distended sac was ruptured The edges of the rubber sheet upon which the woman lay were gathered up and all of the escaping fluid was caught It measured 5 quarts The macerated fcetus was then expelled and a living one followed soon The latter corresponded in development to about the eighth month of pregnancy, the former had apparently died at an earlier period of intrauterine life The woman said that until within five weeks she had noticed nothing unusual in her condition, but that since that time the abdomen had rap idly increased in size, without, however, causing her much inconvenience To explain this case of hydramnios Werth's theory must, I think, be called According to this observer, an hypertrophied placenta, in absorbing more fluid from the maternal blood than the fœtal economy can dispose of, brings about hypertrophy of the feetal heart and kidneys and The increased pressure within the umbilical vein favors a of the placenta In the case under consideration the placenta was quite double the size of a normal single one, with extensive anastomoses between the two sets of fœtal vessels One feetus having died, the other was suddenly called upon to deal with the very large quantity of fluid abstracted from the maternal blood by an enormous placental surface—an

Case 2 — Hydramnios in a multipara, with serious Mitral regurgitation and aortic steno-The | heart disease The quantity of liquor annu was estimated to be 4 quarts

If one accept Tarnier's idea all cases of hydramnios may be divided etiologically into two broad classes, depending either upon over-production of liquor amnii or upon insufficient absorption of the amniotic fluid In the latter division it would seem The veins were that one should put this case choked with blood, the circulation was sluggish to a degree, and if it is true, as it seems to be to my mind, that some of the liquor amnus absorbed by the maternal vessels, the absorption here was reduced to a mınımum

DR HIRST also presented the following report I was recently called by a medical student to see

I found the patient almost exsanguine, hæmorrhage The woman's friends declared and the fœtus dead that the baby had been born while the woman was on her feet, had dropped upon the floor and had centa glued fast to the uterine wall and so tightly adherent that considerable force was necessary to The cord had been torn away from the fœtal surface of the placenta, leaving a spot about the size of a dollar bare of amnion The large branches of umbilical vein were torn across

Dr J Price made a

COMPARATIVE REPORT OF HOSPITAL AND OUT-DOOR **OBSTETRICAL CASES**

I do not wish to discuss at length the old question of home vs hospital practice in obstetrics whole matter has been fully discussed and some excellent books published on the subject Maternity hospitals must exist for destitute women when they To compare the need both shelter and assistance results in out-door practice where patients reside in unsuitable and unsanitary locations with the results of a well organized maternity hospital is impracticable without an immense amount of labor and statistics

We all struggle to secure the prevention of deaths during childbirth The diminution of maternal mortality is the chief object of our obstetrical art

In an established maternity hospital we find difficult and complicated cases, a constant quality in a class of patients particularly prone to accidents in-This class of cases, particucident to parturition larly among the poor, cannot receive the attention of trained attendants at their homes, and hence are admitted to hospitals because skill can do more there in averting danger and death. There are many cases which foil the most consummate skill Again, there are simple complications which defeat the inexpenenced physician and the midwife

In the "Retreat" I aim at the highest degree of surgical cleanliness Distance dirt and all goes well All effete matter and refuse is removed at once from the building The air in the wards is kept in mo-Every attention to matters of detail, especially to kindly and cleanly nursing, is insisted on I have never been able to understand why the results of out door practice among the poor, who have inadequate means of procuring the necessary comforts of life even in health, and who have made no provision for themselves for childbirth, should be perceptibly better than the results in hospital practice am aware that the statistics of out door lying-in patients have been pronounced wholly worthless and In order to satisfy my own mind in regard to this question I have made careful analysis of the cases coming under my own practice during a period of almost three years

The rule in regard to dispensary cases has been attendance by graduates or students of medicine during confinement and recovery, for at least ten days and in the same manner as in private cases, all complications requiring the presence of myself or some one with experience. This rule has been care fully enforced All accidents in cases of difficult labor have been due to delay in asking for assistance Delay is dangerous, promptitude is everything

Died during attendance Apoplexy of the cord. 1, hæmorrhage of bowels, 1, debility, 3

These patients were all attended at their own homes

DR HIRST said that the speaker was to be congratulated on the low mortality of the out door cases He had himself some months ago collected statistics. of the American hospitals and of general obstetrical practice, and had been convinced from this and other investigations that the mortality of parturient women

¹ One child was dropped in the gutter as the mother alighted from a carriage to enter the hospital No injury to child or mother. As there had been no antiseptic preliminary treatment the case was carefully watched. No symptoms of septic trouble set in patient was absolutely comfortable during convalescence. Neither doctor nor nurse were responsible for the accident.

¹ Membranes punctured No hæmorrhage when head and was assisted by forceps.

Patient exhausted by loss of blood and extreme meat of any assisted by forceps
3 Placenta prawia centralis. Version and delivery twenty minutes after admission. Hand not withdrawn after introduction for examination. Hamorrhage great patient exhausted
4 Dead probably one month before delivery due to fall in cellar
5 Foot protruding from vagina when admitted. Forceps. Child

in the latter class was about I per cent 10,000 cases collected in England the mortality had

been 95 of 1 per cent

DR LONGAKER thought that, in consideration of the small number of times the forceps had been used, the fœtal mortality of the out-door cases was not sur-Had the forceps been used more frequently Not more than the death-rate would have been less about one child out of fifty should be born dead

DR WM GOODELL read a report of his

CASES OF LAPAROTOMY DURING THE YEAR 1887

He had 53 of them, as follows

Ovariotomy-27 cases, 22 recoveries, 5 deaths Oophorectomy—19 cases, 18 recoveries, 1 death Hysterectomy—1 case, 1 recovery

Malignant tumor of omentum-1 case, 1 death

Pelvic abscess—2 cases, 2 recoveries

Exploratory incision—3 cases, 3 recoveries Total

53 cases, 46 recoveries, 7 deaths

He showed a table giving the name of the medical attendant of each case, and the place and time of the

operation With regard to the fatal cases the first one was a case of malignant papillary cyst of both ovaries, by which every abdominal organ seemed to be infected Bleeding intestinal adhesions needed several ligatures and the application of Monsel's solution mountable obstruction of the bowel took place and drainage-tube put in In the case of hysterectomy,

the woman died on the seventh day

ingly fat woman, weighing 254 lbs, who could not walk without assistance. The area of raw surface made respectively for sarcoma of the womb and ova made by the deep and long abdominal wound was ries, for malignant disease of the intestines, and the most extensive Dr. Goodell had seen Both ovanes being diseased, were removed, they had contracted adhesions to the abdominal wall, and the larger weighed only about twenty pounds The lady was not again seen by Dr Goodell She died on the the operation was performed to make out a positive

fourth day from peritonitis

The third case was a forlorn hope At the time of the operation she had septicæmia, she was delirious and very ill indeed, and suffered great pain By her shrieks she disturbed one whole floor of the University Hospital, although she was on that ac-The cyst was count confined in a remote room intra-ligamentary and was adherent to the abdominal wall, the intestines, the stomach, the aorta, the All the adwomb, and to the whole pelvic basin hesions but the pelvic ones were severed, but the latter were not touched, as the woman seemed to be dying, and it was apparent that she could not survive the shock of a completed operation Many stimulating hypodermic injections were given during and after the operation, but she never rallied and died seven hours later The fourth was a bed-ridden and very emaciated woman, in whom the cyst had burst several weeks before, and she was being slowly poisoned by the absorption of the colloid matter. The cyst had universal adhesions and every abdom-The peritoneal cavity inal organ seemed infected The patient died on the was flushed and drained eighth day from sheer exhaustion

took place in a case of putrid and rotten dermoid The woman was also bed-ridden from septi-During the operation, while very firm ad cæmia hesions were being severed, the cyst wall was torn and a very small quantity of the offensive fluid es caped into the abdominal cavity This was flushed and drained, but the lady died on the fifth day from septicæmia

Of the nineteen oophorectomies there were an un usual number of difficult cases, both on account of adhesions and of the size of the fibroid tumors, for In the sole fatal which the ovaries were removed case death was due to uræmia from suppression of the urine, unsuspected kidney mischief probably

having previously existed

Of the seven remaining laparotomies, one resulted in death on the forty-eighth day. It was a case of malignant solid tumor of the omentum, causing as citis and excessive pain, from which the patient had been confined to her bed for many weeks great vascularity of the parts and the very extensive adhesions to the bowels made the operation a diffi For two weeks the patient did well, then cult one large abscesses burst out of the wounds and into the intestines, and the drain destroyed her life on the forty-eighth day after the operation

In the two cases of pelvic abscess the sac was sewed to the lips of the abdominal wound and a a two pound subperitoneal fibroid of the wound was The second fatal case was in a short but exceed- removed, on account of pain and vesical irritation The three exploratory incisions were for a fibroid of the womb intention to remove the ovaries, but on account of very firm and deeply seated adhesions, those organs In the other two cases of the could not be reached exploratory incisions, malignancy was suspected, but

Among the twenty seven ovariotomies there was a larger number of difficult cases than usual, nor had he refused to operate in any case offered him. In sixteen both ovaries were removed Twenty three had adhesions, and drainage was resorted to twelve In three the adhesions were universal, in six firm intestinal adhesions existed, while in three the cysts were intra-ligamentary, presenting very formidable obstacles to their removal last cases the result was successful, although the wound had to be reopened four hours later to stop a deeply seated hæmorrhage, and although a fæcal fis tula was established by injury to the rectum

DR KELLY remarked that he had been especially pleased with the careful consideration given by Dr Goodell to certain points in the handling of abdominal cases, which were too often looked upon as a minor matter in the treatment, but are after all the One of the most important of all matters is the checking the hæmorrhage from ad A satisfactory way of checking hæmorrhage from smaller areas on the ab-The fifth death dominal wall is by passing a needle under the periTaw surface to raw surface to ivory rods on either side of the skin-flap thus Fallopian tube, he had checked the bleeding by a weeks ago series of ligatures enclosing the whole broad ligament from its pelvic attachment to the uterus, introduced entirely beneath the raw surface

A practical point of the utmost importance upon which he would insist is that when the bleeding is there has been much stripping of peritoneal adheried off at once by the peritoneum it forms an excel-The drainage most sure to enter at any operation

tube meets this danger

He has had a good many cases of rectal fistula which have been very troublesome, but the tendency here seems to be to heal the tendency of the ulcers to form rectal adhesions by the first incision cases the wall between the abscess and rectum must be very thin The best after-treatment in abdominal cases is to put them in the hands of a trained nurse, and leave much to her judgment

Dr Goodell liked to give credit to his fellow countrymen whenever he could, and if he was not mistaken the credit of first doubling peritoneum on itself and maintaining bleeding surfaces in contact by pins or quill sutures, was due to Dr Kimball, of Lowell, Mass Several years ago Dr Goodell had resorted to this plan, but not since he had used Monsel's solution or the thermo cautery

PHILADELPHIA COUNTY MEDICAL SOCIETY

Stated Meeting, April 25, 1888

THE PRESIDENT, J SOLIS-COHEN, M D, IN THE CHAIR

DR George McClellan reported a case of

AMPUTATION OF THE LEFT HALF OF THE TONGUE FOR EPITHELIOMA

Michael G, an Irishman, aged 40, was admitted the first of this month to my ward at the Philadelphia Hospital He stated that he had never had syphilis, and that his general health had always been goodwhich was borne out by his appearance He had

toneum and carrying several threads across the sharp and shooting pain extending from the root of bleeding area, and upon tying these threads, bring the tongue on the left side down the neck and over He had seen Dr Zwei- the face A small sore was noticed on the side of fel, of Leipsic, invert a large bleeding area on the the tongue about its middle, which rapidly increased abdominal wall, and transfixing skin, muscles and until, at the time of admission to the hospital, it was peritoneum from without fasten a number of sutures the size of a half dollar Articulation and deglutition were interfered with, and there was a constant He had frequently used the cautery, in flow of saliva. There was also, apparently, an entimes past, but not recently In a recent case of larged gland in the submaxillary triangle I diagsevere general hemorrhage from the base of the nosed the disease to be epithelioma, and undertook whole broad ligament after removing a distended its removal by amputation on April 11, just two An incision was made from the symphysis of the chin, a finger's breadth below the jaw as far as the external jugular vein, the deep cervical fascia was torn through with the fingers and knife handle, and the swelling, which was under the sternomastoid muscle, proved to be a degenerated gland, checked all the danger is not obviated, whenever or rather cyst, which was filled with thick, cheesy matter The cyst was evacuated of its contents, the sion, in spite of the fact that the bleeding may have cyst wall torn out as much as possible, and the been checked, a lymph flow sometimes profuse is lingual artery, which was exposed in its relation to often poured into the abdomen, and if it is not car-the hyoid bone, the hypo glossal nerve, and digastric muscle, was secured by a ligature The anterior lent culture field for the few bacteria which are al- belly of the digastric was severed, and the mylohyoid muscle with the oral mucous membrane punched through with the finger, and the tongue having been freed from its frænum and pierced at its apex with a strong needle and string, was pulled The peculiar liability of down into the wound in the neck, as I hoped by so pus cases to this accident is readily accounted for by doing to be able to take away the diseased portion This proved unadvisable, owand ulcerating through, to evacuate itself. In many ing to the short, thick neck of the patient, and would have endangered the carotid and deep vein, and I at once cut through the commissure of the mouth, and, after tlying the coronary arteries, pulled the tongue forward, passed a trocar and canula through the middle of its base close to the hyoid bone, the trocar was withdrawn, and the chain of an écraseur was passed through the canula, and, after withdrawing the latter, I found the écraseur worked admirably I then cut off the affected half of the tongue close to the raphé, and was able to show my assistants that the only bleeding vessels from the tongue itself were at its apex A ligature secured these, and the stump was lightly touched with the Paquelin cautery Both wounds were then united by interrupted silk sutures and dressed antiseptically There was a rise of temperature to 103° the evening following, which was reduced by quinine suppositories and sponging Since then it has been about normal There was a great deal of venous bleeding during the operation, but very little arterial, owing to the early and prompt securing of the lingual and branches of the facial Cracked ice and iced milk only were allowed the patient for the first twenty-four hours The wounds were found healed at the first dressing on the third day, and this morning, (April 25), I saw the patient sitting up in a chair, dressed and wishing to go out He has had no pain whatever, and talks perfectly, and takes nourishment better than for a long time before the operation

Dr. G G DAVIS I would like to ask Dr Mcalways been an intemperate smoker of a short- Clellan where he tied the lingual artery It is usustemmed pipe Six months ago he first experienced ally taught that the proper place to expose this ves-

sel is in the digastric triangle. My own experience, He worked for six years at his trade as stone-cutter, in teaching the operation upon the cadaver, is that and was finally admitted to the Philadelphia Hosit may often be more readily found and ligated behind the digastric, thus obviating the necessity of ease, and a right basal pneumonia After recovering cutting through the mylohyoid muscle joint excision it would be interesting to know how trochanter, and pus evacuated, but excision was not far down the shaft of the bone was removed preliminary resection of the joint and shaft low down is practiced, and afterward an amputation through the thigh performed, I believe that the operation suppuration I at once excised the head of the will be of much less gravity than if the whole opera- femur below the trochanters, and scraped the aceta tive procedure is undertaken at one time Of course, this refers only to cases in which the condition of as is evidenced by the chart, and within three weeks the patient is such as to make a primary hip joint of the excision I amputated the thigh amputation too dangerous

DR McClellan The lingual artery is not difficult to secure The land-mark is the great cornu of the hyoid bone, and by making a curved incision parallel to the angle of the lower jaw, over it, we can readily expose the looped tendon of the digastric muscle and the stylo hyoideus Here the hypoglossal nerve is found, and the lingual artery passes after long exhausting suppuration

immediately behind it

It will be remembered that there was a great mass in the neck, probably due to secondary involvement from the growth on the tongue The first incision was made with the view of removing the gland and bringing out the tongue laterally by the same means of access The gland was found beneath the sternomastoid muscle, and a dissection to expose it would have endangered not alone the carotid, but the deep jugular, which I am loath either to wound or to tie I therefore tore out the cyst after discharging its con- lar surfaces of the condyles tents, and then brought into view the parts over the

lingual

In looking over the history of excision of the tongue. I have been struck with the fact that the different methods adopted all have points worthy of consideration in different cases The operation of cutting through the symphysis is sometimes practiced, also the horseshoe sub-mental incision operation is applicable only in a long, thin neck could not be performed in a short thick neck other operation of simply cutting through the oral commissure is very easy and simple, and exposes the dent to an Eye-Purification of the Thames-The parts sufficiently in all cases where the disease is situated behind the middle of the organ If we simply remember that the deep cervical fascia which Port of London, in his report for the latter half of loops down the two bellies of the digastric muscle also covers the artery and nerve, we need have no difficulty in finding the lingual, and it is readily distinguished from the nerve which lies in front of it, both upon the cadaver and living patient The difficulties sometimes experienced in operating on the former are due to the relation of the parts not being properly remembered

DR GEORGE McClellan reported a case of

EXCISION AT THE HIP, FOLLOWED BY AMPUTATION

Riocco V, the Italian, whose limb I amputated after having previously excised the hip, presents country at the age of 18, and while on shipboard had cases of small-pox on board was passed by the media fall, to which he attributed the trouble in his hip | cal officer at Plymouth and allowed to land six men

pital two years ago, with symptoms of hip joint dis In the hip- from the latter, an incision was made over the great done, owing to his generally bad condition When I went on duty at the hospital, March, 1887, I found the patient with a temperature of 104°, and profuse bulum, which was carious Instant relief followed, The patient made a rapid recovery, and the wound healed, with the exception of one of the lateral margins, which continued to discharge pus and sanious matter until a piece of drainage tube was removed spontaneously, one month ago He is now fat and hearty, and, although not a beautiful specimen of humanity, is a remarkable instance of what the system can endure

> As far as I can remember, Mr Furneaux Jordan was the first who recommended excision of the head of the femur in cases requiring amputation at the The photograph hip, in order to diminish shock shows long flaps This is due to the fact that I first excised just below the trochanters, and later at the amputation simply made an incision over the shaft of the bone down to the middle of the thigh There was very little hæmorrhage The femur was found on removal to be necrosed all the way to the articu-

LETTER FROM LONDON

(FROM OUR OWN CORRESPONDENT)

Sanitary Management of Shipping-National Pen-The sion Fund for Nurses-Abdominal Puncture in Tym panites-Opium smoking in London-Curious Acci-Galen Club

Dr Collinridge, Medical Officer of Health for the 1887, shows that considerable progress is being made in the sanitary management of shipping During the six months over ten thousand vessels were inspected, nearly 88 per cent of which were sailing under the British flag In thirteen cases the ships were fumigated, five on account of small-pox, two for measles, two for enteric fever, one for scarlatina, one for yellow fever, one for chicken-pox, and one in conse quence of the condemnation of its cargo of over 5000 quarters of beef Altogether some sixty four cases of infectious illness were reported, in the majority of which proper disinfection had already been applied by the authorities of the particular ships In one instance, however, it seems that a vessel with three

order to avoid the two or three hours delay which in the wall of the bowel would have been caused by landing them unsatisfactory

Mr Henry C Burdett is to be congratulated upon the success which has at length crowned his persistent efforts to found a National pension fund for Lord Rothschild, Mr H H Gibbs, Mr E A Hambro and Mr I S Morgan have each deposited £5,000 as security for annuitants and policy holders, thus supplying the reserve without which the effort must have failed. The scheme provides a provide for their old age and secure assistance in face was severely burned time of sickness It is proposed to guarantee a certain minimum pension of £15, £22 ios or £30 a year, in return for quarterly payments which vary in amount according to the sums assured, the age at which such payments begin and the age at which the pension is to be received. By slightly larger payments a sick allowance of from ten to twenty shillings a week can be secured By another arrangement two thirds of the premium can be made payable at the age of 50, the remaining third not commencing till ten years later All these schemes are guaranteed, but it is hoped that the bonus fund will make it possible to raise the £15 pension to £26 and to add to the other sums about one third of their respective amounts

An exceedingly interesting case of treatment of tympanites by abdominal puncture, came up before the last meeting of the Hunterian Society The patient, a man aged 46, came under treatment during the autumn of last year, with vomiting, paroxysmal pain, and constipation of about ten days' duration fullness, but no humor could be discovered, and rectal examination revealed nothing Enemata and the passage of a tube revealed nothing The patient | would not consent to colotomy, therefore puncture of the intestine to relieve distension was resorted to as the only treatment which promised relief Eight punctures were made, with considerable relief to the distension, but a violent attack of peristaltic contraction set in about an hour after it Three days later the intestine was again punctured in three places, and in order to prevent peristalsis, two precautions were taken, namely, hypodermic injection of morpho atropine and use of a large aspirating needle No violent penstalsis followed, and a very large amount of gas was liberated Forty-eight hours later the bowels were opened All went well for fourteen days, when symptoms of obstruction again returned, and puncas previously being taken, and in the course of the a two per cent solution of the bichloride

there while the patients were sent on to London in tain small spots, no trace of the puncture was visible

It is not surprising that the attention of medical Local Government Board thought not only that this men, as well as of philanthropists, has been directed proceeding but the explanations offered of it were to the increasing prevalence of the vice of opiumsmoking in the neighborhood of the London docks At the present time there are seven opium dens within a short distance of one another, and it is also a melancholy fact that in the same places of resort may be found many English women of the lowest The medical journals have suggested that the State cannot afford altogether to ignore this state of things It is stated that a nurse who, for the purpose of washing out a bottle which had contained number of methods by which nurses or other officials glycerin, poured some nitric acid into it, with the employed in hospitals or kindred institutions can result that the bottle burst in her hands, and that her

> A strange accident recently happened to one of the attendants at a hippodrome in London man suddenly felt his eye cut with, as he supposed, a pebble kicked up by one of the ponies who were being trained He was admitted to the West London Hospital, and on the following day, there being severe panophthalmitis, the operation of enucleation was performed with the best possible results mous thing was that, although the man was at the time of the accident standing beyond reach of the whip, a knot of a whip was found to have pierced the ball just below the horizontal meridian of the corneosclerotic junction and to have become imbedded in the vitreous humor It was supposed that the thong had become heated and the knot detached had flown off at great speed

Some of the members of the Board of Works proposed that 100 tons a week of the permanganate of soda should be used to purify the water of the Thames during the ensuing summer It was argued that about £,40,000 worth of permanganate would be required Examination of the abdomen showed considerable during the year The subject was eventually, after much discussion, referred to a select committee

> Medical men have now a new club at the West end styled the "Galen Club"

HOW IT STRIKES THE COUNTRY PRAC-TITIONER

Dear Sir -When the country practitioner of today takes up his medical journal he reads with awe not unmixed with incredulity, the earnest discussions of his city brethren of the healing art, as to whether the obstetric practitioner should or should not be held legally responsible for his puerperal fever ture again became necessary, the same precautions cases unless he douche the vagina and himself with following three weeks puncturing was four times re- quite naturally occurs to the aforesaid c p to won-Although great temporary relief was ob- der why puerperal fever is a disease of the cities and tained, the patient gradually sank At the autopsy dense centres of population where these things are an annular stricture was discovered in the first part done, and is almost unknown in the rural districts of the rectum, but no evidence of peritonitis or ex- where such refined methods do not prevail I ventravasation of fæces, and with the exception of cer- ture the assertion that not one country practitioner

in fifty uses any antiseptic precaution beyond cleanliness

Who, more than this same class, who by turns are called into the domain of surgery, gynecology, medicine and obstetrics, would more likely become con-His manifold and varied duties tagion bearers invite to habits of carelessness if not slovenliness in person and attire When in the presence of the spotless dress and immaculate person of his city brother, he bashfully pockets his hands, well knowing that hands which harness his horses, and blacken his boots, if they do not even carry the soft coal on wash days when his wife does the cooking while the one servant, maid of all work, is busy with the washing, will hardly compare in silky softness and pinkness of nails with the taper digits of his esteemed confrère But are these stubby fingered, browned and blistered hands any less capable of conveying contagion, of being coated over with the subtle and invisible mi- his patient, sat Dr Extraordinary carefully sponging

it was my fortune to attend between two hundred modern idea and three hundred cases of labor The only fatal case I ever saw in child bed at term was a lady who was suffering at the time of her confinement, and had been for three days, from a violent attack of facial erysipelas, from which, quite naturally, was evolved a puerperal peritonitis, which speedily proved All but this auto-inoculated case progressed quite favorably, and none more so than those immediately succeeding this one It is but fair to add that owing to the nature of this case, I washed my hands and arms thoroughly in carbolized hot water before taking charge of another Have never used an antiseptic vaginal douche except to correct the fetor of the lochia some days after confinement

These cases occurred in all walks of life, from the one-room hovel of the extremely destitute where a large family existed, and where it was contamination to touch the dirt begrimed bedding on which the accouchement occurred, to the spacious and elegant country home of the well-to-do farmer, where the sheets were of snowy whiteness and where the microorganism would find himself in constant danger from the onslaught of scrubbing brush, dust cloth Add to this the nervous anxiety of a and broom man often far from home and worried about other ing that there were frequent and prolonged vaginal to establish a Bureau of Health," or to disparage the examinations with attempted digital dilatation of the value of the labors of the United States Marine Shades of Semmelweiss, how did any escape! cency and prudence can be so called, was washing laws and system of Louisiana against the persistent The only antiseptic precaution, if such common dethe hands in clean water and soap and cleaning the and unjust attacks of the National Board of Health

When an undergraduate I remember our professor the Reports of the Board of Health of the State of obstetrics opposed frequent digital examinations on the ground that it needlessly removed the lubricate pot disposed to remove the lubr on the ground that it needlessly removed the lubricating mucus so liberally supplied to the parturient canal, but does not an aqueous douche have the tended their thousands of cases without a fatal puermittee on Commerce, bearing date Washington, D.

peral case, and who have practiced no preliminary. peral case, and who have practiced no preliminary C, Treasury Department, February 21, 1888 antisepsis but strict cleanliness

The fact is, there appears to be a medical ten dency to take up every European suggestion or hypothesis as our young men excuse oddities in dress by saying, "It's so English, you know"

Some years ago we had 40 and 50 gr doses of quinine for hyperpyrexia, with perhaps a sudden

cold bath as antipyretic in typhoid

The latest fad is this germ mania A physician in a certain city not three hundred miles from Chicago was called in excitedly by an anxious soon to be father, whose chosen modern method attendant he had not found at his office But before Dr Ordinary could get there Dr Extraordinary had returned and answered the call When our friend Dr O arrived he was ushered unceremoniously into the sick chamber, and though an old man of years of obstetric experience, he blushed at the sight that met his gaze, and retreated precipitately, for there, alone with croorganisms which haunt the day dreams of the his patient's nude body with, it is presumed, the orgermaniae? "If not, why not?" thodox two per cent solution Not a thread of During a practice of six years in Central Illinois germ-concealing garment had this poor victim of a was my fortune to attend between two hundred modern idea. This may do for a Vienna hospital, but is the modesty and loveliness of American womanhood to be sacnficed on the altar of this attenuated micro-organic moonshine?

This is the "whither" of our tendency unless somebody calls a halt, or at least that is the impression of COUNTRY PRACTITIONER at least one

STATE MEDICINE.

State, Interstate, National and International San-Itary and Quarantine Code, Prepared for the United States of America

BY JOSEPH JONES, MD, OF NEW ORLEANS, LA

PRESIDENT OF THE LOUISIANA STATE MEDICAL SOCIETY, BIC (Extract from Report on Organization, April 25,

In my address to the regular medical profession of Louisiana on November 14, 1887, it was not the in tention of the brief observations relating to Public and International Hygiene to revise any organization such as the National Board of Health, or to give any support to the Bill recently introduced into the United "To prevent the In States Congress (H B 1,526) troduction of Contagious and Infectious Diseases, and

Our defense of the police powers and quarantine

The imperfections of the Bill (H B 1,526) now before Congress are fully set forth in the letter of the Secretary of the United States Treasury to the ComOur views may thus be formulated

I It is important that uniform quarantine laws should be formulated for the entire Republic, as will be manifest upon the consideration of the following

(a) The population of the United States of America now exceeds forty millions, and is rapidly in-

- (b) The United States, in virtue of its central geographical position, between the Atlantic and Pacific Oceans, and with the Gulf of Mexico, the Antilles and the Republic of Mexico on the south, is perpetually exposed to the introduction of foreign pestilence
- (c) The United States, either annually or at certain intervals, is exposed to the introduction of smallpox and cholera from Europe and Canada, to the introduction of leprosy and small-pox from China and Japan, and to the annual introduction of yellow fever from the Antilles and the Republic of Mexico, and the Central and South American cities
- 2 The Police Powers of the several States and Territories composing the great American Republic should be fully recognized in any system of internal and external sanitation and quarantine
- 3 The greatest diversity prevails in the sanitary and quarantine laws and regulations of the individual States and Territories

The quarantine systems present different degrees

In times of pestilence, the Interstate intercourse and traffic are hable to sudden and arbitrary interruption, and the brutal shot-gun quarantine may be substituted for the dictates of humanity and the teachings of sanitary science

4 The United States Marine Hospital Service, under the direction of the President of the United States and of the Secretary of the Treasury, has rendered and is capable of rendering important service to the Nation, in the exclusion of foreign pesti-

5 The sanitary and quarantine laws of the several States should be perfected and unified and the most perfect accord established between the individual States, on the one hand, and with the General Government on the other

- 6 The most direct method and the wisest and most liberal, and the one most in accord with the spirit of our National and State institutions, appears , to be the appointment on the part of the individual States, and of the General Government, of representatives duly commissioned, and empowered to meet in general assembly, at such places and times as may be deemed best, for the thorough discussion of the existing sanitary and quarantine laws, and for the preparation of a National Sanitary and Quarantine Code
- 7 THE NATIONAL SANITARY AND QUARANTINE Code should define clearly the relations of the individual States to each other, and to the United States Government, on all matters relating to the domestic sanitation of the individual States, and to public and International hygiene The regulations should have due regard to differences of climate, elevation, en-

tions, and the burden of maintaining maritime quarantine should be borne by the Republic, and should not be inflicted upon commerce, or upon the maritime States alone

- 8 The members of the Association charged with the examination, enlargement, consolidation and perfection of the sanitary and quarantine regulations and laws of the several States, and the elaboration of the National Sanitary and Quarantine Code, should be men of the greatest learning, wisdom and experience in the medical and legal professions receive fixed and ample salaries, so as to enable the Congress to work with due care and deliberation until its important labors are completed
- o After the completion of the labors of the Congress, the Sanitary and Quarantine Code should be submitted to the individual States for their ratification, and after adoption by a majority of the States composing the American Union, the National Sanitary and Quarantine Code shall become National, and shall receive the support of the General Govern-

It will be observed that the plan here proposed is designed to ascertain and formulate the police powers of the people in sanitary and quarantine matters, and is opposed to all hasty, and sectional, and arbitrary legislation, as advised by politicians, or by ambitious and scheming self constituted guardians of the public health

156 Washington St, New Orleans, La, May 5, 1888

MISCELLANEOUS.

NEW YORK STATE MEDICAL ASSOCIATION, Fifth District Branch, will hold its fourth annual meeting in the Magnolia Lodge Rooms Brooklyn, N Y, on Tuesday, May 22, 1888 Valuable papers and topics of interest will fully occupy the time of the meeting

THE MEDICAL SOCIETY OF NEW JERSEY will hold its one hundred and twenty second annual meeting at the Heath House, Schooley's Mountam N J, on Tuesday and Wednesday, June 12 and 13, 1888 For further information apply to Wm Elmer, Jr, Corresponding Secretary, Trenton, N

PAJOT'S ERGOT MILL.—Sir James Paget would doubtless be surprised to read in the last issue of an American contemporary that "Professor Paget, carries in his obstetric bag an ergot mill, resembling a small coffee mill, compact in form, and designed to grind up ergot freshly for use" Pajot claims that ergot is un reliable unless freshly pulverized, and in order to have it in this form he grinds it for immediate use.

DEATH OF DR JOSEPH AUB —We regret to announce the death of Dr Aub the well known ophthalmologist and otologist of Cincinnati, which occurred a few days ago He was in the prime of life, but had been suffering with heart trouble for some

Cincinnati has suffered severe professional loss within the past few weeks in the death of Dr Aub, in that of Dr C S Muscrost, which took place on May 1, and in the probably satal in jury of Dr C D Palmer on May 2, when he was thrown from his buggy

TRANSACTIONS OF THE NINTH INTERNATIONAL MEDICAL Congress — Two volumes of the Transactions of the recent Medical Congress in Washington, are ready and being distributed to members as rapidly as possible. Through the active agency of the late Secretary General Hamilton, 150 members received demic and epidemic diseases, and commercial relatithese volumes while in attendance on the annual meeting of the 150 00

ADDRESS IN STATE MEDICINE

Delivered at the Thirth ninth Annual Meeting of the Ameri can Medical Association, May 10, 1888

> BY HINRY P WALCOTT, M D. OF CAMBRIDGE, MASS

Members of the American Medical Association

When a committee of this body invited me to dehver the address which Dr Cabell felt himself unable to undertake, I accepted the invitation with much hesitation, well aware that, in attempting to fill the place which all had hoped to see occupied by the far below your proper expectations

Mingled with this natural reluctance is also the knowledge that I have not the oratorical skill to repeat in any new or attractive manner those general statements as to the claims of hygiene and State preventive medicine upon the public and our profession which have been so often and so eloquently brought to your attention

Neither am I quite willing to limit myself to an attempt to describe the progress of public preventive medicine during the past year But I shall assume that my text has been given me in the fact which is probably the reason for my invitation to occupy this most honorable place I mean my connection with the State Board of Health of Massachusetts, now in the twentieth year of its existence

This Board has passed through experiences which are more or less true of every other State Board of Health in this country—it has sometimes failed where success was due and has succeeded where defeat seemed inevitable It has illustrated the various stages of progress in the attempt on the part of the State to prevent disease, and has also, at some periods in its history, suffered from the interference of politicians and self seekers

This story, interesting as it might be in Massachusetts, would be quite out of place here, were it not true that we also have a fairly kept record of our vital statistics from the year 1842 to the present time

Therefore it has seemed to me that it would not be unprofitable, in this twentieth year of State preventive medicine, that I should attempt to answer some of the questions that may fairly be asked of those who prevention of disease

You will not need the assurance, I hope, that the example of my own State is used in no limited and provincial spirit We have not hesitated to borrow from our brothers in other States and countries any thing that offered the slightest promise of help in the unending struggle for the preservation of human life We have relied upon their counsel and assistance, and have not been disappointed On the other hand, the legislative act by which our Board was established has served as a model for many of the organizations subsequently formed Our interests have thus been common, our methods similar, and the results will be not much unlike

Another reason for using this local experience lies honored head of our first-unfortunately, perhaps in the fact that our restricted territory and comparaour last, National health organization, I should fall tively large population have brought about conditions which, fortunately for the majority of the States of the Union, will remain in the distant future, but which. sooner or later, will come to all, and almost inevitably sooner than they are expected

> That these experiences can be submitted to no tribunal so competent to correctly interpret them as the medical profession is a proposition which scarcely needs an argument

> Although State Medicine, as the name implies, is the result of legislation in which our profession has little or no share, and legislation which, oftentimes, is not immediately suggested by medical men, still it is quite true that legislative bodies have rarely, if ever, acted upon measures concerning the public health without some understanding of the views of our profession, expressed publicly in the hearings before appropriate committees of the legislative bodies, or privately in the more convincing interchanges of opinion between legislator and constituent while this is true in a general sense of the influence of the profession, it is not true that the best medical opinion receives the highest consideration, for it is not the loudest-voiced and it is constitutionally unwilling to enter the field of politics

> It should be, then, one of the functions of great representative assemblies of the profession, such as this is, to give voice to the deliberate opinions of those who are the only competent critics of the failures or successes of State Medicine

In the earlier days of sanitary reform great improvements in the general health of communities were brought about by public works for the protection of water supplies and the better drainage of have had a share in the public responsibility for the cities, these were carried on under the direction of eminent engineers, who received, and properly, the

praises due to their successful undertakings these very successes had to a certain extent mis'ed the public, which was now inclined to believe that a water supply pure from ordinary contamination, a system of sewers that removed without offensive smells waste matters, were the beginning and end of consisted in brutal and irrational systems of quaransanitary regulation advertises himself, is another instance of the same While there is no question that sometendency thing has been added to the security of human life, and much to its comfort, by the better planned and those suffering from communicable diseases better constructed arrangements for our domestic conveniences, still it is true that the real question has been little advanced by all this-the question how the filth diseases, so-called, originate and how they Many of them are found in conare propagated nection with bad plumbing, some of them, also, where the plumbing appears to be perfect study of their origin and spread must remain in the hands of trained observers of the medical profession, for they alone can read the characters in which the evidence is recorded and assign to the various details It is, therefore, essential that their relative value the relations between the health authorities, whether they exist in the form of boards or single commissioner, and the great body of the practitioners of medicine, should be founded in confidence for without these supports no executive sanitary power can long maintain itself, however firmly intrenched behind political influence

I do not mean to say that there will not be seasons during which legislative bodies will seem to arrogate to themselves the special knowledge which belongs to our calling, but it will be observed that this happens only in the years of comparative good health Let disaster come, let any one of and prosperity the great pestilences invade the land, and all will be Powers will be conferred upon boards of changed health never dreamed of by the founders of the Republic, and appropriations of money made which would, if used in season, have averted many pesti-Our rulers allow the dykes to be broken through and the whole country to be flooded labor of one man might have saved the dyke if applied in season, the toil and the lives of thousands

may be the penalty for the neglect

These great epidemics of contagious disease are treated by Governments generally very much as our ancestors used their weapon-salve, the remedy was rubbed upon the weapon that inflicted the wound, and the patient was for the time an object of second-

ary importance

Would it not be as unreasonable, in this day, to establish a quarantine station at the entrance of a harbor and then to abandon all sanitary work in the threatened district, and to rely for protection on that alone which never has been and never will be, in the weakness of man, a sufficient safeguard?

Before leaving this branch of the subject I wish to call your attention for a moment to the anxieties so frequently shown by our National legislators as to the unconstitutionality of the sanitary legislation interest of the public health It is, I presume, true the above named document for the appropriation of

But that the words "public health" do not occur in the written Constitution of the United States, and they do not appear there for the simple reason that in the year 1787 men knew very little practically about the prevention of disease, their efforts to limit epidemics The sanitary plumber, as he tine, which did not protect, and are only now giving way to the humane and scientific methods of medical inspection, disinfection, at times detention on the frontier, and prompt isolation within the country, of

Public hygiene, which lies at the foundation of modern civilized life, is, almost literally a creation of the present day In earlier times under the scourge of some startling inroad of disease, States and smaller communities had made occasional and spasmodic attempts to repress great epidemics-but a behef in the prevention of disease, as we understand these words, did not exist, and it is within the active life of men now living that this important branch of medi cine has received its proper consideration the first among the medical teachers of this country to direct attention to preventive medicine was Dr Elisha Bartlett, sometime Professor of the Theory and Practice of Medicine in the Transylvania School of Medicine, in Kentucky, a man who exercised by his teachings and writings a great and sound influence throughout the country In his essay on the Philosophy of Medical Science, published in 1844, he claims that the great work of the next and succeed ing generations will be the best methods of preventing as well as curing disease

The words of that great physician Dr Samuel D Gross, himself known and honored wherever the science or the art of surgery is recognized, shows how fully this prediction has been realized. It seems to me singularly appropriate that the words should have been spoken upon the occasion of the dedication of a monument to the memory of Ephraim McDowell, who gave to the world that surgical operation which in the cure of disease has given more years to

woman's life than any other

"The great question of the day is not this operation or that, not ovariotomy or lithotomy, or a hipjoint amputation, which have reflected so much glory upon American medicine, but preventive medicine, the hygiene of our persons, our dwellings, our streets, in a word, our surroundings, whatever and wherever they may be, whether in city, town, hamlet or coun-This is the great problem of the day, the question which you, as the representatives of the rising generation of physicians, should urge in season and out of season, upon the attention of your fellowcitizens—the question which above and beyond all others should engage your most serious thoughts and elicit your most earnest cooperation"

Many of our law-makers have discovered, I believe, no other authority for sanitary legislation on the part of the General Government than that which is contained in the section of the Constitution which de clares that Congress, among other functions, shall have power "to regulate commerce". There does not appear to be any clearly expressed provision in

monia in cattle, and yet the forty-ninth Congress did appropriate \$500,000 for that purpose, and wisely, I am sure we shall all say I read, however, in this same section of the Constitution that Congress shall also have power to provide "for the general welfare of the United States"

In our own day we have seen National, State and local laws swept away by cholera and yellow fever Let us hope then that some ingenious law-maker may find in these words a sufficient authority for the expenditure of enough of the public money, at least, to secure some of those thorough investigations of preventable disease which have characterized the work of the Gesundheitsamt in Germany and the Local Government Board in England

the experience of the last ten years makes it possible for us to state—that improved methods of research, that the knowledge already gained, have made it almost certain that coordinated investigations properly encouraged and supported by such aid as only a great government can give, would lead to the discovery of the causes of yellow fever and malarial fever in the first place, and in the second, to rational methods of dealing with these most formidable scourges of the land in the way of prevention or of cure Then, I say, it does seem in the highest degree absurd, that any form of government should deliberately deprive itself of the sanitary gains which contribute so directly to the preservation of "life, liberty and the pursuit of happiness "

The State Board of Health, of Massachusetts, was established by legislative action in 1869 boards of health, of not much efficiency, had existed from the beginning of the century The State Board of Health entered at once upon its duties, which were advisory rather than executive Under the lead of wise men the public intelligence was quickened health upon all the important sanitary questions to such a degree that the succeeding years brought to the Board added executive power and larger appropria-Seven thousand five hundred dollars were appropriated for the work of the Board in the earlier the conclusive evidence of the people's belief in the value of protective medicine, and this sum does not report

After ten years of most successful administration it was thought advisable by the legislature of the day Public Charities with enlarged powers

The right of the people to pure air, soil, water and food are recognized by the laws of the Common wealth, and various statutes have been passed to secure these results and to prevent their infringement The Board is charged to some extent with the duty

money to help exterminate contagious pleuro pneu- power coordinate with that of the local boards of

The business of investigating and gathering information as to any matter pertaining to the public health, and of diffusing such information among the people, is also included in its functions

Among the matters of which it thus takes cognizance are the causes and prevention of infectious For this purpose coordinate powers with diseases local boards of health are given to the Board, the suppression of nuisances, including the regulation of noxious and offensive trades, the collection and diffusion of information relative to industrial hygiene, or the effects of different occupations, industries and domestic pursuits upon people at various ages and under various conditions of life, the hygiene of When it can be deliberately stated—as I believe schools, school buildings and public institutions, the examination and investigation of public water sup plies and public ice supplies, and the prevention of their pollution, the investigation of drainage and sewerage plans or systems so far as they relate to the public health, the disposal and transportation of the dead, the inspection of food, drugs, and other articles affecting the public health, inquiries relative to the amount of intemperance from the use of stimulants and narcotics, and the remedies therefor, investigations as to the infectious diseases of animals so far as they affect man, the editing of the registration report of the State

What effect has all this had upon the health of the people as shown by the mortality rate, for that is the only trustworthy standard, under our present means of registration, by which to determine the effects of measures taken for the prevention of disease out the assistance of well conceived and carefully executed tables of vital statistics, communities are liable to the most erroneous impressions as to the actual effect of their surroundings upon the general Hence, our legislation in sanitary matters is in constant danger of becoming the reflex merely of vague rumors, hasty and incorrectly formed conclusions, or statements based solely on commercial and interested motives, unless it is distinctly understood that the duration of human life, the diseases by which years, in the present year sixty thousand dollars are it is cut short and the preventable or inevitable character of the disease, so far as we now understand these qualities, are things which can be determined by ininclude the large sum spent upon the registration telligent and continuous investigation by experts, and should be no more the subject of guess-work than the truths of mathematics or the facts of chemistry

Inasmuch as the task which I have taken upon myto very widely extend the functions of the Board by self is the proof of the value of preventive medicine, reorganization and the addition of the power of Com- let us take not the mortality rate as a whole, but the missioners in Lunacy and of the Supervision of the rates from certain specified diseases which are admit-The burden proved too great and ted to be preventable and controllable by means of after a few years the original organization was restored vaccination, isolation and disinfection, and suitable sanitary precautions

Let us then compare these rates in successive years not only with each other, but also with the rates of those diseases in respect to which we possess no well recognized powers of prevention

This comparison shall be made during the period of enforcing these rights and preventing and punish of the existence of our State Board of Health, not ing any violation of them, having for this purpose with the presumption that statute regulation, either

in the hands of a State or municipal board of health, deserves all the credit of the improvement obtained

During this period there has been an active and intelligent interest in all sanitary questions, steps have we can with certainty limit, if not abolish As we been taken on all sides for procuring purer water supplies, better drainage, food and drugs free from adulteration, tenement houses have been much improved, sometimes by private undertaking, and oftentimes under the compulsion of the law But in all these movements the influence of the sanitarian has been predominant, and the improvement in the health of the people is regarded as the only just standard for the measure of our success

When regard is had to the fact that Massachusetts is one of the oldest settlements in the country and, with the exception of Rhode Island, the most densely populated State in the Union, it would not be surprising to find there a relatively high death-rate This would be true even if the conditions which favor health there were equal to those found in other States

The average death-rate for the thirty-six years 1851-1886 was 19 40 per 1,000 living, the lowest death-rate in this period was 16 99, in the year 1867, the highest death-rate that of 1872, being 22 85 per the last registration year, 1886 So far as these figures go, we have no changes of consequence

But if we turn to the general classification of causes of disease into zymotic, constitutional, local, develmental and violent, we find that there has been an almost constant decrease in the class of zymotic diseases during the period now under consideration

PERCENTAGE OF CAUSES OF DEATHS BY CLASSES

Years	CLASSES						
IBART	Zymotic	Constitu tional	Local	Develop mental	Violent Deaths		
1870	25 6	26 6	28 1	156	4 I		
1875 1880	28 6 24 5	24 3 23 7	31 8 38 0	11 2	4 T 3 7		
1885	190	23 7	42 7	107	39		

The years taken are census years

The changes in the class of constitutional diseases have not been so marked as in those of the zymotic class, although the tendency appears to be constant in the direction of a decrease

In the class of local diseases there has been a decided increase, from 28 1 in 1870 to 42 7 in 1885

In the class of deaths from developmental causes the changes in the last three cer us years are insignificant As this class contain deaths from teething and old age, it is to be experied that more accurate diagnosis will diminish its relative importance

The percentage of viole it deaths remains through-

out essentially unchanged;

If we arrange the percentages of causes of death from zymotic diseases in two columns of ten years each, we shall find in the first decade, from 1867 to 1876, the average of the e percentages to be 27 94, in the second decade, 1877-1886, the average has Let us examine more carefully the diseases which

we have a reasonable hope of preventing by appropriate sanitary regulations

We shall find at the head of the list a disease which pass down the list we shall come to diseases which are more and more dependent upon the special treat ment of a physician or surgeon, and can be but slightly, if at all, affected by the surroundings which the public officer of health can control

It seems, however, to be true that, with each succeeding year, a larger and larger number of these are found to be the result of influences that can be re

For the first time in the registration history of the State a year has passed—1886—without the record of a single death from smallpox, and this notwith standing the fact that we are in continual communi cation with countries where the protection of vacci nation is not so generally given as it should be, and one of our chief industries, the manufacture of pa per, involves the use of materials which always carry with them the possibility of the presence of the con tagion of this most persistent disease Many years of comparative immunity from smallpox had led to a It was 18 38 per 1,000 in 1869, and 18 85 in disregard of the stringent laws for compulsory vac cination, and the State paid the usual penalty in 1872 and 1873, the mortality in the former of these years reaching 2 9 per cent of the deaths from all causes, with 1029 deaths from smallpox The atten tion of the authorities was aroused, existing legisla tion was rigidly enforced, and additional powers, where found necessary, were obtained, and there has been no year since when the percentage of deaths from this cause to deaths from all causes has reached fourteen hundredths (14) of one per cent

Typhoid fever has, upon the whole, diminished both relatively and absolutely In 1886 the percent age of deaths from typhoid fever to deaths from all causes was 2 15, in the year of greatest prevalence, within a period of twenty years-1872-the percentage of deaths from typhoid to deaths from all causes was 4 86, and the death-rate per 10,000 living was The diminution in the death-rate from this disease has been especially marked in cities with new water supplies and good systems of sewers The death-rate from this cause is substantially un changed in the small country towns

The death-rates from typhoid fever per 10,000 living, in census years 1865-1885 have been for the 1865, 13 4, 1870, 9 1, 1875, 6 4, 1880, 4 9, State

1885, 3 9 Scarlet fever has more than once astomshed the medical world by a sudden assumption of great violence and fatality after many years of comparatively Graves has called the attenharmless prevalence tion of the profession in a most instructive manner to the experience of Dublin, where from 1804, when an epidemic of great malignancy had come to an end, until 1834, the scarlet fever that occurred was At the latter date the disease burst in upon the city with its old-time ferocity. It is therefore with some hesitation that I use the figures of the registration as to this disease The record for thirty years shows a death-rate per 10,000 living reduced from 17 2 in 1857, to 1 7 in 1886 Though it is possible that we are only nearing the end of a series of benignant years, and that another may see the return of an epidemic over which we possess little power Still it is the belief of our most competent observers, that isolation and disinfection have had a sensible effect upon the spread of this disease period of twenty

Diphtheria first appeared in our registration in 1858, causing in that year eighteen deaths, reached its highest degree of prevalence in 1877, and since that year has much diminished in frequency, but has not again sunk to the low figures of the years 1870–1873, when it constituted less than i per cent of the deaths from all causes

If in the present uncertainty of medical diagnosis with reference to croup and diphtheria, it is desirable to consider them together, and all deaths from croup are added to those resulting from diphtheria, we should not obtain conclusions essentially different from those above stated. An examination of our record shows that the reported deaths from croup are slowly and steadily falling in number, and that the two diseases rise and fall together in the scale of prevalence. It is probable, therefore, that a more accurate diagnosis will hereafter transfer to deaths from diphtheria many cases which would, in times past, have been assigned to croup

The relations of diphtheria to the grosser forms of insanitary conditions, is not yet clearly made out. There is also a probability that some of the lower

animals are attacked by it

The degree of its prevalence in Massachusetts in the United States census year 1880, was almost identical with the rate for the whole country. The general rate was 5039 out of 100,000 deaths from all causes, the rate in Massachusetts was 5010 to the 100,000. In England in 1880 the rate was only 532 per 100,000, which does not vary essentially from the rate of the ten years preceding

In the city of Boston a notification to the board of health of all cases of diphtheria, as well as of certain other communicable diseases, is compulsory. The board in such cases causes a careful inspection of the premises to be made. In the year 1887, when 1049 cases, with 316 deaths, were reported, 927 houses were examined, 534 were found to be in defective sanitary condition, 393, on the contrary, were in good sanitary condition.

A rigid inspection of 900 houses taken at random in any city would, I think, not be unlikely to show nearly as large a number of houses that would fail to satisfy an examination which is very apt to start out with the determination to find some sanitary defect

It is a communicable disease in a very marked degree, but does not appear to have any other relation to filth than this, that the absence of proper cleanliness, and the presence of the material of contagion in the food, person or surroundings, are quite sure to go together. It may also be assumed to be probable that a number of mild cases of the disease always exist, and are the unsuspected vehicles of the contagion. We know this to be true of almost all the diseases of this class, and I think we have buther the contagion.

erto taken the probable existence of such cases too little into account

The diarrhoeal diseases, including diarrhoea, dysentery, cholera infantum, cholera morbus, and enteritis, have only changed place in the list as cholera infantum has varied. Cholera infantum, during the period of twenty years, has diminished, though the fall has not been regular, dividing the period of twenty years into two decades, the average of the first yields a death-rate from cholera infantum of 13 51 per 10,000 living, the second an average of 10 32 per 10,000

Dysentery, which in the first half of this century has several times appeared in epidemics of great severity, has thus far in the second half been steadily diminishing in importance. The improvements in domestic water supplies appear to have had some influence upon this reduction in number, so far at least as the question has been studied in certain cities in the State. Only 243 deaths out of a total of 37,244

are assigned to this disease in 1886

Malarial fevers caused, in 1886, 32 deaths, of which number 20, or 62 5 per cent, occurred in the five western counties, which have but 26 per cent of the population Although serious epidemics have occurred in the eastern counties during the years 1884-5-6, they have thus far had little apparent effect upon the death rate Statistics of disease as well as those of mortality would be an additional index of very great value for the sanitary condition of a dis-In the case of the disease now under considtrict eration, they would be of unusual value, because portions of our State hitherto exempt have been invaded by malarial fevers, and yet the resulting mortality has been insignificant. We can only say that malarial fevers have increased beyond the increase in our population, and that this tender exotic in New England has unfortunately found some new conditions which favor its development

The number of deaths from measles has been very variable through this period, this variability in mortality was more noticeable in the last half than in the first half of the period. The average of the last half was also less than in the first half. The number of deaths has ranged from a minimum of 19 deaths.

MORTALITY FROM PULMONARY CONSUMPTION, BY DECADES, 20 YEARS

always exist, and are the unsuspected vehicles of the contagion. We know this to be true of almost all sumption in 1886 was 5897. The percentage of the diseases of this class, and I think we have hith- deaths from this disease to deaths from all diseases.

was 15 83 Arranging the deaths from consumption in two periods, 1867-1876 and 1877-1886, the average of the second decade is found to be 2 5 per 10,-000 persons living less than that of the first decade, that is to say, from 33 7 to 31 2 There has thus been an actual decrease in this disease, and more marked in the second decade than in the first

Our registration report in its precent form gives us no satisfactory answer to one of the most important questions that arises in the consideration of this How often and under what conditions is the predisposition to consumption hereditary? It is, in the very nature of our life, unavoidable that every individual must at many times be exposed to the contagion of tuberculosis, and yet it is within every physician's experience that many members of families with very distinct histories of consumption in more than one generation, do escape

One of the most important and widely spread in- in number, but it is confessed that the death rate as fluences upon the origin and extension of consumption was announced by an honored President of this Association, also the father of State Medicine in Massachusetts-Dr H I Bowditch-fortunately still living in vigorous old age, who, by his announcement and proof of the law of soil moisture and land drainage in their influence upon consumption, has turned the attention of the world to conditions which can be controlled

Pneumonia has generally held the second place on our mortality lists, and has not diminished in relative frequency in recent years

The total number of deaths reported as due to cancer in 1886 was 1104, the ratio of fatal cases among females to the whole number has increased as 1881, 64 4, 1882, 64 9, 1883, 67 6, 1884, follows 66 6, 1885, 68 8, 1886, 69 7 If the statistics relative to cancer during twenty years are divided into two ten-year periods, with death-rates per 10,000 living, we shall find that there has been an increase with a certain degree of uniformity from 29 per 10,000, in 1867, to 5 6 in 1886, nearly double

MORTALITY FROM CANCER, BY DECADES, 20 YEARS

1867 395 1868 445 1869 492 1870 516 1871 551 1872 542 1873 611 1874 585 1875 593

Deaths from alcoholism appear to have diminished cribed to intemperance directly is but an imperfect measure of the evils resulting from an excessive use of alcohol Neither do the figures of the report con vey any just idea of the actual or relative prevalence of the venereal diseases

The fact that Bright's classical description of the diseased processes in the kidney known by his name, was first published in 1837, and the slow progress made in the accurate medical diagnosis of these dis eases during the half century, would lead us to ev pect in the diseases of the kidney an apparent marked increase from year to year

It has been assumed also that the conditions of modern life have brought about a large actual in crease, either from irregular and luxurious living, or improper indulgences in food and drink been claimed by some that the substances now fre quently added to standard articles of food and drink for the purpose of adding to their keeping qualities, or of fraudulently adulterating them, have an inju rious effect upon these organs

The difficulties of answering these questions are much enhanced by the fact that in the early years of our legislation, when the real nature of diseases of the kidney was but imperfectly understood, very many of the deaths really due to this class were reg istered under the head of dropsy Another large class would appear as diseases of uncertain seat, and diseases "not specified "

With these facts in mind, let us tabulate the deaths from Bright's disease and other diseases of the kid ney in one column, and the deaths from dropsy in a parallel column

From an examination of the registration report of 1850, it appears that out of 16,600 deaths there were 18 under the heading of Bright's disease, a ratio of I i to total mortality per 1000, from dropsy 416 deaths were recorded, a ratio to total mortality per 1000 of 25 In the years following the number of grown, reaching in 1886 a total of 1135 deaths, 2 per 1000 If we now add the deaths from kidney

diseases to the deaths from dropsy, we obtain a ratio to total mortality per 1000; beginning in 1850 with 26 1, and ending with 36 4 in 1886

MORTALITY FROM BRIGHT'S DISEASE, MEPHRITIS AND OTHER KIDNEY DISEASES, AND FROM DROPSI, AND RATIOS TO TOTAL MORTALITY

An increase startling enough to attract attention and require investigation, but still not of the alarming character attached to the apparently overwhelming increase of Bright's disease and the kindred af-

We have no evidence in Massachusetts that any of the substances as used for the preservation or upon the kidneys

Another lesson may be extracted from these It is this that statistical nosologies, as well as laws for the protection of public health, are educational and founded upon the learning of experts, and will inevitably break down if they get too far in advance of the common knowledge

The figures also show that, in a sufficiently extended series of years, an explanation of an apparent discrepancy may sometimes be discovered

This hurried glance at the registration tables will have shown this, I think that in all the preventable

marked in the case of small-pox—a disease that can only seriously affect a community through inexcusable neglect

I will not weary the ears of this assembly by dilating upon a topic on which all health authorities are agreed the necessity for compulsory vaccination and revaccination so long as the system is susceptible of the virus

A single comparison will demonstrate the saving of life in consequence of better sanitary conditions established by the authority of a board of health

Probably no single instance of surgical interference in a disease inevitably leading to early death has attracted more attention, has deserved more admiration, or has added so many years to human life as the operation of ovariotomy

The largest number of deaths in any one year in Massachusetts from ovarian dropsy was 51 assume that all of these lives might have been saved

by ovariotomy

Let me take now the city of Somerville, a suburb of Boston, with 29 971 inhabitants by census of 1885, with natural conditions of soil of varied characterpartly favorable, partly unfavorable, with a mixed population almost wholly occupied with business, the trades and day labor It has had an energetic and intelligent Board of Health, who have used the large powers conferred by our statutes wisely They have a system of compulsory notification of the communicable diseases, rigidly enforced, they practice, so far as possible, isolation and disinfection During their active administration and almost wholly in consequence of it, as I believe, the death-rate of the city has been reduced as follows The Board of Health entered upon its work in 1878

In 1875, a census year, the death-rate was 22 86, in 1880 171, in 1885, also a census year, 1668

The improvements are more marked even when certain districts of the city are separately examined

But this examination is scarcely necessary to prove that the interference of a public health authority, by such sanitary regulations as we can now enforce, has saved more lives in a community of 30,000 people, in a single year, than could have been restored to health, in this same period, in a State of nearly 2,000,000 persons, by an operation justly regarded as one of the greatest triumphs of surgery

It may be objected that, with all this apparent diminution in the mortality from selected diseases, there has still been no reduction in the general deathadulteration of food have a marked injurious effect rate, so far, at least, as the figures of the report are to be taken as evidence

It is unfortunately true that our reports, in the earlier years, had a less degree of accuracy than they now have, that deaths were not so generally reported then as now The records of the year 1855 were carefully examined for the purpose of determining the completeness of the enumeration of the deaths in that year It was estimated by a competent authority as the result of the examination, that not far from 16 per cent of the deaths in that year escaped registration

It is now believed confidently that this deficiency diseases there has been a steady reduction, most does not exceed 2 per cent, and the registration by means of burial permits has been made much more as scarlet fever, croup, typhoid fever, dysentery,

Apart from fluctuations in the returns of deaths to the registration offices, there are reasons for believing that some of the conditions are not now so favorable The proportion of the to health as they have been population engaged in factories has steadily and rapidly increased Larger numbers of the people, absolutely and relatively, live in cities, subject to the unsanitary influences that prevail there

In 1875, 63 per cent of the inhabitants of the State lived in cities and towns of more than 5,000 In 1885 the proportion had risen to 73 inhabitants There has also been a large addition to the native and therefore hardier population, of immigrants from foreign countries, whose adaptability to our climate and conditions of life is still uncertain

Too great expectations seem to have been raised, also, by the very brilliant results of sanitary works in Men had to deal there with all the older countries the evils incident to sanitary neglect that had lasted for centuries, and in great cities at that the other hand, the cities have contained a relatively smaller part of the population, and there has not been the same opportunity given for obtaining a result so striking as the reduction in the death-rate of London, for instance, from the high figures at the beginning of the century to those of to day when she is the healthiest very large city in the world

It may be of interest, in this connection, to call your attention to some of the diseases which have attracted general attention, perhaps excited more interest in the public than all other causes of death

In forty-five years and eight months ending December 31, 1886, there appear to have been regis-

tered 1,163,571 deaths

Small-pox has killed 5,572 in this period and has given rise to more legislation than any other single disease, and is the one most easily controlled provision of law is the beginning and end of its regulation-and that is compulsory vaccination and revaccination

Scarlatina has destroyed 37,666 lives, permanently impaired the value of a large but unknown number, and the attempt to prevent it by sanitary regulation

belongs to recent years

Typhoid fever has been fatal to 45,871 human beings, generally in the prime of life With an origin almost always in fæcal pollution, it becomes epidemic whenever that pollution reaches a water supply or The general conditions which food, especially milk sustain this disease in its endemic form and favor its epidemic spread are the same which produce general unhealthiness

It has been well said that an epidemic of typhoid fever is a sanitary crime and should be punished as But the peculiar history of this disease has had but little influence on legislation in this country

Epidemic cholera, the most persuasive apostle of sanitation that has been permitted to land on these shores, has destroyed from 1832 to this year not more than 2,000 lives In no one year, excepting 1849, the year of greatest prevalence, has it proved so fatal a distance?

pneumonia, whooping-cough, cancer or apoplety, and even in 1849 the deaths from cholera did not vary much from the quarter part only of those from consumption

Hydrophobia is represented by 72 deaths More than half of these occurred in the four years 1876-79 There has been no death from it since 1881

Thirteen deaths from yellow fever have not been considered of enough consequence to be given a place in the general summary They occurred at the quarantine station in Boston and did not, perhaps, recall to any public health officer's mind the fact that about the beginning of this century yellow fever had in more than one year been a pestilence in the city itself

Our experience in State preventive medicine has proved this that while great good can be done to any community by the establishment of a board of health, whose functions are largely those of instruction and advice, it is certain that, sooner or later, the people will place in the hands of those capable of exercising such powers the machinery for making that advice effectual And this has happened with regard to every subject which has been successively made an object of inquiry. There is now ample authority for the control of public water supplies and systems of sewerage, sufficient legislation to punish and prevent the adulteration of food and drugs

One of the most encouraging signs is the more intelingent view taken by the public of the questions to which self-interest seeks to attach a sanitary signifi

Perhaps the much-vexed question of oleomarga We have rine may be taken as an instance of this in this substance a legitimate commercial product which, when properly manufactured, is a safe and It can be so useful addition to our food supply When sold as natural butter made and is so made it becomes an impudent fraud and should be punished But it is no more a matter of concern to sanitarians than the proper making of butter itself is, and some of our legislative bodies appear to so regard it

It has been well said by one of the most eminent of the executive officers of health, Dr Russell, of Glasgow, that "nothing is more conspicuous than the helplessness of the individual under the conditions of civilized life to secure the physical basis of health

How can any single individual in a crowded city make any successful effort to improve, or even to ascertain the quality of the public water supply upon which he is exclusively dependent? What can he do to secure a sufficiently prompt and safe removal of the waste materials of his daily life? How can he analyze the ingeniously sophisticated articles of food or medicine which may represent the ingenious employment of all the scientific skill that selfish capital can purchase? How vain it would be for him to at tempt to prevent the crowding of the city, or the contamination of the air which he is obliged to Lastly, how can he recognize the presence of communicable disease, and recognizing, keep it at

There is no help but in cooperation on the most extended scale possible, individual, municipal, State and National The individual must be compelled to The great give up his liberty to injure his neighbor city must be restrained from converting the stream that flows past it into a sewer that shall poison the small villages that cluster about its banks lower down in its course The country farmhouse must no longer, when a case of enteric fever occurs there, be a menace to the water that supplies a thousand city houses No State should permit its own causes of disease, whatever they are, persons or things, to be transported into another State, nor pollute the common Lastly, the General Government water supply should take cognizance of those causes of disease which can be controlled by no other power, or which are so general that the responsibility for them is National, or so overwhelming in their ravages that smaller political bodies have lost the power, if not the will, to protect the people

Voluntary association on the part of persons, towns, States, or Nations even, will never establish a sufficient safeguard when one dishonest or ignorant associate has it in his power to nullify all the effects of a neighbor's spirit of self sacrifice and restraint

Epidemic disease is an evil that cannot be left to work out its own cure, it widens its circle too rapidly, and the time is long past when any quarantine, using the word in its older sense, would be sufficient to restrain a pestilence within the limits of the district whose sanitary crimes might have fairly deserved some punishment

How, then, shall we organize for the protection of

the public health?

For the individual, that he may not injure his neighbor through his own ignorance or that of his adviser, let the State give him some assurance that the legally used title of physician designates a person sufficiently qualified to give advice for the prevention and cure of disease—and a certainty, also, that the

quack who steals the title shall be punished

Establish, by direct provision of State law, local health authorities for each well-defined unit in our various forms of local government village, town, city or county Place in the hands of these authorities the execution of the laws of the State and all local ordinances and regulations pertaining to the public health, impress upon them the duties of watching all those conditions which immediately affect the health of the people, water supply, sewerage, san. tary condition of school houses and scholars, factories, tenement houses and the markets, periodic inspection of the inhabitants to prevent the neglect of vaccination, house to house inspection at least an-In brief, they should have all the powers which society assumes for protecting the public health

To meet the possibility that some districts may not have intelligence enough to appreciate, or that powerful commercial or other interests may interfere with, these laws, there should be a State authority with

ample powers

This would be called upon for the purpose of har monizing the action of the various local boards, where the interests of various localities were involved. It

should have coordinate power with all local boards in cases of communicable disease, in order that its action may be prompt and salutary It should be enabled to carry on scientific investigations as to the causes of disease, to suppress novious and offensive trades, as it will often happen that some great industry will possess in a community an influence sufficient This condition to control the local board of health did in fact exist in Massachusetts, and no action of our State Board of Health in its earlier years was more heartily commended than that which transformed a town pestilent and disgusting from some fifty slaughter houses into an attractive suburb of The business of slaughtering and rendering is now, in consequence of the action of the Board, carried on in an abattoir entirely without offense

This authority should also have the supervision of the laws for the prevention of the adulteration of

food and drugs

It should have the general oversight of the public

water supplies

It should have charge of the registration of vital statistics, and of the investigations of the diseases of animals so far as they affect the health of man

The educational element should be always present in the work of the State and local boards of health, and as in all other affairs of life the value of the lesson will stand generally in direct relation to the cost of it. The person who receives the benefit of a sanitary improvement should pay, if able to do so, a part, at least, of the cost, and should never be permitted to lose a sense of the obligation of preventing the spread to his neighbor of unsanitary conditions of his own making

All the arguments that have been used for the existence of State health authorities are also available, it seems to me, for the creation and support of some organization for the protection of the public health in connection with the general government. I think that the medical profession is agreed, that no power less than that of the National Government will be sufficient to prevent the introduction of disease from abroad, or control its transport from State to State. There is, of course, a question as to what form that central authority should take and how extensive should be its power.

The well being of the country, to use the language of the Constitution, should imply that we must know all that can be known about those diseases and causes of disease which may affect the whole country

Although the actual epidemic prevalence of disease of grave and frequently fatal character may be limited to certain districts, still the disturbance of commerce and the ordinary relations of life will extend to large sections of the whole country. Therefore the National health authority should have the power and the means necessary for a thorough investigation of the communicable and epidemic diseases and of the best means of preventing their spread. These investigations need not be limited to this country, in fact, it is quite evident that several of the most important diseases of this class must be also studied outside of the country, yellow fever, for instance

The General Government should also make avail-

able for use in all parts of the land, the information from foreign countries, as to the prevalence there of likely to do so in the future, and is at the same time contagious and epidemic diseases communications as may be made by consular officers, for these as a whole have probably no great scientific value, but that great mass of information which through one channel or another reaches Washington

To this should be added the statistics of mortality and disease already published by very many boards of health throughout the land, and not now readily available for use, except by difficult and tedious search | dies through many documents accessible to few

naturally be associated some arrangement for the pends, it seems to me, very much upon the form of prompt receipt of information from all sections of the organization. If that of a board should be se the existence of dangerous communicable diseases, for the purpose of warning from a central office all interested communities A voluntary system of notification, established by the National Conference of the State boards of health, has proved of much service, notwithstanding the fact that some of the great States have abstained from giving this information in a useful manner But the usefulness of this method of communication has been seriously limited by the want of a central office with comparatively simple system for sending prompt advice in any required direction

Not the least of the very many claims of the National Board of Health upon the medical profession was its attempt to secure uniform systems of registration and vital statistics, and a nosology adapted to the changed views now entertained as to the nature This work should be taken up of many diseases again and carried on, if necessary, by liberal appropriations for the purpose of encouraging and assisting everywhere a continuous registration of vital statistics ın suitable manner

Dr Billings, the wise and experienced officer in charge of the Mortality and Vital Statistics of the 10th Census, says

"But, as the United States has no system of registration of vital statistics, such as is relied upon by all other civilized nations, for the purpose of ascertaining the actual movement of population, our census affords the only opportunity of obtaining even an approximate estimate of birth and death rates of much the larger part of the country, which is entirely unprovided with any satisfactory system of State and municipal registration, and the data which the census gives, imperfect as they are, are the only ones by which we can compare the healthfulness of this with that of other countries, or can ascertain, even approximately, the relative salubrity, or liability to particular forms of disease, of different parts of our own territory" And again, "Nothing pays better than good book-keeping in national affairs, and in no part of a nation's work is good book-keeping more useful than in keeping records of the life and health of its people "

The most troublesome point in the whole enquiry How far should the General Government enter into the management of quarantine?

the assistance of the authorities at Washington dur- office

ing any pestilence within her own border, and is not Not simply such fortunate enough not to have felt for three quarters of a century the terrors of the pestilence which has wrought such havoc in other States With all this I say, that it seems to me the duty of the whole coun try, through the national authorities, to assist those communities which are too weak to help themselves, and to undertake the health functions of local gov ernment for those too ignorant to know their reme

A satisfactory settlement of the question as to the In connection with this statistical work would power to be bestowed on the national authority de lected with an adequate representation of the separ ate States, there would then seem to be no senous objection to the bestowal upon this board of a direct control of quarantine The points in dispute be tween the General Government and the States would appear to be safe in the hands of a board of national authority and directly representative of the States It is quite probable that such a board would be cum bersome in form and not altogether easy to controlwhich is far from being an unmixed evil—but there are many contrivances by which a large board can delegate its powers to an executive committee during the intervals between the general meetings—meetings which need not be frequent I can easily see, how ever, that this question is one for the law-maker rather than our profession

The only alternative seems to be a single officerat the head of a bureau in connection with some one An officer not of the departments at Washington charged with great executive powers, who shall have, so far as it is possible, unlimited authority to investi gate, by himself or by competent experts, the ques tions which directly relate to protective medicine He should be at the head of all the current medical statistical work of the Government, with the excep-He should be in tion of that of the public services constant and harmonious relations with the scattered health authorities of the land and should be permitted to cooperate with them in sanitary work He should be subjected to the distractions of no other serviceneither of the Army, of the Navy, nor of the Marine The vast dimensions to which Hospital Service State medicine has already grown, the apparently unlimited field for future extension, make it evident that nothing less than all the thought and all the working hours of the best man are not too much to be devoted to the supervision alone of the investiga tions which ought to be made not in one year of epi

demic panic, but through all years The very manifest advantage to this officer of a board of advice could and would in the very nature of things, be afforded by some representative of the State boards of health, quite similar, perhaps, to that now existing in the National Conference of State The need of early and confider nal inter course with these intelligent, active and responsible bodies would suggest itself at once to the sagacity of Though I come from a State which has never asked any man who would be likely to hold this important

and the Bureau of Education have from time to time and educational interests of the whole country

Of the sanitary investigations carried on by the authorities at Washington, with the exception of those under the direction of the National Board of Health, it is not possible to speak with much satisfaction Not that the scientific men who conducted them were have been But it was very difficult in a year of health to secure the necessary action authorizing inwill be equally difficult to secure the means of continuing the work

Dr Shakspeare was sent abroad, in 1885, to make Southern Europe Beyond a few brief notices in the meagre appropriations medical journals, one State board of health at least knows nothing, through any official information through any department at Washington, of the results of the enquiry As the board of Health alluded watching the second largest port of entry in the hopeless lethargy knowledge is inexcusable

American Public Health Association, as well as at the meeting of the National Conference of Boards of Health, measures were taken for bringing to the attention of Congress some of the alleged facts in regard to the preventive inoculations in yellow fever practice in Mexico, by Carmona, in Brazil, by Freire Congress was requested to appoint a committee of experts to visit these countries and ascertain the truth of the statements made Notwithstanding the apparent willingness of the authorities to grant the petition, the mevitable delay attendant upon National legislation prevented action until the summer of 1887, when the appointment of a single expert was authorized The President, with great promptness, appointed an expert of the best qualifications—and Dr Sternberg made a journey to Brazil, and subsequently to Mexico The year does not appear to have been so favorable for his purpose of studying the subject during the general prevalence of the disease as one of the preceding years would have been. Nor under his rigidly drawn instructions does he seem to have had all the advantages that would have accrued to an investigation less controlled by precise orders

Unfortunately, the evidence submitted by Drs Carmona and Freire appears to have been entirely prophylaxis of yellow fever by their inoculations been yet demonstrated

the result, that seems only just beyond our grasp, will find these claims, however, had been advanced so confidently by men holding honorable positions, inocula

I believe that both the Department of Agriculture tions had been made on so extensive a scale, that a formal examination had become a necessity called to their aid representatives of the agricultural Sternberg's investigations are worth all the money that has been spent upon them The way has been cleared for an exhaustive examination of this most virulent of important pests, an inquiry that should have no limit of time, short of the discovery of a sufficient cause, and if possible, of a preventive, even if an expenditure of money be required, only not entirely competent, it would have been difficult less than the number of dollars that inadequately to have found men as well qualified as many of them measure the country's losses and sufferings under this scourge

It would be a satisfaction to all of us, I am sure, vestigations of diseases that might at any time enter if Dr Sternberg is enabled to complete the work so our country, and there is every probability that it faithfully and intelligently prosecuted from the Havana investigation of 1879 to the present day

But it must be regarded as a misfortune that scientific work of this sort should not be continuous, and investigations of Asiatic cholera, then raging in free from the irksome burden of limited time and

I approach the conclusion of this possibly wearisome repetition of common-places with some hesitation, for I wish to say a few words about the National Board of Health, still by Act of Congress in to is charged with the coordinate responsibility of legal existence, by neglect of Congress in a state of This Board entered upon its Union-which has a more frequent communication work with every promise of success-the members with cholera infected ports than any other, except of it were the best our profession could offer—the New York, the failure to communicate valuable contributions to public hygiene, both by the services of its members and the labors of its experts, have Again, in 1885, at the Washington meeting of the their due and honored place among the records of such work the world over

It demonstrated for the first time in this country, I venture to say, that local, State and National health authorities could profitably and harmoniously unite in suppressing an epidemic of yellow fever, and preventing its spread from State to State, and that, under the influence of an impartially vigilant sanitary inspection and treatment, trade and commerce need not materially suffer Yet all this has not saved it from practical extinction Mistakes were probably committed, but they are trivial as compared to the I feel forced, for my own part, merits of the Board to the conclusion that its organic form—quite distinct from that of a body of such powers with which I am acquainted, and unlike anything in our own National Government-must explain the failure to survive the unjustifiable attacks made upon it

The presence upon the board, of representatives of the Army Navy and Marine Hospital Service, however conspicuous may have been the attainments of their respective representatives, was not ad-They represented interests which ordivantageous narrly are of far less consequence than those of New York, Chicago, New Orleans, or San Francisco

It would not be possible, I think, to select seven insufficient to justify the claims made by them of the men—that being the number of the appointed memdiscovery of the yellow fever germ, nor has a bers of the Board—who should adequately represent the various divisions of the country The States are not accustomed to a representation at the hands of It is a disappointment that we have not reached other States, and the State not directly represented will find it difficult to understand the principle of

The great States of Ohio and Pennsylvania have

not been directly represented on the existing Board Is it well to wait until a new outbreak of yellow fever, or the landing of cholera gives us legislation

founded only in the weakness of fear?

I cannot but think that it is better to have the substance of things whether it comes in the form of Bureau of Health or Board of Health, provided only that some of the great resources of the Nation shall be turned to the protection of that property which is at least as valuable as the cotton fabrics of a Massachusetts mill or the wool of Ohio sheep mean the protection of that greatest property of all -human life

ORIGINAL ARTICLES.

CASES OF IDIOPATHIC ANÆMIA

Read before the Medical Society of the District of Columbia, February 8, 1888

> BY ROBERT T EDES, MD, OF WASHINGTON D C

I do not intend here to give a systematic history of this interesting class of cases, but only to call attention to some of the prominent points illustrated by some which have fallen under my own observa-A very complete and lucid account of the general subject is to be found in the article by Dr Osler in "Pepper's System," vol in sary, however, for the sake of clearness, to mention the more characteristic and diagnostic points which justify us in giving to a case of anæmia the designation of idiopathic, essential, or progressive permi-The latter adjectives are only applicable to a part of the cases which are properly classed together by every characteristic except a fatal termination, and it is not justifiable, certainly until the nature of a disease is better known than that of the one under consideration, to incorporate in its name a prognosis which is not an invariable one

The first of these points is the intensity of the anæmia, often, and, indeed, frequently, without emaciation, or at any rate with a degree of emaciation which does not correspond in degree to the anæmia The color of the skin in cases of this kind, owing to the fat which is still retained under it, is yellow and waxy rather than white, as it is more likely to be in the forms of anæmia depending on malnutrition, and might sometimes suggest jaundice, but does not, of

course, extend to the conjunctiva

The count of the blood corpuscles is low, lower even than the amount of coloring matter would indicate, presenting in this respect a marked contrast It not infrequently, to the anæmia of chlorosis even in cases which recover, falls below 1,000,000 to the cubic millimetre, the normal being in the following cases, where it would have been difficult, in neighborhood of 5,000,000 for men and 4,500,000 for women

The proportionate color of the blood (hæmoglobin) may be a little greater, so that the individual corpuscle is even a little richer in hæmoglobin than normal In chlorosis, on the other hand, the hæmo- the prognostic views associated with it, the recover,

globin contents of the blood are much more dimin ished in proportion, and the individual corpuscle is much less colored than it should be

A few weeks ago I counted the corpuscles of a chlorotic young woman and found but little diminu tion of the count below normal, while the color test (which has been several times repeated with the same result) gave only about one-third of the normal

The shape of the corpuscles is irregular They become swollen, more nearly spheres than discs, and sometimes look like a foot-ball partly blown up, or they are elongated and assume the shape of a pear, a battledore, or a snow shoe, or they have tails This is more obvious in a fresh than in the dried specimen In size also they vary within wider limits than the normal, and there are found very large and very small individuals (megalocytes and microcytes).

The specimens I show here were kindly photograped for me from a dried specimen of the blood of the last case I shall report, by Dr Gray, of the Army Medical Museum I show a photograph of normal blood by way of comparison Some other less important and less constant changes are sometimes observed The proportion of white corpuscles is not materially changed

While the irregularity of shape would of itself, in a case of which nothing else was known, be sufficient to raise a suspicion of idiopathic anæmia, yet it is not quite certain that severe anæmia of other forms may not produce them I have myself seen in other cases alteration in the shape of the corpuscles, not equalling in degree, but resembling, that of the form now under consideration

So much for the form of anæmia The next point is that there is no discoverable adequate cause for the condition, and here, of course, comes the oppor tunity for many difficulties and errors in diagnosis It is obvious that many obscure diseases attended by a secondary loss of corpuscles and color may, before their true nature is discovered, be considered Abdominal cancer, not yet eviidiopathic anæmia dent to the touch or not giving rise to distinct local symptoms, is one of the conditions likely to be sus pected among the first Anæmia from hæmorrhage which the patient does not think of sufficient conse quence to mention, chlorosis, the various obscure diseases connected with changes in the spleen, lymphatic glands or suprarenal capsules, may counterfeit it more or less closely A case in which idiopathic anæmia was among the conditions suspected, but which was found at the autopsy to be one of chronic pancreatitis, was reported in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION for December 24,

The difficulty is not lessened when, as not infrequently happens, there are slight symptoms pointing in some other direction, as will be seen in two of the the absence of a microscopic examination of the blood, to say that the anæmic appearance of the patients was not due in one case to an interstitual neph ritis, and in the other to a chronic diarrhœa.

If we adopt the most alarming nomenclature and

of the patient may be a fortunate but confusing element in the diagnosis

The details of symptomatology I do not propose I will only mention, as of especial importance, digestive disturbances, great weakness, dyspnœa on exertion, and various hemorrhages, including cerebral and retinal, the latter of which may have considerable diagnostic significance

The most noteworthy recent contribution to our knowledge of this affection has been the observation, now many times repeated, that in a certain number body, and also retinal hæmorrhages of cases marked atrophy of the stomach tubules co-The temptation is naturally exists with the anæmia strong to attribute the anæmia to lack of nutrition It is, however, not yet certain that the atrophy is not simply a part of a general degeneration, and dependent on, rather than causing, the diminished nutritive power of the blood

The gastric symptoms, though present in these cases, are not so marked as we should expect to find in a case which is to end in so excessive a degree of anæmia. They are not by any means so severe as we may meet with in cancer or ulcer of the stomach, and yet the failure in the nutrition of the blood is much greater

If it can be shown that, in a certain proportion of cases, gastric atrophy distinctly precedes the development of an extreme anæmia having the features tion of the form we are describing, it seems to me we can phy of the mucous membrane no longer call it "idiopathic or essential," for the cause is an adequate one, and we can only say that certain kinds of gastric (and perhaps further investigation may show, intestinal) atrophy, give rise to a set of symptoms closely resembling those which occur in other cases in which no such lesion can be found It is to these cases that the adjectives "progressive pernicious" most strictly apply

In another set, intestinal parasites, especially tæniæ, have been found, but not frequently enough to establish a rule, or to do more than make it desirable, in forming a diagnosis, to exclude this possible condition, which, however, has not, so far as I am aware, been noticed in this country Neither are we afflicted with the anchylostoma duodenale which, among the workmen in some of the tunnels under the Alps, have been found to be the cause of a severe form of anæmia.

As regards enology I can only say that in none of the cases I have to report has either of the most common causes been present These are the puerperal condition or severe mental shock

CASES

I. An old soldier of characteristic appearance, with a blood count below 1,000,000, but to per cent of hemoglobin, had a slightly enlarged spleen for a time, but it soon disappeared from touch might have been considered a case of leucocythemia had the blood not been examined and found not to contain any excess of white corpuscles in proportion He was soon lost sight of, but I have little doubt that his life was not long

his face and soon began to have headache, dizziness, and noises in his ears When seen he appeared muscular, not emaciated, but his skin was almost yellow and his mucous membrane nearly white. He expressed himself as feeling strong, and was not sure that he could not lift a barrel of sugar out of a wagon as he had been in the habit of doing, although, half an hour previously, he had nearly fainted on walking from the ward to the lecture-room

There were a good many purpuric spots on his

A blood count gave less than 670,000 red corpuscles to the cubic millimetre, but there was not so much change in shape and size as sometimes seen The further progress of the case was unfortunately simple and uninfluenced by treatment He steadily and rapidly lost strength, becoming so weak that he could hardly move in bed without danger of fainting Delirium, diarrhœa, great dyspnœa on exertion preceded the fatal termination, which took place about seven weeks after he first felt himself sick topsy revealed extreme anæmia without great emaciation, there were ecchymoses in various organs There was granulo fatty degeneration of the heart and kidneys, and there were opaque yellow patches in the stomach which may have been fatty, but of which there is no record of a microscopic examina-There certainly was not any well-marked atro-The aorta was of somewhat smaller calibre than usual, and its walls The marrow of the femur was in places red and jelly-like, and contained, in addition to the usual constituents, a few nucleated red corpuscles marrow of the sternum was of a reddish-yellow color, but was not examined microscopically

This was as typical a case of the "progressive pernicious" form as one often sees, and yet both symptoms and lesions remove it clearly from the class of those dependent (if any are) upon gastric atrophy, although it is by no means improbable that, had the patient lived some weeks longer, such an atrophy, consequent upon fatty deneneration of the glandular

elements, might have followed

III A middle-aged woman was seen in consultation, presenting the characteristic external appear-The blood was pale, but the corpuscles were not counted, as, not knowing the sort of case I was going to see, I had not provided myself with the necessary apparatus They were, however, irregular in shape and size Nothing else could be found by She died in about ten days physical examination

In this case there had been no pregnancy for some

years and no mental shock

IV The next case, more chronic in its course, was that of a college professor 57 years of age had been a good deal of trouble in his family in the way of sickness and sudden death, but hardly anything that could be called a shock

His general appearance was sallow, his face and His appetite was good and his digestion hands brown, partly at least from exposure, his legs His wife had noticed the dark color y ellow complained chiefly of weakness, so that going up a II A young man, who had previously considered slight elevation distressed him, and of oppression or himself healthy and strong, noticed a loss of color in sinking across the chest and in the epigastrium

His mind was clear There was Pulse 100 to 108 only slight and occasional digestive disturbance Nothing was to be found by the usual physical examination except a soft systolic souffle along the left

edge of the sternum

The blood was not examined, partly because I had not prepared myself with the apparatus, but chiefly because my mind was occupied by a diagnosis which turned out to be erroneous This was Addison's dis-The diagnosis of his attending physician, a man of wide experience and learning, rather inclined to abdominal cancer

After some weeks, during which I did not see him again, he died, and there were found fatty changes in various organs and red marrow in the bones There were no changes of the suprarenal capsules

V A man, at about 55, had been sick three years with anæmia without known cause, had recovered under the use of arsenic, again had the same trouble

and again partial recovery

When seen, in June, he had been failing since De-He was very pale, his face a cember or January Nothing was to be got by physical little bloated examination except a tender spot at the epigastrium There was no jaundice, no and one lower down It was supposed that hæmatemesis and no polyuria there had been some fat in the stools The blood corpuscles were irregular in size and shape diagnosis was idiopathic anæmia with a possibility of cancer about the head of the pancreas

The autopsy, at which I was not present, showed the muscles to be dark-red, but the other tissues The stomach was thin and pale, the pylorus and duodenum contracted to about one-third the ordinary size, small intestine pale but healthy Pancreas normal, mesenteric glands somewhat en-There may have been some increase in the larged Unfortunately, connective tissue of the kidneys there was no microscopic examination of the stomach or of the marrow of the bones

An examination of the gastric tubules would have been highly satisfactory, but there seems good reason to suppose, from the gross appearances, that this was one of the cases of atrophy of which several have

been minutely described

VI A ship carpenter æt 41, a man of large frame, not fat but by no means emaciated, had not Complexion pale and yelbeen well for two years He complains of weakness, headache, and dyspnœa on exertion, and loss of appetite His sight is dim and he is somewhat deaf Slight cough without expectoration, pain in the lumbar region has had a little cedema of the feet and ankles urine shows some traces of nephritis, which disap-The improvement in this peared in a few days respect, it should be noted, took place before his general condition was much better

The diagnosis might easily have been made of a moderate nephritis in the way of recovery, had not the condition of the blood, both as indicated by his complexion and the count, been entirely out of proportion to the amount of nephritis The characvarying both in size and shape, while the successive of the eye gave negative results ter of the corpuscles was of the usual kind, they counts were as follows

May 20, 780,000, May 27, 735,000, May 31, 955,000, June 7, 1,290,000, June 14, 2,036,000, June 24, 2,695,000

This is one of the cases where uncertainty in diag nosis arises from recovery Soon after this last count the patient eloped from the hospital and continued well enough to elude my search as, although I got distant tidings of him as being pretty well, he evi dently thought I wanted him for some legal rather than scientific purpose At an early period of his sickness, after about a fortnight of very careful feed ing, rendered necessary by his deficient nutrition, being, in fact, partly by the rectum, he made an un authorized meal of ham and eggs without harm, which seems a valuable piece of negative evidence as re gards any atrophy of the stomach The treatment, in addition to the diet, consisted in arsenic in the form of Fowler's solution

VII D C P, a young man, with chronic diarrhœa, anæmic, very weak, pale and listless The diarrhœa improved and disappeared under the use of large mildly astringent enemata

Examinations of his blood were as follows

Oct 14, 763,000 No excess of white A good many of small diameter A good many pointed and tailed Oct 21, 1,019,000 Oct 31, 1,877,000 Nov 5, 1,665,000 Nov 10, 2,178,000 Nov 15, 2,438, 000 Dec 10, coloring matter about 50 per cent of the normal Dec 13 Discharged, gaining in flesh, strength and blood Went to Florida

VIII A man æt 71, of active habits, had not been well for two years except during a visit to Califorma the previous winter He was seen on January Last September he noticed shortness of 13, 1887 breath on exertion, his feet and legs felt cold Six weeks ago, on going out into the street, felt a sudden weakness of the legs and was obliged to return, which he did with much difficulty, being hardly able to get up the doorsteps When I saw him he was in bed, though he was able to stand up for a part of the He complained chiefly of coldness examination and stiffness of the legs, as well as of weakness but There was considerable pain of no pain there about the rectum which turned out to be largely due to his over anxiety on the subject of his bowels and consequent over treatment. It soon ceased to give him further trouble A sensation of constriction or pressure across the lower part of the bowels was a constant accompaniment of the case and seemed to have little or nothing to do with any condition of constipation or otherwise

With the history of his sudden attack and the peculiar sensations and weakness in his legs my atten tion, like that of his family and his former attendants, was naturally directed toward any evidence of spinal The limbs could be moved freely in any disease desired direction as he lay in bed were flabby and small but not decidedly atrophied and reacted well to the faradic current Sensation was everywhere present, and both superficial and deep reflexes were of nearly normal intensity could stand with his eyes shut

Examination of the urine, rectum, and the fundus

heart transmitted toward the right, and some prolongation of respiration over the whole chest, but no distinct rales I should have said that their was considerable expectoration of thick mucus A count of the blood a week after my first visit gave 1,575,000 to the cubic millimeter with many of the corpuscles irregular and small My diagnosis excluded any distinct organic spinal disease, as hæmorrhage, soften ing, or inflammation, or the systematized scleroses, and attributed the abnormal sensations and the pseudoparalysis to anæmia of the cord as a part of a gen-I was not able for some time to rid eral condition vertebræ, or of some abdominal organs, but repeated physical examinations with negative results, and the absence of any new symptoms pointing to such growth, together with the positive results of an inspection of the blood, left no alternative open but idiopathic anæmia Whether the feeling of tightness across the lower part of the abdomen was simply an abnormal sensation like the rest I could not be sure, but it certainly was not due to any distension or growth.

The dependence of a well-marked paraparesis upon a general an emia is a phenomenon of sufficient interest to justify a digression Anæmia and hyperemia of the spinal cord, from the very nature of the case, and in fact much like the corresponding conditions in the brain, have been the subject of many more suppositions (most of them reasonable it is true) than of direct observation

Localized anæmias of the spinal cord may be produced by obstruction of the aorta or by embolism of the spinal arteries A theory has also been held that in some of the so called reflex paralyses a spasm of the vessels cuts off the blood supply from more or less limited areas of the cord With these, however, we are not at present dealing

The existence of a paraplegia dependent, not upon a local anæmia, but upon a general one is, however, admitted, though certainly not at all common in a well marked form Cases of paraplegia after severe puerperal hæmorrhage, such as have been a large proportion of those reported, cannot be regarded as quite so conclusive in this way, since other puerperal processes like septicæmia and thrombosis may complicate the matter, but undoubtedly a part of them are of this character There have been, however, others where large hæmorrhages from the bowels have been followed by a temporary paraplegia, and one where such a paraplegia consequent upon uterine hæmorrhage and in process of recovery, underwent two exacerbations on renewal of the hæmorrhage Another case occurred after profuse epistaxis

Last winter I saw with my friend Dr Bates, of the Navy, a case of this kind, a young man under the care of your Secretary, Dr Adams, who intends to report in full He had suddenly lost the power in His history at first would have led one to suppose that the sudden paralysis was the beginning of his illness, and naturally enough to think of hemorrhage into the cord or its membranes or a very rapid enteritis from which he rapidly sank my elitis, but it appeared on further inquiry that he

There was a systolic murmur at the base of the had been having frequent and profuse hæmorrhages from the rectum for a long time previous, but had kept about his usual work until this attack saw him there were no disorders of sensation, his reflexes were normal, and voluntary motion of every kind was present though not very strong. The hæmorrhage, which came from a small vessel an inch or two above the anus, was being treated by Dr Adams with the result of a complete restoration of the functions of the spinal cord

It is not difficult to explain why deficient supply. of nutriment should affect the spinal cord sufficiently to cause a loss of function, but it is not so clear why myself of the suspicion of malignant disease of the the cessation of function should come on so suddenly when the condition that causes it must be gradual in its development, nor why it should be confined to the lower segment of the cord when the anæmia is

general

We can find analogies, if not an explanation, for the first difficulty, as for instance, in fatty degeneration of the heart which certainly must be developed very slowly but which kills very rapidly The nervous centres of the heart pushed to the full extent of their failing powers break down under a sudden increased demand The last straw breaks the camel's As to the second, there may be some conditions of the circulation which render the effects of a general anæmia more perceptible in the lower part of the cord, or, what is more probable, that the lumbar enlargement is sooner exhausted because more usually called upon for a constant expenditure of energy than that portion which supplies the arms is often noticed in animals coming under the influence of a paralyzing poison that they continue to drag themselves around by the fore paws when the hind legs no longer support them

Hilton Fagge says he knows of no case where anæmic paraplegia has been reported in connection with pernicious anæmia, but the fact of his making the remark shows that this sagacious observer recog-

nized the possibility of such a connection

The further progress of the case is briefly told Careful feeding and the use of tonics, especially arsenic and strychnine, improved the nutrition patient gained a little flesh and a little strength His blood counts went from the original count, on Jan 21, 1,575,000, Jan 28, 1,425,000, Feb 26, 1,620,000, March 27, 1,850,500, April 19, 2,060,000, May 23, 2,250,000, June 13, 2,540,000, coloring matter 70 By this time he had gained considerable per cent flesh and some strength, was eating, enjoying and digesting, a very good variety of solid food noticed soon after this that the patella reflex was wanting, but there were no other symptoms of increasing paralysis There was a good deal of stiffness and some pain about the hips and the hands, and one episode of constipation and irritative diarrhœa relieved by a dose or two of castor oil question of his going away to avoid the hot weather was discussed, but he preferred not to give up the comforts of home until he felt stronger, and during the extremely hot weather of last July he contracted an

The only notable point in the treatment, not al-

ready mentioned, was the use of inhalations of oxygen | kidney, in beginning suppuration, nephrotomy It for some weeks, but so far as the patient or I could is also advisable to remove the organ in prolapse see, it did no good

MEDICAL PROGRESS.

SURGICAL INTERVENTION IN AFFECTIONS OF THE KIDNEY -A BRODEUR has published a work entitled "De l'Intervention Chirurgicale dans les Affections du Rein" (published by G Steinheil, Paris, 1886) in which he examines 327 operations on the kıdneys

Of the 327 operations 212 were performed on females, 94 on males, with 15 children, and 6 cases in which the sex is not given In 136 cases the right, and in 105 cases the left kidney was concerned 86 cases the side is not mentioned Of the 327 operations there were 235 nephrectomies 125 lumbar with 62 4 per cent of recoveries, and 110 abdominal with 50 per cent of recoveries There were 43 nephrotomies 34 lumbar with 67 64 per cent of recoveries, and 9 abdominal with 77 77 per cent of cures, 39 nephrolithotomies 36 lumbar with 77 77 per cent cures, and 3 abdominal, all of which died Ten lumbar operations for nephrorrhaphy, with 90 per cent of recoveries 200, 61 16 per cent, were followed by recovery 1885 S W Gross recorded 233 collected cases of from laryngeal tuberculosis operation on the kidneys, with a mortality of 44 6 per cent, including 93 nephrotomies with 23 1 per cent mortality In a later communication he gives a collection of 17 nephrorrhaphies with only one death

The indications for the different surgical operations on the kidneys, as given by Brodeur, may be thus moist râles at the apex of the left lung. The epi

In wandering kidney which causes severe symptoms, nephrorrhaphy should first be tried after the failure of other measures, and if this be unsuccessful the mucous membrane covering the arytenoid carti nephrectomy should be done

In hydronephrosis which calls for operative treatment, and in suppuration of the contents, Brodeur tite was poor recommends nephrectomy Should a fistula remain, a nephrectomy may be done later under favorable few days' rest was prescribed, during which medicinal circumstances

In simple congenital or acquired cysts of the kidneys, including echinococci cysts, the author advises against nephrectomy, and holds that nephrotomy only is allowable

In carcinoma of the kidney Brodeur believes that, on account of the heretofore very unfavorable results, the surgeon should not proceed to a radical operation without careful examination of the other kidney, whilst for sarcoma of the kidney, he strongly advises extirpation, as well as in cases of benign In small, painless, and otherwise not renal tumors troublesome benign renal tumors the surgeon should at first abstain from any operation

In severe contusion of the kidney the author voice adopts Simon's rules In uncontrollable hæmor- peared, expectoration diminished, nocturnal cough rhage, ligature of the vessels and resection of the ing ceased Dr Heryng, who examined the patient

with threatened gangrene

In renal and ureteral fistulæ which cause much trouble to the patient, nephrectomy can seldom be avoided

In renal calculus nephrolithotomy by lumbar in cision is most advisable, more so than depriving the patient of a kidney by a dangerous operation. In pyelo-nephritis due to concretions, on account of the comparative frequency of affection of both kidneys nephrotomy or nephrolithotomy is preferable to nephrectomy For the same reason nephrotomy is to be prefered in suppurative pyelo-nephritis follow ing diseases of the urinary passages, prostate, etc

Tuberculous pyelo nephritis should scarcely be subjected to surgical interference at its beginning In further advanced tuberculosis of the kidney, sup puration, caseous degeneration, perinephne ab scesses, etc, nephrectomy seems to give better re sults than simple incision of the kidney and removal of the caseous mass—Centralb fur Chirurgie, No 20, 1887

LARYNGEAL PHTHISIS TREATED BY LACTIC ACID AND IODOFORM —DR Luc has obtained successful results by the treatment of tuberculous ulceration of the larynx with lactic acid and iodoform, recom Thus, of the 327 operations mended by M Krause, of Berlin, and M Heryng, of Warsaw, in the case of a young woman suffering The patient was weak and thin, the least fatigue produced dyspnæa, and, aggravated the wheezing from which she constantly At night there was fever followed by pro suffered fuse perspiration The voice was completely lost The patient coughed incessantly, and the sputa con There was dulness, with tained numerous bacilli The vocal cords glottis was but slightly affected were red and swollen, and could not be completely adducted, this was apparently due to infiltration of lages, which was studded with excrescences which were especially prominent in the glottis The appe The patient complained of intense pain in the larynx when she coughed or spoke A The larynx was an inhalations were administered æsthetized by means of a r in 5 solution of hydro chlorate of cocame applied with a brush arytenoid excrescences were destroyed by galvano At the end of a fortnight the eschars came cautery At the end of a fortnight the communication away The infiltration of the mucous membrane presented was considerably reduced The membrane presented a granulating surface of healthier appearance The vocal cords were more easily brought together, and During six months the voice was much stronger the larynx was constantly painted with a 50 per Powdered 10doform cent solution of lactic acid was insufflated after each application of the acid Under this treatment the patient recovered her voice The stridor and laryngeal pain disapthe general tuberculous symptoms —L'Union Med, Feb 16 1888

INDICATIONS AND METHOD OF PERINEOPLASTY tears cause trouble Besides the troubles caused by prolapse of the vagina and retroflexions, must also be considered neuralgic symptoms, pruritus, intertrigo, and pains in the cicatrix during coition and vessel defecation, as well as nervous symptoms, often of a severe nature, and severe pains in consequence of the vaginal prolapse

Kustner compares the different operations for incomplete permeal rupture He distinguishes between mended by Professor Liebreich the double-pointed operation of Hewitt, Freund. Martin and Bischoff, and the bilateral-symmetrical operation (Simon-Hegar, Winckel) By the first the permeum is rendered most resistant He thinks that the median rupture should be operated on by the bilateral-symmetrical, the typical forked tear by the other method For complete rupture Kustner regards the double-pointed method as the only natural

In regard to the technique of the operation, the first care must be given to an antiseptic method of freshening and to an antiseptic suture material For the latter he recommends silver wire and silkworm gut, as they do not act as drains The sutures should be so placed that there is no dead space is best to embrace from the vagina about 3/3, and from the rectum about 1/3 of the depth of the recto vaginal Vaginal and rectal syringings after the operation are injurious In 36 operations he has used a 20 per cent solution of cocaine for anæsthesia, 20 times with good, and 8 times with perfect results The flaps are made with a half-dull scalpel two points are united by a continuous suture, and button sutures are placed in the vestibule, rectum, and on the perineum. The patients are kept quiet for 14 days Kustner thinks that by this method the cures should be 99 or 100 per cent -Centralbl für Chirurgie, No 25, 1887

Occlusion of Large Arteries by Flat Liga-TURES -The London correspondent of the Philadelphia Medical Times mention three cases reported to the Clinical Society of London, going to show that it is unnecessary, and inadvisable to rupture the coats of a large artery when applying a ligature in its In one case the superficial femoral artery was thus occluded for popliteal aneurism, kangarootion in the tumor was arrested immediately and did delay the normal retraction of the uterus not return bed for seventy-two days occurred after amputation at the hip-joint, for sar- [Journal, May 5, 1888

after this treatment, regarded the laryngeal lesions as coma of the femur. As it was thought that it would completely healed This method had no effect on have been fatal to the patient to have opened up the flaps to search for the bleeding vessels, and as pressure on the common femoral controlled the hæmorrhage, a clove-hitch was put around that artery return of hæmorrhage took place, and the patient O Kustner attempts to show that every old perineal made a good recovery MR PITTS, who performed rupture, even the smallest, should be healed by the operation, justified his departure from established penneoplasty, as even small cicatrices of penneal practice by asserting that the old fear of hæmorrhage at the seat of ligature was not felt by a surgeon who placed a flat ligature on the vessels and did not divide the coats, but merely closed the lumen of the

MILK JELLY AND MILK POWDER -The American stretching or tearing of old parametric adhesions by Druggist, for April, 1888, gives the following directions for preparing these milk foods

As a variation in milk diet, the following is recom-

Heat one quart of milk with one pound of sugar. and when the sugar is dissolved continue the heat, at a boiling temperature, for about ten minutes cool it well, and then add, slowly stirring, a solution of 1 ounce of gelatine in a cupful of water add the juice of three or four lemons and three wineglassfuls of wine, brandy, or other liquor Set the glasses containing the mixture in a cold place, so that the contents may gelatinize It is necessary to have the milk quite cold before the other ingredients are added, as it would otherwise curdle

Dried milk, in the form of powder, may be prepared by evaporating skimmed milk in a suitable apparatus, preferably in vacuo and under continued stirring, at a temperature of 60° to 70° C (140° to 158° F) to a syrupy consistence then mixing it with 30 to 50 per cent of its weight of finely powdered sugar, and continuing the heat, with constant stirring, between 30° and 55° C (86° and 131° F) until the product has assumed a dry, granular condition

Ergot in Subinvolution —Some very interesting observations were recently made by DR EMILE BLANC on the effect of ergot in involution of the uterus after labor A fairly large number of women who had gone through normal labor were divided into three categories Forty of them were left to Nature, forty were treated with daily hypodermic injections of Yvon's solution of ergotine (1 cc = 1 gram of ergot) during the first five days after delivery, and the remaining twelve were similarly treated for ten days Daily external measurements were then made in all the cases to ascertain the size of the uterus, and on the fifth and tenth days its internal measurement was taken by means of the uterine sound It was found that the administration of ergot during the first five or ten days failed to tendon was used, and drawn tight round the artery produce any favorable effect in hastening the process in a clove hitch without rupturing the coats, pulsa- of involution, but that, on the contrary, it seemed to Ergot is The patient, a woman, et 45, made an nevertheless an exceedingly useful agent in the treatuninterrupted and perfect recovery, but was kept in ment of secondary hæmorrhage, and its action is In the second case re- more marked the less the interval of time that has ported to the meeting, secondary hemorrhage had elapsed since the confinement -British Medical

A NEW METHOD FOR SUPPLYING THE GALVANIC les having been opened and excised, the entire CURRENT FOR MEDICAL USE -CARPENTER, of burned surface is smoothly covered with dry com-Cleveland, describes his method of procuring the presses of 20 per cent iodoform gauze, over which galvanic current for office use, as follows

The device to which we have the pleasure of calling the attention of the profession consists simply in that of using the current of the incandescent lighting |secured by a roller with a moderate degree of pres system direct from the street-wire passing the door-Thompson-Houston or Edison of the former system placed in our office, and by its infrequency keeps the part at rest means of a rheostat resistance sufficient to reduce the current to a minimum is interposed, then by the use of an ordinary switch-board, the current is increased or diminished according as resistance is cut in or out A milliampère meter is made use of whereby the current is accurately measured while the patient is in the circuit

The device is absolutely safe, as the entire voltage of the wire can be handled without the rheostat being My wire furnishes a very smooth continuous or galvanic current, with an electromotive force of Jameson, of Calcutta, writes 110 volts with a maximum strength of 110 of an ampère, equal to about eighty Leclanché cells This current is constant, does not vary in voltage, and is always ready, night or day, as the main line from which my connections are made is used for commercial purposes, and furnishes lighting for basements, This, I am informed, is the case in all large and in many small cities, so that little to give me a demonstration in taxis which I had not trouble will be met with in securing a wire with a day When a wire is once placed in our office, the task of caring for a battery of cells is at an end, tumor with his left hand, he placed his right thigh on and we have an apparatus that is at once always ready, reliable, economical, cleanly, and durable The rapid introduction of the incandescent lighting system, together with the great increase in the use of this form of light, will place within the reach of very many physicians this current of electrolytic work

The charge for the annual rental of the wire is \$10, not including the cost of putting in, which, if the main line passes the door, should not exceed \$5 device, as will be seen, does away with cells entirely, as well as the time, trouble, and expense of keeping them in order, and I venture to express, as my opinion, that we have a current superior to any that it is possible to have generated from chemical action, besides economy of room, which is not a small item in

cramped quarters A word regarding the danger from contact with the The Thompson-Houston or the electric-light wire Edison incandescent system of an electromotive force of 110 volts, and of a strength of $\frac{11}{20}$ of an ampère, is harmless, and must not be confounded with the arc system of Brush and others, as the strength of the latter is six ampères, and of course dangerous and must never be used -Medical Record, March 31, 1888

THE ANTISEPTIC METHOD OF TREATING BURNS AND SCALDS -PROF S W GROSS, of Philadelphia, suggests the following as by far the most efficient It is that practiced by Mosetig-Moorhof, and it is the chronic, obstinate eczema—Monatshefte für Prakone invariably employed by Prof Gross The vesic- tische Dermatologie, No 8, 1888

gutta-percha tissue is placed The whole is then surrounded by a thick layer of sterilized absorbent cotton between layers of corrosive gauze, which is Such a dressing rapidly relieves pain, prevents We have the wires contact of air and infection by septic pus, and by It should be allowed to remain from seven to fourteen days In burns of the second degree, one dressing suffices In the worst burns, there is relatively little suppuration, and the eschars thrown off are aseptic burns of the face, iodoform ointment (1 part iodoform, vaseline 20 parts), is used, and covered with a gutta-percha tissue mask The ointment should be removed daily — Practice, April 15, 1888

NOVEL METHOD OF APPLYING TAXIS -MR G.

A few days ago a native presented himself at the dispensary with a right large scrotal hernia, which The man was had been down for some months placed on his back, and the tumor manipulated The coverings were fairly tense Before attempting reduction I casually asked the patient if the tumor ever got smaller? He replied "Yes," and proceeded previously heard of, and which will probably be new to many readers of the Journal Lifting up the his abdomen, then crossed it over to the left side, catching the tumor between the pubes and thigh, The hernia disappeared then applying pressure with a gurgle and a snap before I had time to call the attention of the students to this novel procedure The reduction was complete -British Medical Journal, April 28, 1888

TREATMENT OF TYPHOID FEVER BY STROPHANTHUS HISPIDUS - DR POULET reports three cases of typhoid fever treated by means of strophanthus The results obtained were "magical," and he knows of no remedy which can compare with strophanthus As an antithermic in the treatment of this disease its effects are certain and persistent, and are not ac-It appears to hasten companied by any depression the period of deservescence and effectually controls the tendency to hæmorrhage He recommends that it should be given early in the attack -London Medical Recorder, April 20, 1888

SATURDAY, MAY 26, 1888

WHAT IS THE PROPER MODE OF LIMITING THE NUMBER OF MEDICAL COLLEGES AND OF MEDICAL MEN?

Perhaps on no other subject is there greater unanimity of opinion among members of the medical profession, than that we have in this country too many medical colleges from which are annually graduated a number of students largely in excess of the legitimate needs of the people, and thereby productive of all the evils of an overcrowded profession As was fully shown in the Address of the President of the American Medical Association, DR GARNETT. published in The Journal, for May 12, 1888, with a population of 60,000,000 in the United States of America, we have 89 regular medical colleges, giving instruction to 9,591 students and graduating 3,209 each year, while the total number of practitioners is equal to 1 for every 580 inhabitants

It is also shown that the increase in the number of medical colleges and medical graduates has been more rapid than the increase in population correctly attributed, chiefly to the popular desire on the part of our young men to leave the agricultural, mechanical and mercantile avocations for the professions, and the absence of all proper barriers in the form of adequate standards of preparatory general education before entering upon professional study, and of sufficient direct professional attainments to justify their entering upon the practical duties before them

attention to the subject, but concerning the appro-

priate and practicable remedies there is much greater Some who appear to believe in diversity of opinion the absolute paternity of governments would have either the National or State legislative bodies liberally endow, and at the same time arbitrarily limit the These evidently number of the medical colleges overlook the fact that all legislative bodies in this country are composed of individuals who depend upon the votes of all classes of the people for their official positions, and a majority of whom are as poorly qualified to create and maintain a just, stable and efficient system of professional schools as are the majority of the voters who elevated them to office, and who at the next election may relegate them to private life and put a disciple of Christian Science or of the faith cure in their places

A much larger number appears to have full confidence in the sovereign power of resolutions would make us think that all the evils under consideration only need discussion at the annual meeting of the American Medical Association and the adoption by that body of resolutions solemnly declaring that no more medical colleges should be organized, and that existing ones should faithfully exact of every student before admission a thorough general education, a long period of medical college study, and the highest order of medical attainments before graduation, and the work would be done We confess to having had some such faith in the efficacy of resolutions fifty years since But after seeing that great National medical organization devote annually a fair share of its time to hearing able reports, earnest discussions, and the adoption and re-adoption of resolutions covering the whole subject of medical education for the first twenty years of its existence, without apparently making any material change in either the number or curriculum of the colleges, our faith in mere resolutions began to weaken, and we aided in doing just what Dr Garnett recommends in the second "proposition" stated in his Address It was during the annual meeting of 1866, that the Association, wearied with the ever recurring discussion, referred the subject of medical education to the faculties of the schools, accompanied by an earnest recommendation that they hold a separate convention of delegates from all the medical colleges of this country during the week preceding the next annual meeting of the Association, which was to be in Cincinnati, May, The recommendation was accepted and a majority of the medical colleges then existing, accord-The evils of an overcrowded profession and their ingly sent delegates to the College Convention that chief causes are thus admitted by all who have given assembled in the Medical College of Ohio, May 3, Professor Alfred Stille, of the University of

Pennsylvania, was made President, and Professor of too positive opinions, expressed in medical debates, G C E Weber, of Cleveland, Secretary days were devoted to a faithful consideration of the important topics before them, resulting in the adoption of a most admirable scheme of medical college education, by a unanimous vote Its chief features were briefly stated by the Medical Record, of New York, as follows "First, a positive standard of prehiminary education, secondly, a longer time in which to acquire a knowledge of the various branches of medical science and practice, thirdly, a systematic and successive order of studies for the student, and lastly, a certain amount of direct clinical instruction in a public hospital as part of the senior course"

annual meeting of the Association then in session in the same city, and received the unanimous approval of that body, and may be found in full in the Trans actions, Vol 18, pp 371-384, 1867 scheme thus carefully devised and doubly recommended had been before the faculties of all the medical colleges for two years, another convention was assembled in Washington, May, 1869, which was presided over by the late Professor S D Gross, which simply endorsed fully the action of the first convention, and yet the colleges continued in the old beaten path as though a convention had never been held, and three-fourths of them are there still, as shown by the statistics admirably presented in President Garnett's address

If a new convention were assembled and another scheme devised and even unanimously recommended, who would enforce it? We have recalled these early and persistent efforts of the Association not for the purpose of claiming that they were useless because the schemes and resolutions did not enforce themselves or command obedience-for they have been of great service both in developing a correct public sentiment and correcting errors-but to remind the younger and more enthusiastic members of the profession of the ground already gone over, that they may avoid repetitions and be more readily induced to concentrate their efforts in a direction much more likely to reach practical and permanent results, as we shall endeavor to show at another time

PUERPERAL INFECTION IN THE COURTS

At a recent meeting of the Chicago Medico-Legal Society,1 a suggestive paper was read on the "Med-1co legal Aspect of Utterances made in Medical Societies " The writer selected, as his chief illustration

certain sentences from discussions of the Semmel weiss theory of puerperal fever that were held a short time ago before the Chicago Gynæcological Society He spoke with lively feeling of the legal responsibility thrown upon the practitioner by the general acceptance of this doctrine His skeptical allusion to the view of the identity of puerperal fever with puerperal infection constitute an anachronism, melancholy rather than curious or interesting, as clearly pointed out by more than one of the debaters of individual doubt and uncertainty of course need not concern us The pathology of puerperal fever in its general outlines has long been definitely settled, The action of the convention was reported to the and we can neither add to nor take from that which was authoritatively determined before the professional existence of most of the participants in the discussion just mentioned

> But the question of the legal responsibility of the attendants in the event of fatal puerperal fever, incidentally brought out in the paper, is of practical moment and worthy of more than passing notice at present informed, the exact limits of accountabil ity before the law of the obstetrician under these conditions have never been finally decided in this or Indeed, in America, suits of alleged any other land malpractice on this ground are so rare that almost no legal precedents can be regarded as established The notion of professional loyalty, after all, is very clearly defined in the medical mind with us in the It is seldom merely a sentiment In United States the majority of cases, fealty to the profession is looked on in the light of a stern duty This fact becomes more apparent in courts of law than in the "From time immemorial," an able writer sick-room remarks, "the theoretical course has been to express differences of opinion with all consideration in the presence of the colleague, and then to support him and to strengthen his position with the patient and his friends " Unhappily, this state of affairs is not always observed in the consultation chamber, as most of us can bear witness But let a brother practitioner be summoned to appear in the courts upon a charge of malpractice, and the profession is at once up in arms, the error is now apt to he in the direction of Exaggerated conceptions of the opposite extreme fidelity to the common faith, possibly, also, the apathy, if not the active hostility of the public, some times induce the conscientious practitioner to condone an unpardonable sin against the laws of the art and science of medicine

In this connection, it is of interest to note the

¹ Journal of the American Medical Association, May 5 and 12, pp 566, 599

²The Lancet, May 5, 1883, p 887

Fritsch propounds the quesperal infection in foro tion, identical with that suggested to the Medico-Legal Society He writes "A question that the judge addresses to the expert is the following operations or the omissions of the midwife stand in causal relation to the death of this puerpera?'" This question cannot be answered simply by "yes" or "no" At most, only the scientific conviction can be expressed that a causal nexus does exist the expert is never in a position to swear that except for the operations or the omissions of the midwife, the life of the puerpera would without doubt have been preserved Fatal peritonitis may occur in consequence of the rupture of a pyosalpinx during the course of an otherwise normal labor, the possibility of purely accidental infection, in which the midwife plays no part, must be admitted

The modality of the infection must be clearly established before the causal nexus can be looked upon as demonstrated. To establish the modality of infection, three data are to be supplied

- The source of the material of infection must be made clear
- 2 The omission of disinfection must be demonstrated
- 3 Any cause of death other than the puerperal disease must be eliminated

In establishing the first point it is not necessary to demonstrate infection with puerperal poison only A midwife was convicted who was suffering from an inflammation of the lachrymal sac. It was shown that contrary to the physician's orders she had attended women in labor without disinfection of her hands, and that during the confinements she had compressed the tear-sac with her fingers and immediately afterward introduced them into the parturient canal. American readers will recall the sad case of Dr. Rutter and his ozæna.

The omission of disinfection is not difficult to determine Although, of course, the painful, rigorous antisepsis of Lister may not be insisted upon. In case of alleged disinfection the fact of such preparation at the bedside must be attested by competent witnesses

The third point is elicited from the history of the case, the observation of the course of the disease, and the results of the autopsy

In the concrete case of fatal puerperal fever, therefore, when the source of infection, the omission of disinfection, and the absence of any other cause of death than puerperal fever have been demonstrated,

views of Professor Heinrich Fritsch³ respecting puerperal infection in foro Fritsch propounds the question, identical with that suggested to the Medico-Legal midwife and the death of the puerpera

> It is evident that the general behavior of the midwife can have no influence upon the question of her guilt or innocence, but it ought to be considered in relation to the degree of her punishment

> Fleischmann⁴ reports a clear case of puerperal infection by a midwife who had recently been in attendance upon a fatal case of puerperal fever. In urging the importance, in Austria, of stricter laws in the prevention of this disease, he quotes the wise provisions of Saxony—also of interest to us as germane to the subject under discussion.

The ordinance of March 28, 1885, in Saxony, is as follows

"§17 When a lying-in woman delivered by a midwife becomes the subject of puerperal fever, the midwife is not permitted to attend the sick woman any longer Neither can another midwife undertake the further care of the woman sick with puerperal fever.

"The midwife is not permitted to undertake the management of another case of labor within a period of five days, or even longer, reckoned by the district-physician from the day of her last visit to the sick woman"

Desirable, even urgently necessary as such laws certainly are, it is utopian to anticipate their enactment with us formany years to come Little by little, however, the professional mind is becoming saturated with the notion of asepsis in the practice of midwifery, and we may confidently look forward to the ultimate realization of our hopes, even though it be in the "dim and distant future" of which Mr Gladstone speaks

Meanwhile, we venture to express the conviction that Fritsch's opinion upon the medico-legal aspect of puerperal infection will meet with general commendation. Certainly, it is a model of wisdom and moderation.

ABOUT THE SIZE OF A BEAN

"A Puzzled Englishman" complains, in the *Philadelphia Medical Times*, of the loose statements in English and American medical literature as to the size of pathological objects. Such time honored statements as "as about the size of a fœtal head," or "about the size of a millet seed," he thinks we can never hope to be rid of before the millenium. On one occasion his interest in a case was kept until it was stated (by the American writer) that something was

Deutsche Medicinische Wochenschrift Ar 12 1888 p 228

⁴ Wiener Medizinische Wochenschrift No 13 19.8 p 427

"about the size of a dollar," when, masmuch as he (which case?), distilled in the presence of an acid, had seen only a gold dollar, his interest suddenly Again he was lost when he read that a tumor was "about the size of a doughnut" Doubtless most American physicians have been equally puzzled on reading that something was about the size of shilling or a half-crown

Such unscientific comparisons are far too common in medical literature We have often wondered if all the tumors removed in France are "as large as a fœtal head," and why those removed by German surgeons are uniformly either "as large as a fist," or "as large as a walnut"

How many of us have seen a millet seed, and how many have seen three fœtal heads of the same size Doughnuts, as most of us know, are not made of a What are we to infer as to the situauniform size tion of a tumor or an incision, when we read that it was a few inches or a few finger's-breadth to the left of the sternum? Is it not about time that we adopt a standard size for fœtal heads, doughnuts, walnuts, hazel-nuts, and other standards of comparison, or else cease using such standards of comparison and begin to use such as scientific men everywhere can understand Millimetres and centimetres are exact, and everyone knows what they are

Would it not be well to have some uniform color standard? Such expressions as "café-au-lait," greenish yellow, etc., are often far too indefinite, cafe au last being especially indefinite unless one be accustomed to the very best of coffee, the color of coffee and milk ranging from a very light brown or dark yellow to a dark reddish brown definite expressions are very annoying to any one making or using color-tests in chemistry

Another annoying method of indefinite expression is seen in the very loose statements of some writers concerning chemical compounds used Such vague terms as "the oxide of mercury," or "the chloride of mercury" are unpardonable in a scientific communication, more especially when a chemical reaction is Too often, also, is there an ambiguity regarding the quantity of reagents to be used Wendriner, for example, gives the following method foreign confrères may justly complain of English and for detecting antifebrin When one adds a small quantity (how much, 2 or 10 grains?) of antifebrin to normal urine, then adds caustic soda (stick or solution, and how much?) so as to render the urine alkaline, and then distils, aniline is found in the liquid that has not passed off by distillation The urine of patients taking antifebrin will not give this reaction But this is due to the fact that the drug is decom- of Australia will assemble on January 7, 1889, and The urine, in this case will rise on January 12 posed in the organism

gives a large quantity of phenol, of which traces only may be found in the urine of persons that have not taken antisebrin (Nouveaux Rèmedes) A good chemist would have no difficulty in making this test, but good chemists are rare in the medical profession

It should be the object of every writer to make his language so plain that it cannot be misunderstood In the medical profession a great deal of life-may depend upon what is written Much has been said on the subject of writing prescriptions in Latin When one is writing a prescription that is to be printed it is better to use Latin than to use a vulgar or local name of a drug Continental writers are especially prone to use local and vulgar names for preparations of plants, or else to distort the Latin name so as to make it almost unrecognizable Italian, French and Spanish literature it is very rare to find a prescription written in Latin, and it not in frequently happens that one has to look through half a dozen dictionaries or pharmacopæias in order to make an intelligent translation of one word less foreign readers have, to more or less extent, the same cause of complaint of English and American writers, though naturally we cannot see our faults so well as others can But it is a singular fact that the writers of the Romance languages use the Latin less frequently, by far, than do the writers of any other modern languages In one of Simon's prescriptions for laryngismus stridulus we find eau de tilleul called Tilleul means a lime tree, a linden to this word in a medical dictionary, we are referred to tilia, and find that the flowers of tilia Europaa "have been supposed to possess anodyne and anti spasmodic virtues" Under tilia Americana we find that "a mucilage, prepared by macerating the inner bark in cold water, has been applied in burns" Thus far we have no clue as to what eau de tilleul is Again we find a prescription calling for carbonato de htina, we can only guess that carbonate of hthum is what is wanted, for the best Spanish dictionary does not give litina

But there is certainly one thing for which our American writers they still adhere to grains, scru ples, drachms, and ounces, and to inches, and com mon and vulgar fractions

By all means let us have the proposed international pharmacopœia

THE NEXT INTERCOLONIAL MEDICAL CONGRESS

VOLUNTARY MUTILATION BY PERFORATION OF THE MEMBRANA TYMPANI

DR JUSTYN KARLINSKY reports three rare and curious cases of voluntary mutilation, observed by him in the Roumanian Army In the first case examination showed traces of traumatic lesions in the internal auditory meatus, but the functional symp toms were not justified by any lesion of the membrana tympani, nor of remainder of the ear lation was suspected, lesions of greater or less extent were found at each examination, and finally the head of a phosphorus match was found in the secretions There was no perforation of the drum head in this case In the second case there was perforation, with subacute internal otitis, caused by the introduction of a piece of unslaked lime, which was then moist-Fragments of the lime were found in the auditory canal In the third case Karlinsky found a large perforation with everted edges, which had been produced by a curved piece of iron wire The patient had been in the habit of using this wire as an earpick, and it was somewhat uncertain whether the perforation was intentional or not

EDITORIAL NOTES

EPITHELIOMA OF THE CLITORIS -It is well known that primary epithelioma of the vulva is a very rare Richet recently operated upon a case at l'Hôtel-Dieu, and subsequently presented the case at a clinic The patient was 40 years of age, had always had good health, her brothers and sisters were in good health, and her mother died at oo The patient became pregnant when 23 years old, and was delivered of a dead child after having Six months before entering the hospital she noticed a tumor on one labium majus, as she thought, but examination showed that on the lower part of the mons veneris was a tumor as large as a hen's egg, reddish, and with the well-known cauliflower arrangement of its lobes The point of origin of the tumor was really the clitoris Microscopic examination after removal of the tumor showed that it was an epithelioma

ATOMICITY AND BIOLOGICAL ACTION —M J BLAKE has recently reported to the Academie des Sciences the results of a series of experiments on "The Rela tions between the Atomicity of the Inorganic Elements and their Biological Action " He claims that monatomic elements act on the pulmonary arteries, diatomic elements on the centres of vomiting and on the voluntary and cardiac muscles, except glucinium,

elements act on the respiratory, vaso-motor, and inhibitory centres, on the cardiac ganglia, and on the pulmonary arteries, and the tetratomic elements act on the respiratory and vaso motor inhibitory centres of the cerebrum, on the spinal cord, the cardiac ganglia, and the pulmonary arteries

COCAINE IN THE DIAGNOSIS OF LARYNGEAL DIS-EASE -BAUMGARTEN, of Buda-Pest, has found a new use for cocaine, based on its action in blanching hyperæmic mucous surfaces, catarrhal surfaces, and healthy mucous membranes If the paleness does not appear after several applications, Baumgarten concludes that it is not a case of hyperæmia, but a tuberculous or syphilitic process that is to be dealt

THE "TEXAS HEALTH JOURNAL," the first number of which has been received, for July, 1888, is a new 32 page journal of public health published at Dallas, Texas, under the editorship of 'Dr J R Briggs

TWO UTERI REMOVED PER VAGINAM FOR FIBRO-SAR-COMA AND CARCINOMA RESPECTIVELY

I have here two uten which, as you see, are quite large to have been removed by the vaginal method The first, which is the size and shape of a mediumsized orange, with the cervix hanging to it like a thickened stem, is a fibro sarcoma. The entire organ is involved excepting a superficial layer of muscular tissue and peritoneum, and was ulcerated within so that the entire cavity was converted into a pus pocket The uterus was curetted for fungosities 61/2 years ago which acts on the other nerve centres The triatomic and 41/2 years ago by an eminent obstetrician, 2

years ago by a prominent homeopath (for endometritis fungosa), and by myself four months ago patient is 47 years old, and has two children, one 28 years and the other 25 years old The uterus is known to have been enlarged for 7 years The chief symptoms have been metrorrhagia, muco-purulent, slightly offensive discharges and daily colicky pains

The uterus was removed two months ago, and the patient, for the first time in years, feels perfectly well I ligated the broad ligaments in the face of great dif-(probably diseased) that it was practically inelastic, and was ligated in situ The whole vagina was contracted like that of a virgin, and was so unyielding that it was lacerated slightly before it could be dilated sufficiently for work The uterus, after having been cut loose, was delivered with great difficulty, and tore away some of the ligatures Two compression forceps finally secured the bleeding points, they were left on for twenty-four hours The 10doform tampon was removed at the end of week

The other specimen is fully the size of a man's fist, and is an adenoma of the fundus and posterior wall which has undergone cancerous degeneration patient is 55 years old, anæmic, and has had several ment, and, as a last resort, surface applications of children, the youngest of whom is 17 years old She ceased menstruating at 50 years, but soon after commenced to have a pinkish discharge, which has continued and increased ever since, and has lately been somewhat purulent and slightly offensive She suffered with uterine cramps On account of the size of the uterus I found it necessary to retrovert it in order to get at the upper portion of the broad liga-The operation was performed March 10th Although pus escaped into the vagina from a rent | needle, four millimetres in diameter, with a trocar made in the diseased posterior uterine wall by the point, insulated with hard rubber, to within three tenaculum forceps used to aid in the retroversion, the centimetres of the point, attached to the negative recovery has been the same as after normal labor The iodoform tampon was removed on the fifth day, and the first douche given

DR FRANKLIN H MARTIN read a paper entitled A REPORT OF FIFTEEN CASES OF FIBROID TUMORS OF THE UTERUS TREATED BY GALVANISM

(The report including only the year's work of

1887) From Jan 1, 1887, to Jan 1, 1888, I applied galvanism in strong, accurately measured and definitely concentrated doses in gynecological cases over 1,400 During this time I employed galvanism for times uterine fibroids 623 times in 15 cases The result was as follows

Not suitable for treatment and recommended for operation, I Benefited Symptomatically cured Absolutely cured

The author of the paper then selected and gave in detail the history and treatment of five cases, two of which were symptomatic cures, two actual cures, and the remaining case was benefited

The following is a short sketch of each case

uterus, filling the pelvis and extending nearly to Seven treatments were given by the 1st of February, umbilicus

Treatment a large number of applications of galvanism given by three different methods of procedure, extending over a period of more than two years [

Result benefited

The above is a continuation of a history, cited as Case 10, in an article read by the author before the Section of Obstetrics and Diseases of Women, at the thirty-second annual meeting of the American Medi cal Association, at St Louis, May 5, 1886

Miss C, unmarried, age 26, consulted me on ac-The right one was so much thickened count of large abdominal tumor Upon examination I found a large abdominal tumor attached, as I then thought, to the whole anterior wall of the uterus, crowding that organ away from the bladder I have since ascertained that the portion previously diagnosed as the uterus is simply the cervix, the uterus being lost in the mass of the tumor, and its canal traversing its entire depth The tumor was ovoid, smooth, and easily movable under the abdominal walls, about seven inches in its long, and six inches in its transverse diameters The growth was increasing in size rapidly

> This patient then received in turn thorough mals The of the iodine and glycerin treatments, ergotin treat galvinism were made This latter, thoroughly carried out, checked the growth, and markedly reduced the This was found, however, to be size of the tumor of a temporary nature, the growth enlarging rapidly at all times except when under treatment idea of getting more marked results, abdominal galvano-puncture was at last resorted to In September, 1886, four operations were performed in intervals of The patient was anæsthetized and a steel ten days pole of the battery, was thrust through the abdominal wall into the thickest portion of the tumor A large animal membrane electrode was placed upon the ab domen in close proximity and attached to the posi-A current of 200 milliamtive pole of the battery peres was turned on and allowed to pass for fifteen The effect of these operations was a rapid minutes The patient diminution in the size of the tumor was advised to await futher developments At the end of two months she returned, stating that the growth of the tumor had recommenced, the hæmor-

rhage being excessive Dreading the necessary risk attendant upon abdominal puncture, and having at this time success fully treated a number of cases by Dr Apostoli's method, I determined to adopt that safer and, in my opinion, much more effectual means in this case Therefore, in January, 1887, regular treatment was instituted, consisting in the introduction of an intra uterine platinum electrode to the bottom of the uterus, which was found at this time to measure eighteen and a half centimetres, or seven and a half inches in To this electrode was attached the negative pole of the battery, and the circuit was completed by depth interstitial, and subperitoneal fibroid tumor of the the use of the membraneous abdominal electrode

seven treatments were of the negative intra-uterine, the last three of the positive intra-uterine variety The highest current borne by the patient was fifty The following menstruation was free milliampères from pain, but hæmorrhage was as excessive as ever No change in tumor

February Four treatments were given in this month, all negative intra uterine, with no apparent result on tumor or amount of hemorrhage at next

menstruation No pain at menstruation

Two treatments, negative intra-uterine of ment in general health about fifty milliamperes strength The hæmorrhage at the next menstruation caused considerable exhaustion, but was accompanied with no pain, nor was

there any change in the tumor

Eight positive intra-uterine treatments were given, with a view of modifying, if possible, the excessive menstruation The patient at this time was able to tolerate without discomfort a current of as high intensity as one hundred milliampères hæmorrhage of the next menstruation was not maternally decreased, the tumor showed signs of reduction—the uterus measuring sixteen centimetres was puzzled at this time to get some means of checking the exhaustive menorrhagia. I was convinced that the current tolerated was not sufficiently strong reduced fully one-third in size to produce the desired coagulating effect upon the whole surface of the endometrium in contact with the long internal platinum electrode The current, in other words, was not concentrated enough at any one point of the electrode to produce its characteristic coagulating effect, sufficient to check hæmorrhage I, therefore, modified Dr Apostoli's method, by instituting a means of internal concentration This was accomplished by devising my flexible internal electrode, with a given active surface, which, acting only on a comparatively small portion of the endometrium at one time, would enable me in several treatments to successively apply to the whole surface of the uterus a current of sufficient concentration to accomplish the desired results The electrode adopted in this case was three millimetres in diameter, and had an active surface of four square centimetres, and the current used with this was at all times to be one hundred milliampères, passing for five minutes 1

Five positive intra-uterine treatments were given in this month with my new electrode first application the active portion of the electrode, the distal end, was introduced to the bottom of the canal, a gauge on the staff of the sound marked the distance to which the instrument entered the womb At the next treatment the gauge was placed so that the active portion of the electrode would just reach the po nt acted upon by the former treatment same principle was carried out until every portion of the canal had been operated upon by the concentrated current Five treatments were given before the next menstruation The effect was magical

The flow lasted but three days No pain

June Four treatments early in month were given with the concentration electrode as the native pole The patient at this time left city for three weeks

Thirteen treatments were given, first six

negative, seven positive Tumor decreasing in size Depth of uterus fifteen centimetres Menstruation lasts four days and is normal in quantity

August Five treatments, negative

Six treatments, four negative and September Measurement of abdomen was made two positive at this time, and over the most prominent part of tumor was thirty seven and a half inches

Six treatments, all negative Menstrua-Gain in flesh and improvetion still remains scanty

November Nine treatments, three before menstruation, and six following, all negative intra uterine

Five intra-uterine negative treat-December

Although there has been a general gain in flesh since last measurement made, the patient measures two inches less or thirty-five and a half inches Depth of uterus fourteen centimetres or five and a half inches

Thus this patient in one year has gained in flesh, in strength has normal menstruation instead of menorrhagia, and is perfectly free from pain uterus has been reduced from seven to five and a half inches in depth, and the mass of the tumor is Patient still under treatment

Case 2 —Diagnosis Myofibroma of the fundus of the uterus enlarging the whole organ

Treatment Thirty-two applications of galvanism Result Cure

Mrs D, æt 24, married two years, wife of a mechanic, no children or miscarriages, presented herself for treatment March 23, 1887 Menstruation commenced at 14, at present irregular, and for five days excessive, is accompanied with headache, and is followed by severe neuralgic pains Bowels constipated, hæmorrhoids, leucorrhœa, but not excessive, frequent and painful urination

Objective symptoms Vagina small Cervix large and patulous Uterus large with canal taking the direction parallel with the axis of the body, and measuring eleven centimetres or a trifle more than four inches in depth I was assisted by Dr Wunismark in the treatment of this patient

Thirty two applications were given this patient by means of the concentration electrodes with a current

of one hundred miliampères at each sitting

The effect of the treatment was noticed in the behavior of the first menstruation, the flow having been modified in quantity and was without the slightest The last treatment left the uterus seven centimetres in depth, normal in contour, with no evidence The patient who had previof a thickened fundus ously been anemic in appearance, is now fullblooded, in the best of health Discharged cured

Case 3 — Diagnosis Painful, bleeding fibro-

myoma in anterior wall of uterus

Treatment Galvanism—thirty-nine treatments Result Improvement in general health and reduction of the growth Menorrhagia cured and pain at menstruation relieved

Case 4 - Diagnosis Large, painful, bleeding myofibroma of the uterus filling the pelvis and abdomen.

See Medical Record, December 17 1887

One hundred and fourteen applications of galvanism by Apostoli's method

Result Symptomatically cured, pain and menorrhagia relieved, tumor diminished in size, and patient restored to health

Case 5 — Diagnosis Large, painful hæmorrhagic, interstitial and subperitoneal fibroid growth of the uterus completely filling the pelvis and lower portion of the abdomen

Treatment Thirty-eight negative intra-uterine, galvanic applications and eleven positive intrauterine by Apostoli's method

Result Tumor reduced one-third, hæmorrhage modified, pain relieved

Case 6 — Diagnosis Hæmorrhagic fibromyoma of posterior wall of fundus increasing uterus to ten centimetres in depth

Treatment Sixty-two applications of galvanism by Apostoli's method, by means of my flexible concentration electrodes

Growth absorbed, the uterus being re-Result duced in depth to seven centimetres relieved and patient completely restored to health

Case 7 — Diagnosis Large, painful hæmorrhagic myofibroma of the uterus filling pelvis and lower abdomen

Treatment Thirty applications of galvanism

Result Symptomatically cured Uterus reduced in depth from nineteen centimetres to sixteen centi-Tumor markedly reduced Menorrhagia cured and great improvement in flesh and strength accomplished

Case 8 —Diagnosis horn of the uterus increasing the depth of the uterus | lated to eight centimetres

Symptoms Excessive hæmorrhage, accompanied and followed by excruciating pain that remained for ten days following menstruation

Treatment Sixty two applications of galvanism by Apostoli's method, modified by the use of my intra uterine concentration electrodes

Result Cure

Case 9 - Diagnosis Large, interstititial, hæmorrhagic, painful fibroid growth extending to within two inches of the umbilious and causing enlargement of the uterus

Treatment Thirty-seven intra-uterine galvanisms

-twenty negative, seventeen positive Result Reduction of growth fully one-third little relief of hæmorrhage or pain up to the present

Case 10 - Diagnosis Large, subperitoneal fibroid growth, about eight inches in its long, and four in its shorter diameter, with irregular contour attached to

the entire fundus and posterior wall of a slightly en-

larged uterus Distressing pressure upon rectum, Symptoms bladder, and general complaint of heaviness in pelvis with "bearing down," and difficulty in locomo-Menstruation profuse and painful General health impaired

Treatment Thirty-five applications of galvanism

Result Symptomatic cure Case 11 - Diagnosis Interstitial, painful hæmorrhagic myo fibroma of the anterior wall and fundus of the uterus increasing its depth to eight and one half centimetres or three and one-half inches

Treatment Thirty intra uterine applications of galvanism

Result Benefited Depth of uterus reduced to two and one-half inches, general health improved, menorrhagia modified, and pain relieved

Case 12 — Diagnosis Large, hæmorrhagic, in terstitial and subserous fibroid growth of the uterus increasing the depth of the organ to fifteen centi metres or nearly six inches

Treatment Twenty-one applications of galvanism by Apostoli's method as modified by myself

General health restored, hæmorrhage checked, pain and pressure in pelvis relieved, tumor reduced one third, and depth of uterus decreased to thirteen centimetres Patient still under treatment

Case 13 - Diagnosis Myo fibroma of the anterior portion of the neck and body of the uterus, three inches in diameter Uterus not materially changed Hæmorrhage in depth, three and one quarter inches

> Menstruation profuse, but not ex Symptoms cessive, much pain during latter part of flow Fre

quent and difficult urination

Treatment Sixty-one applications of intra utenne galvano-negative treatment by my modification of

Apostoli's method Result Cure

Case 14 — This case was found, after a few treat ments had been given, not suitable for this method of procedure A submucous mass from the interior of the fundus of the womb gradually filled the ute Myofibroma of the right rine cavity, and when I discovered it was peduncu I advised her to return to her home and have it removed by a surgical operation The operation was successfully accomplished by Prof Mann, of Buffalo, N Y

Case 15 - Diagnosis myofibroma of fundus and posterior portion of uterus, accompanied with men

Treatment twenty-three intra-uterine applications of galvanism by Apostoli's method as modified by me

Result cure The point has been well dis DR P S HAYES It occurs cussed and there can be little further said to me, however, that there may be a reason why the positive electrode used in the uterus is more hæmo static than the negative, and that is on account of the cicatrix which follows the use of the positive electrode being more prone to contract, the cicatrix following the negative being like the cicatrix of a From my own experience burn with caustic alkali in the use of electrolysis I find frequently that, at the time of operating, there is a slight hæmorrhage, or at least an oozing of bloody serum, more likely to fol low the use of the positive than the negative pole, especially if any other than a platinum electrode is The destruction of tissue around the positive pole is not nearly as great as that around the nega tive, the oxygen is separated around the positive pole and the acids are liberated, and I find the eschar which follows essentially the one produced by the action of the strong mineral acids on albuminous tis On the other hand, if the negative pole is used,

we find that the destruction of tissue extends probably twice as far from the electrode The appear ance is entirely different, that from the negative pole looking very much as though it had been frozen, and the scar tissue which results from the use of the negative pole does not contract as firmly as does that which follows the positive, and it seems to me that this can be explained to a large extent by the chemical action which takes place along the electrodes There are two, and possibly three factors present in this method of using electricity there is the physical effect, due of course to the liberation of the gases around the electrodes, there is the chemical effect due to the electrolysis or separation of the salts of the body into the acids at one pole and the alkalies at the other, and then there is the physiological effect, which we do not understand as well as we do the chemical and physical effects amount of chemical action which takes place around the pole that is in the uterus, an equivalent amount of chemical action takes place under the electrode you will find an irritation of the skin, and you may possibly get a blister within the circumference of the electrode, so that on the second or third day you will find that it is difficult to apply the electrode where it was first applied That the electricity, as it passes through the tumor, affects the cell life, is a question yet to be proven, and I think the determination of the matter can be considered almost entirely due to the peculiar chemical action which takes place around the electrode

Dr E J Doering I would like Dr Martin to make an explanation about the strength of the cur-Tent which can be used There seems to be considerable difference of opinion among gentlemen in

various parts of the country

Dr Franklin H Martin The question is a difficult one to answer in the time I have at my disposal, but I would say briefly that, with the means of concentration that I have adopted in my intrauterine flexible electrodes, a current of from 50 to 100 milliampères is all that is necessary in order to obtain all the benefits of this treatment Without these electrodes, however, and by the original Apostoli method, I have employed currents ranging from 100 to 1,000 milliamperes, and this without any det-Timental effects

(To be concluded)

GNYECOLOGICAL SOCIETY OF BOSTON

HERBERT J HARRIMAN, M D, SECRETARY Stated Meeting, February 9, 1888 THE PRESIDENT H C WHITE, M D, IN THE CHAIR DR C W Stevens read a paper on

CORROSIVE SUBLIMATE INTERNALLY IN PUERPERAL AND OTHER SEPTIC EMIAS

(See page 615, The Journal, of May 19)

ence in the use of corrosive sublimate in the way recommended by Dr Stevens His usual course was to remove all clots and placenta as thoroughly as possible, using the curette if necessary in cases of Quinine, antifebrin, antipyrin and similar abortion agents were used as indicated Dr Clark has been shy of intra-uterine injections of late years, believing that their use is unnecessary and dangerous a local application he uses tr of iodine, upon a cotton-wrapped applicator

DR A E McDonald had never tried the mercuric bichloride in puerperal septicæmia, but had used it with great satisfaction in the treatment of diphtheria, giving doses of $\frac{1}{32}$ of a grain of the drug until characteristic diarrhœa appears With this

treatment is combined the use of quinine

He had, however, used iod salicylat in puerperal Whatever be the septicæmia with apparent benefit He usually orders 31 of the drug in an 33 of the vehicle and directs that 31 be given every three or four hours

DR SAMUEL N NELSON said The use of ant septics that is placed on the abdomen, and almost invariably in puerperal fever seem to me a necessity, but I think that the chief advantage to be derived is from their employment locally, and when used systematically they have little if any perceptible effect. When they do have any effect I cannot believe it due to their This is particularly the antiseptic qualities as such case when the question is concerning corrosive sublimate, of which the dose compatible with safety is very minute, particularly in proportion to the weight of the body of an adult Note the dose advocated by the reader, viz $\frac{1}{96}$ of a grain at the beginning every three hours, which may be increased to $\frac{1}{48}$ of a Dr Ernst is quoted as authority for the statement that corrosive sublimate in the proportion of 1 to 10,000 will restrain the growth of microorganisms, and this is cited as the reason for giving the drug in the above mentioned dose Does it fulfill the conditions? With the larger dose mentioned $(\frac{1}{4R} \text{ grain every three hours}) \text{ only } \frac{1}{6} \text{ grain is}$ taken in twenty four hours, and if for convenience we estimate the average weight of an adult at 100 lbs or 700,000 grains in round numbers (which is below the actual figure) we find that the proportion of medicine taken in the whole twenty-four hours to the weight of the body is 1 to 4,200,000, which is only $\frac{1}{420}$ part of the proportion cited as authority for the dose In point of fact, Dr Ernst falls far short of the mark, when he says that a solution of corrosive sublimate 1 to 10,000 restrains the growth of microörganisms Many years ago Koch and Sternberg showed that the solution 1 to 10,000 would kill them when exposed for two hours at least four years ago I reported to this society a series of experiments in which I showed that the solution 1 to 10,000 killed the germs in five seconds in every one of several experiments And although I have not investigated further, I believe that a much weaker solution will kill them in this exceedingly short time Moreover, considerable larger doses of corrosive sublimate than has been recommended can be borne Pepper recommends, if I remember the figures correctly, doses of 1/2 to 1/6 of a grain every DR A P CLARK said that he had had no expend two hours for children of about five years old sick

with diphtheria, and used thus, he considered it almost a specific with a severe attack of diphtheria, I took a grain of in what way it is eliminated When corros sublim. corrosive sublimate every day for a week in addition to frequent gargling with a 1 to 1,000 solution—and I am alive to tell the fact When taking a grain a day, I took only about one to one millionth part of my own weight, and even this proportion is much too small to think that good effects can come from the use of the drug on account of its antiseptic properties as such

The advantages of antisepsis locally, however, should not be over-looked, and here I should place He who has made corrosive sublimate at the head an autopsy after death from puerperal fever, and seen the whole interior of the large non involuted judge of the danger The most virulent bacteria are uterus, a stinking slough will appreciate the need All that can be easily removed of action here should be removed, and frequent irrigations of corrosive sublimate solution i to 1,000 should be em-How much better, however, an antiseptic delivery, and hence a normal recovery!

If corrosive sublimate has any effect in shortening or curing the disease when taken into the system, I believe that we must find some other explanation the corrosive chloride internally is of no use in sep than its antiseptic properties, and if repeated trials show good results it is most certainly a valuable remedy, and I hope to hear further reports concern-

ing it DR H C WHITE said that in the computation given by Dr Nelson, showing the relative weight of the antiseptic compared with the body weight, the solid tissues should not be considered, as they are not invaded Only the fluid constituents of the body, such as the blood or serum, should be reckoned

internally in such cases, and hoped that good might opposed to the use of corros sublim in any manner come from such use The routine use of intra-uterine injections by the average physician is a source of In the puerpedanger and should be discouraged ral state nature provides proper treatment, and the woman ought to be left alone as regards any inter-Heat is the best disference with the genital tract infectant, and should be applied to the hands and all cloths and garments used about the patient. Dr White has used one drug more than any other in the diseases in which septic conditions may arise, namely This drug has always answered all sulphurous acid The failure of the remedy reasonable expectations in other hands may be due to its poor quality preparation must be fresh, as otherwise the gas will escape and the medicine become inert and valueless But few druggists can be relied on to provide always a fresh and efficient preparation

DR GEO W NASH, a guest of the Society, said that at the Rotunda Hospital, Dublin, the practice in cases of puerperal septicæmia was to thoroughly wash the uterus with a 1-20 solution of acid carbol He had never seen hydrarg chlorid used there in

W Cushing said he had not arrived in such cases season to hear the paper read and could only judge it from its title He was not disposed to assign much value to corros sublim used as suggested It is im-

possible to tell, in the present state of our knowledge, In the spring of 1884, when ill in just what form the germicide enters the blood and is mixed with blood in a test-tube it forms at once an The only way, however, to albuminate of mercury settle the question as to the efficacy of the drug in septic troubles, will be to pile up cases and thus ar Dr Cushing's practice in these rive at the facts cases was to thoroughly scrape out the uterus under antiseptic precautions and then to thoroughly wash The disorder is undoubtedly due to bacterial infection, and in all the cases dying in Vienna of puerperal infection during his stay there was found the same forms of bacteria which we find in wound A bad smell is no criterion by which to infection Our hope in these cases of puerperal in odorless fection is in being able to remove all the offending When the infection has spread beyond the matter uterus and thrombi have formed in the veins of the broad ligament, little can be anticipated from any Hydrarg bichlorid may be given kind of treatment hypodermically with safety

DR F D BURT said that he had the feeling that The usual practice has been described by tıcæmıa Dr Cushing, but the greatest difficulty lay in removing all the offending matter In accomplishing this object the use of the swab is much more efficient than intra-uterine injections as ordinarily used The simple current of the solution has but little detergent power over decomposing shreds of tissue which may By the thorough use of a swab, howbe attached ever, these offending tissues may be more success-

fully removed DR W Symington Brown said that he was deadly It is the most easily decomposed and most dangerous of any of the mercurial preparations changes which it undergoes when entering the blood prevents its reaching the germs of disease ever good effect results from its use probably arises Dr Brown believed that from its alkaloid action washing out the uterus was not the best and most efficient way of cleansing that cavity, but that the use of the swab was much more effective ways used tr 10dinii as a local application on the From the use of corros sublim forty or fifty cases of dysentery have been reported, and this fact shows its highly dangerous character

DR C W STEVENS, in closing the discussion, said that in puerperal septicæmia there was a natural tend ency to diarrhoea, but that the use of the corrosive chloride in small doses did not increase the trouble He had never kilogrammed his patients to find the exact proportion between the dose and body weight, but had formed his favorable opinion of the drug entirely from clinical results This use of the drug is a resurrection of a former mode of practice, and may prove to be of value in

septic troubles

MEDICAL SOCIETY OF THE DISTRICT OF COLUMBIA

Stated Meeting, February 8, 1888 THE PRESIDENT, THOMAS C SMITH, M D, IN THE CHAIR

DR ROBERT T EDES read a paper on IDIOPATHIC ANÆMIA

(See page 648)

DR REYBURN'S experience in this field had been very limited, as he had only had one case in the past The woman having been treated by a number of physicians without any benefit, finally fell into his hands. She was emaciated to an extreme degree, and had palpitation. He could not trace the cause As a last resort he tried Mitchell's method of forced feeding She was confined to bed, was given six pints of milk daily, massage was applied, she recovered This was a well-marked case would ask Dr Edes as to the treatment in his case

DR EDES had not dwelt much upon treatment A great majority never recover He depended, however, upon arsenic and feeding Nearly all the cases which have recovered have done so under arsenic In his cases there was not forced, but rectal feeding One of the first things to suggest itself in the treatment was, of course, transfusion, but expemence had shown this to be of very little value in the treatment of idiopathic anæmia, and often worse than useless

FOREIGN CORRESPONDENCE

LETTER FROM PARIS

(FROM OUR OWN CORRESPONDENT)

Microbes of Epidemic Dysentery—Smokers' Vertigo -Antipyrin in Labor - Glycerin as a Purgative

At a recent meeting of the Academy of Medicine, M Cornil, on behalf of MM Chantemesse and Fernand Vidal, read a note on the microbes of epidemic He added, as a conclusion, that the presence of the bacillus discovered by these observers in deep organs of a man having succumbed to an acute attack of dysentery, the observation in the stools of five dysenteric patients, its absence in the stools of men in health, the lesions which, it gives birth to in the intestine and the viscera of guinea pigs experimented on, plead in favor of its specificity M Le Roy de Mericourt, an old naval surgeon, observed that two medical men of the navy described, ten years ago, the microbes of the diarrhea of Cochin-China, considering them the pathogenic agents of this malady, but their discovery has not proved of any consequence in a therapeutical point of view regards epidemic dysentery the speaker observed that he could with difficulty admit its microbian origin, dysentery not being contagious, as was demon-

ships, or at the Maritime Hospital of Brest, where he had numbers of cases of dysentery under his care M Rochard, another old naval surgeon, concurred with M Le Roy de Méricourt on the non contagiousness of dysentery, of which he had observed several cases having divers degrees of gravity He thinks that the microbian or non-microbian origin of this malady is not demonstrated, at least clinically this M Cornil made the remark that the presence or absence of microbes does not necessarily imply the transmissible or non-transmissible character of a malady For instance, he said that leprosy is distinctly a microbian malady, and yet its contagious nature is nothing less than demonstrated For M Cornil, all the chapters of general pathology relative to contagion, infection, endemicity, epidemicity, require to be rewritten with new elements, and in keeping with the discoveries of modern science Roy de Méricourt expressed satisfaction at having heard M Cornil declare that all microbian maladies are not necessarily contagious This declaration, he said, was necessary if it were only to appease the public mind, which is imbued with the idea that contagiousness is inseparable from the microbian nature of a malady Thus, for instance, there are many persons who would not have their children vaccinated with human vaccine lymph for fear of tuberculosis being transmitted to them M Cornil responded that the microbe of tuberculosis had never been met with in vaccinal virus, there is therefore nothing to be feared in this respect, though this should not prevent every precaution of prudence being taken in the choice of vaccine subjects

At a previous meeting of the Academy, Dr Decaisne read a note entitled "The Vertigo of Smok-The author formulated the following conclusions based upon observations of 63 inveterate smokers presenting different degrees of vertigo more or less frequent, more or less accentuated I Of the 63 subjects of from 29 to 66 years of age, 49 were aged from 50 to 66 years 2 More than half presented besides, other digestive troubles, alternations of constipation and diarrhea, dyspnea, exaggerated urinary secretion and sweats more or less abundant, insomnia, and palpitations One-third had intermissions of the pulse and granulous angina, some of them the intestinal parietes, the mesenteric glands and the had emphysema, aphthæ, amblyopia, spitting of One hundred and thirty seven cases referred blood to young smokers in whom the vertigo was produced almost always in the morning 4. The occurrence of vertigo coincided, in one third of the cases, with the suppression of profuse sweats and a marked diminution of the urinary secretion This phenomenon may be easily interpreted by all physiologists Sometimes the symptoms of the vertigo of smokers have been confounded with that of cerebral congestion and even of diseases of the heart This error of diagnosis may lead to the most serious consequences, and the author knows at least of one case that came under his notice who died after having been copiously bled for vertigo supposed to have been caused by cerebral congestion, whereas the real cause of death strated by observations that he had occasion to make, was attributable to excessive tobacco smoking. The whether in his long voyages on board men-of-war author explains that in nicotic intoxication there is at

thor's own conclusions Whether this be due to want of care in editing or too great modesty on the author's part, it impairs the value of the work for reference Those who especially desire to refer to the fullest and latest collection of statistics on this subject will nevertheless find it in Prof Stimson's work, which is quite likely, therefore, to become a standard authority

SECOND SERIES OF PHOTOGRAPHIC ILLUSTRATIONS OF SKIN DISEASES A complete work on Derma-An Atlas and Text-book combined GEO H FOY

The first two parts of this work have already been noticed in The Journal The standard of excellence is maintained fully in the third and fourth now at hand We cannot speak too highly of the faithfulness of the illustrations The coloring of these plates is much more correct and lifelike than of any similar It must be remembered that collection seen by us this is not simply a new edition but an enlargement of the old edition, which makes it a complete textbook as well as atlas

A PRACTICAL TREATISE ON DISEASES OF THE Skin, for the Use of Students and Practitioners Second Thoroughly Revised and Enlarged JAMES NEVINS HIDE, AM, MD Pages 676 Philadelphia Lea Bros & Co

We are much pleased to see a second edition of Dr Hyde's well-known and most excellent book Changes have been made on called for so soon almost every page, much has been rewritten and new chapters have been added The nomenclature has been made to conform to that adopted by the American Dermatological Association The illustrations Those depicting morbid histology are numerous Two colored illustraare accurate and well chosen tions of unusually rare diseases have been introduced

MISCELLANEOUS.

THE ROCKY MOUNTAIN MEDICAL ASSOCIATION held its seventeenth annual meeting in the parlor of the Burnett House, Cincinnati, on Wednesday evening, May 9, 1885 Dr N S Davis was called to the chan in the absence of the President The following members were in attendance Drs Davis, Toner, Wise, Donahue, Findlay, Atkinson, Elmer, Stanton, Hibberd, Pollock, Asdale and Morris Honorary members Mrs Davis, Mrs McMeans, Mrs Hibberd and Mrs Donahue The proceed ings of the last meeting and the memorial record were read by the Secretary Two deaths were reported during the past year, viz Dr D W Stormont, of Topeka, Kansas, and Dr A E

Heighway, of Cincinnati, both born in 1820
Dr William Elmer, of Bridgeton, New Jersey, was then elected President, and Dr John Morris, of Baltimore, Secretary and Treasurer On motion of Dr Davis a resolution was tary and Treasurer passed requesting the Secretary to send a card to all the mem bers, so as to secure accurate knowledge as to the number of survivors of the Association The meeting adjourned to meet John Morris, M D at Newport, June, 1889

THE OMAHA MEDICAL CLUB, says the Omaha Clinic, is an association of physicians, and is of a most peculiar type It is without any organization whatever, it has no officers, not even a chairman, and is governed without any rules. Any regular physician in good standing is entitled to admission to its meet-Any regular ings, and all such are cordially invited to be present and take part in the work of the club There is no expense connected

The regular meetings of the club are held on the first with it and third Wednesday evenings of each month, at the office of the physician whose duty it is to read a paper each person attending is purely voluntary. The utmost free dom of action prevails as regards work to be performed, the club being governed solely by the ru'es of polite society which prevails in the drawing room

So far it has been a pronounced success, and the work very satisfactory, since only earnest workers and sincere students of medicine are in attendance

THE WATER SUPPLY OF GROWING CITIES is the subject for which a prize is offered for International competition in 1893 It is one of a series of annual prizes offered by the King of the Belgians, the value of which is 25,000 francs for each award The essays of those desiring to compete must be addressed to the Minister of Agriculture, Brussels, before January 1, 1893

THE ADDRESS IN MEDICINE.

Delivered at the Thirty Ninth Annual Meeting of the Ameri can Medical Association, Cincinnati, May 9, 1888

BY ROBERTS BARTHOLOW, M D . LL D . PROFESSOR OF MATERIA MEDICA GENERAL THERAPEUTICS AND HY GIENE IN THE JEFFERSON MEDICAL COLLEGE OF PHILA-DELPHIA ETC

Mr President and Gentlemen The last Internanational Medical Congress, in some respects, was the most important of the series In the discussion of those great topics included within the domain of State or preventive medicine, matters of high interest for all educated people, of the greatest importance to the well being of society, and that exhibit in the clearest manner the disinterested benevolence of the medical profession, were fully considered an unprejudiced observer it would seem that matters of such high interest would receive respectful attention, and such practical benevolence be greatfully appreciated by the great organs of public opinionthe daily newspapers it must be admitted that it did not prove to be so

It is a remarkable fact that the proceedings of the Congress were revealed to the universal public in a manner that is not too strongly characterized by the word flippant In explanation of this phenomenon it was said that such is the usual attitude of the press toward the medical profession, that these representatives of current opinion do not take the profession "seriously," but rather view the men, and the work of the Congress, as a comedy performance, to be enticised and laughed over on the same lines the great metropolitan dailies stood alone in this attitude, it were the less surprising, but, unfortunately, others participate No thoughtful observer can have throughout the country toward all medical organiza-The same position is assumed by a certain "medico," and the art and science as a profession or Barnum's wooly-horse, or Chang the Chinese giant

ing attorney, who happened to be present, and he also chided them in a manner befitting a pedagogue to his naughty boys, rather than members of a scientific body

The causes of this state of things are not far to seek Every one here present must be familiar with I purpose only to consider those which have to do with the therapeutic art-the most important

Not a little of the ignorance, the crudities, the vague theories of the eighteenth century still linger in the nineteenth century near its close. It is yet understood by many that the therapeutic art is based on some ism or dogma. "Allopath" and "homepath" are still bandied about as having vital power, when they were long since relegated to the lumberroom of the past by modern science We yet hear of "new school" and "old school," as if notions brought out near the close of the last century, compounded of the vagaries of Hahnemann and the mysticism of Mesmer, could still continue guides to The contentions of so called "schools," the noisy demonstrations of the Thompsonians, and electrics, and physio-medicals, the rapid water-cure. and the innumerable special cures, have produced in the popular mind a distrust of all systems

The cry of "new school" has proved the most sympathetic, but the attractive sugar pellets, and tasteless liquids, carry with them their own destruction, for, in the deeper consciousness of men, lies the fatal objection that great results are not to be accomplished by such slender means Hence, left to its own course, homoeopathy has practically died out on the Continent On this side of the Ocean it still maintains a certain influence, because of social conditions and prejudices that are only possible in free communities

The success of such wretched puerilities, such failed to see that such is the disposition of the press manities as the homospathic practice consists of, does more to lower the position of the medical profession than any other cause The false statistics element in American society that delights to be con-sidered "cultured" By these, a physician is a ing unchallenged, are at this moment doing an almost incredible amount of mischief Two years ago business, is no higher esteemed than such shows as a pamphlet was very widely distributed throughout the West, as a trade document, containing much Recently at a meeting of a medical jurisprudence falsehood in the way of statements of pretended society, several members, scientific men, questioned scientific truths, and fictitious statistics, that placed the accuracy of some statements made by the author legitimate medicine in a false position, and disof a paper who is connected officially with the Credited its practice to a most serious extent. This pamphlet was issued by a St. Louis homocopathic official, they were sharply criticised by the prosecut- pharmacy, and was written by a Dr Somers, who

had been a professor in the faculty of Iowa University, and it had, therefore, an air of authority that demands materially contributed to its success. tırade agaınst allopathy—ıts past errors, and its present uncertainties-occupied much of this pamphlet, but its really effective part consisted in statistics made up out of the whole cloth These statistics, it is asserted, were obtained from official publications, and gave the results in numbers of the comparative success of homeopathy and allopathy, in the cities of Boston, New York, Philadelphia, and others was thus shown by pretended official figures, that homeopathic practice is invariably from 30 to 50 per cent more successful than allopathic

What answer can be made to such statements, apparently supported by official figures? I am informed by a physician of the best reputation, living in a large city of the West, that this pamphlet was sent to every house-holder in a considerable town, that legitimate practice was in a short time completely destroyed, and every regular physician reduced to extremity. We need not be surprised How could any physician answer those immutable figures? Those who suffer from the effects of such misrepresentations are clear that an adequate answer should be made, although the profession is averse to medical polemics—for, wherever this lying paper has gone, the regular practitioner is silenced the official figures—what will you do about it? remains unanswered, and is yet doing its work efficiently as a trade circular

When this pamphlet was brought to my notice, I communicated with the official authorities to learn about the source and probable value of these pretended official figures I expected to discover manipulations which made the figures tell the story that suited the purposes of the St Louis drug house, but I was amazed to hear that no statistics of this active principles, for by them we have minuteness of kind exist at all, that a return showing the effect of a system of practice on the mortality rates had never been made, and therefore never published, and hence present time, we must pay deference to taste, and se the figures given in the pamphlet were made out and I ascertained on further inquiry that though every aid were given, it would be a matter of infinite difficulty to get such figures, and to assure their accuracy would require an amount of time and trouble past, in which the point of departure is the exclusive - that hardly any one could give to such a task

We cannot but regret that such misrepresentations No other argument were should go unexposed needed to demonstrate the falseness of a system, maintained by frauds of such a shameless character, but meanwhile the advocates of the system profit by fully elaborated, but I do not find that there is any the forbearance of the medical profession in the at- truth which can be considered new, except the form titude of maintaining its dignity

The one remedy for existing ills—and to put the medical profession in its proper attitude as a scientific body-is to improve the art How can the application of remedial agents be rendered more therefore, little more than a name which it was hoped,

certain? As a teacher of therapeutics for many years, I profession in respect to the powers of medicines are ministration of active principles is necessary, is obvi do not have that familiarity with the physiological tion due to climate, character of season, mode of

powers of drugs which the effective use of remedies It thus happens that the highest precision The usual is not attained Vague notions take the place of scientific accuracy when such has been the progress in this department, that a considerable degree of certainty should be the rule

It must be admitted that the acquisition of thera peutical skill has been greatly hampered by the com plexity of the materials The barnacles of a century have been accumulating on the framework, and the new knowledge has been thrust into the crevices of old notions until all is made to appear confused and

The subject should be divested of its superfluities The list of preparations given in the U S Pharmacopara—our only official authority—can be greatly curtailed with advantage Remedies long in use and of comparatively little value are overloaded with formulæ The preparations of iron given by the Pharmacopæia are thirty eight in number, of mer cury twenty-five, of rhubarb fifteen, of aloes as One-third of these could perform the duty of The botanical and pharmaceutical details are all such that to master them would require the whole of the time given to the medical studies If obtained, such knowledge is of small value to physicians, therefore it should be turned over to the pharmacist, to whom it properly belongs

It needs no argument to show that to accomplish the best results, not only the remedy in its crude form, but its constituents must be accurately known Whenever an active principle is not available, the most concentrated preparations should be prescribed In an especial degree is it necessary to have com plete information regarding the dosage and actions Let me emphasize in the most positive of alkaloids manner the importance of using the alkaloids and dose, singleness of action, and precision of effect

In these "flabby days," as Mr Froude entitles the cure the administration of a remedy which in a crude form may be rejected

Under the name "dosimetrique" a system of thera peutics has been brought forward within a few years use of the alkaloids and active principles made into I will not enter into the theoretical nogranules tions on which Burggraeve bases his system Dr von Penterghem has done me the honor to send me his volume, which contains the dosimetric system Furthermore, their work is of the medicament Dosimetric practitioners are imperfectly superficial acquainted with the physiological action of remedies This so called system is, —their point of departure there is reason to believe, might play the role once the fortune of homoepathy

That to attain to any degree of accuracy the 2d

manipulation, and other accidents A notable illustration of this truth is afforded us in the composition It contains two active principles one Pilocarpine constant in form and powers, an-The proportion of jaborine other Jaborine variable found in different lots of the drug pilocarpus varies one from another, and the process of separating the alkaloid also affects the quantity. Now as jaborine is an analogue of atropine, and therefore opposed in the entirety of its actions to pilocarpine, it is clear that the crude drug must be uncertain in its effects and one specimen vary from another in the most radical manner In this way only can be explained the conflicts of observation first noted, for the alkaloid pilocarpine acts in a uniform manner, and must continue to do so To obtain the desired results it is clear that the alkaloid and not the crude drug must be used

There are many illustrations of the same truth for example, in the actions of cinchona and quinine, opium and morphine, nux vomica and strychnine, etc

There can be but one basis for the administration of That must be a true, exact, and intimate knowledge of the manner in which they act on the tissues and organs of the body This knowledge, as forces it now stands only in part developed, is large, somewhat complicated, but quite available, and will richly compensate all who will master its spirit and form

It is within a comparatively short period that the study of the physiological action of remedies has been the basis of scientific therapeutics The opening of the present century marked the very beginning of this movement, which, even now, is far from We owe to the genius of Magendie, seconded by the labors of Bichat, the fundamental principles, and to Bernard their practical execution It is a curious fact, that when the foundations of physiological therapeutics were being laid, Hahnemann was developing his notion of the spiritual essence in medicines under the tuition of Mesmer, who, his magnetic force School Medicine," we have this eighteenth century ment of the science mysticism unchanged and unchanging, whilst legitimate medicine has been continuously developing, under the inspiration of all forms of physical science To admit that homeopathy had any influence in the of physical truth shaping of scientific medicine, is to admit its right to a hearing It had nothing to do with the new forms the circulation scientific knowledge was taking, especially not with Physiological therapeutics being the form composition the art of cure must, of necessity, assume, is there practical use? Of this there can be no doubt law of antagonism of action is such a guide within and the activity of the function of nutrition its proper range By this is meant such a balancing of effects that the morbid action ceases illustration of the action, and of its consequences, diminishing congestion the vessels, and of fibroid kidney by the use of nitro- the tissues Here tissue changes are held in check, the morbid action, or that maintain a balance of action in electrolytic decomposition must be equally effects until the lesions no longer exist

Besides the antagonism that is direct, there is an That a remedy which has antagonism that is similar a selective action on any tissue will have a curative action in the diseases of that tissue, is a proposition that is generally true If the therapeutic action is similar to the morbid, the curative effect is in inverse proportion to the closeness of the correspondence

If there be similarity of action merely, the curative effect is trivial or is entirely wanting. To illus-Pilocarpus is the most powerful sudorific we possess, but it is the least effective agent in the arrest of sweating On the other hand, atropine is the most effective, and this, as all the world knows, dries the skin by stopping the action of the sudoriparous glands If we place together the physiological agents now used to arrest sweating, we find that they are powerful in proportion to the degree in which they lessen the functional activity of the sweat-glands Thus we have atropine, picrotoxin, strychnine and Such a fact is conclusive against the pilocarpine theory and practice of homeopathy

Next to the action of physiological antagonism as a means of securing accuracy in our therapeutical methods, must be placed the use of the physical The important one, and that only to which

I can allude, is electricity

Infinite harm has been done to this subject by spe-It is not yet divorced from charlatanry of the worst sort—the pseudo-scientific The most senous embarrassment in assigning electricity to its rightful place in our materia medica, is the complexity of the subject Unfortunately, no man can use the agent rightly who is unacquainted with its physics and physiology Within the sphere of its curative action, it is simply unrivalled That this strong statement is not universally accepted is due to the fact that this force is not sufficiently studied, and not appreciated because its powers are not utilized Professional skepticism, added to the ill-repute which comes of inveterate quackery, acts in turn on the at that time, was firing the heart of female Paris with minds of patients, and thus prejudice is engendered To-day, under the title of "New that constantly interferes with the proper develop-

> Notwithstanding the skepticism, or the positive unbelief, there are two facts that cannot be explained away or denied, for they rest on the immutable basis

The first fact is the power of galvanism to affect

The second fact is electrolysis, or electrolytic de-

Late researches have shown that a moderate galany law or rule which may serve as a guide to vanic current increases the vermicular action of the The vessels and thus increases the blood supply to a part, other hand, strong currents tetanize the vessels and A capital thus lessen the amount of blood passing to a part, The same laws hold good is afforded us in the use of amyl nitrite in the relief of the faradic current if the parts to be acted on are of that form of angina pectoris with high tension of so situated that the electrodes come in contact with

As respects electrolysis, skepticism has no ground and ultimately removed, by remedies that oppose of opposition The same laws that regulate polar

applicable within the body as without, the same sub-The action of the electrical stances being acted on current on the vessels, the electrolytic decomposition of materials that can be thus acted on, have brought disease whose short course we attribute to an abor about results not hitherto attainable Merely as indicating results now of daily procuring, and which, no doubt, receive full consideration in the Sections, I mention only the remarkable effects had in the treatment of pelvic congestion, inflammation and its products, of stricture of the urethra, and similar le-Again, in affections of the trophic system, cutaneous diseases, etc, quite a different aspect has been given them by electrical treatment. Nor should I fail to mention the quite remarkable results which large number of cases that present strong reasons in have been lately achieved by the combined currents their symptoms or lineage, or both, for believing -galvano faradic

Will my brethren who practice the obstetric art permit me to ask why post-partum hæmorrhage shall not be promptly arrested by the faradic current, instead of by ergot, friction of the abdominal walls, and other reflex stimuli intended to secure uterine contractions?

There is a vast field needing cultivation in the application of hygiene to therapeutics The comparatively new method of the dietetic treatment of disease offers us remedial agencies which certainly approximate to exactness in method and surety in result Time and the occasion permit me only to offer the merest hints for your serious and wise consideration

ABORTIVE TREATMENT OF TYPHOID FEVER

Read in the Section on Practical Medicine at the Thirty ninth Annual Meeting of the American Medical Association, May 10, 1888

> BY L D WOODBRIDGE, M D, OF WILLIAMSTOWN, MASS

Much has been written in reference to the abortive treatment of typhoid fever Most of the literature of the subject has concerned itself chiefly with the advocacy of different drugs, and the statement of clinical results obtained by them The profession will not test these methods extensively until they are shown to rest on a rational foundation of facts of anatomy, physiology and pathology My purpose is to make a beginning, at least, in this direction, to state the facts that should give both encouragement While I shall not omit and direction to our efforts a statement of my method, I count it of secondary importance The facts that have guided me to it are guiding me still, and have, I believe, still better things

The difficulty of proving beyond question the success of an abortive plan of treatment of a given disease is greatly increased by the following facts that in order to ment the name, the treatment ought to clinical history, that the symptoms pathognomonic of of the significance of early symptoms, contributions most diseases occur late in their course, that there-fore a successful abortive treatment will arrest most urine test, being probably also the most valuable

diseases before the development of symptoms that allow of a positive diagnosis, and while there is yet room for a possible doubt as to the identity of the tive plan of treatment

The demonstration of the success of an abortive treatment of typhoid fever presents these difficulties in an extraordinary degree, because the symptoms recognized in the past as absolutely pathognomonic all occur late in its history

The difficulty can be overcome and an absolute demonstration reached only by the following methods

- r Correspondence of results reached in a very them to have been typhoid fever
- 2 Post-mortem appearances obtained in the event of death from some other cause, during convalecence from what we believe to have been aborted typhoid fever
- 3 A possible aid may be had by a closer study of the early symptoms, that will allow us to attach more diagnostic authority to some of them than we have in the past, perhaps, also, by new methods of research to discover new pathognomonic symptoms that occur so early as to be always present even in aborted

Such observations will themselves need to demon strate their reliability by long and repeated trial be fore we can use them with absolute confidence in establishing the claim of any proposed abortive treat ment of the disease

The question at once presents itself How far have these difficulties been overcome? The reply will be found along the line of the three methods pro posed for overcoming the difficulties

A large amount of evidence has been gathered bearing upon the possibility of arresting the progress of cases giving reasonable ground, in symptoms or lineage, or both, for believing them to be typhoid This evidence will have varying weight with different minds

Our German confrères have done much, by ex tended observation, to establish to their own satisfac tion the utility of what they are pleased to call a "specific" treatment by calomel or sodium Niemeyer finds the argument so convincing as to state "that after the accurate observations of Wunderlich we can scarcely doubt that by this remedy (calomel) we may in some few cases cut short the disease" Sansom and Wilkes, in England, Henry, Peabody, Nelson and White, in our own country, are also among those who should be gratefully remembered for their re search in this direction

I am not aware of any published record of obser vations bearing upon the second method-post mor tem appearances in supposed successful cases of aborted typhoid fever, in which death may have oc curred during convalescence, from some other and unrelated cause

To the third method of a more exact determination

The present status of the problem may perhaps be fairly stated thus It will require the utmost diligence and care on the part of the profession for many years to come, in order to add to the extended observations of the past sufficient data to make a final settlement

of the question possible

Results already reached by observers in Germany, France, England and America afford so strong a suggestion of the possibility (some of us will perhaps say, the probability) of a favorable solution of the problem, that duty as well as interest should hold us all to careful observation and record of all facts bearing upon it It is this double impulse that prompts me to what I have to say

That I am not advantageously placed for original investigation, in a locality where typhoid fever is my lips against attempting an argument that rested to the fact of infection through the lungs It does impel me to come chiefly on clinical facts facts of anatomy and pathology with much modesty and with great deference to the views of those whose clinical opportunities have been greater

Let me state briefly at the outset those conclusions to which my own mind is tending, to which I shall

hope to win your assent

I That there is a modified form of typhoid fever, seen in localities provided with a pure water supply, whose development is slow, whose earliest symptoms are pulmonary, and which deserves more careful study than it has received

2 That there are early symptoms of typhoid fever to which we may attach much, if not a pathognomonic, value, a value greater than that we were accustomed

to assign them a few years ago

3 That certain facts of anatomy and pathology point not only towards the reasonableness of methods already employed for the so-called abortive treatment, but also of adding to those methods other expedients

4. That the cases so far observed in which these methods have been followed, though insufficient to fever, are sufficient to strongly suggest their usefulness, and to demonstrate their harmlessness

outside of typhoid fever in febrile affections, es-

pecially in those difficult to classify

We consider first, then, the evidence of the existence of a form of typhoid fever modified by condiwith a pure water supply

The azenues by which the typhoid germs gain entrance to the body are the respiratory and alimentary Lodgment in either of these tracts involves danger Lodgment elsewhere is probably harmless

We may well believe that the initial lesions will be different, and developed with different rapidity, according as the vehicle by which the germs enter, is the respired air or the ingesta—whether fluid or solid In the latter case the germs mingle at once with tions for rapid development. Here, too, is found a consideration of much importance in the symptomathat arrangement of blood-vessels and lymphatics tology

which gives most favorable conditions for rapid absorption, having indeed this for its office

Manifestly, germs entering by the respiratory tract will find much less favorable conditions both for increase and absorption, for here are in health no fermenting materials, and structure is adapted to inter-

change of gases rather than of fluids

Explanation of the fact that typhoid fever may be contracted through germs presented with respired air has been offered by the statement that some of the germs lodging in the pharynx and mouth are swallowed with the saliva. We may admit as at least equally probable, that after primary infection of the bronchial mucous membrane, germs contained in phlegm which is coughed up, but fails of expectoration and is therefore swallowed, may carry infection rarely seen, is doubtless true, and might justly seal to the alimentary tract Pathology adds its testimony

We can hardly fail to trace a growing tendency even to an argument based chiefly on acknowledged among recent authors to give greater prominence than before to the changes in the respiratory tract A more or less severe bronchitis, with not infrequent enlargement of the bronchial glands, is fast gaining deserved recognition as one of the most frequent I must content myself with only three quolesions tations from prominent authorities in support of this statement Loomis says "So constantly is catarrhal bronchitis present in this fever that Dr Stokes proposed to call typhoid fever, bronchial typhus" Niemeyer says "We find changes in the respiratory The typhoid laryngeal ulcer organs in all cases already described is not infrequently found There are always signs of an extensive catarrh even in the smallest bronch, marked by dark redness of the mucous membrane, and scanty tough secretion bronchial glands are swollen, vascular, and occasionally have a medullary appearance, such as we shall describe for the mesenteric glands" Flint says "The enlargement of these glands (bronchial) in some cases is considered as corresponding in pathological character to the enlarged mesentenc glands" This demonstrate finally their power to abort typhoid is a fact full of diagnostic significance for us, and of special importance where a well-protected public water supply reduces to a minimum the danger of 5 That these measures have a wide application infection from fluids through the digestive tract, and leaves open only the much smaller opportunity of infection through the respired air

Three conclusions are inevitable from these facts

1 That in cases where germs are received first into tions frequently obtaining in communities provided the respiratory tract, the early symptoms should be bronchial rather than abdominal

2 That in such cases the symptoms should be slow in development, owing to the conditions unfavorable to rapid increase and absorption of the germs

3 That such cases are likely to lack in their early history many of the typical symptoms of the disease, te, to be atypical, and that room should be given for such cases in our consideration of early symptomatology and diagnosis

We may add one more statement, viz that in dead organic material, and in the lower bowel with communities provided with a pure water supply, this fermenting fecal material—so finding the best condi- is likely to be the most frequent type of the disease,

If any question the possibility of infection through the lungs they must do it in the face of the fact that serting most, if not all, recent writers concede it on the proven double ground of clinical experience and pathological to a preceding case need not deter us from a diag

The testimony of the inflamed bronchial mucous membrane and the enlarged bronchial glands is not and practical estimate of symptoms easily gainsaid

SYMPTOMATOLOGY

We turn next to symptomatology, and especially to the question whether there are early symptoms to which we need to give more prominence than in the Whatever concerns diagnosis may find place here, for if we are to claim abortive treatment of typhoid fever, we shall need to establish reasonable, if not positive evidence that the disease whose short course we attribute to the treatment is indeed typhoid, and therefore one whose natural history is a course of several weeks' duration

We find ground for diagnosis of disease from

I Its lineage, both as regards its parentage and offspring

2 From symptoms observed during its course

From post mortem appearances

Typhoid fever is a disease that may give us evidence from all three sources Aborted typhoid fever, except as death may come in early period of convalescence from some unrelated cause, can gather its evidence from only the first two sources, lineage and symptoms

The discussion of diagnosis, so far as it depends upon lineage, leads immediately and necessarily to the question of etiology Is it ever of spontaneous origin? This we have not now time to discuss, and must content ourselves with a statement of the fol-

lowing postulates

1 No recent prominent writer, with possibly one exception, ventures to positively affirm the negative as more than an individual opinion

2 All recent and prominent writers mention both views with respect

3 The strongest opponents of the spontaneous origin have in many instances to confess their inability to trace the relationship they claim between a given case and its parent

4 Several of the most prominent recent writers are to be guarded in the patient's behalf, as, if successful, zealous champions of the spontaneous origin of the the treatment must begin early

disease from putrescent organic matter

Loomis admits that there are strong advocates of both sides, though himself not a believer in sponta-Murchison stoutly upholds spontaneneous origin Reynolds' "System of Medicine" makes ous origin this statement, "We must therefore conclude that this disease has a spontaneous origin in putrescent matter" Wilson, while himself a dissenter, admits the weight that must be given to such an advocate as experience

The latest utterance from high authority I have been able to find is that of Dr Janeway, who, in the ciety, last fall, defined his position as one of willingwith which patients are, at first, unwilling to believe
ness to admit the possibility of its arising de novo from
filth fermentation, but inability to admit it as more filth fermentation, but inability to admit it as more as those of a cold, is referred to by many writers than a possibility

In view of these facts, are we not justified in as I That it must be said of both views Not 2 That inability to trace a suspected case nosis of typhoid fever

Three considerations must control our discussion

That we have to do with a disease whose pa thognomic symptoms occur late in its clinical history

2 That its early symptoms are generally obscure and not infrequently attend other diseases

3 That if we shall ever arrive at a successful abor tive treatment we shall see only the earlier symptoms, and even these modified by this treatment If asked to give the most characteristic symptoms, we should doubtless answer the eruption, and abdominal symptoms of tenderness and diarrhoea, and the peculiar temperature curve If intestinal hæmorrhage is present it doubtless strongly confirms the diagnosis, but as that occurs in only one in twenty of well au thenticated cases we can hardly class it among the symptoms to be expected, even in a case following the natural history of the disease Eruption and diar rhea rarely occur before the early part of the second week Abdominal tenderness is often present among the earliest symptoms

How many of the symptoms generally considered as most essential to a positive diagnosis we shall find in aborted cases, if such exist, will depend upon how early we have begun the treatment and how rapidly

it proves effective

In the cases that have fallen under my observation, eruption has not been infrequent, and abdominal ten derness quite constant Diarrhœa has been of rare occurrence The temperature curve we should also expect to find materially modified by successful abor tive treatment, though retaining certain strong points of resemblance, quite enough to suggest, if not estab We must, therefore, if admitting lish its parentage an abortive treatment, undertake a careful and cor rect estimate of the value of other and early symptoms

Under the former expectant or symptomatic treat ment, we found our most urgent motive to early di agnosis in prophylaxis in the interest of others than If an abortive treatment is accepted as the patient possible, our motive is strongly reinforced by interests

It therefore behooves us, in the future, to give the closest attention to the symptoms that will afford us, if not positive, at least reasonable, grounds for early A careful review of the statements of diagnosis Loomis, Flint, Bartholow, Wilson, Niemeyer, and the "Systems" of Pepper and Reynolds, must lead us to assent to the following conclusions, which will also doubtless find verification in our recollection and

We must limit ourselves to those symptoms that are sufficiently characteristic to be an aid in early

differential diagnosis

The onset is generally insidious The frequency

Headache, often of great severity and obstinacy, but sometimes slight, is rarely absent

Epistaxis is referred to by all writers as a usual symptom, varying from so slight a degree as almost

to escape notice to profuse hemorrhages

Tenderness of abdomen, sometimes quite general, sometimes most apparent in right iliac fossa, is universally mentioned, and if to it is added ileo cæcal

gurgling, it gains still more significance

Constipation is probably more frequent than diarrhæa during the first week, though several writers assert a tendency to more than the usual response to a mild laxative There remain the three symptoms which, I believe, deserve more weight than we have been accustomed to give them, viz cough, temperature, and Ehrlich's urine test

atory tract, has been sufficiently stated geal nerve This view would seem to be supported in the cacum the altered physical signs at right apex that often at- to establish in this connection are three tend such enlargement

most, if not all cases, the cough and mucous expectoration betray the bronchial catarrh " Wilson says "Bronchial catarrh is of sufficiently common occurrence to acquire a certain amount of diagnostic significance" Loomis writes "Slight bronchial catarrh can hardly be regarded as a complication, it is so much a part of the clinical history of the disease "

Temperature — In typical cases, the well-known temperature curve is observed early in the disease, if not from its beginning, but atypical cases are so frequent that we need to inquire whether there are not other features of temperature that will afford valuable This, Wilson believes, we have in a marked tendency toward a constant morning remission, and this my own observation strongly confirms, as my of temperature resulting from treatment widely atypical the temperature may be is shown by the outbreak among the German troops at the siege of Paris, where many fatal cases occurred without rise of temperature Wilson calls attention to another feature of the temperature that he deems characteristic, viz that it is very labile, easily elevated by trifling causes, as first solid food, etc makes much of sweating as a diagnostic sign

confirmation, promises to be most useful

treatment of typhoid fever, and which suggest modifi-

rious intestinal lesions occur, the location of the areas of intestinal ulceration, the relation of the

large mesenteric glands to those areas

The period of occurrence of the intestinal lesions calls for only brief statement Enlargement of the solitary glands may be observed as early as the third or fourth day in some instances, and continues till twelfth or fourteenth day, when ulceration begins, and may continue till the twenty-eighth day statement is significant chiefly as indicating the narrow limits of the period during which an abortive treatment that depends solely upon intestinal antisepsis can have any hope of proving effective

As to location of lesion, the duodenum escapes ul ceration, the jejunum is very rarely affected, the ileum is most frequently the sufferer, and ulcerative Cough, at first dry and hacking, is insisted on by lesions are frequently confined to the last four feet several writers as an aid in many cases My own of the ileum, while the largest ulcers are almost inview of its importance where we may fairly infer that variably found in the last six inches of this portion infection, if present, has occurred through the respir- of the intestine, i e, in the part just above the ileo-I question | cæcal valve It is, indeed, not infrequent, in cases whether the spasmodic cough often seen in such cases | presenting few ulcerative lesions, to find them limited does not depend upon pressure of enlarged bronchial to this small portion of the intestine. In the large glands upon the bronchi or upon the recurrent laryn- bowel, the most frequent seat of ulcerative lesions is If found beyond that, they grow less not only by the character of the cough, but also by frequent as we go downward The important points

I Tendency toward such lesson increasing in the Fint states that "a slight or moderate cough is small intestine as we recede from the point of enalmost invariably present" Niemeyer says "In trance of the bile—an antiseptic fluid—a fact that suggests the possibility, at least, that this natural antiseptic fluid proves generally effective in the upper part of the small intestine, and that therefore the addition of another antiseptic might so far extend the effect that the entire intestinal tract should escape injury from the bacillus It is true that it is only a suggestion of such a possibility, and not a demonstration, a suggestion, however, of such force as to make it a duty to address ourselves diligently to the task of testing the possibility by all safe means

2 The ulcerative tendency culminates at a point remote from the point of entrance of the bile, and behind an obstruction constituted by the ileo-cæcal valve, and analogous to the obstruction afforded by a stricture of the urethra, behind which the congescases have followed this rule even during the decline tion, inflammation and ulceration that maintain a gleety discharge so often intrench themselves

> 3 The large intestine developing the ulcerative tendency most in the cæcum, where fæcal matter is most easily long retained, and progressively less as we go toward the rectum, where evacuation of con-

tents is most frequent and immediate

The therapeutic significance of these facts lies He also chiefly in the suggestion that whatever we can safely do to reduce this natural obstructive tendency of the Ehrlich's urine test, though perhaps needing further leo-cæcal valve, and to keep the bowel comparatively free from long retained fæcal matter, will contribute We turn next to the discussion of anatomical and to the recovery of our patient, and to the prevention pathological facts that suggest the reasonableness of of the worst features of the disease, dependent on methods previously advised for the so-called abortive ulcerative lesions That the mesentenc glands most involved are always those immediately related to the cations of those methods and additions to them The ulcerated areas, is the fact that most concerns us in facts most significant in reference to our present purtheir pathology, a fact that has, as yet, proved rather Pose are the period of the disease at which the va- suggestive than productive in my own thought

Besides these pathognomonic, pathological lesions, there are other minor ones, of not infrequent occurrence, not considered pathognomonic, and yet of ministration of antiseptic drugs which are eliminated perhaps greater significance than we have been accustomed to think These changes concern the upper portion of the alimentary canal and the res-The large swollen tongue, indented piratory tracts by the teeth, the swollen lymphatic follicles in tonsils and at base of tongue, and the not infrequent ulcerations found in pharyn, osophagus, laryn, and trachea, are referred to by most recent authorities as coincident with, and analogous to, the intestinal These minor lesions afford important therapeutic suggestions as to addressing an antiseptic abortive treatment to the entire digestive tract from mouth to anus, and if possible to the respiratory tract! as well

It is also a suggestive fact that, even when no abortive treatment is attempted, cases are not infrequently found in which the first authorities (Loomis, Pepper, as they must all be reached by some agent which Reynolds, Wilson, Bartholow) accept without question is swallowed the view that the solitary and Peyer's glands, after the enlargement observed in the early period of the disease, undergo resolution without ulceration, a fact | following facts that disposes finally of the objection often advanced against abortive treatment, that if the poison once gains entrance to the system, the disease must run through all its peculiar phases both of symptoms and pathological change

Having these suggestive facts of the pathology of the disease, let us endeavor to build upon them a

reasonable

THERAPEUSIS

The movement to find an abortive treatment for typhoid fever has arisen in connection with the theory of the intimate relation of a specific germ to the That view may be now fairly regarded as disease established, and, if true, it is only rational for us to search for some agent with which we may directly Indeed, we should be lacking in combat the germ our performance of duty did we, as a profession, fail in the urine The profession to make such search most diligently have not been forgetful of this duty, and as a result, the day seems near its dawning when we can set before ourselves more rational and definite aims in our therapeutics

A therapeusis based upon the germ theory must, in view of our present imperfect knowledge, set before itself two aims

I To destroy the germs of the disease, or arrest their development

2 To combat the ptomaines which are developed

during its course

We consider first the conflict with germs conflict we may well believe must be conducted on two fields

1 On the surface of mucous membranes with germs that have not yet entered the tissues

2 In the tissues with germs that have gained ac-

cess to them

efficient antiseptic therapeutics to the bronchial mu- tents Certain facts of clinical experience are sug-

cous membrane is still open to question Inhalation of antiseptic vapors or of oxygen, and internal ad by the lungs, as, for example, eucalyptol, are as yet our best and very uncertain agents

The alimentary tract we can deal more directly with, and through a larger variety of agents We may approach it through two avenues-the mouth and the anus, in both cases our agents are likely to lose in effectiveness as we depart from the point of introduction, while that introduced into the rectum will be limited to the large intestine As far down as the ileo-cæcal valve we must depend solely upon antiseptics introduced by the mouth, and cur aim should be to use antiseptic measures along all the tractmouth, œsophagus, stomach and intestine

The mouth and throat may be reached by a mouth wash or gargle frequently employed The esopha gus, stomach and intestine we may consider together,

Would intestinal antisepsis be useful if we could effect it? We may find an affirmative answer in the

a Even in health, a considerable portion of feeal matter consists of micrococci and micro-bacteria, and that poisonous ptomaines are developed as a re sult of their activity

b The effect of nature's disinfectant fluid in the intestine, viz the bile and its apparent effect in restraining development of the germ in the upper por-

tion of the small intestine

c The results of clinical experience

May we safely attempt such intestinal antisepsis? Clinical experience must here again give us our only That we may safely take considerreliable answer able amounts of some antiseptic materials into the digestive tract is well established, and if doubt exists, it must concern the question whether these amounts Fortunately, we have are sufficient to be efficient a test for that in the presence or absence of phenol It is a constant product of intestinal putrefaction, and is eliminated by the urine Dr Henry has demonstrated that during the use of thy mol phenol disappears from the urine-a proof of effective intestinal antisepsis Perhaps no more striking proof of the possibility of intestinal antisepsis could be afforded than this action of thymol -It does not lower temperature when no sever exists, its effect is uncertain, and at best slight, if fever is not associated with disorder of alimentary tract, it proves an act ive antipyretic in typhoid fever where such disturbance, dependent upon germs, is at its height Phenol here, too, disappears from the urine during its use

Another clinical fact going to prove intestinal anti sepsis to be both possible and safe is the large class of antiseptics that are effective agents for the arrest of diarrhœa dependent on germ development Ac knowledged advocates of this view are found in large numbers among the first names in the profession

Other agents than germicides may aid in limiting The first field we find in the respiratory and all-germ production in the bowel Evacuants may aid The possibility of the application of us by preventing long retention of the intestinal con

gestive of the very practical value of evacuant measures in typhoid fever Loomis says diarrhea through the entire course of the fever is a favorable rather than an unfavorable symptom " "When the diarrheea is present in the early period of the disease, it is better to let it alone " The advan tage of an active laxative in the initial stage of the disease is too generally conceded to admit of doubt -an advantage shown in reduction of the number of microorganisms, and in reduction of temperature

disease, the problem of controlling development of the germs in the tissues may not be so difficult, and may not require a charging of the whole body with The problem will be a simple one, if we can find special hiding and breeding places of the germ within the body, where the bacilli are rapidly developed, and from which they, or the poisonous pto into the blood in increasing quantity, till its power of disposing of them is exhausted, and the whole system succumbs to their influence That such is the fact I think we must admit, if we would give a rational explanation of the phenomena often observed

What are these hiding and breeding places? My answer rests in part on some well recognized facts of anatomy and physiology, and in part upon some not irrational, but I will admit theoretical, inferences from these facts In the ordinary process of absorption from the intestine, two carriers wait in the in digestion into the circulation, viz the capillaries and the lymphatics Material in solution, as the peptones, enters by way of the capillaries, material in suspension, as the emulsioned fat, by the lymphatics, aided, doubtless, by the peculiar structure of the epithelial cells, whose root-like processes of adenoid tissue extend to, and are continuous with, the wall of the lymph vessel in the centre of a villus closely packed rods on the surface of the epithelial cell first entangle the foreign body, and the amœboid activity of the cell conducts the entangled mass along the cell tissue and its root-like processes, till it reaches the cavity of the lymph vessels, so determining its entrance into a lymphatic, rather than a capillary

We may fairly infer that this is also the pathway of the germs, as they would correspond more to the suspended oil globules than to the dissolved peptone A few germs, perhaps, enter the capillaries, but we may well suppose that a fluid containing as much ovygen as the blood, with which it parts readily, would be capable of promptly disposing of a small number

of such germs

On the other hand, germs received into the lymphatics find a medium much less inimical to germ development, as it contains only a slight trace of As these pass along the lymph vessels to the point of entrance into the general circulation, they are obliged to pass through, we might almost say to be filtered through, the pulp of the mesenteric diet specially rich in fats, would gain the same result glands and many of them would be almost inevitably

moved from oxidizing agents Those carried on "A mild through the glands to the general circulation may be destroyed by the well oxygenated blood

Favorable as is the condition in the mesenteric glands for germ development, a much more favorable condition is found in the closed lymph follicles that constitute the solitary glands and Pever's patchesentirely closed sacs, with no lymph current running through them, as have the mesenteric glands, to molest developing germs, the products of the glands es-If opportunity of treatment is offered early in the caping probably partly into the capillaries, and partly into the lymph sinuses that he beneath them

My view, supported, but I will admit, not proved. by the peculiar lesions of the disease, is that the an antiseptic sufficient to be destructive in every germs, finding their first place of lodgment and increase in the contents of the bowel, find a second such point of lodgment and increase in the closed lymph sacs of the solitary glands and Pever's patches and in the lymph glands of the mesentery, their rapid maines which they produce, or both, are poured out increase there giving rise to inflammation and enlargement of their structure, and to a constantly increasing rate of discharge into the blood, till that fluid is no longer able to destroy the germs or their products, the ptomaines, and the constitutional symptoms, characteristic of the disease, result

If this be true it has an important bearing upon the possibility of abortive treatment If intestinal antisepsis be possible we certainly have an early opportunity of aborting the disease, while germs are

confined to the contents of the bowel

If my view of the part played by the solitary, testinal wall to convey the nutritive products of Peyer's and mesenteric glands be true, we have a second opportunity, after the germs have gained access to the tissues, but are practically confined in their development to these lymph structures, and the blood is yet able to dispose of such as are discharged In partial support of such a view, let me om Loomis "It is scarcely questioned that into it quote from Loomis the typhoid poison, to a great extent, gains entrance to the system through these glands and lymphatics, and here produces the primary irritation '

This fact gives two most useful suggestions to one who aims at the abortive treatment of typhoid fever

1 That though it were proven to be unsafe to introduce into the general circulation a germicide in quantity sufficient to be effective there, still he need not limit his antiseptic measures to the intestinal tract, but may make the effort to pursue the germs as far, at least, as their first place of hiding and increase in the tissues, viz, the lymph structures of the alimentary tract

2 That probably the most effective agent for such pursuit would be a fatty germicide, if that can be found, or failing of that, a germicide so united with a fat that in the process of digestion it will be retained in the fat when the latter becomes emulsioned, and would be so absorbed by the lymphatics, as the fat is

It is also possible that an insoluble germicide finely triturated, might prove effective Or, that accompanying a germicide which is soluble in fats, with a

The prospect of obtaining a germicidal effect in entangled there, and find, if not an ideal, at least a these tissues would seem to be excellent, as these favorable, place for development, comparatively re- organs he directly in the path of absorption from the bowel, and as the lymph current is at best a very slow one, allowing more time for the action of a germicide in the gland tissue, before it should be car- trefactive changes are active in the body ried on into the general circulation

The structure of the spleen, closely allied as it is to that of lymph-glands, suggests that it would be likely to prove a place of hiding and increase for the germs, after they had once been thrown into the blood faster than that fluid could dispose of them, and this seems to be the case as shown by its constant enlargement, a change subsequent to that in the intestinal and mesentenc glands, and by the en ormous number of the germs found there in fatal cases by microscopic examinations

The possibility of pursuing the germs to this point turns upon the possibility of safely introducing a ing chiefly the heart, lungs, and cerebro spinal germicide into the blood in sufficient quantity to prove effective, unless it should be found that the spleen, tolerant as it is of some forms of hypodermic is not the germ, simply as a foreign body, but the medication, should be tolerant of some effective ptomaine (or ptomaines) resulting from the growth germicide given in that way

It appears, therefore, that there are three periods in the disease during which we may address ourselves to germicidal, and so abortive, treatment of the among these diseases

disease

testinal tract

2 After they have gained access to the lymph structure of the intestine and mesentery, but while the blood is yet able to dispose of all the germs thrown into it from the glands

3 After the production of germs has passed the limit of the blood's power to destroy them, and there

occurs a general infection of the body

Manifestly the difficulty of attaining our aim increases as we advance from the first to the third of

these periods

Whether a single remedy suited to all stages can be found, and if not, what choice of remedies we had best make for each stage, whether in treating each stage later than the first, we must carry over into it the remedies of the preceding stages, are problems that will require close observation and most patient research

So much for the first of the aims we set before us,

viz, combating the germs of the disease

The second aim is to combat their product-a ptomaine or several ptomaines, which, we cannot yet assert

The ptomaines are the latest, and a most welcome and suggestive addition to our knowledge of the They open up a wide field for causes of disease surmise and investigation, and give more promise of leading us to rational treatment of disease than has any fact brought to our notice for several years past

A brief statement in reference to them, which will serve to freshen recollection in our thought, will not be amiss Perhaps we may best present such a statement in the form of the following postulates

1 As vegetable cells, by an activity peculiar to themselves, develop a material known as an alkaloid, so animal cells in normal activity develop materials known as animal alkaloids, ox ptomaines 2 That ptomaines are also developed under other

conditions, viz, in the normal processes of digestion, and under all circumstances where bacteria and pu

That these ptomaines are numerous, the kind developed depending upon the character of the cell that produces them, the species of bacteria at work, and the stage of putrefaction

4 That many diseases are attended with the de velopment of a ptomaine peculiar to the disease, and which, if introduced into animals, causes promptly the development of symptoms allied to, if not iden tical with, the symptoms of the original disease

5 That the ptomaines produced differ with each

disease so far as investigated

6 That these ptomaines produce symptoms affect

7 That the active agent producing the symptoms of the germ and the changes it effects in albuminoid material of the tissue or of the intestinal contents

8 That typhoid fever and lobar pneumonia are

9 That from cultivation of typhoid fever bacillus, I While germs are limited to contents of the in- a ptomaine has been derived which proved fatal to small animals in twenty-four hours

10 From the urine of both typhoid fever and pneumonia patients two extracts have been obtained, either of which will produce death, but whereas one leaves the heart in diastole, the other leaves it in systole

II That several facts point to the conclusion that these ptomaines are thrown off by the excretions, and that such elimination, if rapid, is sometimes fol lowed by a prompt disappearance of symptoms

Such a fact is the sudden termination of symptoms after profuse sweating, as in intermittent malarial Such also is the remarka fever and in pneumonia ble success had in the treatment of yellow fever by hypodermic injections of ½ to ¼ of a grain of pilo carpine muriate, reported by Dr. E Habersmith The profuse sweating and catharsis or emesis, or both, was followed by return to health in forty eight hours

This ptomaine enemy we may combat in the di rection of preventing its formation, of destroying it by effecting its decomposition, by using strictly antidotal remedies and by hastening its elimination from the system Doubtless the best, indeed perhaps only way of preventing its formation is by destroying or rendering mert the germs of disease, whether in the Therefore any germi intestinal tract or the tissues cide that we use effectively for that purpose will at the same time effect this

The destruction of the ptomaine after it has once appeared in the system is something that we know little about, too little as yet for intelligent discussion, and we therefore dismiss it with this simple mention, and the suggestion that we may find encouragement to our effort in this direction in the fact that some at least of the ptomaines have an exceedingly unstable chemical equilibrium, and may therefore offer themselves easy victims to an agent that invites their con stituents to more stable combinations

slight extent, unwittingly followed in the use of digitalis for heart failure

Elimination of the poison we may perhaps hasten in vigorous patients by profuse sweating. The remarkable results gained by Nelson with veratrum italis viride are perhaps attributable, in part at least, to the drug acting in one or both of these methods large bowel free from accumulation by large enemata, in addition to those already referred to cially is this the case when we remember that the large intestine is in health the place of most rapid development of bacteria and formation of ptomaines, and also an organ capable of carrying on active ab This is a field that waits our study, and seems to offer a rich harvest to the wise and patient seeker

Having laid this foundation of many facts of anatomy, physiology and pathology, and I hope not matenally weakened it by some theoretical considera tions drawn from them, I am ready to present in detail the methods of treatment I am accustomed to follow

No precaution, in effort to procure good ventilation, pure air, proper diet and careful nursing, is In cases presenting evidences of primary infection through the respiratory tract, I have sometimes employed creasote inhalations with Beverly Robinson's oro-nasal inhaler, with apparently good results, in at least diminishing cough

The digestive tract receives antiseptic attention

throughout

Frequent use of an antiseptic mouth wash, generally Dobell's solution with listerine added, has been only recently employed, and I do not feel justified in urging it on the ground of any positive results demonstrated yet, but on purely theoretical considtions derived from pathological facts already noted

To this antiseptic wash is added occasional doses of the gr of hydrarg iodid rubr in 1 per cent trituration with sugar—this to be used three to six times a day, allowed to melt on the tongue, and no fluid to be taken after it for several minutes The antiseptic effect of this is doubtless felt in the mouth, esophagus, stomach and bowel In order to avoid the danger of salivation this is not used after the second or third day, unless very infrequently

The main dependence for intestinal antisepsis as far as the ileo-cæcal valve, is sodium salicylate in doses of 10 grains every two to three hours, given either in capsules or Wyeth's compressed tablets I am well aware that it has been pronounced by some high authorities to be not only useless, but also positively injurious, attention has been called to the statement that it depresses the heart, diminishes of evil effects from one full dose at the outset increases diarrhoa and tendency to hæmorrhage

The antidotal treatment we have probably, to a in methods of administration that I have found necessary, have been to take a few swallows of some fluid nourishment before the capsules, and the addition, in some cases where the patient's circulation is poor even in health, of a few small doses of tr dig-

There is a large class of available antiseptics It have used sodium salicylate not because I know it suggests another possible advantage of keeping the to be the best, but because I found it safe and efficient Other agents that call for very favorable mention are Dujardin-Beaumetz's solution of carbon bisulphide, thymol urged by Dr Henry, beta-naphthol advocated by Dr Bouchard, naphthalin advocated by Dr Peabody seems to have a good record using it we need, however, to remember that it is objectionable in cases in which lung symptoms are In well selected cases I am disposed to think it may prove more effective than sod salicylat, as Dr Peabody finds it reduces temperature to normal in 24 to 48 hours, a more prompt result than I dare claim for the soda salt

> Salol I have been led to be suspicious of, as, if used in sufficient quantity it needs to be closely watched in reference to its effect upon the kidneys Two 10 grain doses have, in my experience, once caused suppression of urine

> The iodine carbolic acid of Dr Sansom, of London, also advocated by Bartholow, has in my hands proved very disagreeable to patients, and much less

efficient than sodium salicylate

Sulphurous acid, much praised by some, and the phenic acid treatment of Dr Déclat, have served me well in a few cases, but not as satisfactorily as the

sodium salicylate

My third therapeutic agent is calomel, given in one large dose at the outset, if the case is seen before a free diarrhoea has set in If seen later on, a dose of equal parts of castor oil and syr rhei has the preference, as an efficient but soothing laxative, which tends to limit its own action If abdominal palpation and percussion give no sign of accumulation in the bowel, even this would be omitted in cases with free diarrhœa. The use of laxatives in the disease has been much inveighed against In Reynolds' System we find the statement, "Calomel should be avoided, its action is too irritant " One cannot but wonder, prior to personal experience, whether the danger is not overstated by authority, when reading of the results gained by the Germans, as shown by statistics covering hundreds of cases, and of Dr Bartholow's large confirmatory experience rather assent to the statement of that sage among medical teachers, Dr Loomis, who says greatest caution must be observed in the use of cafact that it is eliminated by the kidneys and may irri- thartics in any stage of the fever " The German tate those organs I am grateful for the suggestion, mortality, reduced from 13 2 per cent by the exand always watch the urine of my patients closely, pectant treatment to 8 8 per cent by an active calwhile using it, but have yet to meet any unpleasant omel treatment continued during the first week, may result from its use The same may be said of the go far towards relieving our minds of apprehensions respiratory movements, causes gastric disturbances, tholow comes strongly to our support with advocacy I of 71/2 to 10 grain doses every alternate night till the have watched for, but have not observed them, as in third or fourth day Dr Peabody, who believes that any way troublesome results The only precautions for two years past he has aborted many cases coming

under observation during the first ten days of the disease, employs as an initial measure a 10 grain dose Niemeyer, Liebermeister and Wunderlich also lend the support of their strong names to the treatment

Apart from my own confirmatory experience, I cannot but conclude from the testimony of others that the measure is at once safe and useful member to have heard Dr Fordyce Barker give his value of this and of intestinal antisepsis carried on approval to such an initial dose as a wise rule

My evacuant agent for the remaining course of the disease, after this initial dose of calomel, or castor oil and rhubarb, and also my chief reliance from beginning to end of the disease for an antiseptic agent below the ileo cæcal valve, is a daily large enema of an improvised decoction of chamomile flowers and The nurse is instructed to add a small handful of chamomile flowers to 3 pints of water, and allow it to simmer, without boiling, on the stove for one hour, then to strain it through cheese-cloth to remove any woody fibre that might prove irritating, add a teaspoonful of borax and administer as an enema, giving all that the patient can be persuaded to At the second or third using, if not from the take outset, an adult will generally take all for a few minutes is not essential, but doubtless increases the beneficial effect At times, no little tact is required to induce the patient to take the necessary amount In difficult cases, the Sims position, and momentary pauses in the administration, will facilitate the process A slight amount of discomfort during the giving of the enema is not unusual, but need not deter us

Some writers give urgent warning against the use "Large enemata of such enemata Wilson says are attended with danger arising from their liability to set up energetic peristaltic movements which may extend to the lower part of the ileum " "The constipation of enteric fever is most safely treated by tensity of the diarrhoea, and I have obtained most the daily administration of small enemata of strong warm soap-suds or of thin gruel" Much of the acknowledged force of this argument as applied to advanced cases in which there is a probability of ulceration having occurred, is lost, when we apply the he mentions its use by the stomach alone, but I should treatment in the early history of the case, where the not hesitate to use it largely diluted as an enema, as abortive treatment has its best opportunity

In treating advanced cases the size of the enemata The advantage of it in early should be reduced treatment is enhanced by the "peristalsis extending to the lower part of the ileum," as the measure proves in that way not only an evacuant agent for the large bowel, so removing obstruction from before the fæcal matter lying just above the ileo-cæcal valve, but also as an active evacuant of this matter in the lower portion of the ileum, at the point of most frequent

ulceration

The vast importance of any agent that will give safely a daily evacuation of the material tending to collect here, so preventing not only the irritation resulting from such collection and retention and consequent fermentation in the early history of the disease, but greatly diminishing the amount of absorption of ptomaines and septic material likely to occur by like means—less the enemata, which I believe to through the abraded surfaces of the ulcers—the im- be a most potent agent—they have frequently aborted

portance of such an agent is, I believe, incalculable We may, perhaps, give emphasis to it by calling to mind the fact that, while the bladder in health allows of almost no absorption, in diseased conditions resulting in ulceration some topical applications have to be most cautiously used, in order to guard against the danger of absorption through the abraded surfaces

Another consideration adds to our estimate of the Wilson has pointed out most clearly that the fever has two distinct movements the first or primary fever, due to specific germ infection, the second, an irritation or hectic fever from ulcerations, sloughing and resorption Even if the impossibility of destroying or retarding development of the specific germs in the intestinal tract or the tissues, or of combating the ptomaine which appears coincidently with their de velopment and activity, should be demonstrated, there yet remains here, in conflict with the causes of this septic fever, a large field for abortive treatment of typhoid fever We might well hope to limit the symptoms to the type represented in the class of cases grouped by most writers under the head of abortive typhoid, in which, from failure of the en Retention | larged solitary glands and Peyer's patches to ulcerate, we have the course of the fever limited to that due to specific germ infection

> The chamomile and borax I have employed, not because it is necessarily the best, but it is simple and seems to be efficient. It combines in each of its constituents agents that are mildly antiseptic and astringent Stronger antiseptic solutions could doubtless be safely used In future cases I shall be disposed to use the solution of carbon bisulphide, rec ommended by Dujardin-Beaumetz He says of it "For six months I have been giving this carbon bi sulphide water in typhoid fevers in doses of from 5 to 10 tablespoonfuls a day according to the insatisfactory results from the point of view of intestinal antisepsis Nor have I seen any untoward accidents from its employment It has proved to be possessed of efficacy above all other medicaments" It is true

well as per os

Other promising therapeutic agents for enemata are oxygenated water, solution of peroxide of hydrogen and, as supplementary to, rather than substitute for, fluid enemata, gaseous enemata of oxygen

This is the treatment that I commend to your favor-It is new only in the particulars able consideration of attempted antisepsis extending through the entire alimentary tract and to the lungs, and in the use of large and antiseptic daily enemata

Does this treatment abort typhoid fever? I cannot answer positively, because, as we have seen, typhoid fever rarely, if ever, admits of an early positive

I believe that it does diagnosis

1 Because the method commends itself to me as rational, and not unlikely to give such a result

2 Because competent observers are persuaded that

pronounced cases of the disease (Peabody, Henry, had never before suffered from it with such frequen-

3 Because my own experience is sufficient alone

to justify such a conclusion to my own mind

It must be a matter largely of judgment, and therefore I cannot find fault with those that dissent have grown familiar with the answer that many objectors make to the second and third reasons offered for "the faith that is in me" "There was an error in diagnosis, the cases, if arrested, were certainly not typhoid " I heard it first from Dr Alonzo Clark in the course of one of his lectures on typhoid fever "Gentlemen, if you arrest a fever you have diagnosed as typhoid, that fact is proof of your error in diagnosis" I question whether the day is not passed when fair minded men will venture to assert that as more than an opinion I trust the argument, with such record of the experience of others as I have been able to offer, would commend itself to you for trial, without evidence from my own experience

I have already so far trespassed upon your time that I am impelled to offer only a few illustrative cases to meet the demand of this practical time, that asks every one who advances a theory to establish it by evidence The demand is perhaps more reasonable, since the method has some new features, clinical evidence of the value of which cannot be had as yet, unless offered by my cases As the early positive diagnosis of typhoid fever is of at least questionable possibility, I will narrate the symptoms and leave each one to draw his own inferences One group of seven cases in the same family, using the public water supply, which was doubtless pure, so that we might look for infection through respired air, will be repre-

First Patient —Young man, much indisposed for over a week before I saw him Severe cough which did not yield to ordinary remedies Seen December 25 Frequent chills through the night, temperature 102°, headache, marked abdominal tenderness, most marked in right iliac fossa, with moderate tympanites and distinct gurgling Eruption on abdomen fourth day after seen No looseness of bowels Morning temperature 2 5° less than evening Temperature steadily declined during treatment, normal on sixth ness and entire loss of appetite, developed

Second and third cases taken ill December 30, five days after the first was seen No 2 had no marked First temperature observed 101 3°, headache, Eruption on abdomen (three spots) the fifth day after treatment was begun, tenderness over abdomen quite general, most marked in right iliac fossa, gurgling slight, marked morning remission,

temperature normal on fifth day

No 3 No distinct chill, but frequent chilly sensations, headache, nose bleed, slight abdominal tenderness, spots of pneumonia, highest temperature 104° Temperature had fallen nearly to normal on sixth day, when pneumonia set in, confined to bed for two weeks, no eruption observed

Case 4—Chill, temperature 102 5°, marked ab-

Temperature normal on fifth day

Case 5 - Severe chill, marked tenderness of right iliac fossa with moderate tympanites, highest temperature observed 102 75°, headache, no eruption Temperature normal on sixth day

Case 6 — Headache severe, no nose bleed, no abdominal tenderness or gurgling, no eruption On bed but not undressed most of three or four days Highest temperature observed 100 75° Normal on

the fourth day

Case 7 suffered least, no chill, no abdominal tenderness, headache, no nose bleed, temperature 100 5° Normal temperature on fourth day No eruption A partial explanation of the lightness of the symptoms in the last two cases may be that they had been previously using a per cent trituration of hydrarg iodid rubr as a prophylactic measure

The temperature of all showed a marked morning remission, and all felt, during and after the fever, a degree of prostration out of proportion to the other Enlargement of spleen was marked in symptoms All had a troublesome No 1 and slight in No 2 cough, as might be expected, considering the probable avenue of infection, the lungs Nos 1 and 2 sweat profusely during convalescence

Case 8 —The patient was exposed to typhoid fever during his care of a friend who died with well-marked symptoms of the disease, viz, headache, epistaxis, tympanitis, abdominal tenderness, ileo-cæcal gurgling, diarrhœa, and as typical an eruption of typhoid

fever as it has ever fallen to my lot to see

The friend was not under my care, but I saw him a few times at the request of his physician less attention of those nursing him left his linen often soiled with the discharge, and the air of the sickroom foul

The person who later became my patient laid out the body of his friend and complained bitterly of the foulness of the body and linen Eight days later he suffered from serious malaise, chilliness, and slight headache, but did not call medical aid for a week, during which time his symptoms grew constantly worse, and thirst, feverishness, abdominal tender-When I first saw him temperature was 104° Headache intense, abdominal symptoms of tympanitis, tenderness and gurgling well developed, and patient had had epistaxis Next day eruption on abdomen ap-Temperature steamly declined to normal peared on fifth day

Case 9 also assisted about the patient who died, and had symptoms corresponding nearly in time of development with Case 8, but of less severity—viz, quite pronounced chill, headache, temperature 102 6°, abdominal tenderness, pain and tympanitis with ileocæcal gurgling, but no eruption Seen at same date as preceding Temperature normal on fourth day Both 8 and 9 had slight, dry cough

Case 10 occurred in a locality where well marked cases existed at same time Patient was seen on dominal tenderness, tympanites and gurgling nose third day of decided symptoms Temperature 103 4°, bleed every day This patient was ordinarily sub- severe headache, dull countenance, epistaxis very ject to nose bleed once in a week or ten days, but slight, abdominal distension and tenderness, bowels constipated, eruption appeared distinctly one week after first observation Patient was at times slightly delirious Temperature declined to normal on twelfth I might multiply cases did time allow day

The objection will doubtless be raised that the leading hospitals have tested and discarded as useless the abortive treatment of typhoid fever To this

two replies at once suggest themselves

That typhoid patients are rarely received into a hospital till the disease has passed beyond the period best adapted to an abortive plan of treatment

2 That the methods thus far tried have lacked what I believe to be a most essential factor, viz. the

large antiseptic and astringent enemata

I can hardly close without commending the treatment as remarkably effective in the irregular forms of fever, dependent, as doubtless many of them are, upon germs and resulting ptomaines What I would upon germs and resulting ptomaines specially urge is not the use of sod salicylate by the mouth, or of borax and chamomile by enema, or of creasote vapor for inhalation, but of some efficient antiseptic by all these methods

The statements of Drs Peabody and White lead me to think it not unlikely that later trial of naphthaline and sulphurous acid may change the estimates of their value, derived from a few cases in my own ex-

Permanent reduction of typhoid temperature to normal in 24 to 48 hours, which they report, I have not yet seen in well-marked cases by the use of sod salicylat It is most earnestly to be hoped that these gentlemen will give us more detailed accounts of their methods and results

What agent or agents will prove best can be shown only by long-continued and most careful tests That the results already reached put upon us all the duty of aiding in the settlement of the question, is a con-

viction that, individually, I cannot escape

Wilson states that "typhoid fever destroys more lives that could be saved than any other acute disease We that accept the abortive treatment of the disease, as he does not, repeat the statement with an added and sad emphasis, and find ourselves urgently impelled to persuade all to test a measure in our thought so full of promise No problem more occupies the thought of the profession to day, none so busies its laboratories with earnest research, none give such promise of yielding for us better therapeutic resources and for our patients a more certain recov-

It behooves us to take a part in the movementat least to study closely its results and if possible to

contribute to them

I append an instructive letter from Dr Horace C White, and would also refer the reader to Dr Peabody's statement of his own and his friend's experience, as given in the published proceedings of the Association of American Physicians

Ehrlich's urine test is admirably stated by Dr A

Jacobi, in the same transactions

Dear Dector -In answer to your request for a statement of The British Medical Journal, of Dec 3, 1870, contained an Germany, which for many months has called forth my experience in the abortive treatment of typhoid fever by the use of sulphurous acid, I am obliged to write only a hasty reply

article on the administration of sulphurous acid in typhoid fever, by G Wilks, of Ashford, Kent, in which after giving his experience in its use he says "I will state distinctly what I claim for the sulphurous acid in typhoid fever, that it arrests the fur ther development of the fever poison, and by continuing this arrest long enough, exterminates the fever Briefly, it is an antidote '

In 1871, I began the use of this remedy when practicing in Maine, in a locality where typhoid was prevalent and severe My expectation was more than realized, and my results would justify the claims of Dr Wilks, in nearly every case. I have continued to use it for the past 16 or 17 years and have lost none

of my confidence in it

Since my removal to the suburbs of Boston where we have much less typhoid fever, I have used it very extensively in car latina, diphtheria and kindred diseases, with equally good results. In fact, there is no remedy that I feel more confidence in pre scribing than this It has never failed me in but one case of scarlatina, and I lost no confidence in the remedy in that case, as the child was already in articulo mertis when I was called It has never failed me in diptheria, except in a very few cases which were complicated with croup, or in other words, where the membrane was located far down the trachea

I know these are strong statements, but I think I have used the medicine long enough (nearly 17 years) to have been able to have eliminated the enthusiasm which attaches itself to a new

And now allow me to answer the question Why is not the sulphurous acid as potent a remedy in the hands of others as it has been in mine? The answer to this question is not difficult 1st A misconception of what the medicine is What is labeled sulphurous acid, is a solution of sulphurous acid gas in water Being chemically SO₂, it is often supposed to change to sulphuric acid SO₃, by exposure This is not so In fact, it is difficult to change SO₂ to SO₃, but when left in a partly filled, or not sealed bottle, the gas escapes, leaving an almost mert substance As a consequence, prescriptions are seldom filled with the medi cine of proper strength, unless the druggist is accustomed to its use. I have had no small amount of trouble on this account even with those we generally consider very reliable druggists. In fact, I seldom get the medicine of proper strength on prescrip

tion until the druggist has been labored with 2d My confidence in the remedy and in its safety leads me to prescribe it freely and also to disinfect the rooms at least wice a day with the gas by burning sulphur, believing that if the germs of disease can be destroyed by fumigation, as has been the practice for many years, that the air can be kept free from

germs or sterilized by frequent use of the gas

But I am wandering from the subject In typhoid fever, when called early, I expect a decided remission of the fever in from 24 to 48 hours, and the fever is kept a very mild type if not completely aborted ever after I give it mixed with syrup and diluted with water, also by inhalation I will close this hastily written letter by quoting the close. written letter by quoting the closing words of Dr Wilks' paper "Very possibly, I have failed to convince you of the advantages of the plain of using this drug, but let me again remind you of the plain fact that of 173 cases of this fever occurring in our practice dur ing the past fourteen months, two only died, and those two did not take the acid, for the one it was not prescribed, the other was a drunkard and would take nothing Of the 171 who took sulphurous acid not one lost his life, and there were few who were not convalescent within fifteen days of commencing the treatment Surely such a result will induce you to try the midi cine for yourselves when opportunity offers

Very sincerely yours, HORACE C WHITE

THE CASE OF THE EMPEROR OF GERMANY Expediency in Diagnosis-Would it Legitimately Guide the Treatment?

BY HENRY FRASER CAMPBELL, MD, OF AUGUSTA, GA

The momentous case of Frederick, Emperor of

the tender sympathy and inspired the fervent prayers of benevolent hearts throughout the civilized world, recalls to mind one in my own experience, and I am taken at the time

The principal interest and turning point in this case rested, as will be seen, upon a change of diagnosis accepted in despair, to replace a verdict which, though based upon apparently the most reliable data attendants unhappily away from the course of medi-The measure of recation imperatively demanded jecting the more rational view because hopeless, and of being guided in treatment by a questionable one on account of its bright promise of a happy result, would hardly be acceptable as to its logic, but such 'perversity in diagnosis" may sometimes be regarded and consequently from the measures of treatment as expedient in practice

two of my colleagues, both distinguished for their accuracy in diagnosis and long known as teachers of pathology, Mr D H W, aged 30 years I found the patient in a condition of great emaciation and feebleness from deficient nutrition, being unable to take adequate food on account of the distress at all efforts at deglutition Aphonia was complete could with difficulty express himself in whispers

The cutaneous surface was free from maculæ and from all eruptive or other morbid manifestations of any kind, nor had there appeared any cutaneous affection at any period in the history of the case He was free from nausea, and the digestive organs were apparently otherwise intact under the digestion of fluid nutriment His sleep was often interfered with by uritative cough resulting in an expectoration which was purulent in character His respiration was oppressed, and the attacks of dyspnœa had recently become more alarming and frequent

Exploration of the fauces discovered a reddened and tumid condition of the pharyngeal walls with enlarged and prominent follicles, and here and there small patches of superficial ulceration covered with

a thin deposit of grayish matter

At the time of the conference the condition of the patient generally and the extreme irritability of the fauces, precluded the use of the laryngoscope, but previous examinations with this instrument were reported to have revealed tumefaction of the glottis with narrowing of the rima and a thickened and stiffened condition of the vocal cords—no tuberose enlargements in the submaxillary space or in any other part of the cervical region

For nearly a year past this young man had been subject to soreness and discomfort of the throat, with cough and increasing hoarseness He was free from

fever at the time of this examination

At the time of the conference the patient had but recently returned from a health resort, where systematic treatment had been interrupted This treat

of the pharyngeal wall had been brushed with a mild solution of bichloride of mercury

While in attendance upon another member of the moved to report its incidents from notes accurately family, this case had been confidently reported to me as one of "cancer of the throat" It was further stated that this was the diagnosis of the attending physicians, and that their prognosis was entirely unfavorable

From the fact that no nistory of syphilis could be and rational conclusions, had still served to lead the developed in connection with this case, and also from the exemplary character of the patient as well as from the unquestionable sincerity and candor of his statements, taken in connection with the somewhat aberrant and unusual assemblage and order of symptoms, the two eminent gentlemen in attendance had entirely excluded syphilis from the diagnosis,

I was asked, "Upon what grounds do you propose In 1874 I was called to visit in consultation with constitutional treatment in the present case?" replied, "Certainly not upon a well assured diagnosis of syphilis, but a different diagnosis, whether of scrofula or cancer, condemns him to despair now, and to death in a few months—on the other hand to admit the suspicion of syphilis as an element in the etiology, opens to him light and hope and a possi-He bility of restoration to health and a vigorous manhood" My diagnosis was but little more than a doubt of the expressed opinion of the attending physicians—I simply proposed to give the patient the benefit of that doubt as his sole chance of life

> I was courteously requested to formulate such measures of systematic treatment as I thought proper to propose Without accepting formal charge of the patient, I suggested the following treatment

B,	Ferri et potassa tart Syrupi m	Zv1 Zv11j
R	Potass. iodidi Elixir simplicis (vel aquæ)	Zvi Zviij

Take one or two teaspoonfulls from each vial three times a day in half a glass of water, before or after meals.

It was recommended that the mixture be taken through a glass tube, to avoid staining the teeth. The following was also recommended

Potassu chlorat Aquæ destill ng S Use as : Use as a gargle frequently during the day

Such fluid nourishment as could be ingested was to be taken freely In case of failure of deglutition, particular directions were given for supporting the elevations within the laryn were reported as the patient by rectal nutrition, if necessary, the mediresult of this exploration. There were no glandular cines were to be administered by the same process A mild mercurial course was advised to be combined, somewhat later, with the above modification of the todide element of what is known as "the mixed treatment" for constitutional syphilis

Ricord has been quoted as saying of tartrate of iron and potassa, that it is the sworn enemy of phag-I have found it for thirty years the sworn enemy of the suppurative process as well, under certain conditions, and during that entire period I have ment formerly consisted in codhiver-oil, tonics, and seldom prescribed iodide of potassium in certain nourishing fluid diet constitutionally, and locally by forms of constitutional syphilis without combining it astringent and alterative gargles—the affected surface with this particular one of the ferric salts. It is to

this combination I refer when I speak of a modifica-lities contributing to the establishment of the diagnosis tion of the mixed treatment

Not recognizing at the time of the consultation in the mind of the enlightened physician, or even in that this patient had been formally relinquished into the estimation of intelligent communities, the exist my hands for treatment, I did not see him for over ence of constitutional syphilis, even in its most indu twenty days from the time of my first visit time I received a note from the patient, informing an aspersion of the virtue or morality of the individual me that he was better, and desired to know if I wished so affected any change in the medicines, as he had finished that

prepared by the first prescription

at all favorable had followed in so short a time as the pipe, the drinking cup-whether in times of peace result of medication in a case apparently so nearly upon the great highways of travel, or during war in hopeless, I at once went to see the patient I certainly was not prepared for the marvellous improve-His complexion was greatly improved, he had evidently gained flesh, had entirely recovered his voice, and was cheerful and even sprightly in his He stated that his appetite was good, and that for the past five or six days he had been able to take solid food with little or no discomfort cough and expectoration had greatly abated, and on examination of the fauces the ulcerations were found to be greatly diminished, and had assumed a more healthful appearance, while the prominent and tumid follicles had regained nearly their natural appearance The former prescription was renewed, and at a sub sequent period the iodide of potassium and tartrate of iron mixture was reduced to two doses a daymorning and noon-while there was added to the treatment 1/6 of a grain of protiodide of mercury, to be taken at bedtime

It is not my design to detail the subsequent history of this anomalous case of syphilis, nor that of many others of a clearly recognizable character affecting the air passages, under my observation and within my experience. For ten years after the date within my experience of treatment he was in robust physical health, nor has there appeared at any time the slightest manifestation of the disease of the larynx or fauces

With all our illumination on the nature of constitutional syphilis and the rules established for its indisputable recognition as well as curative treatment, there still remain many abnormal and obscure conditions, of which almost every practitioner of extended observation or protracted experience can readily recall one or more instances The entire absence of history, either in heredity or in direct acquirement, the unimpeachable and immaculate character of the patient, together with the irregular and aberrant presentation of symptoms, all combine to add to the obscurity and inscrutableness of the complex phe-

Who cases so obscured, it is well known that system-who treatment based on suspicion has come to be bracognized as a legitimate means of arriving at a coren ct and assured diagnosis

Asso, the case above summarily reported, this device Ehrlichage of a difficult, and withal a misleading, Jacobi, in the _was all that was left upon which to mosis or a fragment of hope for the

in syphilis, we may say that the time is long past when At this bitable manifestations, can be regarded as necessarily

Besides impure sexual relations and heredity, how varied and multitudinous are the methods and ave Greatly gratified at the intelligence that anything nues of its transmission The cigar, the smoking the emergencies of the field or in camps, often must become the common chalice of refreshment for offi cer and common soldier, from the lowest to the high est in rank These are some of the means, reasonable and probable, by which inoculation of syphilitic stom atitis may infect the entire system of the thirsty and the unwary

It would scarcely be considered legitimate to accept or to deny any of the varying opinions as to the exact nature of the disease expressed by the attendants of the Emperor, all of the highest rank as specialists and diagnosticians, these have been made public through authentic bulletins cancer, scrofula, perichondritis, have each had their turn in occupying the minds of all who read and contemplate these announcements of his constantly varying condition All agree upon the saddening recognition of his imminent danger, if not of his near and rapidly progressive approach to Besides the natural advance of the diseasewhether scrofula, cancer or syphilis-death may come to him suddenly, by the rupture of an abscess into the trachea, or by some unavoidable accident attend ing even the most skilful removal and replacement Progressive improvement seems little of the tube thought of in his present condition, a reprieve of a few days gives temporary hope, which in its turn is dashed by the recurrence of abscesses, fever, and in tense alarm

It is in this condition of the sufferer upon whom all eyes are turned, and at whose restoration all would rejoice, that I have ventured at this time to discuss that which is perhaps as yet not a fully accepted pol This I have de icy in the guidance to treatment scribed in connection with the case above reported and also illustrating this principle Expediency in di agnosis—that is, to select from the several theories of the disease that which is most hopeful, and allow this diagnosis—perversely, if you please, even though not the most logical—to become the guide to treatment

Cancer is incurable, scrofula in such advanced condition is also incurable, syphilis, even in its most deplorable advance, is often amenable to treatment, and complete restoration possible Then why not let expediency guide the treatment? This, then, I would explain, is what is meant by expediency in diagnosis

April 28, 1888

MEDICAL PROGRESS.

CEREBRAL SYMPTOMS OF PNEUMONIA IN CHIL-DREN -DR L EMMETT HOLT read a paper before the Medical Society of the County of New York on March 26, in which he drew the following conclusions

r Cerebral symptoms in the pneumonia of children were very common 2 Convulsions belonged almost without exception to infancy, being rarely Occurring at the met with after the age of 2 years onset, they belonged essentially to lobar pneumonia, they did not indicate a bad prognosis, nor even in most cases a severe attack When late convulsions came on, death within twenty-four hours might confidently be predicted 3 Delirium came oftenest between the ages of 5 and 8, usually in conjunction with extensive disease and high temperature These cases, although severe, with but few exceptions ended in recovery 4 There was no such intimate associas had been frequently stated Such symptoms occurred in only about one fifth of the apex cases Nervous symptoms occurred much more frequently when the disease was extensive and the temperature very high He emphasized two points in treatment First, that in the hyperpyrevia of pneumonia the cold pack was a safe and the most efficient means of reducing the temperature Second, the use of antipy-rin to allay restlessness, quiet delirium and cough, and promote sleep Doses of 2 or 3 grs were sufficient in an infant of from 6 to 9 months. It might be repeated every six or eight hours

DR ANDREW H SMITH thought, with regard to the immediate cause of the cerebral symptoms in pneumonia, that the cases might be divided into three I Those in which the cerebral symptoms were brought about by the direct influence of the pneumonic poison 2 Those in which they resulted from high temperature from high temperature 3 Those in which they resulted from exhaustion He regarded lobar pneumonia as an infectious disease, and as likely to be ushered in by cerebral symptoms, like other infectious diseases The convulsion in children corres ponded to the chill in adults There might be apparently broncho-pneumonia, yet associated with it might be isolated spots of the croupous variety Convulsions were in some instances associated with He was inclined to ascribe delirium in most cases to high temperature Then there was a group of cerebral symptoms more or less of a typhoid character which occurred in the later stage, and were the result of exhaustion He thought kidney complications might cause cerebral symptoms in some Gastro-intestinal disturbances also produced their share of cerebral symptoms He agreed with doses of antipyrin in subduing restlessness and insomnia. N Y Med Jour , May 26, 1888

SALICYLATE OF SODIUM IN TONSILLITIS -MR

profession I myself have used it for eight years, and I certainly must have seen reports of cases so treated in the medical literature of the day, before so There can be no doubt of its efficacy in preventing an attack of quinsy from running its usual I have treated more than a hundred cases with it, and in the great majority speedy resolution has taken place, in most of those cases which went on to suppuration the remedy had either not been given early enough, or the doses had not been large enough, nor given with sufficient frequency—a most important point where salicylate of sodium is employed, whether in acute rheumatism or tonsillitis In incipient cases, and especially those occurring in gouty or rheumatic habits, this drug acts like a charm I give to an adult from 10 to 20 grains every two hours, or 10 grains every hour until relief is afforded, aud then the dose is gradually reduced I eschew all astringent gargles, and direct the patient to use hot milk and water ones, or when the breath is very ation between cerebral symptoms and apex disease feetid, warm gargles of permanganate of potassium, or hyposulphite of sodium In cases where the patient has had several attacks of the disease, small doses do no good at all, and even large ones sometimes fail Nearly all my failures have been in this class of cases

A few years ago the attention of the profession was called to the wonderfully successful results obtained by treating tonsillitis with bicarbonate of sodium, in doses of from 10 to 20 grains every two or three hours I have been trying it in some of those cases where the salicylate has failed, and although I have no extended knowledge of its effects, I feel justified in saying that it appears equal to the latter in subduing the inflammatory action, and preventing suppuration, besides being free from the tendency of salicylate of sodium to produce tinnitus, In the case of a gentleman vertigo, and deafness aged 34 years, who told me he "had spent the last six years of his life in getting quinsy and getting rid of it," and in whose case the salicylate had failed, I advised him to take 10 grains of the bicarbonate every hour as soon as he felt an attack impending, with the result that several have been rendered abortive -Practitioner, May, 1888

Intrapleural Injections of Sterilized Air in THE TREATMENT OF PNEUMO-THORAX -Much interest has been aroused over the presentation by Pro-FESSOR POTAIN, before the Academie de Médicine, of a patient whom he had cured of pneumo thorax by the injection of sterilized air Such a statement seems at first paradoxical, but an account of the case The patient, 23 years of age, suffering explains it from incipient phthisis, was suddenly attacked with fever, which lasted fourteen days and was accom-Dr Holt regarding the beneficial effects of small panied with extensive pleuritic effusion, accompanied, at first, with air in the pleural cavity As the effusion increased the lung became compressed, and the opening connecting it with the pleura was closed The effusion finally reached the fossa supraspinata, Chas Grabham, says until recently I was not aware and the patient's condition called for interference that the virtues of this salt in this painful and ob- If the effusion were withdrawn, however, it was scure disease were not more generally known to the thought probable that the connection with the lung

would be opened, and the pneumo-thorax would reappear Professor Potain therefore devised an apparatus, in the shape of a double cannula connected twenty minutes with a manometer, by which, as fast as the liquid was successful, was repeated on five subsequent occasions sterilized by being passed through cotton and then through a strong solution of carbolic acid the next three months the fluid, which was slightly after the others purulent from the first, was withdrawn twice more The amounts removed were 1 400, 1,600, and 500 cubic centimetres The patient gradually improved, his original pueumo-thorax did not return, and even his tuberculous symptoms disappeared, so that he was discharged cured Two other cases were treated in a similar manner, one being cured and the other improved.

Professor Potain thinks that his results quite justify him in recommending this new procedure in appro-It allows one safely to remove a large priate cases amount of liquid from the pleural cavity, and thus obviate the danger of repeated evacuations and of producing congestion and rupture of the lungs from sudden expansion

The prognosis of pneumo-thorax ordinarily is very bad Among 46 cases of tuberculous origin collected by Professor West, of Heidelberg, 44 died and 2 were cured Among 11 previous cases of this disease observed by Potain, 8 died and 3 were cured-Medical Record, May 26, 1888.

PECULIAR EFFECTS FROM A BELLADONNA PLASTER DR J E HORN reports, in the Cincinnati Lancet-Clinic, the following results from a belladonna plaster which was applied for the relief of the soreness resulting from a severe contusion "It was on about thirty hours, and because of the burning it produced the patient removed it, and a vesicated spot the size of the plaster was visible Two days later I was called in and given a good scolding On looking at the arm I was actually frightened, the denuded surface was of a deep, angry red, and a scarlet hue extending from its edges in every direction was swollen all the skin would hold from shoulder to elbow, even extending to the fingers and hand, but not so great below the elbow In fact, I had an extensive inflammation almost resembling erysipelas The patient complained of dryness of the throat, and had double vision The inflammation remained about one thing for three days, and then began to gradually subside I have known belladonna plasters to irritate, but never saw anything like this, even when a vesicant had been applied '

COCAINE IN LITHOTRITY -In a case in which an attempt to perform lithotrity proved futile on account of the extreme urntability of the bladder and the prostrate condition of the patient, Dr Phélip injected into the bladder 16 grs of cocaine dissolved in 12 fluid ozs of water at a suitable temperature After a few minutes, during which the patient was moved into different positions to insure the anæsthetic coming into contact with all parts of the wall of the bladder, it was found possible to proceed The patient felt no pain whatever, and the surgeon

was enabled to do his work quietly and completely. The anæsthetic condition of the bladder lasted about The air was with the same happy result It was noticed, however, that the effect produced by the last two injec-During tions was less marked and did not last as long as No untoward symptoms followed at any time, but it is recommended to adapt the dose of the drug to the degree of vesical irritation, and never to use the higher strength before trying the effect of a weaker one -British Medical Journal, May 5, 1888

> Intravascular Injections in Collapse—Dr DIARKONOFF has made a number of experiments on ten healthy dogs with a view of testing the effect of an intravascular injection of common salt, to which a little alkalı has been added, on a collapsed condition of the organism In order to induce collapse, chloroform was administered, and when the animal had shown signs of being in a more or less dangerous condition a small quantity of Schwarz's solution (which consists of chloride of sodium 6 grams, caustic soda o o5 gram, in 1000 grams of distilled water) was introduced into the distal end of the femoral artery, or into the proximal end of the femoral vein or the jugular vein A remarkable effect was produced by these injections on the character of the pulse and on the blood pressure In some cases in which the heart appeared to have stopped, contractions were by this means reinduced The effect on the respiration was not so constant, still, this usually improved Of course, when the chloroform was pushed beyond a certain point, saline injections and artificial respiration alike failed — Lancet, April 21, 1888

MALTED FOOD IN INFANTILE DIARRHEA —In the Australian Medical Journal, December, 1887, Dr. CLENDINNEN writes that he has met with considera ble success from the use of malt in the treatment of infantile diarrhœa In a case in a child about three months old, there were passed very large lumps of casein, together with a quantity of green matter. The author ordered the child to be fed upon half a teaspoonful of Kepler's extract of malt added to a pint of milk In forty-eight hours the lumps of casein, together with the green matter in the motions, had disappeared, the child slept well, and the In several other cases this diarrhœa ceased entirely treatment was adopted with complete success Three ways have been suggested for adapting the casein of cow's milk to the requirements of young children (1) peptonization, (2) the addition of barley-water, (3) the use of malt

ANTIHEMORRHAGIC INJECTION -MOUTARD-MAP-TIN advises the following

> Ergotine Glycerine

Inject from 1 to 1 5 grams of this solution

SATURDAY, JUNE 2, 1888

THE "GENIUS OF AMERICAN INSTITUTIONS"

In the telegraphed letter of a contemporary from the meeting of the Association in Cincinnati we "The amendment proposed by DR N S Davis taking executive power from the Association was not acceptable, and is thought not to be in keeping with the character of American institutions" (Medical News) This paragraph is, in the first place, misleading, since the object of the amendment was not to take the executive power from the hands of the Association, but out of the general sessions, and the objection to the amendment that the Association has no desire to abandon the management of its own affairs, is no objection at all

But this article is not for the purpose of discussing that amendment What we wish to know is, what is meant by that stereotyped phrase, "The genius, or spirit, or character of American institutions?" After meeting the phrase a hundred times or more, in the daily papers, in medical journals, in political speeches, in pulpit orations, and in private conversation, with out once getting even a vague idea of its meaning, especially when it is used in senses so apparently contradictory, one naturally becomes a little curious to know the proper usage and meaning of the term

Is it an idiomatic expression, used when one has no other retreat from an argument or a proposition? The daily papers rail at propositions for further centralization of governmental power, at the medical laws and acts, at the creation of boards of health with police power, and at proposed laws for restrain-

the genius of American institutions" Medical journals conducted in the interest of some colleges not too far above the grade of diploma-mills, or by editors that have thread-bare professional consciences, launch anthemas at attempts at high medical education, and at medical organizations that will not admit irregular practitioners, as being "contrary to the spirit of American institutions" Some time agoa correspondent of a daily paper in this city spoke of the registration of midwives as being "subvertive of the spirit of American institutions" Another Chicago paper speaks of the refusal of reputable physicians to advertise in the lay press as "not in consonance with the character of American liberty and institutions" While, on the one hand, ministers and advocates of the Sunday observance laws have said that the keeping open of saloons on Sunday is "a strike at the character of American freedom and institutions," the saloon men, on the other hand, declare that these laws are "a blow at the very spirit of American institutions"

We have been led to believe that the idea and realization of representation of the whole by a chosen few is a distinctly American institution, and yet we are informed that a proposition for such representation is not acceptable because "it is not in keeping with the character of American institutions" What does the phrase mean? It is a secretion like that of the cuttle-fish, used to befog an argument from which there is no escape Are we to believe that there is some "subtle, occult atmospheric condition" that givestone, and color and character to every thing that originates between Cape Cod and Cape Blanco, and between the Lakes and the Gulf, and that makes the American institutions infinitely superior to any and all others? Is this true in scientific and political American medicine? Is the face "set as a flint" against all improvements and suggestions that have had birth in other lands one of our "American institutions?" "The cobbler, the mule driver, and the hod-carrier may combine their forces and, if they are smart enough to obtain the influence of somepoliticians, get a charter for a medical college, and embark in the profitable business of selling diplomas, which duly registered in our court houses, will enable other cobblers, mule drivers and hod-carriers tofreely distribute, for good cash, the blessings of whatever medical knowledge they may have been able to scrape together" This may be called an "American institution" But, "let medical education alone," says one, "this is a free and democratic country, ing or regulating the adulteration of foods (as do the a man has a right to be educated as he chooses, to manufacturers), and say that they "are contrary to force him to be educated properly is contrary to the

spirit of American institutions" "Let the people take care of their own health," says another, "if a man chooses to have a cess-pool next to his well it is his own business, and other people have no right to interfere. Such interference is subversive of the spirit of American institutions"

Every fight that has been made in this country against a medical practice act, against a board of health, or against laws for the protection of the health of the people, in whatever way, or from whatever sources of danger, has been made on the ground that such acts or laws were unconstitutional, and "contrary to the genius of American institutions". All suggestions and attempts for regulating or restraining the manufacture of patent medicines have been met by the answer. "The manufacturers have the right to engage in that business if they wish, if people choose to poison themselves it is their own look-out. But to restrain or control such manufacture would be contrary to the spirit of American institutions."

After all, then, the phrase seems to amount to this "I know of no argument against your proposition, but I will look wise and say it is not in keeping with the character of American institutions. I myself do not know what those words mean, but they sound as if they were pregnant with unutterable wisdom, and I use them for the sound."

Haste without regard to accuracy seems to be a growing "American institution," if we may judge by the telegraphed reports of the meeting in Cincinnati While those of the profession that do not attend the the meetings of the Association are anxious to know what is done at the meetings, they are not in such a tremor of haste and expectation that they cannot wait No one can possibly object for an accurate report to an accurate report of the business meetings of the Association, but as the matter now is, it usually takes some months to correct the maccuracies of one week's issue of some of our electric contemporaries curacy is neither condoned nor corrected by telegraph wires, notwithstanding the marvelous therapeutic properties of electricity

TOXIC EFFECTS OF ANTIFEBRIN

A correspondent of Comanche, Texas, asks the following questions "How many deaths have been reported from antifebrin? What has been the fatal dose? And what are the toxic symptoms besides depression, collapse, etc?" These questions were prompted by the death of a young lady recently, which was attributed to antifebrin, of which she had

been in the habit of taking 10 gr doses for paroxysms of headache. The symptoms in this case as given by our correspondent were "coma, contraction of the pupils, breathing slow, spasmodic and stertorous, cyanosis, slow and feeble pulse, collapse and death nine hours after the supposed ingestion of the drug". It is further stated that the deceased "was known to have purchased a 2-oz bottle of tinct opin a few days before her death, which was never found," and was also a victim of melancholia

The only case we recollect seeing reported as a death directly from antifebrin was by von Quand, as briefly alluded to in the chapter on Antipyretics in the "Annual of Universal Medical Sciences," just published In this case it is simply stated that the child, age not given, took 4 grs of the antifebrin every two hours all day, at the end of which time it was found in complete collapse, strongly cyanotic, and soon died

The fatal dose for an adult has not been ascer tained From 1 to 2 grams (grs xv to xx) in 24 hours, have been repeatedly given in febrile and neu ralgic affections without toxic effects. When given in larger quantities it has induced cyanosis, increased frequency of respiration, feebleness of pulse, natural or dilated pupils, and marked indications of collapse. Those who have experimented with the drug represent its toxic effects to be similar to those of aniline, from which it is derived. The symptoms of the case mentioned by our correspondent certainly much more perfectly resemble those produced by toxemic doses of opium than any hitherto observed from the use of antifebrin

UNIVERSITY OF MINNESOTA

The Board of Regents of the University of Min nesota has established a Medical Department in con The department is nection with the University It is to be a high grade located at Minneapolis school, embracing the main features of the Medical Department of the Northwestern University, Har vard, the University of Michigan, and the University This action of the Board does not of Pennsylvania increase the number of schools in Minnesota but, upon the contrary, reduces the number nesota Hospital College and the St Paul Medical College have ceased to exist, and a portion of the Faculty of each school are elected to positions in the This action on the part of the Board is new school largely in response to the wishes of the profession of the State for a high-grade school in connection with the University, with a Faculty in sympathy with

with the new Medical Practice Act The Board of Regents very properly appointed a committee con sisting of the President of the State Medical Society, the President of the State Board of Health, the President of the State Board of Medical Examiners, the President of the University, the Dean of the Medical Department, to nominate a Faculty for the new de-The instructions of the committee were to secure the best men at their command C J Bell, of the Johns Hopkins University, is the only Eastern man in the Faculty He is elected to the Professorship of Chemistry The University of Minnesota is very amply endowed in lands and by the State, and by maintaining a high curriculum for its medical department, it will undoubtedly enlist the good wishes and support of the profession of the Northwest

MULTIPLE INCISIONS FOR INDOLENT ULCERS -Harbordt's method of treating indolent ulcers, which has been in use in the St Spiritus Hospital in Frankfort on the-Main for some years, is thus described by DR F SPATH, in Centralbl für Chirurgie, No 14 The whole ulcer is divided lengthwise by a deep incision extending a considerable distance into the healthy tissue, after which cross incisions are made through the callous tissue into the healthy tissue at intervals of about 1 8 cm The incisions should extend through the skin and the subjacent fascia, so that the wounds will gape widely Hæmorrhage, which is sometimes profuse, is controlled by tampons, and the whole wound is dressed with iodoform dressings The dressing is removed in from 8 to 14 days when healthy granulations will be seen springing from the incisions, they soon cover the whole surface, to the level of the surrounding skin, from which there is a rapid growth of new epidermis It is at this stage, when there has been great loss of skin, that transplantation may be effected and will be useful incisions are made after necrotic fragments are removed, and when the ulcer is no longer foul

REFLEX INHIBITORY POWER OF COCAINE—MR
E HURRY FENWICK reports four cases in the Lancet,
of May 5, which show that cocaine is possessed of
considerable reflex inhibitory power. A series of experiments on decapitated frogs showed that when a
20 per cent solution was thrown into the cloaca so
as to inject the bladder and rectum, reflex excitability
was so far diminished that the foot would be retained
in a 2 per cent of sulphuric acid for 20, 30, 60, or
even more seconds, while usually the time is about

oo8 to o15 seconds In a very painful case of myalgic wry-neck a 20 per cent solution (gtt 30) thrown into the urethra caused a diminution of the crampand stiffness in 40 seconds, and in 60 seconds complete relief, which lasted for some hours Mr Fenwick reports also a case of facial neuralgia and flying pains, and one of burning pain in the glans penis and legs relieved by cocaine thus applied Such applications have, however, no power over strong stimuli, corresponding to the pain of carcinoma, inflammation, etc

PHENACETIN IN PYREYIA —MR H GRENFELL calls attention, in the Practitioner, May, 1888, to the use of phenacetin—para-acetphenitidin, the ethylic ether of paramidophenol—in the treatment of pyrevia This drug is a slightly reddish, inodorous and tasteless powder, but slightly soluble in water, more so in glycerine, and readily soluble in hot alcohol It is insoluble in alkalies and acids (except glacial acetic acid It is most conveniently administered in capsules The cases, with charts, reported by Mr Grenfell, show that phenacetidin is an undoubted antipyretic In cases of pyrexia the action of the drug is seen within half an hour after adminis-The patient generally perspires freely, and feels drowsy, often falling asleep The best dose for an adult seems to be about eight grains bear the drug well It is also a satisfactory analgesic ın neuralgıa

EDITORIAL NOTES

THE STATE MEDICAL SOCIETY OF WISCONSIN will hold its forty-second annual meeting in the Court House, Milwaukee, convening at 8 o'clock PM of Tuesday, June 5, 1888, with a full and interesting programme of work before it L G Armstrong M D, Boscobel, President, J T Reeves, M D, Appleton, Secretary

THE OHIO STATE MEDICAL SOCIETY will hold its forty-third annual meeting at Columbus, O, June 13, 14 and 15, 1888 The programme gives promise of an interesting and profitable meeting President, Samuel F Forbes, Toledo, and Secretary, G A. Collamore, Toledo, O

THE MISSISSIPPI VALLEY MEDICAL ASSOCIATION will hold its next annual meeting at St Louis, commencing September 11, 1888, and continue three days

We regret to learn of the illness, from perityphlitis, of Dr. Frank P Foster, editor of the New York Medical Journal

SOCIETY PROCEEDINGS.

AMERICAN MEDICAL ASSOCIATION.

THIRTY-NINTH ANNUAL MEETING

The Thirty-Ninth Annual Meeting assembled at Central Music Hall, Cincinnati, O, May 8, 1888

DR W W DAWSON, Chairman of Committee of Arrangements, called the Association to order and introduced Rev R A Gibson, who offered a prayer

The President, Dr A Y P GARNETT, of D C, took the chair, supported by the Vice-Presidents, Drs Duncan Eve, Tenn, D Colvin, NY, CJ O'Hagan, NC, and A Stedman, Col The Permanent Secretary, Dr Wm B Atkinson, Pa., and the Assistant Secretary, Dr Jos Ransohoff, were at their posts The Treasurer, Dr R J Dunglison, Pa, and the Librarian, Dr C H A Kleinschmidt, Ex-Presidents Drs L A Sayre, N were present Y, N S Davis, Ill, T G Richardson, La, and Jos M Toner, D C, occupied seats on the platform HON AMOR SMITH, Mayor of Cincinnati, made an

ADDRESS OF WELCOME

on behalf of the citizens DR C G CONEGYS then delivered the following ADDRESS OF WELCOME

on the part of the profession

On the part of the medical profession of this city I am happy to welcome you to Cincinnati, and to assure you that we, with all of the citizens, feel greatly honored that you have selected this, the most central city of the Nation, for this annual congress Twice before, to-wit in 1850 and in 1867, the Association has held its annual councils here, and your professional brethren and the people cordially united to make those occasions encouraging and profitable It is sad to feel that a majority of those who then assembled, and of those who greeted you have passed away, but it is evident from the numbers, the freshness and manly vigor seen on every side, that the genius and spirit still live-yea, are augmented and fully competent to carry forward the great purposes

of your predecessors These large assemblies of medical men, in increasing numbers every year, prove indubitably that the value of the Association is no longer a question To say nothing of the scientific discussions involved, it is clear that the associations of the Association It is, certainly, a give immense satisfaction to all great pleasure for men, who are engaged in common duties and modes of life in widely separated areas, to be thus brought together for the establishment of acquaintanceships that promote community of action for a higher performance of their beneficent work It is a wonderful sight to beamong the people hold so large a body of cultured men who are striving, always and everywhere, to enlarge public happiness by investigations for the prevention of those causes and agencies that undermine the public health and welfare, when, if complete success should crown

their lofty aims, the remunerative part of their labors would be about extinguished, yet, in all ages (and never as much so as now) the medical profession is unceasing in its labors to trace devastating epidemics to their lair, to avert the processions of infectious diseases, to isolate those who are suffering therewith, to disinfect localities, to point out the most healthful modes of living-in regard to light and air, the punty and abundance of water supply, the evils of adult erated food, the overtasking of labor, the prevention of ill-assorted and consanguineous marriages, the abuses of the brain, and the suppression of those two giant evils of civilization-intemperance and prostitution

This period of your assembly is one of extra ordinary interest to our people, for this is the centen nial year of the settlement of Cincinnati, and you can see by the vast structures in Washington Park and in the rear of this building the extraordinary preparations for its magnificent celebration It is an heroic age and a glorious race which we wish to com We wish to crown their deeds with memorate praise and their memory with gratitude, to recount their hardihood, labor, self denial, and piety, and to remind their descendants, who occupy the fields of their conquest, of their sublime patriotism, and to excite them to emulate their courage, their toil and their public virtue

Allow me then, briefly, to dwell on that periodmore especially on the character of a medical mind that pervaded that time as one of those "immortal men who live again in lives made better by his presence "

One hundred years ago a small body of adventur ous men, with their families, descended the beautiful Ohio and landed their rudely constructed barges on The State of Virginia, with great noble the shore ness of soul, had ceded the vast Northwestern Tem tory to the General Government, and Congress had enacted that it should be a land of unqualified free The richness of the soil and the cheapness of the lands led citizens of the East to seek new homes The colony that landed here was ın western wılds not large, their whole possessions occupied but a small number of flat boats or barges It seemed to be a stupendous undertaking thus to plant themselves in the primeval forest on this wild coast, with no means of immediate sustentation but the stores in their barges and what they might hunt in the wilder There were no grounds open for any culture and the forest was roamed by wild beasts and more savage and hostile men

But this forlorn hope of civilization were men of no common mold They brought with them courage, culture, and integrity, and were full of the high aims of the Eastern people who had just fought for their independence and secured the vast British posses sions south of the Canada line They were imbued with the loftiest motives that can animate the soul, and fearing nothing but God, they confronted the wilderness and its warlike denizens with that daunt less courage which renders individuals and com munities, when their cause is just, unconquerable

They constructed their cabins and block houses,

organized a military band, established a school, and and his soul loved nature rived, possessed of various trades and implements servation with the fervor of deepest passion velopment of crops of grains and fruits post was established, a Territorial Governor came out, a county was organized, a seat of justice created, and the foundations of a State were displayed their condition of peace and hope was soon blasted The terrible defeat and massacre of the army of St Clair, in 1791, struck terror to the settlers savages were more belligerent and daring than ever before, and general consternation prevailed

The Eastern people became aroused to the necessity of protecting the pioneers President Washington to conquer a peace He arrived with all the troops heart he could gather in the summer of 1793, and camped

on the western side of this city

The losses of the western settlements had been so large by the defeat of St Clair that the forces of General Wayne were insufficient for the proposed Delay followed delay, but at last the reinforcements came The settlers south of the Ohio at length freely offered themselves for the war

Nearly a century has passed, but the descendants of the pioneers shall never cease to commemorate the joyful time, when, with bugle notes and flying banners, 2000 mounted riflemen from Kentucky, led by Governor Shelby, crossed the Ohio and joined the camp of Wayne This was a sure presage of the victory which he gained, and which broke the savage power forever Wayne's success brought peace to the Ohio valley, all terror of the savages subsided, and an immense immigration from the East and South set in Cincinnati felt the influx commerce and manufacture began to flourish, and great public spirit emerged, so that in a few years she became the higher learning There was no lack of cultivated people, indeed, in the pulpit and at the bar, and in medicine, there were men possessed of acknowledged ability and collegiate training, and several of them had a national reputation, but there was no master mind who, as a leader, could bring into combined action all the needs and desires of a growing and refined community for the establishment of institutions for instruction in higher learning

In the meanwhile, however, there was growing to manhood, in the wilds of Kentucky, one whose soul had caught the spirit of the times, and who, at length, came to Cincinnati with the largest desires to take his part in her future welfare He had been nurtured amid all the deprivations, hardships and perils of the wilderness, and his faculties had been

From his earliest conbuilt a rude church Then they passed a long and sciousness he had drunk in all her wild and beautiful severe winter, but in the spring new colonists ar-| forms, and it had kindled his natural powers of obfor a better construction of tenements and the de- a mind, so full of enthusiasm for knowledge in Na-So they ture's arcana, coull not remain in the dull, routine gradually multiplied, felled the forest, opened fields, life of the planter It was happily directed towards and the hamlet gradually became a village, and that medicine, and Daniel Drake came to this city in the expanded to a town Meanwhile a strong military first year of the century and apprenticed himself to Dr Goforth as his office student and apothecary His opportunity for formal instruction in books had been very limited, but this lack of opportunity was greatly compensated by his habits-so thoroughly acquired—of observation, comparison, and medita-After a patient and methodic service of six years, in which he had made himself familiar with the text book, he felt that he must go to the famous school of the East where Rush, Physic and Wistar taught With scanty means he completed his long commissioned General Wayne to form a new army journey on horseback and gratified the wish of his

> On his return, with enlarged views of culture, he entered busily into practice and rose rapidly in the public estimation Besides medicine, he investigated at large subjects in natural history and physics, also studies of the aborigines and the monuments that marked their residence in our valleys. He wrote also descriptions of the rising City, the Miami val-These writings, leys and their prospective wealth particularly the scientific ones, attracted wide attention, so that when at a later period he returned to Philadelphia to attain his degree he was received by the faculty of the University and the distinguished

society of Philadelphia as a savant

To the south of us then, in Kentucky, lay another flourishing frontier town of nearly equal population with Cincinnati It was not only distinguished for the heroic patriotism of its people, but also for their high social culture and the organization of the Transylvania University Lexington first held aloft the torch of science in this wild world, and was recognized as the Athens of the West There, under the most busy and progressive town of the frontiers auspices of B W Dudley, in 1817, the first medical But the town was without any institutions of school in the West was organized, and Drake was elected one of the professors Dudley and Drake were of the same age, and both Kentuckians first met as students in Philadelphia Dudley graduated in that year-1806-and four years later went to France, joined the French army as junior surgeon and served on Lavey's staff in many battles, ending, I believe, at Waterloo Drake returned home to gain the means to go back to the University and obtain his degree, which he accomplished in 1816

Thus these two great and ardent minds were again united, and with their associates, Caldwell and Richardson, soon developed a flourishing medical department in the University But neither Drake's residence and happy associations in Philadelphia, nor his success as a teacher in Lexington, could divert his thoughts and hopes from his beloved Cincinnati, precociously developed by all those struggles with indeed, it only kindled within him an inappeasable dense forests, ferocious beasts and savage men that zeal to return to devote his life to the erection of the pioneers must encounter and subdue. His young great schools in the arts and sciences life was passed in the wild solitudes of the forests, signed, after delivering two courses of lectures, and consecrated himself to his great purpose He spared God, he who seeks God out of and apart from rea He spent a winter at the nothing to accomplish it State capital and secured charters for the Cincinnati College, the Medical College of Ohio, and the Cincinnati Hospital as a place for the demonstration of clinical and pathological medicine His ambition was not only to be successful as a practitioner and teacher, but an active-minded, useful citizen as well, and he gave much thought to all propositions that would promote the general welfare He soon comprehended that the traffic and commerce connected with the river were inadequate to the building of the Drake will shine as a star of light forevermore great city of his prophecy He saw, the first, I believe, the utility and practicability of a canal to connect the river with Lake Erie, and at a later period, when railroads attracted attention, the immense importance of connecting the city with the great South by a railroad to Charleston, and he earnestly pressed his projects by his writings and public addresses Both of these great schemes of internal commerce are now in operation and have proved of value to Nothing seemed to escape him for the adornment of the city and the comfort of the people The line of elm trees on the south side of Washington Park were planted under his own direction over hope that you will take a general view of its topo sixty years ago

He was a voluminous writer on professional and general topics, but the work with which he crowned his life's labor was his "Systematic Treatise of the Diseases of the Interior Valley of North America," to which he devoted more than twenty years of travel throughout the vast Mississippi Valley It was, so to speak, "dug out of the very elements of the continent and society of America" It is a great work of absolutely original research in medical topography, and will always remain a monument to his fame that has no parallel in the science and literature of

medicine

Though Drake has long been dead, yet all of his great undertakings remain and are flourishing Cincinnati College is the large Law school of the Ohio Valley, the Medical College of Ohio, now a Medical Department of the University of Cincinnati, was never so prosperous, the Clinical and Pathological School of the Hospital is attended by 400 It has a large and growing library and students museum, and is now undertaking to establish a pathological laboratory for original research beautiful elm trees are now as verdant as ever

The wonderful activity of Drake's mind, which led him to undertake the most severe professional labors and throw himself besides into every struggle for the advancement of the interests of society, is readily explained when we consider the philosophic spirit which animated his mind, for he was possessed of that gift of genius which sees beyond all the apparent disparity of phenomena, that severe unity, after which all true philosophy is continually aspiring

To him the universe was not a summation of material phenomena conveying sensuous impressions merely, but a revelation His was a reverent and that "he who seeks in nature, nature only, and not Ark, P O Hooper, Cal, H S Orme, Conn, W. reason, he who seeks in reason, reason only, and not C Wile, Dak, J D McConnell, D C, D W C.

son, or reason out of and apart from God, will find neither nature nor reason, nor God, but will assuredly lose them all "

All the institutions he planted exhibit his great powers of mind and will always preserve his memory fresh and venerated in the great Western Valley In the medical firmament bending over the world, reaching from the past and stretching indefinitely away amidst all the glittering galaxy and burning orbs that represent the immortal dead, the orb of

In Cincinnati his great example and precepts have continued to affect its inedical life. I think it my duty to say to the members of the American Medical Association that a spirit of original research has been carried forward here, and in a period of forty years of professional life in this city I have never known so many young men of thorough training in our own schools, and supplemented by severe study in the clinical and pathological schools of Great Britain and the Continent, as are now among our active practitioners

A few last words about our city at large We It is very peculiar and striking graphical situation If you will ascend our hills you will find that they are built of those stratified sedimentary masses that Between all belong to the lower silurian epoch these layers quantities of marine shells are found that prove that they formed the bottom of a great salt sea

Vice-President Dr Duncan Eve, of Tenn, pre sided while THE PRESIDENT delivered the Annual Address (See p 573, THE JOURNAL May 12) On motion, the Address was referred to the Editor of THE JOURNAL for publication, with the thanks of the Association

As some of the Sections have Dr N S Davis more papers than can be disposed of in the afternoon hours, they ask permission of the Association to meet for Section work at 11 o'clock in the morning, so that they may have a morning as well as an afternoon ses sion, therefore

Resolved, That the Sections may meet for scientific work at 11 A M as well as at 3 P M

The resolution was adopted

Dr Davis asked the Judicial Council to meet at the Burnet House at 9 AM on Wednesday Permanent Secretary read invitations from the Col lege of Music of Cincinnati, from the Cincinnati Chamber of Commerce, from the Technical School of Cincinnati and from the Centennial Exposition Association, which were received with the thanks of On motion, the Association ad the Association journed to meet at 10 A M on Wednesday

WEDNESDAY, MAY 9- SECOND DAY

THE PRESIDENT called the Association to order at The Secretary announced the following IO A M

Patterson, Ga, R. Battey, Ill, C Gilman Smith, Ind, T B Harvey, Ia, R W Llewellyn, Kan, J E Minney, Ky, D S Reynolds, La, T G Richardson, Me, A Garcelon, Md, J J Chisolm, Mass, Minn, Alex J Stone, Neb, R C Moore, N J, I N Quimby, N Y, L D Bulkley, Ohio, Thad A Reamy, Pa, A M Pollock, S C, J Evans, Tenn, T K Powell, Tex, E J Bell, Vt, D P Allen, Va, J W Chancellor, Wis, J T Reeve, U S N, W T Hord, U S Marine Hosp, John B Hamilton

Dr Roberts Bartholow, of Pa, read the

ADDRESS IN MEDICINE

(See p 669) On motion it was referred for publication

Dr J H Hollister, of Ill, Secretary of the Board of Trustees, read the

ANYUAL REPORT OF THE TRUSTEES OF THE JOURNAL as follows

The Trustees for the publication of The Journal OF THE AMERICAN MEDICAL ASSOCIATION respectfully submit the following as their annual report

THE JOURNAL has been issued upon the day named for publication, each week of the current year

The number of copies required for the supply of the members of the Association and for subscribers weekly was 4,572 To provide for exchanges, and for the completion of files, as members may desire, the weekly issue was placed at 5,000 copies editorial management, as formerly, is committed to Prof N S Davis as editor in chief It has its own office of publication at Chicago, and the cash value of its type, fixtures, etc , belonging to The Journal printing-office, amounts to \$1,054 19, which is free of incumbrance and properly insured

The receipts of THE JOURNAL for the year have hands been as follows

It should be said in explanation that all member ship dues are paid to the Treasurer of the Association, leaving only the money paid for subscriptions, advertisements, reprints and extra Journals to be Hollister, Secretary, Ill received at the office of publication From the sources just named there have been received at this and its recommendations were adopted office during the year ending March 31, 1888, the sum of \$11,897 98, of which \$2,452 25 was from subscribers, \$8,548 48 from advertisers, \$753 75 for reprints, and \$143 50 rent for part of printing office These figures show an aggregate increase of income from the sources named of \$4,317 35 over the receipts from the same sources the preceding year

The disbursements on account of The Journal have been as follows

The total publication expenses of The Journal during the year ending March 31, 1888, was \$16,-THE JOURNAL, from four to six pages of advertising, next meeting 200 copies to the regular weekly issue, the printing of the triennial list of permanent members of the to the Constitution offered at the last session Association, and the issue of 20,000 extra copies and

The aggregate their distribution as sample copies cost of these several items fully equals the increase in expenses, and yet, as shown in the preceding paragraph, the increased receipts through the publica-C J Belt, Mich, W Brodie, Mo, T J Lutz, tion office alone have exceeded the increased expenses by \$1,217 S9

It will thus be seen that THE JOURNAL is not only self-sustaining, but actually-a source of revenue to

The Trustees are unanimous in the opinion that the increased receipts should be wisely expended in the improvement of The Journal As the type in use is becoming somewhat worn, they have decided that the next volume shall appear in a new dress and with a better quality of paper They have authorized, beside this, a sum not to exceed \$400, to be expended in meeting legitimate needs, at the office of publication

It is also the purpose of the management, so far as means will permit, to enlarge the editorial corps and render The Journal of constantly increasing value to our members and subscribers

We believe that the best interests of The Journal require that we make the following request, namely.

That the Association shall place at the command of the editor in chief the exchanges of The Journal. for reference, and that the books and monograms for review and editorial notice be also placed at his disposal to be used by him in such manner as in his judgment the interests of The Journal may require

In conclusion the Trustees desire to express their sincere thanks for the confidence which the Association has been pleased to repose in them, and they beg to assure you that, so far as their individual and united effort may avail, they will earnestly endeavor to command the continuance of that confidence and to fulfil as best they may the trust committed to their Very respectfully,

J M Toner, President, D C, E M Moore, N. Y, Leartus Connor, Mich, A Garcelon, Me O Hooper, Ark, L S McMurtry, Ky, E O Shakespeare, Pa., Wm T Briggs, Tenn, and J H.

On motion of Dr W H Daly, Pa, it was received,

Dr E A Wood, of Pa, Chairman, read the report of the Committee on Dietetics

Dr F Woodbury, of Pa, presented certain views as an exposition of how the work on Dietetics should be done

On motion of Dr L A Sayre, N Y, amended by Dr Benj Lee, Pa., and accepted by Dr Sayre, it was Resolved, That the Committee on Dietetics becontinued, and that it be and is hereby instructed to present a report at the next meeting of this Association embodying the general principles to be observed 261 47, being an increase of expenditure in this de- in a rational system of dietetics, that the Committee partment of \$3,099 46 over that of the preceding have power to enlarge its membership, and that the This increase of expenditure has been caused Committee of Arrangements is hereby authorized to by the addition of four pages of reading matter to give its work a proper place on the programme of the

Dr N S Davis, Ill., brought up the amendments

Vice-President Dr Duncan Eve, Tenn, presided.

The amendment relative to members by application was read, and on motion was unanimously

adopted as follows.

Members by Application shall consist of such members of the State, County and District Medical Societies entitled to representation in this Association, as shall make application in writing to the Treasurer, and accompany said application with a certificate of good standing signed by the President and Secretary of the society of which they are members, and the amount of the annual membership fee, \$5 shall have their names upon the roll and have all the rights and privileges accorded to Permanent Members, and shall retain their membership upon the same

The amendment regarding the Board of Trustees was presented and unanimously adopted, as follows

The Board of Trustees shall consist of nine members, three of whom shall be elected annually on the nomination of the standing General Committee, and It shall be the duty of shall serve for three years this Board to provide for and superintend the publication and distribution of all such proceedings, transactions, and memoirs of the Association as may be ordered to be published, and in such a manner as the Association may direct, and in doing this, it shall have authority to appoint an editor and such assistants, and determine their salaries, and procure and control such materials as may be necessary for the accomplishment of the work assigned to it To further facilitate its work it shall be the duty of the Secretaries of the Association and of the several Sections, during each annual meeting, or as soon thereafter as practicable, to deliver to the Board, or such editor or agent as it shall appoint, all such records of custom of the profession to render services gratui proceedings, reports, addresses, papers, and other documents as may have been ordered for publication, either in the general sessions or in the Sections All frequent occurrence of endorsements and recom moneys received by the Board of Trustees or its agents, resulting from the discharge of the duties assigned them, must be paid to the Treasurer of the Association, and all orders on the Treasurer for disbursements of money in any way connected with the work of publication must be endorsed by the President of the Board of Trustees It shall be the fur ther duty of the said Board of Trustees to hold the official bond of the Treasurer for the faithful execution of his office, to annually audit and authenticate his accounts, and present a statement of the same in its annual report to the Association, which report shall also specify the character and cost of all the publications for the Association during the year, the number of copies still on hand, and the amount of all other property belonging to the Association under its control, with such suggestions as it may deem

The third amendment, relative to the superseding

of the Nominating Committee was read

Dr J M Keller, of Ark, moved to amend that

each State should select On motion, of Dr Daly, this was laid upon the

After some further discussion, on motion of Dr H A Johnson, of Ill, it was agreed to print the

amendment and make it the special order for Thurs day, at 12 M

On motion, adjourned to meet on Thursday at

THURSDAY, MAY 10-THIRD DAY

THE PRESIDENT called the Association to order at IO A M

The Permanent Secretary read the following

RESOLUTIONS ADOPTED BY THE STATE MEDICAL SOCI ETY OF ARKANSAS AT THE THIRTEENTH ANNUAL SESSION, APRIL 27, 1888, AND ORDERED TO BE TRANSMITTED BY THE SECRETARY TO THE AMERICAN MEDICAL ASSOCIATION

Resolved, That the members of the State Medical Society of Arkansas have for years observed with pain and mortification the patronage given to char latanism in all its multifarious aspects by the religious press of our country

Resolved, further and more specifically, that the appearance in religious papers, ostensibly published for the inculcation of truth and morality, of serious homilies on prayer and praise side by side with cures for consumption, cancer, Bright's disease and other incurable ailments, to which an editorial endorsement is often given, as well as secret preparations under the cloak of remedies for diseases, but really intended for purposes of fœticide and other immoral uses, largely tend to shake the confidence of the profession of medicine in the integrity and purposes of the managers and editors of such journals

Resolved, further, that it has been the well known tously to clergymen, which we do not regret nor do we propose to recall, and yet we must assert that the mendations of the clergy of our country of penpa tetic doctors and advertising charlatans has in many instances been the only reward of our gratuitous services

Resolved, further, that we are aware that the editors of religious newspapers admit the painful situation in which these advertisements place them, and attempt to excuse themselves by saying that it is necessary to take these advertisements in order to obtain means to conduct the papers, but, in the language of ortho dox theology, we would say, "Put behind you that damnable doctrine that we must do evil that good may come"

Resolved, further, that as a Society we declare that the continued perpetration of the above offenses by some of the clergy and religious press of the country brings harm to the bodies of their constituency, and damages materially their influence upon the thinking

class of the medical profession

On motion of Dr W T Akins, of Ill, the resolu tions as read were fully endorsed as the sense of this Association

The Permanent Secretary read an invitation from the Philadelphia County Medical Society for the As sociation to hold its next meeting in that city

Dr P O Hooper, Chairman, read the

REPORT OF THE NOMINATING COMMITTEE

To the President and Members of the American Medical Association -Your Committee on Nominations have the honor to report that they yesterday met and organized by the selection of Dr P O Hooper, of Arkansas, as Chairman, and Dr John B Hamilton, of the Marine Hospital Service, as Secretary After mature deliberation they, by ballot, pro ceeded to the nomination of the following officers for the ensuing year

For President—W W Dawson, of Ohio

For First Vice-President - W L Schenck, of Kansas

For Second Vice-President-Frank Woodbury, of Penn

For Third Vice-President—H O Walker, of Mich For Fourth Vice President—J W Bailey, of Ga For Treasurer—Richard J Dunglison, of Penn

For Permanent Secretary—Wm B Atkinson, of first Tuesday in June, 1889 Penn

For Librarian—C H A Kleinschmidt, of D C For Chairman Committee of Arrangements—H R Storer, of Newport, R I

The following were elected Trustees to fill the va cancy caused by the expiration of their respective terms of office E M Moore, of N Y, John H Hollster, of Ill, and Joseph M Foner, of D C

To fill a vacancy in the Judicial Council caused by the death of Dr Stormont, of Kansas, W A Phillips, of Kansas

To fill vacancies in the Judicial Council caused by expiration of term of office A M Pollock, of Penn, W C Van Bibber, of Md, J F Hibberd, of Ind Chas S Wood, of N Y, J McF Gaston, of Ga, W H O Taylor, of N Y, George L Porter, of Conn

To deliver the address on General Medicine—Wilham Pepper, of Penn

To deliver the address on General Surgery-P S

Connor, of Ohio

To deliver the address in Slate Medicine—W H Welch, of Md

For Members of the Committee on State Medicine—Ala, Jerome Cochran, Ark, Jas A Dibrell, Jr, Cal, G G Tyrrell, Col, Chas Denison, Conn, W C Wile, Dak, F P Kenyon, D C, J F Hartigan, Del. LP Bush, Fla., JY Porter, Ga, JP Logan, Ill, J H Rauch, Ind, L D Waterman, Ia., J F Kennedy, Kan, W E Oldham, Ky, J N McCormack, La, S E Chaillé, Me, T J Foster, Md, T A Ashby, Mass, H P Walcott, Mich, Henry B Baker, Miss, Wirt Johnson, Mo, L D Matthews, Minn, Perry H Millard, N C, Thos F Wood, Neb, W M Knapp, N J, I N Quimby, N Y, T M Flandreau, N H, G P Conn, Ohio, Byron Stanton, Ore, W D Relar Done Done Lag P J H R Storer. The Permanent Secretary read the

REPORT OF THE RUSH MONUMENT COMMITTEE, A L Gihon, Chairman, also, report of Dr Toner, Treasurer of the same

REPORT OF THE RUSH MONUMENT COMMITTEE

As Chairman of the Committee appointed to provide for the erection of a monument to Benjamin Rush at the capital of the United States, I beg to report progress, albeit that progress is exceedingly slow and unsatisfactory Your Committee might be wholly discouraged but for the fact that nowhere has there been met anything but approval and commendation of the proposed monument So uniform has been this sentiment that it cannot be doubted that, among the more than 100,000 physicians and students in the United States, a sufficient number will be found to contribute a dollar each to erect such a statue at the National capital as shall be creditable to the medical profession, an appropriate testimonial of this great patriot-physician, and a conspicuous ornament among the many beautiful works of art which adorn the city of Washington I have never met a person opposed to this project, and have only heard of one, whom I regret not having seen, for he must be the one without compare in our profession, who did protest against giving a dollar towards erecting a statue to a man "who had founded a medical college at Chicago and had not left money enough to put a monument over his own grave"

The chief problem your Committee has had presented to it and has not yet satisfactorily solved, is how to collect these subscriptions from persons who, while quite willing to hand a dollar to any one ready J M Toner, Fla, Neal Mitchell, Ga., P R Courtle- to receive it, forget, or neglect, or do not care to take

the trouble to obtain a mailable dollar and send it to any appointed address Similar forgetfulness, neglect and indisposition are true of individual members of the effigy of Benjamin Rush should have a place in the Committee, who, under its original constitution, were charged with the collection of subscriptions from the residents of the entire State or Territory which The labor and expense of atthey represented tempting to communicate by correspondence with tendance at Cincinnati, and though, at no distant 100,000 individuals scattered over all this country are day, I entertain the hope of a field of duty less re so great, that it is hoped the members of the medical profession, on reading this statement, will at once inclose their subscriptions to the Treasurer of the Monument Fund, Dr Joseph M Toner, at 615 Louisiana Avenue, Washington, D C, and that every physician so doing will further personally interest himself, and herself, in obtaining a similar subscription from each friend and acquaintance in the ranks of the profession in his or her immediate neighborhood

Apart from individual effort, the chief dependence of your Committee must be on the zealous cooperation of the medical societies, medical colleges, and other medical institutions, and more than all in that of the medical press of the country The State Medical Society of California, at its annual meeting at San Francisco on April 18, gave an earnest of the True to their promise of possibilities of State work the previous year, every member of the Society, during a recess taken for the purpose, handed a dollar subscription to Dr Tyrrell, the member of the Committee for California, who was thus able to transmit to the Treasurer \$106, the amount subscribed being the exact equivalent of the number of members in attendance This Society went further, and by vote instructed the Permanent Secretary to communicate with the President of every County Medical Society in the State and urge concurrent action tant State lend such enthusiastic and material aid to our undertaking, may it not be expected that all others will manifest similar interest, which ought to be proportionally greater as the birth-place and home of Rush and the site of the contemplated statue are approached?

Unless the several States and Territories can be represented in the Committee by men who will engage to thoroughly canvass each respectively, the work of collecting funds must chiefly devolve upon the officers and an executive subcommittee, who, through the columns of medical journals and the cooperation of medical associations, will endeavor to reach the greatest possible number of our professional It will obviate the necessity for intermediary correspondence if all subscriptions and donations are at once mailed to Dr Toner, the Treasurer, as above suggested, and in this connection it may be proper to state, in reply to numerous inquiries, that the limitation of subscriptions to one dollar is not intended to prevent the donation of any other sum which those interested in the project may desire to make.

After previous recitals of the eminent services of this "greatest physician this country has ever produced,"-of this learned and distinguished man of letters and science, this indefatigable philanthropist, Treasurer \$709 19 sanitarian and social reformer, this illustrious states | cal Society has, I am informed, made a subscription

man, Revolutionary military officer and patriot, it is unnecessary to add another word in explanation why the National gallery beside those of the other founders of this Republic.

I have to regret that the evigencies of the naval service to which I belong have not permitted my atmote, if the Association believe it will be for the better interests of this undertaking to place the chairmanship of this Committee in other hands, I beg to be permitted to resign my trust for this purpose, assuring my fellow-members of my undiminished interest in the realization of a project which I had the honor of first proposing to them, four years ago, at To the Medical Corps of the Army Washington will ever remain the credit of having inaugurated and established the great National Medical Library and Museum which now graces the capital of this coun-As an officer of the Medical Corps of the Navy, I shall always feel proud of having suggested and, in however feeble a way, contributed towards placing at the portal of that magnificent and unrivalled depository of medical literature, science and art, the enduring testimonial of one who so honored his profession that his name is inseparable from American medicine, and so honored his country that his exemplary life is part of that country's history Respect-ALBERT L GIHON, M D, fully submitted

Chairman of Rush Monument Committee.

The Treasurer of the Rush Monument Committee begs leave to submit this his second annual report of the financial condition and prospects of the movement to collect sufficient funds to erect an appropriate monument to the memory of this great physician-As far as I can discover, the project is approved by all who have given a moment's thought to it, and no physician who loves his profession ever declines to give, when asked by a duly authorized agent Committee has upon it a member resident in each State and Territory, the Army, Navy and Marine Hospital Service, with a view to reach the whole profession, yet the Treasurer has only heard from the following States and Territories during the year

Arkansas, California, Dakota, District of Columbia, Maryland, Pennsylvania, South Carolina, Tennessee, Wisconsin, U S Army and U S Navy

The Chairman of the Committee, A L Gihon, Surgeon U S Navy, in his report gives a succinct account of the efforts of the Committee in the past, and its hopes in the future, to meet the reasonable expectations of the American Medical Association in this enterprise to which it has committed itself shall therefore confine my report strictly to the finan-There was remaincial condition of the movement ing in the treasury at the time of my last report \$392 The whole sum which has reached the Treasurer since his last report is \$498, and the total outlay since last There are practically no bills outstanding and there is now in the bank-book of the The Pennsylvania State Mediof \$500 to be paid in annual installments, \$100 of which has been paid and is credited in this report It is also reported that the Michigan State Medical Society has voted \$100, this has has not yet reached the Treasurer Contributions by the medical men attending the State Medical Society of California during last month amounted to \$105 and were made to Dr G G Tyrrell, member of the Rush Monument Committee for that State For some cause not yet me in two postal orders explained, the post-office in Washington has not been informed, up to the time of my leaving, to pay these orders In my report I have treated this amount as actually in my hands or in bank, for I had confidently All I can now do expected it to be paid each day is to exhibit the post office orders which are pinned to the bank-book as my authority, which I do bank book of the Rush Monument Committee is herewith submitted

The rules adopted by the Committee for husbanding the funds collected for the monument have been They are, in brief, that all moneys strictly observed received shall be deposited by the Treasurer in the bank of Riggs & Co, of Washington, to the credit of the Rush Monument Committee, that no debts shall be contracted by individual members of the Committee not authorized by a vote of the Committee except the necessary expenses of postage and printing, and these must have the concurrent sanction of the President, Secretary and Treasurer, and that no moneys shall be drawn from the treasury except upon vouchers bearing the endorsements of the President and Secretary of the Committee

Appended to this report is an alphabetical list of all the contributions since last report, with their postoffice address and the amount given by each

May 7, by balance

L S McMurtry, T Briggs W

On motion it was received and placed on file The Permanent Secretary then read the

REPORT OF THE LIBRARIAN,

Dr C H A Kleinschmidt as follows I have the honor to present the accompanying catalogue of additions to the Library of the Associa-

tion since my last published report It will be seen that the catalogue covers the period from May 1, 1886, to May 1, 1888, for the reason that my last re port made to the Association in 1887, was somehow lost after having been presented

In the period specified 369 distinct titles have been added to the Library, exclusive of Transactions of Societies Reports of Boards of Health, and Medical Journals not previously received and catalogued as The Library therefore at present contains about 7500 volumes, representing 2850 titles

In conclusion, I would respectfully suggest that the subscription to the Index Medicus for the current year be continued, and that the sum of \$10 be ap propriated to that end

Respectfully submitted,

C H KLEINSCHMIDT, Lıbrarıan

On motion it was received, and the amount, (\$10) requested was granted

The special order being the consideration of the amendment laid over from yesterday, on motion of Dr N S Davis it was laid on the table until the next annual meeting, on account of delay in receiv ing printed copies as ordered yesterday

Several motions having been offered on the same, the President decided them out of order as the sub

ject had been disposed of 40 13

The following amendment was offered by Dr N S Davis, which lies on the table until the next annual "Strike out the last clause or paragraph meeting of Section VII, relating to individually affixing names to the constitution and regulations of this Association "

Dr H N Moyer, of Ill, offered the following amendments which lie on the table until the next

annual meeting

There shall be created a Section of Pharmacy and Materia Medica which shall have its own autonomy in like manner as the Section in Dental and Oral Surgery Reputable members of State Pharmaceutical Associations shall be eligible as members of the same on presentation of credentials from their State Secretary, but shall have no voice in The Section the general sessions of the Association of Surgery shall hereafter be denominated the Sec-There shall be tion of Surgery and Gynæcology created a Section of Anatomy and Physiology The Section of Obstetrics and Diseases of Women The Section of Diseases of shall be abolished Children shall hereafter be denominated the Section The Section of of Obstetrics and Pædriatrics Dermatology and Syphilography shall hereafter be denominated the Section of Dermatology and Gerito-The Section of Medical Juris Urinary Diseases prudence shall hereafter be denominated the Section The Section of of Mental and Nervous Diseases State Medicine shall hereafter be denominated the Section of State Medicine and Medical Jun-The Section of Practice of Medicine, Materia Medica and Physiology shall hereafter be denominated the Section of Internal Medicine

On motion of Dr J M Keller, of Arkansas it 7.25 Resolved, That in future, each Delegate or perma

nent member, shall, when he registers, also record the name of the Section, if any, that he will attend, and in which he will cast his vote for Section Officers

He stated that he had offered this because it was found that members voted in several Sections, thus aiding in the election of officers of more than one Section

had yesterday, permitting the Sections to meet at

After some discussion, it was adopted

Dr W Brodie, Mich, offered a motion that in future the Committee of Arrangements do not provide for an exhibition

On motion of Dr I N Love, Mo, the subject was laid on the table

Dr Toner, of the Committee on Necrology, announced that his report had been published in THE Journal from time to time

Dr A Garcelon, Me, announced for the auditors that they had examined the accounts of Dr Toner, Treasurer of the Rush Monument Fund, and found from the Section on State Medicine them correct

A communication was presented by Dr I N Quimby, N J, from the Woman's Christian Temperance Union

On motion, it was laid on the table

On motion, the Association adjourned to meet at 10 4 11, on Friday

FRIDAY, MAY 11-FOURTH DAY

THE PRESIDENT called the Association to order at IO A VI

The Address in State Medicine was read by DR

H P WALCOTT, Mass

On motion of Dr Toner, it was referred for publication, and thanks rendered to the author THE JOURNAL, May 26)

Dr N S Davis read a brief abstract of the report of the Standing Committee on Meteorological Conditions

On motion, the report was referred for publication Dr I N Quimby, N J, read the report of Committee on Fæticide

After some discussion, on motion of Dr W Bishop, Pa, the whole subject was laid upon the table

Dr H O Marcy, Mass, read the report of the Committee on duties commonly exercised by Coroners On motion of Dr S T Armstrong, U S Marine

Hospital Service, the report was received and the Committee continued

The Permanent Secretary read the names of the newly elected

The Permanent Secretary then read the following

To the Secretary of the American Medical Association, Sir —I have the honor to report that the Section on State Medicine respectfully recommends the passage of the following resolution by this Associa-

Resolved, That the American Medical Association urges upon the House of Representatives of the Congress of the United States, the necessity and importance of the immediate passage of Senate Bill No 2493—"To Perfect the Quarantine Service of the United States"-which bill has passed the Senate and is now pending in the House of Representatives, in order to make provision for protection against the introduction of contagious diseases before the approaching summer Very respectfully,

S T ARMSTRONG, Secy of Section on State Medicine

Cincinnati, May 11, 1888

On motion, this resolution was adopted as the sense of the Association

Dr J M Keller, of Ark, read the following notice for amending the By-laws, viz "To change the By-law whereby the officers of Sections are elected by the Sections "

This will lie over till next meeting

Dr W Porter, Mo, and others called up the amendment to the Constitution offered by Dr C Seiler, Pa, in 1884, and now asked for by the Section on Ophthalmology

The action was agreed to, and a new Section on Laryngology and Otology was created

The Permanent Secretary read the list of members.

appointed as delegates abroad, as follows

R H Plummer, San Francisco, Cal, N S Davis, Chicago, Ill, J J Chisolm, Baltimore, Md, L A Sayre, N Y, J B Hamilton, D C, C C Vaughan, Mich, J E Owens, Chicago, Ill., S J Jones, Chicago, Ill, H A Kelly, Philadelphia, Pa, A E Hoadley, Chicago, Ill, W H Myers, Ft Wayne, Ind, F E Washam, Chicago, Ill, J V Shoemaker, Philadelphia, Pa, D A K Steele, Chicago, Ill, Alex McAlister, Camden, N J, Ephraim Cutter, New York

After much discussion, on motion of Dr N S Davis, the report by Dr Quimby, on Faticide, was taken from the table and referred to the Section on State Medicine

In accordance with certain suggestions in the President's Address, Dr Quimby brought up the subject of legislation for State Boards of Examiners

Dr Armstrong stated that such a committee al-

ready existed

Dr Toner moved to refer this matter to that committee

On motion of Dr J H Murphy, of Minn, the whole subject was laid on the table

On motion of Dr S F Forbes, Ohio, it was

Resolved, That the American Medical Association approve of the movement looking to the celebration in Washington, in 1892, of the 400th Anniversary of the discovery of this Continent by Columbus, and the establishment there of a Museum of the Arts, Industries, and Antiquities of the Free Americans, and hereby request Congress to pass the necessary legislation by appropriations to this end

On motion of Dr F Woodbury, Pa, the following

was unanimously adopted

WHEREAS, The delegates and members of the American Medical Association at the conclusion of its 30th annual meeting have been very hospitably received and entertained by the local profession and citizens of Cincinnati, and

WHEREAS, Owing to the well directed efforts of the Committee on Entertainment and their able colleagues, this has proved to be one of the most harmonious and enjoyable meetings ever held in the

history of this Association, therefore

RESOLVED That the heart-felt acknowledgement of this meeting be tendered to the physicians of this city, to the Apollo Club, and to all who have contributed towards the great success of this session, and especially are our thanks due, and we take pléasure in this manner to express them, to the rare cotene of ladies, who have given brilliancy to the social entertainments by their charming presence They are the best jewels in the crown of this metropolis, which is destined to be the "Queen City" of the East as well as "the West"

On motion of Dr Toner, the thanks of the Association were given Dr Garnett, for the able manner in which he had presided Dr Garnett acknowledged this in a brief and appropriate address

On motion of Dr W H Daly, Pa, the Association then adjourned to meet in Newport on the 1st

Tuesday of June, 1889

WM B ATKINSON, Permanent Secretary

ADDRESS

IN

MEDICAL JURISPRUDENCE.

THE STATUS OF MEDICAL JURISPRUDENCE AS AFFECTING THE MEDICAL PROFESSION AND THE LAITY

Address delivered at the Thirty ninth Annual Meeting of the American Medical Association, May 11, 1888

> BY E W REID, WD, OF BALTIMORE, ND ,

CHAIRMAN OF THE SECTION ON MEDICAL JURISPRUDENCE

A by-law of the American Medical Association requires that "The Chairman of each Section shall prepare an address on the recent advancements in the branches belonging to his Section, including such suggestions in regard to improvements in methods of work, and present on the first day of its annual meeting, the same to the Section over which he presides " To the majority of the Chairmen this should be a comparatively easy task, masmuch as the advancements in their respective branches are advertised through the media of the medical journals and other publications, are considered by the medical schools and colleges throughout the world, and if deemed worthy, are taught by them

But to the Chairman of a Section of Medical Jurisprudence in America the work is more difficult because of the indifference manifested by our schools, and the lack of any considerably garnered modern information from which to draw, a deficiency that 15, in this country, the result of the limited association of law with medicine Therefore, the wisdom shown by the American Medical Association in creating this Section is deserving of more than ordinary commendation, because it will not only stimulate to greater activity the workers already in the field of forensic medicine, but will bring in many more There is not at present sufficient incentive to induce the lawyer to investigate the philosophy or latent principles of the law, there is still less to spur him to inquire into that of medicine Consequently, he dips no deeper into the troubled waters of even his special branch of science than is necessary to enable him to fill his the law though not undiscovered are unapplied

of science which compelled him to go far beyond the pale of symptomatology and therapeutics, and which offered no direct emoluments to compensate him for the time and study that would be diverted from that which he has been inclined to consider the legitimate bounds of his profession For this reason, and because of the scarcity in almost any form of medicolegal laboratories to which could be carried the crude gleanings of the hardly pressed but enterprising physician, to be so wrought and polished that they could be intelligently applied to law as well as to medicine, much useful information has been lost to the world And a branch of jurisprudence, second in importance to none, capable of vast expansion, and which should be one of the most useful and active factors of human society is comparatively unavailable

MEDICAL JURISPRUDENCE A PROFESSION

That live journal, the Philadelphia Medical Register, in an admirable editorial on the subject, says "It would best become the dignity of science and truth if legal-medicine were held as a definite and distinct profession, in which the emoluments were sufficient to justify a physician in abandoning all other practice in the interest of this special work "

RESPONSIBILITY OF THE PHYSICIAN

The holding of legal medicine as a "definite and distinct profession," should now, and I sincerely hope will, in the near future, be possible But until that period arrive, the doctor who is zealous for the honor of his profession and his own reputation, must exercise a more scrupulous vigilance than has hitherto been supposed requisite He can no longer be satisfied with the daily writing of so many recipes, or the distribution of so many pills or plasters cessful he must not merely keep abreast the times, but must keep, be it ever so little, in advance of them He must be active in his efforts to discover new worlds in medical science, as well as bold and aggressive in their exploration He must be fearless but also judicious in the adaptation of new principles, and that he may be both, he can no longer ignore the fact that he must at least possess sufficient knowledge of the law to enable him to distinguish between that which is lawful and that which is unlawful in the application of modern medicine, that he may success-Therefore many of the healing qualities of fully defend himself against the attacks of the ravening wolves and vultures which will be all the more The busy practitioner of medicine has hitherto likely, because of his independent advancement and imagined he had no time to devote to any division the shaking off the shackles of old theories, to infest

his path and to endeavor to prey upon him must confront the possibility that at any moment the neglecting to observe these rules is clearly shown by aid of the law may be invoked to seek to hold him responsible for the consequences that may ensue, not only from the use of newly-discovered drugs, but from even the most intelligent administration of well established remedies

Therefore, when giving medicines, such as sodium salicylate, chloral, or others of like nature, which are liable to be followed by delirium, hallucinations, illusions, etc, it will be best to surround the patient with such safeguards as will prevent him from injuring him-He must also bear in mind self or other persons that many customs though founded on a humane rules (which I quoted above) the general practitioner, basis, can no longer be followed with impunity, e g, the physician cannot now safely conceal his lancet, and, without having given his patient warning, plunge from the imputation of which even an acquittal will it into an abscess, nor, even after the consent of the not always clear him in the eyes of the public patient has been given to be anæsthetized, in order to have one eye removed, is it advisable for the oculist to remove both, no matter what grounds he may have for believing it necessary to do so The consent of the patient to the removal of the second eye is as essential as it was to that of the first After craniotomy and delivery should life remain in the child the accoucher may not on any grounds complete the work of destruction begun in utero, for the moment the safety of the mother is no longer involved the rights of the fœtus, temporarily in abeyance, are restored, and the law recognizes the sanctity of that life no matter how feeble the existence or how mon-The time may not be far distant strous the form when the operation of craniotomy will have to be justified, not upon a mere assertion of impaction, but upon a basis of actual measurement, and the pelvimeter will have to precede the cranioclast physician should also know that the common law does not formally recognize the induction of premature labor, and when his State has failed to afford him protection by statutory provision, unless he exer cise extreme caution he may find himself in a situation from which it might be difficult to escape creditably

Tidy says (Vol 3, W L, page 100) "It is manifest that if any question should arise or action at law be commenced against a medical man either for inducing abortion, or for manslaughter if the child born alive died because it was immature, it would be necessary to show (1) that there was a necessity for the operation, the life of the mother being at stake, and the operation being less to be feared than natural delivery, and (2) that his action was bona fide" Now the constantly increasing number of conditions which are daily alleged to be sufficient grounds to justify the induction of premature labor may render to successfully defend himself against a charge of is given by Taylor, page 718, in the history of an imadequacy of cause for its performance therefore inadequacy of cause for its performance, therefore, operation performed by one of the most eminent operation performed by one of the most eminent operation performed by one of the most eminent to quote again from Tidy "We strongly urge upon surgeons of the United States upon an infant whose to quote again from Tidy "We strongly urge upon surgeons of the United States upon an infant whose surgeons of the United States upon an infant whose to quote again from Tidy "We strongly urge upon surgeons of the United States upon an infant whose surgeons of the upon the predominance of the most eminent to quote again from Tidy "We strongly urge upon surgeons of the United States upon an infant whose surgeons of the upon the medical men (1) Not to induce premature labor or sexual organs were imperfect with predominance of abortion without the most mature consideration. Not to undertake it until after consultation with a for the child's future welfare and happiness it would second practitioner (2) In any case to have the hard the ha full consent, in writing if possible, of the husband or it should retain them under such an imperfect devel guardian "

The trouble that may accrue to the physician from Taylor, page 592, where he says "This practice has been condemned as immoral and illegal, but it is impossible to admit that there can be any immorality in performing an operation to give a chance of saving the life of a woman when by neglecting to performit it is almost certain that both herself and the child will perish Any question respecting its illegality can not be entertained, for the means are adminis tered or applied with the bona fide hope of benefiting the female, and not with any criminal design" Yet he says further on "By non-observance of these in the event of the death of the woman or child ex poses himself to a prosecution for a criminal offense, Within a recent period several practitioners have been tried upon charges of criminal abortion who had obviously neglected to adopt those simple measures of prudence, the observance of which would have been at once an answer to a criminal charge Because one obstetric practitioner of large experience may have frequently and successfully induced premature labor without observing these rules and without any imputation on his character, this cannot shield an

other who may be less fortunately situated" The physician must also remember that he is more liable to have a charge of criminal abortion brought against him when the woman is single than when she is married, the law in such a case regarding the oper ation with extreme suspicion, yet the need for its performance may be as imperative in the case of the husbandless female as of her upon whose marriage was set the seal of both Church and State

The nature of many diseases and injuries is such as to compel the medical attendant to quickly deter mine his course of action entirely from a medical or On the other hand, there are surgical standpoint cases in which he must pause long enough to consider his treatment from other standpoints as well as those of medicine and surgery, e g, where mantal rights are involved, as when a lacerated cervix uteri is closed to a pinhole to prevent further conception, at the request of the patient, but without the consent of the The operation if successful would, I think, make the gynecologist liable to an action at law, for procreation being one of the principal objects of matrimony, the closing of the wound when not con tra-indicated by physical conditions, should be made in accordance with that doctrine, so, also, where the work of the surgeon may impair or destroy the social, civil and political rights of one of those most unfor tunate of beings, hermaphrodites

A striking illustration of the possibility of so doing (3) In any case to have the be better that it should have no testicles at all than

opment of the other organs He therefore removed them by operation from the labia or divided scrotum, and had the dissatisfaction to find that they were perfectly formed in every respect, and that the spermatic cords were quite natural Three years subsequent to the operation it was found that emasculation was complete, for the disposition and habits of the being had materially changed and were those of a girl, she was found to take great delight in sewing and housework, and she no longer indulged in riding sticks and other boyish exercises" Thus from regarding the operation from only one point of view, a creature already accursed by fate, is altogether deprived of those rights and privileges which by reason of the predominance of the male sex would have remained to him, such as right of suffrage, privilege of holding office, and the possibility of obtaining the higher wages from which females are excluded

In offering some of the above suggestions I may have seemed to disregard the warning of the proverb about letting sleeping dogs lie, but daily occurrences proving that their sleep is of the lightest, I have remembered the greater wisdom of taking such precautionary measures as will render it impossible for the

aforesaid dogs to bite should they awake

THE NEED OF MEDICAL LEGISLATION

There has lately been manifested, at the meetings of the Society of Medical Jurisprudence and State Medicine of New York, a laudable disposition to discuss in a practical manner such questions as arise from the ordinary, as well as the more unusual cir cumstances of daily life I would recommend to this Section to give to such questions even greater and more critical consideration, as the discussion of such subjects in a common sense way, by these bodies, will surely do something towards stimulating the now tardy and indifferent legislator to take measures to, at least, attempt to mitigate some of the more glaring evils that now exist either because of defective legislation, or from the absence of any laws bearing on them There is probably no lack which brings greater suffering to a larger number of people than the absence in many of our States, and the neglect of enforcement in others, of proper laws to regulate the practice of medicine The cries of the victims of ignorance and unscrupulous greed which come not only from one State, sympathy and aid of the law more powerfully than any individual possibly can

I will do our distinguished legislators the justice to say I believe if they were brought face to face, as kind that we can ever even partly realize physicians are, with the fearful suffering, often followed by death, of the victims of quacks and charlatans, they would exhibit at least a modicum of the interest and energy which they display when a bill is proposed which is likely to interfere with any of their privileges or pleasures, such as chicken matching, or other pursuits or amusements of a like elevated or intellectual nature In these declining years of the nine-

leaped space and made rapid communication possible, not only between the inhabitants of the same city or country, but so linked continent to continent that what occurs in one is, within a few hours, published in the newspapers of the world, one would imagine that the sceptre had been stricken from the hand of Superstition, her temples leveled in the dust, and her devotees converted to a purer and more whole-But not so She is as rampant and powsome faith erful to day as ever, her shrines are as numerous and her followers as blind The mares of her Tam O'Shanters may not be in such imminent danger of losing their tails, but the Tams are as credulous as was their rollicking prototype who so narrowly escaped Nan-The smoke of the fires that set nie's supple fingers her cauldrons boiling stifles the air of as many secret places as when the apparitions were called up to answer Macbeth's questions, or so many scaffolds in New England groaned with the burden of their innocent victims A despot, she troubles but little about improvement in methods of ruling her subjects. The creaking is as audible, the mechanism of her machinery as rude, her miracles as palpable frauds as when she herself was fresh from chaos, but, like death, she

gathers in the wise and the simple

One would suppose her cabinet performances and materialized spirits would not deceive a child, but that some of the brightest minds of the age have succumbed beneath their influence let our lunatic asylums bear witness Apparently, though, the assisting spirits are more accommodating now than formerly, for at one time they were wont to postpone their coming until the scent of the witches' savory stew was strong in the air But it has not been mentioned that the spooks who so kindly decorated the canvas held over lawyer Marsh's willing head by the fat hands of Madame Diss Debar were offered even a smell of It would seem that even the electric light cannot so illuminate the mind that there will remain no dark recesses in which false beliefs may lurk and breed With many of these erroneous conceptions it were futile for either legislator or medical man to attempt to deal until they have taken such form as is likely to be productive of serious harm either to the persons in whom they exist, or to those around them Of the many phases of superstition which have attained proportions that render them worthy of critbut from almost the entire land, should appeal for the | ical scrutiny, there is none so dangerous as that which makes its possessor the facile subject of conscienceless quacks and death dealing frauds I think it is only when attempting to grapple with a matter of this

> "How small of all that human hearts endure, The part which laws or kings can cause or cure "

Few persons dream of the extent to which quackery is practiced, or the hold it has upon many men and women who, one would imagine, were far above its influence Only a few exceptionally atrocious cases are brought to the notice of the public, the obscurity of some of the sufferers, and the reluctance teenth century, when, if ever, the human mind might of others to acknowledge that they have ever resorted be supposed to be not far from its zenith, when in- to such irregular sources, serving as safeguards for vention has proceeded from triumph to triumph, when the charlatans who torture them. There is no need the telephone, electric telegraph and cable have over- to pronounce on these creatures and their victims the

malediction Macbeth invoked upon the witches "In- ately skilful physician might have so assisted nature fected be the air on which they ride, and damned all those who trust them " Those who trust them are already damned.

A case in point was brought to my notice some A man and his wife, whose intelligence on many subjects is above the average, are living in a snug and tasteful home not far from Baltimore Several weeks ago the woman, who was several months advanced in pregnancy, miscarried Neither midwife nor regular doctor was called to attend her, and the neighboring women who sought to relieve her suffering with hot applications and other simple means were not allowed to continue their efforts, as both she and her husband believed she was under the influence of a witch's spell, and that such remedies would only increase its malignant effects. Instead of these a so-called magnetic doctor, who professed to be wise in the wiles of witchcraft, was sent for This distinguished gentleman, who, at the beginning of his medical career, united the profession of a huckster with the practice of quackery, and peddled paper thing to gain, uses the most deadly agents in a way pills and potatoes, witch's potions and charms, ban anas and fish from the same wagon, came with the cheerful alacrity characteristic of his class, bringing with him three charms, at \$3 each, which he disposed, as to him seemed best, about her person At each of his tri weekly visits he would turn her over on her face, and sit for half an hour holding his stubby fingers two or three inches above her spinal column, explaining that he did not dare to touch her, as the flow of magnetism was so great it would probably throw her into convulsions During one of his visits, upon her complaining of constipation and requesting some cathartic pills, he called for pen, ink and paper, wrote a few words on a narrow strip, rolled it into the shape of a pill, and made her swallow it, telling her it would have "the happiest, speediest and most gentle effect "

Not being properly attended at the time of the miscarriage, and the feeble contraction of the womb failing to expel the placenta, the woman lay fourteen weeks flat on her back, suffering the most excruciating pain, which was accompanied with a constant The retention of a discharge of blood and mucus decomposing substance was evinced by the sickening stench which made it almost impossible to remain in the room with the patient, and the absorption of the septic material into the system was manifested by high fever and delirium Complaining, during one of her lucid periods, of the weakening effect of the continued discharge of blood, the wretch told her he would bring her a prayer which she must repeat until the flow ceased I doubt if there can be a more pitiable sight than this poor woman, almost at death's door from septicæmia, scarcely able to lift her burning hands to her brow, suffering such agony as might suffice to kill the strongest man, yet, with the tena city of desperation, striving, even through the vagawill bring her surcease of pain, and with parched lips such as could be acquired in sweeping the office, and ries of delirium, to hold fast to that which she hopes in almost inaudible whispers repeating again and again emptying spittoons, after his employer's death hung fragments of a supplication but little better than wildest out his shingle, and commenced the practice of medgibberish Yet this is a case in which even a moder- icine on his own account

that in a few days the woman would have been restored to her usual health, whereas she is still confined to her bed with small prospect of recovery

The above is a fair sample of the methods em ployed by this, either deluded imbecile or unscripulous scoundrel, so successfully he has been able to give up the huckstering branch of his business and devote himself exclusively to the cultivation of his magnetism, and the sale of his charms and magic powders There is no better illustration of the proverb, "Fools rush in where angels fear to tread," than can be found in the reckless use by quacks and mountebanks of powerful and dangerous drugs which even the most experienced of our profession handle with the greatest caution A physician of good standing will, in using such remedies, be influenced not only by a conscientious regard for his patient, but by the effects which any mistake or lack of judgment may have upon his own reputation But the unli censed charlatan, having nothing to lose, and everythat would appal the community, were it known. The country stands aghast at the devastation caused by some fearful epidemic, yet this is usually short in duration, and it is doubtful if the number of its victims equals the number annually slain by criminal incompetency, yet there is comparatively little effort made to stop the nefamous practice

An octoroon who flourished some time ago in Baltimore was in the habit of openly boasting that she would take any drug, regardless of its nature, that she could obtain from any source, put it in a bottle and, after pow-wowing over it awhile in the presence of the credulous fools who visited her, would demand, and generally receive, from \$5 to \$20 Many of the itinerant quacks are the vilest scoundrels on One of these villains, travelthe face of the earth ing from State to State, pitching his tent on vacant lots of cities, towns and villages, dressing in fantastic costume, having a band of music and Indian dances, doing anything to attract a crowd to which he could sell his vile nostrums, stopped at a small town in While there he was consulted by some Maryland foolish girls in regard to some ailments peculiar to He insisted upon making an examination, after which he told them it would be impossible to cure them unless they would allow him to have sexual This is a case in which every intercourse with them decent man would like to unite in himself the offices of jury, judge and executioner, yet this fit subject for the gallows sells his poisons, offers his atrocious insults, and goes on his way unmolested

A school or college must be of good standing to be allowed to issue diplomas, but any ignoramus can hang out a sign and otherwise advertise as a doctor without having suitably prepared himself to perform the duties of one In Baltimore an ignorant man, who had served a doctor in a menial capacity, and had had no opportunity to gain knowledge except

Another plea which should be urged is that such persons prevent patients from receiving the service of skilful practitioners A man who had been injured by heavy lifting was attended by one of these incompetent persons After the patient's death, which oc curred on the third day after the date at which the injury was received, this individual very coolly stated that he did not, while visiting the man, know what was the matter with him, nor did he know what had caused his death Under such circumstances a regular practitioner, obeying the precept that teaches "in the multitude of counselors there is safety," would have called other doctors in consultation, but ignorance is generally autocratic There should be a statistician appointed by the State to investigate and report the history of the numerous wonderful cures and operations advertised not only by quacks, but also by physicians of good repute If this were done, it would be found only too frequently that, while the fame of the performance was being blown abroad, the subject of it was resting under the sod. It is due the public that the per centum of survival, in such cases, should be given, as false statistics are calculated not only to deceive the laity, but also to mislead the profession

skill displayed by the operator, and the success that attended the performance of a rather uncommon operation upon an inmate of one of our hospitals, was published in most of the papers of the country, but the trifling fact that the woman operated on died in a few hours after was not mentioned The class that cures the disease regardless of the effects of the method used, is quite too large

A report was made to me of a case in which a Pennsylvania so-called specialist was to receive \$100 and his traveling expenses if he succeeded in eradicating a cancer in the breast of a Baltimore County woman After her death, which ended three months of terrible torture caused by the application every few hours of powerful escharotics, he demainded and obtained the sum promised, on the ground that he had extirpated the cancer, though the process employed had prob ably caused the death of the patient, and he had ex pected that it would when he undertook the case, as experience had taught him that a diseased condition of various organs was generally produced by such eradication, but, being a specialist, he had nothing to do with that He was only prevented from getting a photograph of the denuded ribs by reason of the light in the room not being sufficient to enable the photographer to do his work, and the woman was quite too ill to be moved to a lighter apartment expressed great regret at the failure, as he wished the picture to exhibit as confirmatory evidence of his skill and success

STATE MEDICAL EXPERTS

There should be competent men also appointed by the State, at adequate salary, to serve as medico-

whether willing or not may, at any moment the law sees fit to specify, be required to go on the witness stand in the character of a medico legal expert that place, unless he be well posted in forensic medicine, and possess the coolness and self reliance required to repel the onslaught of the lawyers, his reputation for knowledge and skill may receive in twenty minutes injuries that cannot be repaired in a lifetime There are no stitches, however skilfully set, which will so bring together the jagged edges of such wounds that no disfiguring cicatrix will remain, like the mark set on Cain, to be seen and known of all men dian takes greater delight in the agony of his victim than the average lawyer takes in the suffering of the medical witness under the treacherous thrust of the cross-examination He seems to avenge on him the bitterness of all the potions and the griping of all the pills that have gone down the legal throat from the birth of law to the time of the trial As the red savage whirls his bloody tomahawk and threatens one part of his writhing victim, and then, with lightning speed, strikes where least expected, so increasing the torture of the certain blow by the uncertainty as to where it will be inflicted, so the legal gentleman flashes before the strained senses of the medical wit-Some months ago a most eulogistic report of the ness, fettered by the law which, forbidding retaliation, leaves him at the mercy of his persecutor, the keenedged weapon of the law, and the blow falls always where least expected A contest of this kind, if contest it can be called, where the advantages of freedom and special training are mostly on one side, is as unfair as would be an encounter between the trained pugilist and a man not only ignorant of fistic science. but also handcuffed and gagged The arena of pugilism is not the only place where freedom and nice training will do more for one than brains alone service demanded by the court and for which, in many States, no adequate compensation is allowed, frequently requires an amount of investigation and a consumption of time the physician can ill afford to A case of this kind came under my notice a few days before I began this paper A young medical friend of mine, after having rendered three months of conscientious, gratuitous attendance to a patient who was supposed to be suffering from the effects of a blow, and a kick, learned that he would have to go into court as medical witness Thus, at the time when he had reason to suppose that his work of charity, at least as far as that patient was concerned, was ended, he is obliged to begin a tedious investigation of the physical and pathological conditions and habits of life of the man prior to the as-He must patiently inquire into many apparsault ently trivial matters which, nevertheless, may prove to be of the utmost importance in elucidating the history of the case This information must be obtained from the patient, his relatives, or friends, who will naturally endeavor to conceal whatever may be prejudicial to the patient or favorable to the assailant. Yet, when brought into court, the doctor will be exlegal experts on occasions when the aid of such is pected to be able to state with the utmost exactness necessary I know this point has been urged before, how much of the man's suffering was the result of the but I that I then the point has been urged before, how much of the man's suffering was the result of the party of his babits of his party of the pa but I think the urging should be continued until suc- injuries received, of his habits of life, or of the pacestal and the urging should be continued until suc- injuries received, or his habits of life, or of the pacestal and the lawyers. cessful, as it is exceedingly unjust that any physician, thological conditions which, according to the lawyers,

may, might, could, would or should have existed prior to the assault. If my friend fare on the witness stand as many of his medical brothers have fared before him, he will not be there long before he will find, though ostensibly called there to state simple facts relating to the case, the law will strive to utilize him as an expert, and the time which should be spent by him in assisting in elucidating the truth, will have to be expended in defending his own reputation for knowledge and skill against the imputations of the lawyers

WHEN ARE DYING DECLARATIONS ADMISSIBLE?

To be admissible, "dying declarations must be made in extremity, when the party is at the point of death, and every hope of this world is gone " consideration of the fact that the mental and physical conditions of the person at the "point of death" are usually such as to render the reliability of his statement extremely doubtful, no matter how conscientious he may be, there is no time when justice more imperatively demands the presence and aid of an intelligent, experienced physician, than when the law is endeavoring to fasten the crime of homicide legislatures and the meagre facilities afforded a large upon a prisoner through the identification and dying declaration of the victim of deadly assault, or of foul As in many instances the fate of the prisoner rests mainly upon such evidence, no means should be left untried which will assist in determining its The nature of many agents used to destroy life, and of injuries which result fatally, can be alleged as sufficient reason why, when it is necessary to bring the accused into the presence of the injured person to be identified, the State should, if possible, have a physician present whose duty should be to make a careful examination of the declarant's mental, visual and other conditions For, at the time the declarant may be trying to identify the prisoner, his intellect and vision may be so disturbed by cerebral anæmia resulting from the loss of blood as to lead to the gravest mistakes Also because the insidious intellectual changes which are sometimes the sequence of cranial injury may convert the best friends into the bitterest foes, and yet be undetected by inexperienced persons, though they would be suspected by the doctor from the nature of the injury

Another fact likely to be unknown to a large majority of the laity is that, in anæmia resulting from loss of blood, the upright or semi-recumbent position may render the declarant less capable of making a trustworthy statement, whereas the horizontal position, by encouraging the flow of blood to the brain, would increase mental activity and thus tend to promote the ends of justice

The effects of the kind and quantity of stimulants given so freely at such times should also be noticed, as these not only vary greatly in different persons, but vary greatly at the different periods at which they are administered to the same person

Where a woman is dying of septicæmia consequent upon criminal abortion, there may be light delirium, slightly confuse the memory and distort the imagina- ment of such knowledge are much greater than in tion, yet not be discovered by persons unfamiliar sparsely inhabited places, who are totally ignorant

with the concomitant symptoms and pathological conditions present.

PREVENTION OF CRIME

How to prevent crime has been a momentous problem in the past and is still one. The higher education of the masses is generally urged as the best solution that can be offered When this higher education no longer means, as it mainly does at present, the teaching in a superficial manner by our educational institutions of many comparatively useless branches and so called accomplishments, but such special instruction and training as will qualify our boys and girls to grapple successfully with, at least, a few of the numerous practical questions which will In | inevitably confront them, then it can be presented as a potent agent towards the promotion of the desired "Ignorance," it is said, "is the parent of crime," but the doctrine of heredity does not exempt the offspring from punishment. In many instances, arraignment and conviction are the first intimations persons have that the deeds committed are crimes

The limited publication of the laws enacted by our majority of our people to acquire knowledge of many offenses at common law are fruitful sources of crime and suffering, as well as of great expense to the State. If the teaching of Medical Jurisprudence were rendered imperative in our schools it would do much to prevent crime, since our youths, both male and female, would not only be taught the nature and enormity of various crimes, and how easily from want of this knowledge persons may innocently become accessory thereto either before or after the fact, but its doctrines would be carried home by them, and thus kept fresh in the minds of the people If the introduction of Medical Jurisprudence in our schools did no more than teach our girls the sanctity of their relation to, how best to promote the welfare of the life which they may bear within them, and the magnitude of the crime of attempting at any period, by any means, to compass its destruction, also the temble and lasting, if not fatal effects on the mother of any effort to destroy the fœtus, it is impossible to estimate the good that would be accomplished or the evil that would be prevented

There is probably no crime more common than fœticide, and none that is so frequently the result of Few of the many women that resort to ignorance it either to hide their shame, or because they are unwilling to endure the trouble and care of children, have any idea of the hemousness of the deed, of its effects on themselves, or the extent to which it would make them amenable to the law The ancient doctrine that up to the tenth day it is merely an egiluxio is still largely believed, and because of the prevalence of that opinion abortion produced within that period is not regarded by the masses in the serious manner it would be if its nature were better known are many men and women, even among the higher classes, and living in cities, where it is reasonable to suppose the opportunities afforded for the acquire

that the destruction of the fœtus during the earlier stages of gestation is a crime even in a moral sense, much less one of sufficient turpitude to render them

hable to criminal prosecution

Another advantage which should not be lost sight of, is that in teaching Medical Jurisprudence in our schools we will be instructing our future legislators in that branch of science and thereby preparing them better to understand the needs of the people, and to frame laws to meet them If a knowledge of forensic medi cine were generally diffused among the laity we would have laws to take cognizance of offenses against the mind which are liable to produce insanity and develop some of its worst types, known as homicidal and suicidal mania The law prohibits the infliction of corporal injuries and frequently punishes the inflictor, but against assaults upon the mind it at do not more frequently disable the assailed, unfit him him incapable of self preservation than do wounds of the mind Great mental irritation or distress pro duced by continued complaining, malicious tantalizing, persistent nagging, ceaseless importunities for things not in the power of the importuned to grant, or causeless accusations of immorality may lead to permanent impairment of mind and body Men and women have been driven to moral and financial ruin, to lunatic asylums, and to their graves, by the repining over the unpreventable, and whining for the unattainable of persons from whom the exigencies of life rendered escape impossible

The virtues of the persecuted have in some instances thrown up barriers which their distress could not overleap A man was observed sitting evening after evening in a saloon Some surprise was expressed at this as he neither drank nor sought the company of the other frequenters of the place, but sat by himself and seemed dazed and stupid Upon inquiry it was learned that he was a sober, industrious mechanic who had been driven to this state of melancholia by a querulous wife This is only one of numerous cases, the history of which would illustrate the need which exists of laws to protect against such attacks When such assaults are made by the husband upon the mind of the wife, or by the wife upon the mind of the husband, the interposition of the law is especially necessary, since when married it is more difficult for the persecuted person to escape In almost every contract except that of marriage the law protects the parties thereto from such breach or non observance of the terms as may be likely to evilly affect the contract. Then why should not the law afford a similar security to the parties to a contract of marnage, and enable either husband or wife to secure the interposition of the court, by injunction, or otherwise, to prevent the continuance or repetition of such acts as are likely to injure one party or both, or lead to dissolution of the marriage itself?

This query, with the preceding proposition, I now submit for your consideration

THE APPENDIX VERMIFORMIS, ITS FUNCTION, PATHOLOGY AND TREATMENT

Read in the Section on Surgery at the Thirty-Ninth Annual Meeting of the American Medical Association, Cincinnati, May 8, 1888

> BY HENRY H SMITH, MD, LLD, OF PHILADELPHIA, PA

In writing of "Intestinal Obstructions," Treves states,1 that "their importance may, in one way, be estimated by the circumstance that over 2,000 individuals die every year in Great Britain from obstructions of the bowels, exclusive of hernia " Dr Senn, of Milwaukee, also considers them of such consequence, that during the last eighteen months (January 1888) he has reported "one hundred and fifty operations performed on animals, for the purpresent affords but little protection, yet bodily injuries pose of studying the effects of the principal varieties of intestinal obstructions produced artificially " for the performance of his daily duties, and render Treves does not state what proportion of the deaths he speaks of, were due to disorders of the appendix, and Dr Senn's experiments have not yet been extended to this tube It is, however, widely known, that the appendix is sometimes a cause of constriction of the ileum, and that stenosis of its cæcal orifice, from inflammation of its coats, or concretions or foreign podies in its canal, frequently induces local and general peritonitis, peri cæcal abscess or Whether the starting point of the perityphlitis latter is in the appendix or the cæcum, is a question yet sub judice, but there is much evidence daily accumulating to show that it is the appendix United States, Dr J H Musser, of Philadelphia, states,3 "that appendicitis is in the origin of peri cæcal abscess, perityphlitis, and peritonitis in about 90 per cent, or perhaps a larger proportion, of such cases," and it is now, I think, generally admitted by surgeons, that perforations of the cæcum are rare as compared with those of the appendix

> In the Index Medicus, are references by 248 authors to disorders of the appendix, as the result of the appendicitis Of these cases, ninety four only are reported as due to the presence of foreign bodies Some of these authors detail several cases Lewis, of New York, furnishing forty cases of foreign bodies As seventy-six of these authors were phyalone sicians of the United States, the results of appendicitis have been widely recognized, though not so assigned by them Concretions and supposed foreign bodies, were found in about 30 per cent of these cases

Although so well and widely known, Lieberkuhn individual or joint interest or lead to impairment of having written "De valvula caci et usu processus Vermicularis" in 1739, and Herlin "De l'usage de l' Appendice Vermiformis," in 1718, this organ has not been as minutely studied in its relations to the

alimentary canal and the process of digestion, as the jection, but at other times it occupies half or more of fatal character of its disorders demands, and though the calibre of the opening, and interferes with a free all present, doubtless recall the general anatomical communication between the cæcum and the appendix relations of the appendix, perhaps its special structure in either direction Sometimes opposite to this and its probable function are not so well understood Indeed, there is reason to think that many practitioners hold the opinion of a recent writer and teacher who states, "we have this little organ (appendix) singularly useless physiologically, placed in a singularly unfavorable position anatomically, and steines or excrement stones) is unknown," and this so formed that escape of its contents is very difficult, whilst it is very prone to become diseased in

A few words on the special anatomy of the appendix may suffice to bring the subject of appendicitis and its results, to the notice of this Section, and elicit such discussions as will tend to show the surgical opinions on the subject, and aid in the scientific treatment of a serious pathological condition that is daily creating increased interest cæcal abscess and perityphlitis being often only symptoms of a pre-existing disordered action in the appendix

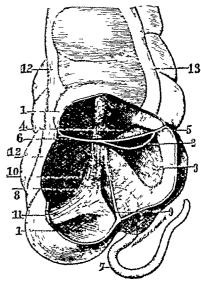

SPECIAL ANATOMY OF THE APPENDIX

The appendix cæci, or vermiformis, in man, varies in length from six or eight to ten centimetres, or from two to six or nine inches, the cæcum being only one and one-half to two inches long, and widely expanded The calibre of the appendix, is in breadth internally, about the size of a goose-quill It is not a straight tube, but is generally slightly flexed or curved on itself, and varies in its normal position and direction, being sometimes adherent to the left and posterior face of the cæcum and extending upwards nearly to the gall-bladder, or under surface of the liver

Its blind extremity points nearly always towards the spleen, though it may dip down into the pelvis and become adherent to the right broad ligament of the uterus or to the right ovary, these variations of position being due to the length of the fold of its peritoneal attachment to the mesentery Sometimes its free end becomes adherent to some other organ, and is twisted as a loop around the small intestine as a constricting band, causing obstruction or strangulation of the involved bowel At its base, the ap pendix opens obliquely into the posterior and inner side—but not the lowest point of the cæcum—just below and on the same side as the ileo-colic valve. whilst its summit or blind end, is rounded and firmly On slitting open the canal of the appendix, we may note the comparative thickness of its walls, and that its mucous coat and sub-mucous tissue, is well developed, and by a semi-lunar fold that partly conceals the cæcal orifice, forms a sort of valve or ridge, that opposes the passage of solids from the cæcum to the appendix, fæces, etc, being forced into the appendix mainly by straining or by vomiting

Speaking of this valve of the appendix Henlè says "that as a rule, this duplicature of the mucous membrane is sometimes only a small border or pro-

valve and deeper in the appendix, there is a second valve-like projection" Gerlach states "that in elderly people, these valves of the appendix are atrophied or shrunken, and this is the reason why confirms the opinion that perityphilitis is compara tively rare after 40 years of age "Typhlitis is most common between 16 and 35" Appendicitis is mostly met with before the 45th year, though sometimes, as in a recent case in New York, the patient was 58 years of age and had sloughing of the appendix, from a concretion, abscess and general

rependix, so that nothing can drop into the appendix.

Copied from Prof Sappey's Anatomy, Paris, 1874

The coats of the appendix are the same as those of the other intestines, but its walls are often much thicker, and vary in thickness according to the contraction or diminution of the length of the tube its muscular coat, the longitudinal fibres predominate over the circular ones, and are apparently a continua tion of some of the fibres of one of the longitudinal The action of these longtudinal bands of the colon

⁵Reported nine inches by Dr T G Morton, Philadelphia ⁶Handbuch der Systematischen Anatomie des Menschen Dr J Henle, page 278 Eingeweiderlehre, 1862

⁷ Gerlach Abhandl der Erlangen Physical, Medicia, Societat 11,7 ⁸ Ziemssen's Cyclopedia of Med Vol viii.

fibres of the muscular coat of the appendix, diminishes its length and gives it a curved or vermicular action, thus forcing its contents into the cæcum whilst relaxing and opening the cæcal onfice, and favoring the escape of its secretion (Dried) Specimens) and (Fig I) The power of the longitudinal fibres of the colon thus alluded to is marked, as has been shown in the horse at the veterinary school of Alfort, where bullets, marbles, and other foreign bodies swallowed by the animal, were quickly elevated in the ascending colon by muscular contraction In a case of artificial anus in the Pennsylvania Hospital, Philadelphia, reported' by Dr Hunt, the vermicular movement of a portion of the posterior band of the colon which is continued into the appendix, was so strong, that a finger introduced into the opening was firmly grasped by the muscular coat, and small articles were drawn up the ascending colon with a great degree of force

"The follicles of Lieberkuhn" or the tubal glands, are numerous, and found in the mucous coat of the The "agminated glands of Peyer" are appendix also well developed near the summit of the tube It is not settled that a gland or two of "Brunner" is not also present In the Herbivora and omnivorous animals, these glands of Peyer are more developed than in the Carnivora. Prof Colin of Alfort, regards them as secretory organs, and of enormous dimen-He says10 "A gland of Peyer sions in the Rodents of the length of a finger of a glove, lines their appendix throughout its entire length Sometimes he also found the appendix free from food and entirely full of a beautiful greyish opaque or transparent liquid, not found in other portions of the small intestines, but was sometimes found in the colon when the solitary follicles were very closely developed fluid is similar to the mucous found in the appendix When stenosis of the canal of the ap pendix occurs, and the escape of its secretion is prevented, the appendix may become distended to the size of the fore finger or larger, creating a "Mucocele" a case of which is reported" by Feré the new born infant the canal of the appendix is relatively larger than in the adult, and often contains Meconium whilst in the adult, small hard particles of solid fæces resembling the dung of mice, or like raspherry seeds, may become the nucleus of concretions that frequently are mistaken for foreign bodies that have been swallowed In the post mortem evaminations of bodies, accidentally in the dead house of the Pennsylvania Hospital, concretions were found in each as shown in the specimens *

FUNCTION OF THE APPENDIN ---Whilst the structure of the appendix has thus been studied, its Function yet remains in doubt Indeed, several writers regard the function of this organ as of but lutle importance, an appendix vermiformis being present only in six varieties of animals Dr Chapman, of Philadelphia, says (a) "That a true ap-

pendix vermiformis is only found in Man, the Gorilla (b), Gibbon (c), the Chimpanzee, the Orang (d), Wombat (e), and Capybara (f), and that in many of the mammalia, the cæcum (which corresponds to the cecum and appendix together in man) is large and often very long, that in the mammalia generally, the size of the cæcum is in an inverse ratio to that of the stomach In the Capybara or Water-Pig, whilst its cæcum measures twenty-six inches its stomach measures ten inches, whereas, in man, whilst the stomach measures latterally from thirteen to fifteen inches, his cæcum is only from one and one half to two inches, and his appendix vermiformis measures Chapman, therefore, refrom three to six inches gards the appendix in man as having no particular significance or utility "

Morgani, Jno Hunter, Meckel, Haller, and others, also report authentic cases in men, where the appendix was wanting, and hence, they ascribe little value to its function Nevertheless, as it exists in connection with the alimentary canal, and as its disordered action disturbs digestion to a degree that often results in death, it may influence our treatment of its diseased condition, to recognize, if only on imperfect proof, its healthy connection with the process of digestion as seen in animals as well as man

In studying digestion in man, we note that as the chyle passes from the ileum through the ileo-colic valve, it rests or settles into the lowest portion of the cæcum as a liquid substance, on which the secretion of the appendix is poured out As the liquid elements of the chyle are rapidly absorbed, a thickened mass is seen to form and undergo chemical changes, analogous to a solution of gum, and this liquid was being transformed from an acid to an alkaline substance with the evolution of hydrogen, nitrogen and other gasses that create a marked fæcal odor, not ordinarily so marked in the small intestines absorbent action of the cæcum is accomplished through its mucous coat, which is furnished with numerous follicles or "cryptæ minime," of Meckel The great uniformity of these follicles in the colon, Horner states,12 "enable us to count them with certainty thro' the microscope In the cæcum, they are found at the rate of about 400 for every one-eighth of an inch square, and admitting the entire area of

*(Note.—Some notes on the vermiform appendix Received April 30 1888 from Dr. Henry F. Formad Demonstrator of Morb d Anatomy in the University of Pennsylvania and as Coroner's physician largely occupied on post mortem examination.) Received April DR HENRY H SMITH Philadelphia

DR HENRY H SMITH Philadelphia

Dear Doctor — From my notes upon cases and studies upon the post mertem table. I found that you are perfectly correct in your observation that the vermiform appendix is proportionally much larger in infancy than in adult life. Microscopic examination also confirms your observations on the vermiform appendix, with all the glandular elements peculiar to the small intestine save the Brunner's glands and that it evidently contributes to the functions of digestion. I have very frequently seen typhoid and tubercular ulcerations and catarrhal changes in the vermi form appendix as a part of a general disease of the mucous membranes of either the large or small intestines. The average length is from three to seven inches—the length being greater in the colored race and relatively greater in the Germans and Irish than in other nationalities. Excal matter and concretions are exceedingly common in the vermiform appendix surely much more common than is generally he'd Yours respectfully Henry Formad I Special Anatomy by Win E Horner VLD Philadelphia Volid page 57

the colon to be 500 inches, and that 19,200 of these follicles exist in every square inch, we have the extraordinary number of 9,620,000 muciparous crypts or absorbing points, in connection with the underlying | cumulation of its secretion, to distention, ulceration, veins and arteries of the large intestines cæcum alone creates marked changes in the chyle soon followed by pus, and abscess in the right iliac by the absorption of its liquid elements through the region, especially in the loose connective tissue blood-vessels and crypts just alluded to, is well It is not therefore surprising that this very vascular structure of the cæcum should soon participate inflammatory changes induced by disordered action of the appendix which open into it "

That the appendix exercises some influence on the course of the tears from the saccus lachrymalis action of the cæcum in digestion is quite probable, as its mucous coat differs very materially from that of ing that the function of the appendix is to aid digesthe cæcum and colon in the arrangement of its capillaries and mucous crypts, as shown13 by the minute injections of Neill, of Philadelphia, in 1851, whilst Gerlach states 4 "that the intervening spaces as would be proper in any catarrh of a mucous mem between the crypts of the appendix are so prominent, as to make them look like small bridges" a marked anatomical difference With this vascular structure, we may well suppose that the secretion of the appendix is free, and differs in some way from that of the cæcum Perhaps it is the source of a lactopeptone mixed with a large amount of mucus and some phosphates or carbonates of lime, that in some way modifies the formation of the fæces, and by its mucus secretion facilitates their passage up the ascending colon, hence, an early symptom of appendicitis is constipation The presence of an appendix vermiformis in certain herbivorous animals and its absence in the carnivora, would also seem to indicate that this organ has some influence on the digestion of vegetable matter Tiedman and Gmellin, long since observed that the gastric juice of the herbivora, possessed this power, whilst that of the carnivora, (that have no appendix) was not sufficiently active to destroy coarse vegetables, cereals or

The term "gastric juice" thus employed by them, is not limited to the secretion of the glands of the stomach, but includes the secretion of the liver, In the Carnivora pancreas, and intestinal juices that have no appendix, the pancreas is said to be comparatively small, and though participating in digestion, it is well known that both they and the appendix vermiformis can be excised without materially impeding digestion, thus Brunner in 1673, removed the pancreas from eight dogs that continued to live varying periods, their faces remaining normal, and Prof Colin, " of Alfort, in 1857, removed portions of the pancreas in six dogs, the animals subsequently preserving their health and spirits and increasing in flesh

Whatever may be the part played by the appendix vermiformis in connection with digestion (and its function certainly requires further, investigation), it

is evident that we have in it a mucous coat hable to catarrhal inflammation, under which changes are created that lead to stenosis of the tube, to the ac That the and perforation of its coats, and to peritonitis, that is around the cæcum, a symptom often spoken of as pentyphlitis. This catarrhal inflammation or appendicitis, resembles in its results duodenitis with obstruction of the ductus communis choledicus, or of the ductus ad nasum with obstruction of the

> As surgeons, are we not then justified in suppostion and the onward course of the fæces from the cæcum, and consequently, must we not in the early stages of appendicitis, carry out the same treatment brane? In other words, should we not strive to overcome the early constipation and restoration of the natural secretions of the bowels by emptying the cæcum, and favoring increased peristaltic action? Or, when this fails, promptly overcome the obstruction by an operation?

PATHOLOGICAL CHANGES IN THE APPENDIY VERMIFORMIS

The varying position of the appendix has been noted by Treves, of London, Fitz, of Boston, Formad, of Philadelphia, and several others Its most usual position is behind the ileum and its mesentery with the tip pointing to the left, or behind it on the inner ot left side of the cæcum, pointing directly upwards and often adherent to the colon It may be found in a right inguinal hernia is It may vary in size as well as position, being sometimes small and atrophied, or dilated to the size of a finger or of the ileum," dilacation being more common than atrophy It usually contains mucus or specks of hardened fæces, but not unfrequently presents concretions or calculi that are adherent to and distend the tube These calcult or supposed foreign bodies that are swallowed, according to an analysis recently made at my request,20 were composed of calcium and phosphor ic acid (Ca_s) (PO₄)₂ = Ca₃H₂, (PO₄)₂ = CaH (PO₄)₃, and did not contain any cholesterin Another small specimen, (b) weighing only 80 milligrams, left about 6 per cent of ash, consisting of calcium phosphate Its struc with a small amount of carbonate of lime The examination of a second ture was laminated and larger specimen by Dr Leffman gave the same results, phosphate of lime and no cholesterin In specting a section under the microscope, I found a conglomerate structure of yellowish brown atoms, united by apparently condensed mucus specimen, at first supposed to be a cherry stone, was examined microscopically by Dr Guy Hinsdale, of Philadelphia, and proved to be only impacted faces

Thornton, of the appendix and fatal pentonitis, produced by an orange seed (?) or what was supposed to be such

Mason reports perityphlitis with perforation of the appendix, rupture of the wall of the abscess, causing general peritonitis and death seventy four days after the abscess had been freely opened These are but a few of the well recorded cases of the results of appendicitis

For these and previous references I am indebted

to the Index Medicus

The glands of Peyer in the appendix may become the seat of tuberculous deposit, softening, ulceration and perforation, as is sometimes seen in phthisis pulmonalis, or there may be a perforation of the appendix from softening and ulceration of Peyer's glands ın typhoid fever Great changes in the walls of the appendix sometimes result from appendicitis ulceration supervenes, the walls and the canal may become contracted and indurated, the appendix being so shortened as to be only 1 or 2 inches long, giving the operator the impression of its being a gland or neoplasm, but a careful examination with a probe will usually detect the canal of the appendix.

The stenosis of the canal of the appendix, leading

the nucleus of which may be a speck of hardened feces around which the mucus collects, receiving in addition a deposit of phosphate or carbonate of lime. As the liquid is absorbed, the layers of the calculus become denser and it is moulded to the shape of the canal, impacted, and often firmly held in place Sometimes several calculi, from the size of a raspberry seed to that of a date or olive stone, for which they may be readily mistaken, are also seen Whilst writing this, I received from Deputy Sur-

sults in the formation of a calculus, as before stated,

geon-General Marston, of London, his report to the British War Office of the meeting of the Ninth International Medical Congress In this I find his opinion corresponds with my own Writing of appendicitis and the cavity of the peritoneum through a perforation of ulceration he says 31 "These are often described in the text books as due to the introduction of foreign Mestivier-s speaks of a tumor near the right side of bodies into the canal, but in my experience, while such may be present, they are not always so from tuberculous affections of the glandular structures of this part of the bowels, all the cases I have seen have been of a similar character The canal contains a substance in shape and form like a date stone, fairly dense, but capable of being cut or indented by the finger nail, of a brownish or yellowish brown color, formed apparently as follows An insignificant fragment of fæcal matter finds its way into the canal of the appendix vermiformis, catarrhal inflammation follows, with a fluid secretion holding phosphate in solution as a product of the inflamma-The fluid being absorbed, the phosphate forms a soft concretion, which becomes moulded to the shape of the appendix and in turn sets up inflammation, ulceration or sloughing of the coats of that part of the intestine "

SYMPTOMS OF APPENDICITIS

The symptoms of appendicitis are, in the commencement, such as indicate disorder of digestion, the disease appearing sometimes without premonitory symptoms and resembling a certain type of colic, with vomiting and griping pains, that at intervals attain great severity and double the patient up, to relax the abdominal muscles Sometimes the right thigh is flexed on the pelvis to relax the iliacus internus and psoas muscles The pain may be preceded or followed by vomiting, first bilious and subsequently stercoraceous Often there is pain towards the navel and a sense of constriction of the belly as in hernia, with continued constipation, or one or two movements of the bowels and then constipation symptoms, under the ordinary treatment of colic, may pass off and not return for several weeks, but after an uncertain period of weeks or months, the griping and vomiting return with more violence, though sometimes the attack is violent from the commencement, with evidence of disorder in the right iliac or lumbar region, the patient ignoring previous attacks and misleading his physician, unless closely When the symptoms are severe and questioned last for twenty-four or forty-eight hours, with tender-

ness and evidence of local peritonitis, fever is apt to follow, the pulse counting 90 or more and the tem-perature reaching 102° or more, with indication of localized pain Free urination also is often a marked symptom The belly sometimes becomes tympanitic and percussion may indicate a degree of flatness in the right side or towards the umbilious, but flatness is not always noted, owing to gas in the colon Sometimes, under the relaxation of ether, it is possible to recognize by palpation a spot that is doughly or more resisting than natural Sometimes it is more prominent than usual, and sometimes it is possible by relaving the abdominal walls to circumscribe a swelling or tumor that is sensitive to the touch and corresponds with the position of the cæcum, but often there is only a thickening of tissue and no defined tumor As gas cannot escape from the bowels, tympanitis becomes more marked, fever increases, with pain, and symptoms suggestive of perforation of the bowels and acute pentonitis appear, but frequently we note only a slight acceleration of the pulse during the colicky pain and are liable to be misled by the temporary relief of pain and the absence of swelling or fluctuation

DIAGNOSIS OF APPENDICITIS

One of the marked difficulties met with in the treatment of appendicitis is a correct diagnosis, and this difficulty is so great that Mr John Hunter said it never could be satisfactorily made during life difficulty is often increased by the fact that the case is sometimes under the care of the family physician who only calls for the surgeon's assistance at the last When seen early appendicitis may be suspected from previous history, especially a continued tendency to constipation and the repetition at varying intervals of colic or vomiting. When a suspicion exists of the presence of obstruction in the appendix a correct diagnosis can only be arrived at by exclu-Thus, are the symptoms presented due to hernia, to volvulous, an intussusception, a tumor of the mesentery, or other organs Comparison of the symptoms of each of these with the history of the case will greatly aid the diagnosis Then, the patient being etherized, let careful palpation be practiced of the right iliac, hypogastric and even lumbar regions Sometimes a cæcum can be recognized as impacted, sometimes a doughy or imperfectly indurated structure can be felt in the right iliac or lumbar region, at other times there will be severe acute pains in these When any of these symptoms are recog nized, when the pulse and temperature permanently rises and there are the symptoms of peritonitis, the diagnosis may be regarded as sufficiently correct to justify surgical interference If laparotomy is performed and the diagnosis of pus, perforation, or thickening of the appendix is not found, the result will be often more favorable than the subsequent changes induced by appendicitis left to nature The use of an exploring needle is liable to serious objections and dangers and is not a useful addition to our means of diagnosis

PROGNOSIS

The prognosis of appendicitis is always grave, al the result uncertain, the patient's condition tests. bling that of one with a reducible hemia, lubbe at any moment to be strangulated Sometimes under early and appropriate treatment the symptoms d appendicitis disappear, the disease terminating appa ently in resolution and in the restoration of the pen staltic action of the cæcum, but in other instance, where there is hesitation in diagnosis and delay a treatment, the disease running on to a pentyphilite Discess, perforation of the appendix, artificial artis or cleath from peritonitis may be anticipated The program osis is always largely influenced by the duration of the symptoms, especially when local pentonibility of the symptoms, especially when local pentonibility of the symptoms, especially when local pentonibility of the symptoms of the only chance for a successful tempta stances offers symptoms on the only chance for a successful tempta tion, for as Marston timely operation such cases might be saved "

TREATMENT OUF APPENDICITIS omy and its after treat As the details of laparott ovor Morton and others ment are to be presented by he upon the Section the who will follow, I will only urgent tion of appendicib importance of an early recognizing treatment adapt and the carrying out of a preliminar chadministration of ed to intestinal catarrh, such as the grains are taken, 5 grain doses of calomel until 20 or 30 to stomacheen this being often readily retained by the of stimulating when it rejects liquids, the free use he, the adminimization of hypodermic doses of morphis ion as the interaction of hypodermic doses of morphis ion as the istration of hypodermic doses of morphis ion as the the griping, and the administration as so te of coda stomach can retain it, of a dose of sulpha or magnesia, the first heary professible. or magnesia, the first being preferable of the arguments against the use of purgate general peritonitis, but I am now speaking early stages of appendicitis, with probable stell in of the canal, and before perforation occurs stage saline purgatives relieve congested vessels, & crease the serous discharges, empty the cæcum, a favor the escape of the secretion of the apperdly An important part of the early treatment of appe dicitis is, to etherize the patient and by judiciou palpation or taxis, endeavor to recognize the ob struction and favor penstaltic action This palpa tion should be exercised with the same caution as would attend the attempt to reduce a strangulated After persevering for 48 hours with this treatment, if relief is not obtained, I would at once resort to laparotomy under strict antiseptic precautions

The line of incision in laparotomy for perforating appendicitis will be hereafter stated by Dr Morton, The incision in the median line, known as the Cæsar. ean section, is the ancient one, a successful operation in a so called case of ileus being reported by Dr Fuschnus in Hufeland's Journal of Feb 7, 1826 34 Whatever incision is selected should be prolonged until the appendix is found Let the surgeon first look for and examine the appendix for calculus or

²³ Report of 9th Congress by Marston, 1888, p 43 4 Eberle's Practice of Medicine

perforation, and the subsequent steps of the operation can be decided by circumstances Generally it is safer to ligate the appendix and cut it off close to the crecum, and I am satisfied that an early laparotomy offers less risk to life than a temporizing course, that is liable to end in suppuration of the connective tissue of the vascular structure of the cæcum and the development of a general peritonitis The simple evacuation of the abscess without amputation of the appendix does not secure the patient against a return of the trouble, as was proved in a patient shown me by Dr Morton, and will be reported by him

SUMMARY

The following summary is presented for the discussion of this subject

1 Appendicitis is characterized by constipation, vomiting, griping pain, and other symptoms of disturbed digestion

2 Appendicitis very frequently creates the pathological conditions that result in concretions, ulceration, pentyphlitis, or pericæcal abscess

3 When a diagnosis is made and a preliminary treatment of an intestinal catarrh fails to arrest ap pendicitis, laparotomy should be promptly performed

4 A delay in operating in appendicitis, as in strangulated herma, increases the danger of a fatal termination

APPENDIN

The following translation from Herlin's paper, as alluded to in the first part of this paper, was made and forwarded by A Asst Surgeon, D S Lamb, U S Army, but arrived too late to be incorporated in the text. As it exhibits the opinion of an anatomist on the "function of the appendix vermiformis" in 1768, it is now offered for consideration of the reader

Philadelphia, May 12, 1888

REFLECTIONS AND OBSERVATIONS ON THE USE OF THE VERMIFORM APPENDIX OF THE CÆCUM

By M Herlin, Demonstrator of Anatomy at the Port of Brest From Journ de Med Chir, etc., July, 1768, page 321

Anatomists have devoted themselves through all scribed, and demonstrating their mechanism though they have satisfied us as to an infinity of interesting objects by which medicine has profited, it is necessary to admit that they have not yet discovered all, and hat there are some parts the use of which is but little Since all that has been said upon the use of he appendix of the cæcum does not explain the estined, might we not advance what has not been the stercoral column upon its fundus at it is, if only to satisfy our curiosity

the use of the appendix of the cæcum, it is only that which assigns to it the property of being the reservoir of a mucous humor, flowing continually into the cæcum to lubricate this intestine, and protect it from the acrimony of matters lodged there, which has some truth in it, and which merits attention, but this is very far from filling the idea one ought to have of the utility of this part, as I will soon show with some anatomists, that the appendix of the cæcum is not larger in the fœtus than in the adult, (caused by the distension the part experiences from the presence of mucus retained in its cavity by the presence of the meconium) is to hazard an opinion that the inspection of the part contradicts, since we do not find it more sensibly charged with this mucous in early life than in the adult, and one observes on the contrary, that this little intestine is smaller in persons in proportion, as they are more or less constipated and subject to stercoral colics object on which anatomists have passed, and which demands attention, is that the cul de-sac of the cæcum is scarcely marked in the fœtus, but increases more or less with age, and about in proportion as the appendix in developing loses in length, without doubt, because the change is made so insensibly during the whole course of life The opening of the bodies of some sailors who died of a kind of colic called dry colic, opened my eyes on this subject found the appendix of the cæcum in two of the subjects almost entirely effaced, the cæcum and colon enormously dilated and filled with a quantity of hard matter and much rarefied air The coats of the colon were very thin, its sacs had disappeared, and its ligamentous bands were scarcely visible, while those of the cæcum, continuous with it, and the coats of the cul-de-sac, appeared to have lost very little of their ordinary thickness

I see then in this, not only the explanation of the phenomena that the cæcum and its appendix have presented to me in the state of disease, but the reason of all the variations naturally seen in the disposition of this organ, which determines more ex-

actly its use

In order to conceive the thing, it is enough to have present in the mind, the disposition of the cæcum and colon One soon feels that the matters time, to determining the use of the parts which they de- retained in the cæcum cannot pass out into the arch Al- of the colon, because they would be raised considerably against their own weight, and the power to act on them can have the effect only of pressing them laterally, whence it ought to result that the tendency of the matter would be, that part of the effort would necessarily be lost in the fundus of the cæcum, here we find a point of support that reacts hanges and variations to which this part is subject, upon them with more advantage as the cæcum is nd is hardly in accord with the arrangement or the fixed and retained by its ligaments, and as it cannot unction of organs to which this body appears to be escape the force which is applied perpendicularly by This function, 'ssed heretofore, viz, to determine the true desti- continuous and necessary to nature, and which ion of it Supported by observation, I shall try tends without ceasing to dilate and elongate the lo it, although the result may appear to have but fundus of the excum, would soon thin and burst e interest, but it is important always to know it if nature had not taken precaution against such accidents by a mechanism as simple as admirable, in If all the opinions that have been proposed as to sustaining the fundus of this intestine, so that the three

ligamentous muscular bands, which contract the colon, form with it the appendix, and present a part which is insensibly developed, and foreshadows (in furnishing the augmentation of the cæcum) the thinning of the coats, and perhaps in certain cases, the rupture of this intestine, preserving always by this arrangement, of the three bands placed along the length of the colon, an equal and durable force, which would not have been the case if they had been placed transversely and sustained the fundus It is also to preserve this function, and to render it solid and durable, that nature has thrown a little on one side, the narrowing of the cæcum, the weight of matters thus acts less directly on this part, and development is a little more difficult, and with a slowness which is an advantage It is quite true that in the appendix there is filtered a mucus, and therefore we should regard it as one of the uses of this part, to furnish a matter capable of lubricating the cæcum, but which, at the same time, is capable of opposing efficiently the extension of the walls of this little intestine which we may regard as a corner stone

The contraction and the folds of this part, which are larger as the appendix is elevated, and more favorable to turn out the liquor which is filtered into the cæcum, and are intended to prevent the too rapid flow of the mucus, the presence of which in the appendix is necessary to the preservation of its state

From all these economic views of the use of the appendix vermiformis, it is easy to deduce all the natural or accidental varieties that this part may present in different subjects and all ages Why, for example, when the appendix corresponds to the fundus of the cæcum, we find it larger and less shrunken? Why, as age increases, this part is found shorter than in subjects where the appendix is placed on the side, and as in this last case, when the appendix is much narrowed and very long, we find in the progress of age the cæcum capacious and its walls very thin We explain also easily, why women who have had children, have the appendix short, and the cul-de-sac of the cæcum very long, in a word, there are no phenomena which I have mentioned above, which may not be ascribed to this explanation, and confirm forms of microbes found by Friedlander and Frankel at the same time, the use which I believe should be assigned to the vermiform appendix

TREATMENT OF ACUTE AND CHRONIC PURULENT INFLAMMATION OF THE MIDDLE EAR (OTORRHŒA)

Read before the Philadelphia County Medical Society, April 25, 1888

> BY LAURENCE TURNBULL, M D, OF PHILADELPHIA

The cavity of the tympanum, or middle ear, in health is filled with ever-renewed air by the Eusta- time, upon some of these changes, the most imporchian tube, and thus the waves of sound reach the labyrinthine nerve of the ear It is deeply and securely situated in the temporal bone. It measures leaves of the Extract from the author's Clinical Manual of Diseases of the Extract from the Extract from the author's Clinical Manual of Diseases of the Extract from

breadth and height being about one-half inch, and its shape is the form of a cube. The cavity of the tympanum is apparently lined with a continuation of the mucous membrane of the Eustachian tube, and yet the epithelium is distinct—that of the Eustachian tube is ciliated, whilst in the middle ear it is tessellated, or in squares This epithelial and subepithelial lining takes the place of a penosteum by transmitting the blood-vessels which supply the bones This latter fact is important to notice, as any serious affection of this membrane will ultimately react upon the nutrition of the bones forming the cavity, thus resolving a severe catarrh into an ostitis The existence of this mucous cushion is the reason why affections of the middle ear are so numerous in young children The close contact of the jugular vein to the cavity of the tympanum exposes it to the influence of pus collecting on its floor '

In acute otitis media, or inflammation of the middle ear, there are frequently but slight pathological changes in the ear except swelling, deep redness, and small perforations of the membrana tympani The discharge is either mucus or mucus and pus-This can be shown by the pus dissolving in water, and the mucus found floating on the top

By the use of anodynes, cocaine, chloroform, morphia, etc, pain is relieved, with the internal use of tincture of aconite, antipyrin, frequent hot foot baths, with local depletion, inflammation is checked The parts should be cleansed with a mild, warm, antiseptic wash, and, as a rule, all goes well The case generally recovers in a short time, without any permanent injury to the hearing apparatus, if not neg-You, medical gentlemen, are all familiar lected with this disease in young persons and children, the latter having as many as two, three, and even four, acute attacks during teething, or the result of the This disease is now so well exanthemata or cold known and, as a rule, so promptly treated, that a much smaller number of cases are now permitted to pass to the second stage of inflammation of the middle ear—the purulent variety—which causes such extensive changes in the hearing apparatus In such cases of acute otitis media Zaufal finds exclusively the two in pneumonia, viz a large, short bacillus, encapsulated, and a diplococcus, also encapsulated He has also shown that the exudation in acute otitis media, before rupture of the membrana tympani, contains pneumococci to the exclusion of all other microorganisms, and that these, introduced into the nasal fossæ, can give rise to a meningitis without irruption of the cranial envelope 1

In collecting a large number of cases of suppuration of the middle ear, which includes three or four years, I find that, out of 1,700, 454 were acute, while 1,246 were chronic, 18 had facial paralysis, while the balance included polypi, caries, necroses, cholesteatomata and tubercles Let me dwell, for a short

meatus or that portion of the ear covered by skin, of the membrana tympani, extending into the mastold cells, and through the Eustachian tube to the throat and nose After this disease has existed for some time, there is an increase of the bulk of the mucous membrane, caused by excessive infiltration with round cells, and enlargement, with new formation of vessels

The subepithelial layer, stripped of its epithelium, is replaced by round cells, a suppurating, granulating surface, traversed by many vessels, takes its place The purulent process leads to destruction of the tissues, to ulceration and wasting of the mucous mem brane, which is eaten away so that the bone is often laid bare

This is especially the case in tubercular ofitis me dia purulenta, and it has been demonstrated by numerous post-mortems that they tend in a very short time (six to eight months) to extensive necrosis of those parts bordering on the diseased middle ear, and extending into the labyrinth, the rapid course of the disease being due to the tubercular diathesis

It is also often the case, in this form of disease of the ear, that tinnitus and impairment of hearing precede the perforation, which is most generally painless, but with rapid destruction of the drum head transformation of the round cells into spindle-shaped, there occurs a formation of a firm connective tissue, which leads to abnormal adhesions between the membrana tympani, the ossicula, and the walls of the tympanic cavity, producing permanent deafness The membrana tympanı almost always suffers a loss of its structure, and in severe and protracted cases we have large perforations

Treatment - These perforations are most ordinarily treated by a combination of alteratives, so as to modify the nutrition and prevent the destructive tendency from gaining headway The local application is also of importance, especially such remedies or local means as change the surface of the granulahons, gently stimulate and cleanse them No agent in our hands has acted so promptly and well as very finely levigated boric acid, alone or in combination with iodol, the latter to act as a true antiseptic, using 1 part of the iodol to 10 of boric acid used alone should be sterilized, by heating before using on a platina foil, as it contains fungi and bacteria when kept for some time. The powder must be carried down to the perforation, and through it as much as possible, so as to reach the diseased mucous membrane and the Eustachian tube with the little instrument I show you If it is blown in, it adheres to the edges of the auditory meatus, causing irritation, and sometimes small abscesses This powder has a stimulating and an astringent effect, just as alum used in the same manner It should be packed carefully, so that the diseased membrane be fully covered is not necessary to seal it, indeed, it is almost impossibe to cause the retention of the pus in the cavity, as the powder absorbs it, and the former when applied produces a watery discharge by its stimulating effect, so that the patient will be obliged to wipe off the liquid

As to boric acid causing retention of the secretion but in the mucous membrane of the middle ear, back in the treatment of necrosis of the temporal bone, or in a large perforation, it has not acted so with me I have used boric acid since 1881, after my return from Europe, and like its introducer, Freidrich Bezold, of Munich, I have been convinced of its efficacy in these severe cases, and that the objections to its use -1 e, its causing retention of the secretions—as advocated by some, are entirely without foundation According to his and my own experience, extending over a period of seven or eight years, its use has always been followed by favorable results, so he had no reason to modify his statements made in 1870, as to its therapeutic value. He has also confirmed his opinion of the unreasonableness of these objections by a series of physiological experiments, in which he tested the capacity of absorption of powdered boric acid for fluids outside of the body, before, as well as after, saturation and drying out of the powder with purulent secretion which enclosed in a glass tube covered with a perforated membrane was exposed to the influence of fluids from the ear

> This special mode of treatment is peculiarly applicable to large perforations of the membrana tympani, when the perforations are small they are more effectually treated by a solution of boro glyceride, carbolic acid, or peroxide of hydrogen

> When the perforation is situated in the membrana flaccida or Shrapnell's membrane, with disease of the attic of the tympanic cavity, we resort to a syringe (intertympanic), or a catheter to which a soft rubber ball with a double valve is attached, to withdraw the fluid, and not let it return when diseased, either of which is inserted into the perforation and the parts washed with a solution of peroxide of hydrogen or an antiseptic If carrous bone be found, covered with polypi, the latter should be snared and the dead bone removed, but if the bone be found only inflamed it should be treated by diluted nitric or carbolic acid, to stimulate the granulations and restore it to its normal condition. All tearing and cutting operations—as these tend to malignant disease must be avoided, everything should be done with extreme care and gentleness When pus blocks the tympanum in disease of the middle ear the tuningfork is heard better through the air than through bone But when the pus is removed, and the inflammation is reduced the bone conduction will again improve as the pressure has been removed from the labyrinth.

It has been found that functional disturbances in hearing are produced by chronic purulent inflammation, by the cicatrices and changes in the membrana tympani, and adhesions before referred to in the middle ear, after all discharge has ceased alterations in tension of the sound conducting apparatus, caused by the cicatrices producing irregular vibrations in the membrana tympani Second, cicatrices which cause adhesions of the membrana tympani with the promontory, and the articulation of the incus with the stapes, impeding the power of vibration of the ossicula Third, if the adhesions are confined to the portion of the membrana tympani situ-

² Arch für Ohrenheilkunde Band xv, and in the Ærtsliches Intelli-genzblatt, 1881 No 26

ated below the handle of the malleus the acuteness lute necessity that the pressure of the au-which is of hearing has been found to be considerable, while fourteen pounds to the square inch-should be equal adhesions in the upper half of the membrane pro- on both sides of the membrana tympani, and all obduce more disturbance of the hearing, or deafness, structions to this must be removed to attain perfect especially when the handle of the malleus is drawn hearing. It is of importance that our patients, con inward and ankylosed with the promontory Fourth, valescent from chronic purulent ear disease, should it has been proved that imperfect hearing power may breath through the nose, and be able to shut the exist even in cases of extensive destruction of the mouth, especially when sleeping, to prevent the drymembrana tympani, and with the loss of all the ing effects on the throat and Eustachian tube. This bones, except the foot-plate of the stapes—that is, if it is accomplished by a mouth-band tied behind the were movable, and the membrane of the fenestra rotunda was not thickened The regularity of our perception of tones is due to the deadening of the sounds produced by the ossicles, the membrana tympani can only be properly considered as a sound conductor in connection with the ossicles Even if fair hearing of ing effects of all operations by the use of nasal tents speech and music remain, the removal of the membrana tympani, or protecting membrane of the tympanic cavity, is dangerous to life, for it is deprived of a covering which is essential to its continuation in health To retain and restore to a healthy condition the diseased and ulcerated bones of the ear and the membrana tympani is of the utmost importance

Extension of this chronic purulent disease of the ear by the Eustachian tube as a pus-carrier, produces disease of the upper part of the nasal cavity, by developing polypi, enlarging the pharyngeal tonsils, adenoid growths, and hypertrophic enlargements of the turbinated bones and ozæna

We fully agree with Politzer, that combinations of ozæna with disease of the ear are much rarer than we would suppose, from the extension of the process toward the entrance of the Eustachian tube the ear is implicated, the mucous membrane of the middle ear becomes most frequently sclerosed many cases of deviations of the septum we have found perfect hearing, unless complicated with prior ear disease, or exostitis extending through the whole line of the meatus, these are removed by the dental Such cases suffer from coryza or cold in the head, commonly so called, but are promptly relieved by a 4 per cent solution of cocaine There are also many cases of anterior nasal polypus which do not produce deafness

One of the chief causes of deafness is the extension of the pharyngeal tonsil into the tuberosity of the Eustachian tube, and even into its osteum In the so-called ethmoiditis of "Woakes" there is not necessarily any causal connection between the ear and these affections, in many cases the nasal trouble has long existed without involving the ear If the ethnoid cells become diseased, or necrosed near the Eustachian tube, then we may have paresis of the palate attended with a distressing form of tinnitus, as in one case under our care, there was perforation of the membrana tympani from extension of the irritation through the Eustachian tube In this case the patient recovered under local and constituspicula of bone, or hypertrophied tumors from post the radial and the ulnar sides of the index, as well as terior portions of the turbinated bones, improves the the radial side of the middle finger, were resected to deafness of cases of long standing, when attended a great extent The forefinger now became analysis with retraction of the membrana tympani, the re-sults of naso-pharyngeal disease There is an abso- which, as is known, is supplied by the radial nerve,

ear, as recommended by Delstanche in the case of children, after the removal of the cause treatment of the naso-pharyngeal disease should always precede this, in order to see that nothing obstructs the respiration, and to watch the controvert of laminaria, or those of platinum, or glass covered by soft rubber, and thus keep up nasal intubation

1502 Walnut St, April 25 1888

"MEDICAL PROGRESS.

TRANSPLANTATION OF NERVE FROM THE RABBIT TO MAN -DR GERSUNG, of Vienna, assistant to Professor Billroth, has recently performed a novel and interesting operation—the transplantation of The case has not nerve from the rabbit to man hitherto been published in any medical journal but, owing to its general interest, the bare fact had found its way into the lay newspapers Our Vienna correspondent has received from Dr Gersung a verbal account of the salient points of this most remarkable operation, which has so far been conspicuously suc-The patient is Professor von Fleischl, the cessful distinguished occupant of the chair of physiology in Sixteen years ago he ac the University of Vienna cidentally wounded himself while conducting a postmortem examination, and severe inflammation of the whole right upper limb ensued During the course of the disease the terminal phalany of the thumb The stump thus left was pain became gangrenous ful, and later on reamputation was performed was followed by the formation of neuromata For this condition the branches of the median nerve which supply the thumb were first resected, together with the terminal neuromata and at a later period, when new neuromata began to develop, the central parts of the same nerve, together with the branches of the radial nerve which supply the thumb, were resected Fresh neuromata now developed on the branches of the median nerve, which were treated, without any success whatever, by the injection of hyperosmic acid and electrolysis Two years ago the neuromata were resected again, and the resection of the nerves was continued as far as the "ligamentum carpi vo-The removal of the diseased lare," on this occasion, the branches which supply

in the same way the whole radial side of the middle recurred, as after the previous operations, and during importance with medicinal treatment the course of the second week after the last operation, the patient became aware that a fresh neuroma tomatic drugs, and are devoid of danger was developing The suffering finally became so severe that the patient wished to undergo another operation, in order to procure, at least, temporary relief Accordingly the following operation was per-On March 4 the patient was put under the influence of chloroform, and the neuroma, which was situated behind the volar carpal ligament, was excised, the nerve being cut through behind the neuro-The penpheral nerve stumps of the two digital branches above mentioned were then sought for rabbit was now killed, and as long a piece as possible of the sciatic nerve of the animal, with the two branches into which it becomes divided, was dissected from it (the animal still presenting voluntary contractions) The sciatic nerve was afterwards inserted into the space between the central stump of the median nerve and its digital branches, the central end of the sciatic nerve was sutured to the connective tissue which covered the median nerve, and the two branches were sutured to the digital branches of the median nerve, the portion of nerve, measuring about 6 centimetres, which was deficient was thus made up After the operation severe pain persisted for some hours, but then entirely subsided Healing took place by first intention As two months have now elapsed since the date of operation and the pain has not returned, it may be hoped that the favorable result will become a permanent one Sensibility, moreover, is becoming reestablished in the part Gersung has postponed the publication of the case, because he wished to observe whether complete sensibility would return, he hopes with confidence that this will be the case The ultimate result will be as now appears probable, Dr Gersung's recommend- June 2, 1888 ation that the operation should be given an extended trial will doubtless be widely acted on -Brit Med,

PATHOLOGY AND TREATMENT OF PERTUSSIS —DR EDMUND WENDT draws the following conclusions at the close of a paper on this subject

Jour , May 19, 1888

I There is constantly associated with whoopingcough a special microorganism, discovered by Afana-

2 This microbe is a small bacillus, having properties that distinguish it from all other known bacteria.

3 The "bacillus pertussis" (bacillus tussis convulsica Afanasieff) can be readily demonstrated in the sputum of patients having the disease

4 While its etiological significance appears estab lished, it does not possess much diagnostic importance, since it is found only after the clinical features of the disease are already well marked

5 The treatment of pertussis has not yet been materially advanced by this discovery

6 Antiseptics locally applied do not appear to

shorten the duration of the disease

7 Hygiene and judicious alimentation are, in the finger became an esthetic The pain, however, again present state of our knowledge, of, at least, equal

8 Antipyrin and the bromides are reliable symp-

g A specific has not yet been found

10 Abortive forms of pertussis may occur, but no plan of treatment now known can claim to have abortive efficacy

Although I have deprecated the habit of recommending particular drugs on the strength of gratifying personal experience, I cannot refrain from alluding to the use of antipyrin in pertussis Dr Sonnenberger, of Worms, was the first to call attention to this new drug in the treatment of whooping-cough He claimed such surprisingly good results from its employment that my sceptical faculty was immediately fanned into activity, Nevertheless, so far as my own limited experience goes, I must own that antipyrin has with me a better record than any other one drug I can claim no cures from antipyrin what the drug has appeared to me to favor, was an easy course of the disease to final recovery, a mitigation of the paroxysms, especially at night, possibly a reduction in their numbers, and certainly a free-This is higher praise than dom from complications I can conscientiously bestow upon any other method But I am far from claiming as much of treatment as Sonnenberger, for antipyrin, that author asserting it to be distinctly curative. As to the method of its employment, I have followed the directions of Sonnenberger, who gives one seventh of a grain to very young children, and gradually increases the dose according to the age of the child To adults he gives fifteen grains The medicine is administered three times daily, and sometimes once during the night Children take it readily when dissolved in a little water and raspberry syrup The remedy should be awaited with great interest, for if it is as favorable continued throughout the attack - Medical News,

> THE BLOOD IN DIABETES —LEPINE has recorded a case of diabetes which terminated fatally in coma, and in which, for the first time, it was positively shown that in this state the blood loses its alkaline reaction (Revue de Medecine) As far back as 1883, at the debate on diabetes at the Pathological Society, Dr Ralfe first drew attention to the fact that the symptoms of diabetic coma were not unlike those produced in animals poisoned by an injection of acids into their veins, or whenever attempts were made to diminish the alkalinity of the blood by other means, whence the speaker inferred that the poison concerned was of an acid nature, which by decomposition in the urine became converted into acetone This idea of "acid intoxication" has since been generally adopted, and Minskowski has discovered the presence of an acid (oxybutyric) in diabetic urines which is capable of breaking up in aceto-acetic acid, This acid does not, and thus furnishing acetone perhaps, exist in the blood and tissues in a free state, but is probably combined with some base with which it forms an acid salt. In Lépine's case, intravenous injection of a saline fluid containing about an ounce

each of sodium chloride and sodium bicarbonate to three pints of water was employed when the coma first set in After this there was some immediate improvement from the coma, the pulse rallied, the temperature rose from 96° to 97 5° F, and the patient could speak, but not swallow Twelve hours afterward venesection was employed prior to the trial of claims that in this way (1) disinfection is more thor a fresh injection, when it was found that, in spite of ough, (2) the hands are made purer than it is possi the previous injection of a large quantity of alkali, the reaction of the blood was neutral—a clear proof, main soft and free from rough epidermic scales, and Professor Lépine thinks, of the acid nature of the the odor of carbolic acid is destroyed, (4) the undisease, and its power to destroy the normal alkalinity of the blood It may be a question, however, says The Lancet, whether the injection of an alkaline | June, 1888 bicarbonate into the blood in diabetic coma is a right procedure For, though the reaction of the salt is alkaline, yet its constitution is acid, and, as Dr Ralfe pointed out some years ago, probably acts as an acid salt in its decomposition with other salts in the body, and so actually tends, after the immediate effect of its alkalinity has passed off, to diminish the alkalinity of the blood Should this, on further inquiry, prove correct, it might be advisable to employ neutral sodium phosphate instead of the acid sodium carbonate for intravenous injections — Medscal Record, June 2, 1888

THE CORRECTION OF NASAL DEFORMITY BY MEANS OF PLASTIC OPERATION -DR OBLINSKI, of Krakau, in his paper refers more particularly to deformities resulting from loss of the cartilaginous framework of the nose Dieffenbach treats this class of patients superficially, recommending the division of the cicatrices, which deviated the point of the nose, by means of a tenotone, and the filling of the nares with lint This method gives only temporary relief

In a girl, æt 16, Prof Oblinski found the following deformity The tip of the nose, as a result of the destruction of the cartilaginous septum, was sunken in, on each ala nasi there was a deep longitudinal groove, formed by cicatricial tissue, dividing the lower half of the nose into three spheroidal growths, which eventually would completely obstruct a free removal of bone 3 The desirability of thor the nares At the upper end of the right sulcus there was seen an opening through which the air en-The author, after completely tered into the nostril cutting out the right groove with its cicatricial tissue, and also incising the opening in its upper extremity, replaced the gap thus left by an oblong flap from the cheek, cut from the upper end of the right sulcus | March 17, 1888 The flap was 2 cm long and 1 cm broad and easily The left Primary union occurred filled the gap sulcus was also excised in the same manner, and replaced by the oblong cheek flap The cosmetic re The tip of the nose was well sult was satisfactory The author recommends, however, a larger flap in the future, thus allowing for subsequent contraction — Deutch Zeitschr f Chir, Band 24, heft 1-2 — Annals of Surgery, June, 1888

CLEANSING THE HANDS -DR VOGEL, of Eisleben, etc, whose hands become covered with dirt from when required for use — Druggists Circular and working in oxides and acids which cannot be re- Chemical Gazette, June, 1888

moved by ordinary means, first rub their hands with warm oil and then, when this has thoroughly pene trated, with powdered borax Subsequent washing with soap and water makes the hands perfectly clean He advises those who have to use carbolic acid to go through the process above described first, and ble to make them by soap alone, (3) the hands re comfortable anæsthesia of the hands, after washing with carbolic acid, is avoided -Druggists Circular,

MECO-NARCEIN —DR LABORDE has called the attention of the French Academy of Medicine to the valuable soporific qualities of a product derived from opium, to which he proposes to give the name of meco-narcein Narcein as ordinarily prepared is comparatively insoluble, and therefore has very little physiological effect. He has succeeded, however, in obtaining a product quite free from morphine, and consisting of narcein mixed with various unknown A fifth of a grain induced a calm sleep alkaloids in a dog weighing thirty pounds, without any appar ent after-effects It would appear to be devoid of the preliminary exciting effects of morphine, and does not derange the digestive apparatus Dr La borde recommends it in the treatment of insomnia of nervous origin, in broncho-pulmonary affections characterized by cough and excessive secretions of mucus, and finally in morphinomania -British Med ical Journal, May 26, 1888

SURGICAL TREATMENT OF DEPRESSED COMPOUND FRACTURES OF THE SKULL -MR LAWFORD KNAGGS reports a case (fatal) of compound depressed frac ture of the parietal bone, and calls special attention to the following points in the treatment of these r The value of the large flap over the cru cial incision 2 The advantages to be derived from ough exploration, even by means of a flap of dura mater, in cases where that membrane is injured 4 The great importance of thorough cleansing with powerful antiseptics, even of the cerebral substance itself in suitable cases, and of endeavoring to secure from the commencement complete asepsis -Lancet,

TANNIN WOOL -DR RICHARDSON describes in the Asclepiad, a preparation designated tannin wool, which he recommends as being of great service in treating ozæna and other diseases attended with fetid It is said to be a ready styptic and to possess good antiseptic properties It is prepared by odors adding pure cotton wool, bit by bit, to a saturated solution of tannin in distilled water, at 140° F, until all the solution is taken up, then drying the wool It should be kept in slowly in an evaporating dish a closed bottle in the rough state, and teased ou

THE

Journal of the American Medical Association PUBLISHED WEEKLY

THE EDITOR OF THIS JOURNAL would be giad to receive any items of general interest in regard to local events, or matters that it is desirable to call to the attention of the profession. Letters written for publication or scottaining items of information should be accompanied by the writer's full same and address, although not necessarily to be published. All com munications in regard to editorial work should be addressed to the Editor

SUBSCRIPTION PRICE, INCLUDING POSTAGE.

PER ANNUM, IN ADVANCE . SINGLE COPIES 10 CENTS

Subscriptions may begin at any time. The safest mode of remittance is by bank check or postal money order, drawn to the order of the undersigned. When neither is accessible, remittances may be made at the risk of the publishers, by forwarding in REGISTERED letters.

JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, NO 65 RANDOLPH STREET.

CHICAGO ILLINOIS

LONDON OFFICE, 57 AND 59 LUDGATE HILL

SATURDAY, JUNE 9, 1888.

PENNY WISE-POUND FOOLISH

A person who has misappropriated the nom de plume "Justice" has published under the auspices of the "Tax Reform Association of Chicago" a pamphlet entitled "Extravagance is the Cause of the 53 cent State Tax in Illinois" Comparative statistics are pointed, showing the expenditures of various departments of the State Government, including among others the State Board of Health It appears from the figures quoted by "Justice" from the reports of the Auditor of Illinois that the expenses of the State Board of Health for 1878 were \$1,669,15, while for the two years ending September 30, 1886, they were \$29,841,87 "In what way" then asks the writer anent this obvious increase of expenditures "were the people of the State compensated for this outlay of money? The truth is," "Justice" continues, "there is no necessity for the existence of this Board under the pay of the State There might as well be a State Board of Lawyers to see that none but competent men practice the profession of law"

It may be true that in Illinois taxation by the State Government is excessively high, and it may even be a fact—which "Justice's" pamphlet was intended to show—that such excessive taxation has been due to the predominance of a particular political party in the management of the State Government Whether true or not, the matter is not one that concerns us as medical men But in the sanitation of the State, and in the protection of the public health, we have mercenary considerations connected with tax-paying

come before a body like the State Board of Health, as well as with the needs of the public, and the necessity of protecting public health, it is only just to the people and to the State Board of Health that the attack of "Justice" should receive more than passing mention at our hands

The suggestion of a State Board of Lawyers is a little unfortunate for "Justice," it weakens rather than strengthens the argument, for it is by no means certain that such a Board might not render the legal profession and the people generally invaluable service The better members of the Bar admit if it existed that of late years not a few of their profession have constituted something not far from a pestiferous pub-There are members of the Bar that do lic nuisance but little business besides procuring divorces, bribing juries, corrupting legislators, promoting litigation, swindling the ignorant and confiding, and defrauding even the strong and well-informed There is scarcely a corporation but has its "attorney" to engineer projects that cannot for a moment bear the light of investigation, and never is a member of the "wealthy criminal class" unable to secure the services of "distinguished counsel" in the execution of any nefarious scheme that can be cloaked and garmented in the forms and phrases of the law A State Board of Lawyers, clothed with sufficient power, and having enough conscience and backbone to undertake the herculean task of reforming the Bar, might therefore do effective service in excluding quacks from the legal profession, and purifying the morals of some that would be left

But "Justice's" fundamental error seems to have been in overlooking the fact that the State Board of Health does a far greater work than that of being merely an examiner of applicants for admission to practice medicine-though its work in performing this duty alone is of some value in saving the public from incompetent practitioners and quacks the sanitary work of the Board far exceeds the amount and importance of its work as an examining and licensing body, "Justice" could have perceived -had she not been blind by reason of having the mythical scales over her eyes instead of in her hands. -by considering the items making up the expenditures of the Board In the two years ending September 30, 1886, Dr Clark, Kreider, Ludlam, Bateman, McKenzie and Haskell received for "expenses as members" \$625 36 In this time these gentlemen attended not less than eight meetings of the Board, an interest greater and more direct than the mere for which the amount each received averaged \$105, or about \$13 apiece for each meeting, clearly not an And having some familiarity with the problems that extravagant price Other items were vaccine points

\$21728, vaccinating negro paupers to prevent spread of small-pox \$100, chemical examinations in the Momence meat-poisoning cases and of Chicago water-supply \$550, expenses of a member of the Board in connection with the Momence meat-poisoning case \$100, expenses of a member of the Board for visiting a man affected with glanders \$22 70, detectives for services in investigation \$38 o5, Secretary for expenses in investigating and preparing for prevention of epidemics and contagious diseases We also find that in the two years the Assistant Secretary was paid \$2,400 for salary, and \$1,271 50 for clerical services—\$1,835 75 a year, other clerical services for the two years amounted to \$6,708 63-\$3,354 31 a year, incidental office expenses for the two years \$2,959.36 Thus far there is no "unnecessary and extravagant use of public money," and we have a total of \$16,471 41 The remaining items of expenditure were for messengers, janitor, merchandise, attorney's fees, secretary's salary, and stationary, printing and binding, which last three items amounted to \$5,973 46 If there was any waste of money in these items it was due to the awarders of the contracts to the "State printing ring," not to the Board of Health

"Justice" further complains that the Secretary of He did nothing the Board paid himself \$10,837 89 Of the amount thus figured \$2,959 36 of the kind have been included above as office expenses for two years, and \$1 878 53 have been accounted for under the necessary traveling expenses of the Secretary to provide against the importation of disease into the Is he to pay his own expenses when on such The remainder of the amount "paid himbusiness? self" was \$6,000 for salary in two years no one will say that this is a princely salary Secretary of the State Board of Health receives less salary than any of the three State Railroad Commis-"Justice" is singularly silent concerning this Board of Railroad Commissioners Theoretically it constitutes a body of railway experts, practically, as any one may see from the "Reports," it is officered by men that have not even an elementary knowledge of the practical art in which they are supposed to be experts, and for their "time" they receive \$3 500 a year, the three thus taking \$10,500 from the treasury It has not been very long since one of of the State them was heard to say that he was "not losing any law practice by the time that he gave to Board" "Justice" be bent on reform of State taxes this incompetent trinity furnishes ample scope for the practice of economy

"The truth is," says Justice, "there is no necessity for the existence of this board under pay of the State

In what way were the people of the State compensated for this outlay of money?" Is "Justice" a recent importation into this country and State, or has she yet to hear of the smallpox epidemic of 1880-82 in Illinois? Does she know that the Illinois State Board of Health warned the people in March, 1881, of the threatened danger, when smallpox was at less than half a dozen points outside of Chicago, and urged vaccination and revaccination, that little heed was given to this first warning, that after September, 1881, the epidemic spread to 77 of the 102 counties of the State, causing an aggregate of 8,856 cases, 2,978 deaths, and a loss of \$4,403,968, exclusive of the actual value of human life lost and the disabled condition of many of the survivors, that by January 24 1882, the epidemic was at an end, chiefly through the labors and efficiency of the State Board of Health of Illinois, and that this action of the Board caused a saving, outside of Chicago, of 1,517 cases, 320 lives, and more than \$2,790,000 (exclusive of actual life-value), enough to pay the present expenses of the Board for about seventy-five years? Is it not perfectly clear that the present expenditures of the Board are less than 2 per cent of the amount saved to the State and the people in 1882 by its vigi lant and efficient Board? If "Justice" wishes to see the figures upon which these statements are based, they can be found in the "Fifth Annual Report of the Illinois State Board of Health," pages 218-20

No epidemic of any kind has ever been so widely and so intelligently observed as that of which we have just spoken, and the records of the observa tions, which cover 125 pages of the "Fifth Annual Report," are of very great value to the people, the tax payers, not only of this State, but of every State in the Union, and will continue to be of value for years And if the lesson taught by that epidemic, and by its extinction mainly through the efforts of to come the State Board of Health, be heeded by the people of this State, they will be free from further invasions of this kind, and will never regret paying the Board a small percentage on the amount it saved six years ago, to say nothing of the actual dollars and cents saved by it since that time

"Justice" has something to say, in the same connection, of the National Board of Health Every one that has looked into the subject knows that this very necessary organization was rendered inefficient, and finally killed, by act of Congress—by the "penny wise, pound foolish" notions (not ideas) of legislative

"Justices" Notwithstanding the fact that cholera and yellow fever have cost this country more than a thousand million dollars, exclusive of the actual value of thousands of lives, in spite of all the light of ex perience, and of all the easily accessible literature that proves conclusively the absolute necessity of a National organization to cooperate with the State Boards of Health in protecting the people from imported death, there may yet be found a person to write a dime pamphlet in which it is gravely asserted that a State and a National Board of Health are sources of "unnecessary and extravagant expendi ture of the people's money"

Until "Justice" has succeeded in abolishing the Board of Railroad Commissioners, or in officering it with competent and efficient men, so that the results of its labors will bear a comparison with, rather than be a contrast to, those of the State Board of Health, she had best "sing small"—if indeed she would not render more efficient service to her "Association" by maintaining a discreet silence

THE HEREDITABILITY OF HEART DISEASE

There is a popular belief that heart disease, in its generic sense, can be inherited Hence many individuals whose parents, one or both, have died of some cardiac affection, are haunted by the dread of the ultimate development in themselves of the same disease

There is considerable vagueness of ideas, and even a looseness of expression among medical writers concerning the inheritance of disease, as, for example, when congenital syphilis and cancer are both classed as hereditary In a strict sense the former is inherited, since it is transmitted as such from parent to offspring, whereas the child of cancerous or tuberculous progenitors receives a certain predisposition to dis-He inherits a constitutional defect which renders him peculiarly hable to develop the cachevia of his immediate ancestors, but until it is developed, he is the subject of a diathesis The diathesis is hereditary in this case, and hence, when the constitutional tendency has borne its legitimate fruit, the disease may be said to be hereditary

However desirable it might be to hold to so rigid an interpretation of inheritance as opposed to constitutional predisposition, it is impracticable to do so, and one must content himself with the decree of cus-Therefore, although hereditary syphilis is congenital, other diseases accounted hereditary are not necessarily congenital, as, conversely, all congenital disorders are not inherited

ops in the offspring as a consequence of a special tendency imparted to the embryo by either the paternal or maternal element, or both, the impression thusmade being so strong that the ultimate appearance of the disease, under favorable conditions, is almost an unavoidable certainty

In accordance with this definition, the hereditability of heart disease depends upon the answer to the query whether or not there can be discovered in families a definite hereditary predisposition to cardiac disorders? Assuredly no one would venture to as sert that, because the parent dies of some cardiac lesson, the child is likely to die of it in turn there is a consideration which should be taken into account in making a prognosis of that child's future health, and is of no small importance to life insurance This is that, although there may not be companies so striking a predisposition to heart disease as to constitute a diathesis, still there may be some tissue weakness or susceptibility that renders the heart the pars minoris resistentiæ This would seem not improbable if heart disease had existed in several successive members of a given line of ancestors, or been developed in a considerable proportion of the children of a given family To be specific if a mother dies of valvular disease induced by inflammatory rheumatism, and all four daughters bear evidence of the implication of the same set of valves, in consequence also of rheumatism, does it not look as if there were a family susceptibility to the same morbific influence? An objector may urge that in this instance the susceptibility can be said to apply only to the rheumatic poison, and that the development of valvular disease is but incidental True, but the percentage of cases in which endocarditis is developed in the course of rheumatism is comparatively Whereas in this family all five individuals attacked by rheumatic fever are left with valvular le-Would any physician ignore such a history in treating one of the family for an attack of inflammatory rheumatism?

There are other forms of heart disease, however, in which an inherent tendency seems to play a more ac-These are fatty degeneration and the vative part rieties of cardiac decay dependent upon and associated with arterio-sclerosis Obesity is often a family trait, yet all such families do not present equal hability to fatty heart Again, in certain families there is an unmistakable proneness to atheroma, as, according to Fothergill, is so often seen among sturdy Yorkshire squires Yet in some, the heart is the first to give out, and sudden death from An hereditary disease, therefore, is one that devel- cardiac failure overtakes member after member,

while in other families cirrhotic kidneys are the rule The death of Mathew Arnold is a case in point He died suddenly in consequence of some heart disease, for which Sir Andrew Clark is reported to have treated him for years We have seen no statement as to its exact nature, but, there is a fact in his family history, which, according to the theory of hereditary predisposition, ought to aid one in forming an opinion as to its character His father, Thomas Arnold, of Rugby, died at the age of 47, during his second attack of angina pectoris, and at the autopsy, his heart was found to be fatty throughout in consequence of insufficient nourishment, since, it had but one coronary artery, and that a small one Now, if this fact be coupled with that of his son's sudden death, at the age of 66, the inference seems forced upon us that Mathew Arnold's disease was also one of muscular degeneration of the heart, and not Should this conclusion prove to be correct, valvular it would appear to strengthen the theory of the hereditability of such forms of heart disease

We believe in hereditary tendencies more widespread than are capable of satisfactory scientific demonstration, and hence, although in the class of cases in question a predisposition is oftentimes too weak to warrant the term hereditary, still we are of the opinion that such a predisposition does exist It differs from that of tuberculosis, etc., only in degree, not in kind Facts on all hands go to prove that in each individual there are certain constitutional peculiarities, congenital and not acquired, which govern not only the course and termination of disease, but likewise the susceptibility to its invasion When such peculiarities are handed down from one generation to another, they become at length sufficiently marked to deserve the title hereditary this sense, therefore, that a hereditary tendency to heart disease may be established

HOW TO LIMIT THE NUMBER OF MEDICAL COL LEGES, AND LESSEN THE CROWDED CONDI-TION OF THE MEDICAL PROFESSION

The thirty-ninth annual meeting of the American Medical Association, recently held in Cincinnati, has received more uniform commendation from the medical press of this country than any preceding meeting for many years. Of the many good papers and addresses presented during the meeting, perhaps no one is deserving of more attention than the Address of the President, A Y P Garnett, of Washington, both on account of the subject and the distinct and emphatic manner in which the chief points of interest.

were presented In The Journal, May 26, we took occasion to call the attention of our readers to what had been done in previous years, both by the Association and by conventions of representatives of the colleges alone, in regard to the adoption of a uniform and adequate system of medical college instruction, as recommended in the second proposition of the President's address

His first proposition, that the Association appoint "a standing committee, to be called a Committee on Legislation, for each State, Territory, and the District of Columbia, to consist of five members of the medical profession in good standing, three of whom shall have no official connection with any medical school or college," has never yet been tried. The duties of the proposed committee in each State and Territory are "to attend the sessions of the respective Legislatures and use all honorable means looking to the reduction of the number of medical schools in the United States, and a consequent diminution in the annual number of medical graduates," by the passage of laws appropriate for the purpose, and for the creation of a Board of Medical Examiners in each State where such do not already exist, which shall be required to examine all applications for li cense to practice medicine in their respective States, The objects sought to be accomplished by this plan are all commendable, but the plan itself appears to be unnecessarily complicated in its details, and without any provision for securing uniformity in the action and influence of the several State and Terri It would doubtless be difficult to torial committees find five competent and influential members of the profession in each State who, as a committee, would be willing to spend their time attending the sessions of the several legislative bodies, or who would be asking for the enactment of laws of the same import The first and most important in the several States step towards the accomplishment of any desirable legislation, is to have a form of law, simple as possible in its details, but accurately adjusted to the accomplishment of that higher standard of both pre liminary and professional education so much desired This must be done by a committee, and then receive the cordial endorsement of the National Medical Association and of the several State Socie It had been confidently expected that such a form of law would be presented by a committee in the Section of State Medicine at the recent meeting in Cincinnati, and if approved by the Section, then to be presented for the approval of the Association For some reason, the charman ın general session

no formal report was made. The committee was continued with instructions to report at the next annual meeting. In the meantime the medical press should be rendering important aid by a candid and thorough discussion of the subject in all its bearings.

EDITORIAL NOTES

New York Post Graduate Medical School and Hospital —At a meeting of the Board of Trustees of the New York Post-Graduate Medical School and Hospital the following appointments were made in the Faculty

Abraham Jacobi, M. D., Professor of Diseases of Children, Robert F. Weir, M. D., Professor of Clinical Surgery, Peter A. Callan, M. D., Professor of Diseases of the Eye, L. Bolton Bangs, M. D., Professor of Diseases of the Genito-Urinary Organs and of Venereal Diseases, Joseph E. Winters, M. D., Professor of Diseases of Children, O. B. Douglas, M. D., Professor of Diseases of the Nose and Throat Dr. William A. Hammond, being about to remove to Washington, has resigned his position as Professor of Mental and Nervous Diseases. Dr. Hammond was one of the founders of the school

ARSENIC IN WINE—About a month ago a large number of persons in Hyères, France, were poisoned by adulterated wine—Analysis has recently shown that the wine contained a large quantity of arsenic, added for the purpose of hastening fermentation, and considerable quantities of arsenic have been found in bodies of the dead exhumed for the purpose of analysis—A large number of the people of Hyères still present symptoms of arsenic poisoning

ELEMENTARY RESPIRATION OF THE BLOOD AND TISSUES—MM GREHART and QUINQUAND have recently reported some experiments on this subject, a portion of them being made with the blood alone, the others with blood in which a certain amount of fresh muscle was immersed. Their experiments show that the blood is simply a carrier of oxygen, and that the blood globules, in so far as respiration is concerned, acts in the same way as the elements of the tissues

WM R. WARNER & Co have issued the following notice to physicians

"We take this method of denouncing the circulation of certain erroneous reports as being the outcome of either ignorance or malice. We have no connection with the firm of H. H. Warner & Co, of Rochester, who make 'Safe Remedies' and other patent medicines. Our advertising is to the Medical profession."

LEPROSY IN RUSSIA—Leprosy is on the increase in the Baltic provinces In Lithuania there are from 250 to 300 lepers, in the district of Dorpat it is estimated that there are 10 lepers to the 1,000 inhabitants. It is now demanded that the government name a commission to study the best means of combating the spread of the disease. A special hospital for lepers is to be founded at Riga, to accommodate 40 patients

Physiological Antagonism —M Chouppe claims that the action of strychnine is hastened by antipyrin, whether the latter be administered before, at the same time with, or after the strychnine By placing animals under the influence of acetanilide he has antagonized the effects of very large doses of nicotine given afterwards

Some members of the American Medical Association purpose leaving about the middle of July to attend the meeting of the British Medical Association at Glasgow in August For further information, as to rates, etc., address Mr. Chas. Truax, 77 Wabash Ave., Chicago

TRICHINOSIS IN GERMANY—For the third time this year trichinosis has appeared in Saxony, at Niederplanitz and Neudorfeld, near Zwickau, where there were about 80 grave cases on May 23

SOCIETY PROCEEDINGS.

PHILADELPHIA COUNTY MEDICAL SOCIETY

Stated Meeting, April 11, 1888

THE PRESIDENT, J SOLIS-COHEN, M D, IN THE CHAIR

DR JOSEPH PRICE read

A REPORT OF THREE CASES OF OPERATION FOR STRAN-GULATED HERNIA.

Case 1 —Miss B, white, æt 40, single, a patient of Dr Dundore, had had a reducible inguinal hernia of long standing and had never worn a truss. In May, 1887, it became irreducible, and the bowels were completely occluded for three days. Well directed efforts to reduce failing, Dr. Dundore decided upon operative interference, and invited me to see her. The usual symptoms of a strangulated hernia were present, the abdomen being greatly distended and tympanitic

Upon incision the bowel was found to be firmly adherent to the sac, requiring considerable dissection to free it completely. After severing the stricture, the bowel was pulled out for a few inches, and found to be completely occluded by bands of inflammatory tissue due to limited peritonitis at the point of stricture—the neck of the sac. These bands were broken

up by fingers, forceps, and scissors, which restored the calibre of the bowel and it immediately collapsed The bowel was very dark in color until released from discomfort, a burning sensation, and finally the herthese inflammatory bands, when its color changed nia appeared rapidly, and I decided the circulation sufficiently good to restore it to the abdomen The canal was Dry dressing, recovery

Case 2 -Miss K, white, æt 75 years, never pregnant, a patient of Dr F X Dercum, who called me in consultation March 1, 1888 Found the patient in bed and very feeble, with a history of complete attack in about a year, and from this time on she has occlusion of the bowel for twelve days, and stercoraceous vomiting for eight days The abdomen was much distended and tympanitic There was a tumor the size of a hen's egg over the right femoral ring which presented no fluctuation nor other symptoms There was also a tumor over the of local trouble left femoral ring the size of a goose egg, likewise presenting no symptoms of local trouble The patient said the tumor on the left side had existed for eighteen years, while that on the right side was more recent, but also of several years' standing failing to accomplish any results, operation was suggested as the last resort, and was performed the next day at the patient's request As there were no symptoms specializing either ring as the site of the obstruction not vomited tion, and as the distension was so great that occlusion at some other point was feared, the incision was made in the median line Examination now revealed that the tumor on the left side was not a hernia, but either a hydrocele of the canal of Nuck, or an old hernial sac that had become cystic The gut was incarcerated at the right femoral ring, and very firmly adhe-Fearful of tearing the intestine, I made another incision over the tumor, and was compelled to dissect the intestine from its sac The intestine was then drawn through the median incision and carefully examined It was found to be greatly congested, but speedily cleared, and was returned to the abdomen The neck of the sac was twisted upon itself, and transfixed by deep buried sutures of silk, and stitched to the edges of the ring, the canal being closed by The median incision was closed deep silk sutures with silk sutures Dry dressings The bowels moved spontaneously the same evening, and the patient recovered without a bad symptom Stitches were removed the tenth day

Case 3 —Operation for ventral herma (By Dr Joseph Hoffman) Mrs M, æt 58, married at 19, She first noticed the ten children, four miscarriages rupture about fourteen years ago, when it was the She in no way attributes the ori size of a thimble gin of the rupture to childbeaaring, which, since she is a large, heavy woman, weighing about 190 lbs, and having a great pendulous belly, would at first grasped as if it was in a vise About 10 inches of suggest the probable cause The cause to which she the large intestine were found in the sac attributes the hernia is a rather singular accident Being, as has just before been stated, a large woman release, the gut was carefully washed and returned and her belly pendulous, when lying on her side, the The incision was closed by deep and superficial su abdominal walls, lax and flaccid, lie loosely on the tures, all of silk The catgut we happened to have her husband, he turned in his sleep, and in so doing it by the enormous belly walls Indeed, the silk was put his elbow directly upon her belly, forcing, as little better, for having been so long in antiseptic 20-

seems probable from her story, the two recti muscles At any rate, from this time on she suffered Her husband being a cripple and a fruit dealer, she was accustomed to help him by carrying his baskets from the market, by this means her closed by buried silkworm-gut sutures, the incision trouble grew worse Two or three years after its first appearance she was suddenly taken ill, her bowels refusing to move Finally, after taking forty cents worth of castor-oil, a movement was secured with great suffering After this she had a second violent had attacks at intervals of about four months, till the time at which Dr Price and myself operated on her, the last of August During this period she was seen by six or eight physicians, most all of whom described her trouble as "twisting of the guts," but operation was never suggested Cathartics were administered to her each time she was attacked, no physician seeming to recognize the fact of their danger, one excepted, who also finally ordered them At her first attack, it has been omitted to state that she was given In all she had ten or twelve serious at up to die tacks At her last seizure, in August, 1887, after efforts to secure two other physicians, she came for I found the woman in extreme pain, she had Examination was made and the herma discovered above the umbilious, about the size of a pint tin-cup or larger, very tympanitic and hard Application of hot poultices was ordered, and a hy podermic of ½ gr of morphia given The next morning she was much relieved, the tumor smaller, and altogether she was very comfortable, so much so, indeed, that I omitted my visit the day after The next, the fourth day, I again visited her, and to my dismay found her vomiting stercora This was all the more astonishing because I had not been in formed of any change for the worse I at once ad ministered a second hypodermic of morphia, and went for the assistance of Dr Joseph Price After some delay I found him, and we operated at once An incision about 6 inches long was made over the The integument was very thin, and extreme care was necessary to avoid cutting through the in-On getting through into the peritoneum we found it so much thickened that it was at first impos sible to distinguish between it and the gut It was finally differentiated and carefully dissected free from the gut, to which it was closely adherent The guts, too, in the sac were closely adherent, and separated The sac was tied off and removed with difficulty The distension of the bowel disappeared at once on its being freed The strangulating portion of the sac was so firm as to resist all efforts to stretch it, and only by the utmost care was the bowel released, tion was very dark, but not gangrenous After its One night while in this position, at the side of was too slight to withstand the great strain put upon

lution it had become rotten, and was thoroughly untrustworthy I was unfortunate, too, in the breaking of the curved needles which, having been made for the Hagedorn holder, were not fitted for an ordinary instrument The operation was, however, completed The woman made a rapid recovery, and in three weeks was up, and stated herself more comfortable than she had been for fourteen years

The incision did not suppurate worth the name, and closed promptly, though not smoothly

Examination to day finds the patient entirely comfortable, though the recti have again separated wears both a band of rubber adhesive plaster and a muslin bandage Is entirely well Her belly bandage is 501/2 inches in circumference

Dr John H Packard thought The amount of material presented for discussion in the papers read is so large that it would be difficult to do it justice

In connection with the cases of hernia reported, he briefly mentioned another, in which an old femoral herma was subjected to unjust suspicion The patient, a woman, about 50 years of age, was brought to St Joseph's Hospital with intestinal obstruction of four day's standing, her general condition was bad, and she had fæcal vomiting femoral hernia, which had given trouble on several occasions, but had always been successfully reduced This was cut down upon, and the sac found to be Laparotomy was at once performed, a twist of the small intestine being found and relieved, flatus was discharged per anum, and the intense congestion and distention of the bowel relieved so that the mass was easily returned In spite of vigorous stimulation hypodermatically and by the mouth, the patient | ing sank, and died in about six hours In this case, which will be elsewhere reported more in detail, an earlier operation would probably have had a different result

As illustrating the difficulties attending the diagnosis of abdominal tumors, a case may be mentioned which occurred at the Episcopal Hospital some years later I saw her surgical ward to be operated on for an apparently movable tumor situated on the left side of the belly two inches below the level of the umbilicus found, however, that the mass was firmly adherent to the panetes, and the operation was abandoned The man died a few months later, and an autopsy showed that the disease was epithelioma of the pylorus, which had in some way become displaced and fastened by peritoneal adhesions in its abnormal relation

the actual lesions in these cases A woman who was brought to the Pennsylvania Hospital in 1886 on account of a gunshot wound, complained of pain in the right thac region only, yet the ball had ranged upward from the left loin to near the right axilla, wounding the pleura, colon, stomach, liver, right internal mammary artery, and right breast

DR. WM GOODELL Some two years ago I operated, performing a double ovariotomy The cysts were colloid, and there was no indication of malignancy About a year afterward, the patient then

being apparently well, she fell in getting out of a carriage There was pain in her right side, considered by her attending physician in the country to be an attack of peritonitis The pain afterward shifted to the left hip, growing worse and worse She was brought to me again and I examined her with the utmost care, feeling sure, from the symptoms and from the emaciation that had occurred, that there was malignant disease I thought that perhaps the stump of the ovary had taken on malignant degener-Finding nothing, I called in a distinguished specialist, who twice examined her under ether, but failed also to detect a cause for the pain actual cautery was applied along the course of the sciatic nerve, to which region the pain was referred Death took place in a few weeks, and at the autopsy, which was requested by the lady before her death, disseminated metastatic cancer of the liver was Clearly the ovarian disease had been malignant in the beginning, and was the focus from which sprang the hepatic disease But the salient point here is pain apparently in the sciatic nerve, while the site of disease was the liver

A few words as to Dr Barton's case 1 The pa-She had an old left tient died probably from acute septicæmia seen so many cases of burst cyst recover, that I have ceased to regard the acident as dangerous unless the general health has deteriorated from chronic absorption of septic material Of course, this may occur My last case failed to rally, and died on the seventh day from sheer exhaustion The rupture had occurred some weeks before from a fall, and the vital powers were slowly impaired, as if by chronic poison-Here every abdominal organ was infected and she was greatly emaciated, and also bedridden

On the other hand, I was surprised to-day by a visit from a patient upon whom I operated not quite two years ago She had been tapped by a prominent physician in New York, who was unable to remove the fluid because it was colloid A few weeks She was then very weak and emaci-A man was sent down from the medical to the ated and confined to her room At the operation it was discovered that the cyst had ruptured and that every organ was either affected or infected with Even the skin and the abdominal wall were colloid infiltrated with it where the trocar had entered thought she would recover from the operation, but expected death in a few weeks from progressive colloid infection She was in blooming health when she called on me to-day, and had gained forty pounds

With regard to the prognosis in these cases of burst colloid cysts, I hardly know what to say The seat of pain is very deceptive as an index of have seen cases remain well as long as three and four years, and then the disease returned in some On the other hand, I have had a fatal other organ return in a few months' time When we open an abdomen and find the whole peritoneum roughened with miliary prominences or with papillary excrescences, are we dealing with a benign or with a malign disease? This is the important question, for on it hinges the prognosis, yet I am unable to answer it.

The apparent improvement after exploratory laparotomy referred to this evening, especially in bleeding

fibroids, I have met with several cases, and it is mentioned by others I cannot explain it Possibly the irritation from the operation causes uterine contraction, or sets up some change in the circulation

I think that Dr Barton removes his stitches too I used to remove them in five or six days But some years ago a wound, after ovariotomy, reopened and there was considerable oozing of serum The patient recovered, however stitches to remain seven full days In a case of laparotomy in which I had removed the stitches on the eighth day, the patient, who was doing well, got some hot tea into her windpipe on the tenth day, and in the paroxysm of coughing the wound re-I had much difficulty in returning the distended bowels, and she died in two or three days apparently from shock, and not from inflammation Two or three months ago I opened an abdomen to in this case The patient is excitable, nervous, and remove the ovaries for a fibroid, under a distinct of rare intelligence. When I recall the relief after promise not to touch the tumor I could not get at the first operation, her extravagant delight at walkthe ovaries they were so imbedded in the tumor, and ing two miles to church, and the fears for her reason, I accordingly closed the wound On the ninth day I must confess that I look for a return of the pain the stitches were removed A few days later, through once more, for I cannot see the relation between a some imprudence of the patient, the wound burst uterine tumor and a pain complained of high up in open to the whole of its length My son closed it, and the woman barely escaped with her life such cases I shall in future leave the stitches in for could employ was cannabis indica in small doses at least two weeks

A word as to the use of ether I had nineteen cases of oophorectomy last year, with one death In that case the operation was very easy, yet suppuration of urine followed and the patient died from uræmia, which I attributed to the ether As symptoms of kidney disease were not manifest before the operation, I omitted to examine the urine Yet serious renal lesions must have existed, and I cannot but think that her life would have been saved, had chloroform been used as the anæsthetic

I was interested in Dr Keen's paper,2 for the case was my first one of oophorectomy and the operation was performed per vaginam The operation was not difficult, although the vagina was small There were marked nervous symptoms after the operation, but The lady had been a patient of no inflammation She had excessive Dr Weir Mitchell for rest cure abdominal pains, profuse menorrhagia and metror-Dr Mitchell recognized a fibroid tumor and The tumor was as requested me to see the patient large as an infant's head, and we decided to remove This was done on October 4 November 20, the patient had been so much benefited that she walked two miles to church in such a state of ecstasy over this, that her mother After that ill-defeared she would lose her mind fined pains returned and there was some bleeding from the vagina On December 17, I removed a painful neuroma of the cicatrix The tumor was painful neuroma of the cicatrix then reduced in size one-half In March, 1878, the tumor had become so small that it gave inconvenience by coming down in the pelvis, bringing the womb of the same year, I found the tumor merely as large in Dr White's case, but there was organic disease of as a horse chestnut and springing from the right side it and of other organs. That death was as indepen-

of the anteflexed womb In December she complained of occlusion of the bowel and bleeding at stool, which I attributed to piles In 1880 there was more or less pain in the left hypochondrium, with more or less nervous phenomena April, 1882, there had been two slight menstrual flows, with the usual molimina Later on violent and repeated hæmorrhages from the bowel occurred, which were at-I then allowed the tributed by the patient to vicarious menstruation For these hæmorrhages I removed, in February, 1884, a large mass of piles by ligation, and also stretched the sphincter ani for a fissure Since then I have not seen the patient

It is interesting to note the rapid diminution of the large tumor From the size of an infant's head it was reduced in nine months to that of a horsechestnut Neurosis was one of the marked features The patient was also highly the left hypochondrium In susceptible to certain drugs, and the only anodyne I

DR M PRICE In many cases it will be found that the cause of strangulation of the bowel is adhesion of the small intestine and bands of inflammatory lymph, The pressure and irritation set up slight peritonitis, and finally, adhesions An early exploration will save life Handling of the bowel and tearing the adhesions, or snipping them with scissors, will do no Sometimes we cannot distinguish a mass of matted intestine from a tumor, as in the case of a little colored girl I opened the other day By the time we had separated the adhesions and liberated the intestines there was no tumor I think that in many cases a fatal result may be attributed to the opium treatment If any one will employ Epsom salts immediately after the patient comes out from the ether, where he now uses opium, he will never regret He will regret the use of opium

As to removing stitches, if we use silkworm gut we need not give ourselves any concern They may be left in indefinitely if we choose They will bear a strain of fifty or sixty pounds, and give no inconve-

nience of any kind

DR JOHN B ROBERTS The case of Dr White renders it appropriate to refer at this time to the historic case of Dr Levis, known as the "ethyl bromide death," which led to the abandonment of that anicsthetic in this city The patient was placed under the anæsthetic for lateral lithotomy, for there were but three or four of us at that time in favor of the supra pubic operation The skin was incised, but before anything more could be done the patient died larger, irregular stone, but smaller than this exhibited by Dr White, was found wedged into the neck of the The kidney was not markedly diseased, as

THE JOURNAL, May 12, p 580

of anæsthetic as was that of Dr White's patient had not fixed the day of operation twenty four hours earlier

cases Such stones can be much better moved by supra pubic operation than any of the perineal operations.

Dr. H A Kelly I had a case of referred pain due to the presence of fibroid tumors similar to that reported by Dr Keen There was much emaciation, constant cough, and a pulse of 120 She coughed whenever I touched the tumor I performed hysterectomy, removing with great difficulty a mass of tumors, amidst which it was impossible to distinguish the uterus The stump could not be brought up, and was treated intra peritoneally Cough has stopped, weight increased twenty pounds, pain is gone, and the patient is in the best of health and spirits

The indications for the treatment of the various kinds and conditions of herma are so different that it

is difficult to discuss them together

In one case, which I watched for years through many attacks, I finally made an autopsy The patient was very fat and the intestines protruded in a large mass which could never have been returned to the abdomen which had so long been accustomed to their absence The only operation possible would have been splitting the ring to relieve the tension In this sac I found the colon and the vermiform appendix with small intestine

I was called last fall to a case of strangulated umbilical hernia, and finding the patient collapsed and no time to be lost, instruc ed the husband to give chloroform while I operated with my pocket case instruments For suture I employed some embroidery sill lying on the table with which she had been mak-After releasing the intestines I split the ring and brought together the opposite side, thus obliterating the sac and curing the hernia permanently The patient has remained well since

The stretching of the scar in the so called ventral hernia after laparotomy is not a true hernia and not

liable to its dangers

Three weeks ago I saw a man who had developed typhoid symptoms, followed by rupture and escape of fæcal matter from the scrotum, due to the strangulation of an old incarcerated hernia of 25 years' standing, caused by jumping down a cliff in the Fort Pillow massacre The hernia was formed by a diverticulum from the bowel, and the whole mass, with the adherent sac, was one gangrenous mass which was removed in shreds, leaving a large opening in the bowel I had no good available tissue to close this, ard used his right testicle, which I fitted into the opening, and secured by a row of stitches around its circumference, being careful not to allow any stitch to penetrate the substance of the testicle This has healed perfectly in situ, and the bowels have moved naturally and regularly Some years ago Dr Hunter reported a case to this Society, in which a man repeatedly pulled his testicle up to support and inguinal hernia, when to his surprise one day it stayed there, and finally became adherent, curing the hernia

DR KEEN I think the difference of locality bethink Dr White is truly to be congratulated that he tween lesion and pain, referred to so much this evening, will probably explain the pain in my case would like to ask Dr Goodell which of the tumors There is another point of interest in both these in the specimen he would consider the original one?

DR GOODELL The intra mural one, The great diminution would hardly have occurred otherwise

DR KEEN A point elicited in our papers and discussion this evening is the reciprocal invasion of gynecological surgery by the general surgeon, and general surgery by the gynecologist Nothing but good can come from this It will be mutually advan-

DR BARTON I must bow to Dr Goodell's authority in the matter of removal of stitches, and yet my own tendency, growing out of experience, is to take them out earlier and earlier I think that by this I avoid suppuration There is a difference between the lax abdominal wall after the removal of a thirty or forty pound tumor, and the tense condition of that wall after operations of the class I have been most engaged in In these the great tension often causes suppuration if they are permitted to remain long In order to afford support after removal of stitches I have been in the habit of taking two large pieces of adhesive plaster and cutting a series of tails upon each and fastening one piece on each side of the abdominal incision These plasters are long enough nearly to reach the spine on each side, they are laced in front with heavy thread and are tightened as necessary by taking up the slack in the thread

GYNECOLOGICAL SOCIETY OF CHICAGO

Regular Meeting, March 23, 1888

THE PRESIDENT, HENRY T BYFORD, M D, IN THE

(Concluded from page 663)

DR J C Hoag read a paper on

SOME CONSIDERATIONS REGARDING DEATH OF THE FŒTUS IN UTERO

A careful inquiry concerning the comparative frequency of premature expulsion of the impregnated human ovum can scarcely fail to surprise the physician, although anything like statistical accuracy in its determination is, for very obvious reasons, an utter impossibility In making up an approximate estimate, one must needs remember that the impregnated ovum is often discharged at a menstrual period without the patient's knowledge of any unusual circumstance beyond an increase in the discomforts which often attend menstruation, and which are not infrequently attributed to trivial causes To say nothing of the patient's ignorance, the physician himself is frequently unable to decide whether such an occurrence has taken place, even after an examination of the menstrual discharges

Good authorities are of the opinion that we may safely reckon one case of abortion in the first months of pregnancy to every eight or ten cases of partun-

Accordingly, the importance of | Charpentier's work as follows tion at full term careful study, to ascertain as fully as possible the whole, the ovum represents a membranous sac comproximate causes of this occurrence, cannot be overestimated, and still the writer believes that there is evidence of great apathy on the part of the profession in this respect, as evidenced in the very terms employed in classifying the causes of abortion convenient term "habitual abortion," for example, is one which cloaks a great part of our ignorance of Such an expression as "abortion from unknown causes," would at least be preferable as holding forth in its very confession of ignorance an inducement to explore its unknown depths

As an example of the unsatisfactory state of our knowledge in this direction, one need only turn to In an inthe reports of large lying-in hospitals teresting analysis1 of two years' work in Prof Gustave Braun's Clinic, 6,230 labor cases are reviewed Premature labor occurred in 565 cases, the causes being tabulated as follows

Syphilis	(about) 70
Pulmonary tuberculosis	9
Peritonitis	2
Other fevers •	23
Faulty placental insertion	10
Vitium cordis	I
Injuries	, 7
Eclampsia	I
Induction of labor	4
Twin pregnancy	43
Total	170

This leaves 395 cases to be relegated to the category of the unknown

In Braun, Chiari, and Spaeth's analysis of 7,835 cases of labor occurring in the Vienna Hospital for the year 1850-1851, 393 cases of premature labor are ıncluded cause be definitely determined

Causes of the Premature Interruption of Pregnancy These may be considered as they relate, 1st, to the father, 2d, to the mother, 3d, to the ovum, and 4th,

to traumatism

Causes referable to the father -These are constitutional vices, particularly those of syphilitic origin

Causes referable to the mother -Those include general and local diseases, climatic and hygienic influences, and finally certain idiosyncrasies which seem to be productive of abnormal irritability on the part of the uterus, even in the absence of recogniza-

Causes referable to the ovum — These comprise all diseased conditions of the fœtus and its appendages Traumatism includes accidents, efforts at criminal

abortion, and the justifiable induction of labor

In considering the subject of abortion in general, one can scarcely fail to be struck by the disproportionate frequency in multiparæ, and this seems clearly to depend on local diseases, such as endometritis, metritis, and uterine displacements

"Considered as a posed of two membranes peculiar to it, the amnion and the chorion, and of one membrane of uterine origin, the decidua, a sac which contains the fœtus, the cord, the placenta, and the amniotic fluid Each of these parts may be the seat of lesions constituting the pathology of the ovum"

If we exclude attempts at criminal abortion and the justifiable induction of labor, traumatism may be said to include only a small proportion of the causes of abortion, thus, in the two analyses above referred to, we find only fifteen cases referable to injuries in These figures, would not, howa total of 904 cases ever, represent the proportion in private practice But whatever may be the mediate causes of the in terruption of pregnancy, the death of the ovum is almost without exception the immediate cause of the awakened uterine activity and the premature expul

sion of the product of conception

Death of the fœtus may be determined by dis turbances of nutrition, due to faulty development of the ovum, and especially its appendages, which lead to abstraction from the fœtus of its supply of nutri This may occur when the energy ment and oxygen of growth in the membranes is so considerable as to unduly divert the blood supply to their develop ment at the expense of the fœtus, or when suddenly or gradually the exchange of blood between the mother and the fœtus is obstructed or destroyed, the one condition prevailing in cases of inflammation of the membranes, which, when affecting the chorion, results in the formation of moles, the other when the uterine mucous membrane is the seat of the chronic inflammation known as endometritis decidua

Again, the exchanges between fœtal and maternal In only 126 cases, or one third, could the blood may be impaired by maternal hæmorrhages, whether from the uterus or from other organs, thus, in cases of hypertrophic development of the tufts of the chorion, the fœtal vessels may be so compressed as to fill the maternal blood-spaces, as seems to be the case in syphilitic disease of the membranes Extravasations from the placental vessels may also compromise the circulation of the fœtus, and when These extravasations extensive cause its death may be produced by comparatively slight mechanical influences, in cases where the vessels have very thin and delicate walls, and particularly in cases of fatty infiltration consecutive to endometritis extravasations may be caused by local hyperæmia due to the abuse of alcohol, or to fever, uterme displacements or organic diseases of the heart, lungs, or liver

As for syphilis, this may cause the death of the fœtus either primarily or secondarily velops late in pregnancy, the fœtus may reach full When it develops earlier, it is much more likely to result in the interruption of gestation

The point of this paper is to draw attention to the With regard to diseases of the ovum I quote from influence of endometritis, in determining the pre-1 Klinische Mittheilungen über Geburt u Wochenbett, etc., aus den Jahren, 1881, u 1882, von Dr. C. Fürst.

2 The terms premature labor, abortion, miscarriage, immature de livery, etc., are so variously used that the writer prefers to quote the exact expressions used by the different authors of this disease is a matter of daily observation, and

subject of habitual abortion With this we content ourselves, whereas, no doubt, a careful study of these cases would often lead to the discovery of a patho logical cause of remedial nature. That a lack of fecundity on the part of a woman is often due to an endometritis, and is overcome by a cure of the diseased condition, is a matter of frequent clinical experience That systematic writers mention the rôle played by endometritis in the production of abortion, the prophylactic measures in the prevention of abortion, is of course, true, but it may be safely asserted that the great importance of this subject has not been sufficiently insisted upon, and that, if attention be especially directed to it, the causes and treatment of so-called habitual abortion will soon become much better understood

In endometritis, extravasations into the hypertrophied tissue of the decidua often take place the disease is of moderate extent, or if it develops late in pregnancy, and does not involve the placenta itself, it may be borne without influence upon the development of the fœtus If, however, it develops earlier or in a severer form, it may often compromise the life of the fœtus by leading to endometritis decidua with its hyperplasia, extravasations, and fatty infiltrations labor, when it comes on, is apt to be complicated by adherent placenta with its consecutive dangers The frequency with which one meets examples of adherent placenta, in cases of labor which are otherwise normal, is to me a hint of a link connecting en- quested her to use the vaginal douche dometritis with abortion The discovery of the true grandest life-saving discoveries of all times, and in the pathology of pregnancy we have a field which before human lives

Report of Case —I now offer for your inspection a specimen of macerated fœtus with its appendages The patient who gave it birth was born in this State She is 24 years of age, well-developed, weighing about 160 lbs, 1s strong, and claims to have enjoyed married three years ago, her husband being a skilled meshanic of exemplary habits and enjoying fairly good health Seven months after marriage the patient gave birth to a macerated fœtus of six or seven months' development One year later, this occurrence was duplicated About a year and a half later still, she gave birth to the fœtus which you now see

The placenta of the first fœtus was somewhat adherent, and did not come away entire The patient spert two weeks in bed and, according to her own statement, was pretty sick Subsequent to this she enjoyed good health until after the birth of the second fœtus, since which time she has not felt as well as before marriage

A leucorrhœal discharge made its appearance after the birth of the second feetus, and has continued most of the time to the present day, and since this event,

to say she aborts because she has aborted, she is the slowed much during labor, and never at all during gestation

My acquaintance with the patient began on the 28th day of last December, when I was informed that she had reason to suspect that pregnancy had been interrupted, and requested an examination I had no hesitancy in pronouncing the fœtus dead, whereat she expressed great regret, caying she had long desired a child, and had believed that this time her hopes would be realized The examination revealed and mention the treatment of the disease as one of a doughy condition of the belly, which was not distended in proportion to the supposed period of gesta-The position of the fœtal parts could not be The os exturnum admitted one finger made out A thick muco purulent discharge, of disagreeable odor, was present in considerable quantity

As regards subjective sensations, the patient said that the last fœtal movements had been felt four days. before, and that they had grown gradually feebler before altogether ceasing She had also experienced sharp pains in the abdomen, and had noticed a feeling as though the fœtus had turned over, such as is often described in connection with a dead fœtus She had not, however, noticed the other sensations of mawkish taste in the mouth, languor, and a sensation of cold in the abdomen from stoppage of the fætal circulation, and concomitant abstraction of If the placental decidua be involved, heat from the uterus—a phenomenon, by the way, which has been made available as a diagnostic point in determining whether the fœtus has died or not

> I advised the patient that she might expect the expulsion of the fœtus in about ten days, and re-

On January 5, twelve days after the cessation of pathology of the puerperium has been one of the feetal movements, I found the patient in the second stage of labor, the pains having begun some hours I had barely time to offer support to the may be made productive of almost as rich harvests of feetus before it was discharged, with the membranes intact, the placenta soon following under the influence of gentle compression of the uterus The placenta was intact, and labor ended with a moderate discharge of blood With the exception of the presence of a small fresh coagulum on the surface of the placenta, a pale color, and considerable friability of very excellent health for the most part She was its tissue, I could discern nothing abnormal in its appearance

The fœtus itself is 14 inches long, and corresponds to the sixth month of development. It exhibits the usual appearances of maceration in the softening and separation of the epidermis, the dark discoloration of the corium, the flaccidity of the body, the separation of the cranial bones, and the looseness of the These appearances remain very much the same now as they were at birth, and you may judge

them for vourselves

Subsequent to labor the patient felt very well, with the exception of painful contractions of the uterus and distension of the breasts, conditions which received appropriate treatment. At noon of the sixth day of the puerperium, I was struck by the flushed appearance of the patient's face and, upon inquiry, found that she had awakened that morning with a her menstrual periods have been accompanied by severe headache, but it required additional interropain, headache and fever. The patient has never gation to elicit the fact that she had also experienced a chill (which she referred to as merely coldness of nor her husband has ever been the subject of syphithe feet), and some additional severity in the pains lis from uterine contractions up to this time had been nearly normal, was now not the occasion of her first mishap I believe that found to measure 100 5° The lochia was somewhat fetid, but the patient said she had passed no clots A vaginal examination revealed a subinwhatever voluted uterus The patient accordingly presented every appearance of one about to enter upon child-pregnant bed fever

At 5 o'clock PM the temperature was 1015° With the assistance of the husband I placed the pa tient upon her side and, introducing a Sims' speculum, proceeded to thoroughly irrigate first the vagina and then the uterus with a carbolic acid solution, employing for this purpose the long glass fenestrated nozzle with double curve, and facilitating its introduction and the subsequent procedures by the use of the double tenaculum forceps With a good-sized cu rette of a modified Sims' pattern, I next proceeded to scrape the placental site, with the result of bringing away what seemed to me an enormous quantity of soft pulpy material, composed almost wholly of set in a convenient handle fibrin and blood corpuscles, and which I now offer | bodies in the puerperal uterus is sure to obstruct the for your inspection this material as about equal to the volume of a 3-oz At first I was unable to reach the fundus uters with the instrument, but after repeated efforts, which resulted in bringing away consistent masses half as large as one's finger, I was able to reach every part of the endometrium Every stroke of the curette dislodged masses of fibrin, but even after a most vigorous scraping the endometrium at the fundus had a rough, knobby feel

Following the use of the curette with a renewed employment of the douche and placing some pencils of 10doform in the uterus, I arranged the patient comfortably in bed and was interested to measure her temperature It had subsided 1 5° The following morning I find the patient, after a good night's rest, with a normal temperature and feeling far more comfortable than at any time since her labor temperature remained normal for three days, when it exhibited a considerable exacerbation I accordingly introduced a Sims' speculum again and thoroughly douched the uterus The speculum was necessary, because I found it impossible to introduce even the convenient nozzle above described without it, and this leads me to remark, parenthetically, that after having employed the intra-uterine douche for of matter, if I deem a removal of it requisite nearly six years, I have reached the conclusion that it is occasionally quite impossible to administer it the specimen presented this evening, but will refrain without the assistance of the speculum, and that un- from a discussion of the minute pathological aspects necessary violence is often resorted to in attempting of fœtal death at present, hoping to make the subject In my case, even with the to introduce the nozzle speculum it was not easy to do so without the aid of the tenaculum venture the assertion that the physician often deceives himself in believing that he has administered an adequate intra-uterine douche when, in point of fact, the nozzle of douche has barely entered the After the second and last douching, cervical canal my patient made a rapid recovery In this case I am satisfied that neither the patient

The patient herself has undoubtedly long suf-The temperature, which fered from endometritis, although this was perhaps a repeated application of the curette in this case and the additional application of topical remedies will effect a cure of the endometritis, and enable her to give birth to a healthy child, if she again become

I have said nothing, however, as yet, with regard to another point which may have some bearing on the causal relations of feetal death in this case The patient has an abnormally slow pulse, the heart often pulsating as infrequently as forty four beats to the The relations of heart disease to pregnancy minute and parturition have been discussed by various authors, and Matthews Duncan has suggested the possible influence of such diseases upon the production of abortion

The more I use the curette in puerperal cases, the better pleased I am with it I prefer an instrument with a large scraping surface and with a long shaft, The presence of foreign I estimated the total bulk of progress of involution, and the depth of the canal is altogether disproportionate to the size of the retained decidual or placental tissue or coagulum Duncan has reported a case where a small bit of placenta was retained in which, at the time of the removal of the tissue eight months after the expulsion of the fœtus, the uterine canal was 8 inches deep. In my case I found that involution had made no progress at the time of the curetting and the instrument which I used, although 11 inches long, was almost too short

I cannot help feeling that the employment of the finger nail as a curette is a dangerous procedure It is of interest in this connection to note the results of some recent experiments by Prof Furbringer, as re ported in the N Y Med Record of March 10 The experimenter, employing for his subjects thirteen assistants and chiefs of clinics, required them to thor oughly disinfect their hands according to the most approved methods He then succeeded in extract ing enough septic material from under their fingernails to start colonies in twelve out of the thirteen

For my own part, I infinitely prefer the curette, which I do not hesitate to use in any case of abortion where I suspect the retention of even small quantities

I have made some microscopical examinations of one of more extended study at some future time

A word with regard to the management of labor in As a corollary to this proposition, I general may not be entirely out of place in this con I lean more and more to the side of connection I do not believe that it is servatism in obstetrics best to use even the vaginal douche after labor with out some special indication for it. As for the intrauterine douche and the curette, I think they are not very often needed, but that when either one of them

² Matthews Duncan, Clinical Lectures 1830

certainly I would not think of using the curette without both preceding and following its use with the douche Further, a single intra-uterine douche is thoroughly given, than a dozen

Finally, I would like to reinforce what I wrote in a previous paper, read before this Society, with regard to the value of auscultation and external palpation as enabling us to avoid frequently repeated vaginal examinations I have very recently read with great interest that Credé, always a conservative and successful obstetrician, has of late practically abandoned vaginal examinations, and teaches others to do so At the time when the paper above referred to was read, I was unaware that any one had ever definitely insisted on this point

Dr. P S HAYES I was glad to hear Dr Hoag say that there was difficulty sometimes in administering the intra uterine douche. His case brings forcibly to mind a case I had, where Dr Nelson was called in consultation The woman had a strongly adherent placenta. She had at the third or fourth month attempted to produce a miscarriage by the oil of tansy, or something of the kind, and had failed, but she had produced a good deal of irritation and, as a result, there was a strongly adherent placenta. I had to introduce my hand to remove the placenta. A few days afterwards she developed puerperal fever, and the strangest part of it was that apparently there was no odor I used intra uterine injections, and after one or two injections she had a chill and high temperature, and I found a difficulty in introducing the tube In order to introduce the tube, I placed my hand on the abdomen and pushed the uterus upwards and backwards, and when that was done, there was a free discharge of fetid lochia which had accumulated there While I did not use a speculum, I think if one had been used, and the tube carried to the fundus every time, the case would have required fewer injections to have made the good recovery which she eventually did make In this case there was undoubtedly an anteflexion of the puerperal uterus, which effectually closed the uterine canal and caused the accumulation of the lochia in the uterine cavity

DOMESTIC CORRESPONDENCE

"SPONTANEOUS" INFECTION

Dear Sir —There is but a single word in your excellent editorial ["On Spontaneous and Contact Infection in Puerperal Fever," THE JOURNAL, May 19, 1888], that I hope will not sink deep into the mind of the profession In contradistinction to contact infection, you recommend on the authority of Miculicz the term spontaneous infection I hope that the use of the word spontaneous will not prevail It has had too unfortunate a history in biological literature to be used in any ordinary sense with infection The signification that it acquired through the long discus-

is required, the other is apt to be needed too, and modified as to adapt it to use in this connection must hereafter mean what it did mean when the subject of spontaneous generation of bacteria was under Spontaneous infection in such a sense discussion often worth more to the patient, if properly and is, in the light of modern bacteriology, either an absurdity, or is calculated to deceive and perpetuate incorrect notions of infection There is no longer a doubt that infection means invasion with living mi-The spontaneous development of a human crobes organism in the uterus would be no greater miracle than the spontaneous development there of the infecting microbe Very respectfully,

BAYARD HOLMES, M D

1535 Bowen Ave., May 23, 1888

The use of the term spontaneous, in the designation of a certain class of cases of puerperal infection, is not free from objections, and Dr Holmes' criticism But we employed the word, in the ediis pertinent torial mentioned, in a sense strictly technical and clearly defined We still think the expression, spontaneous infection, as thus limited, preferable to the words auto infection or self-infection, chiefly because its exact, technical signification in surgical literature is well-known and very generally accepted use of words, as Professor Hill remarks, there is only one sound principle of judgment That principle is not etymology, but good use, i e, reputable, national and present use

The fallacy of ambiguity, that Dr Holmes points out in his friendly stricture, we think is apt to arise in the processes of the popular, rather than of the We are addressing a special class professional mind of educated men, and we have nothing whatever to do with popular impressions as to the meaning of this much abused word At the same time, we are prepared to admit that a better term may be, and probably will be, coined —ED]

SEXUAL DESIRE IN INFANCY

Dear Sir —The following seems worthy of record. as I am unable to find a case on record where there there was evidence of sexual feeling at so early an Female, aged eleven months, has always been When ten months old the mother first noticed well that when the child was left alone, on the floor, or bed, or in her cab, she would frequently go through some peculiar up and down motions of the pelvis, continuing thus for a minute or more, and then ceasing for the time The mother finally concluded the motions were made to satisfy a sexual desire, and that the child desisted only after experiencing something corresponding to an orgasm The father was sent to consult me about the matter, and as was natural, I was somewhat skeptical about the mother's diagnosis, and advised the father to have the case more closely watched and report again in a few days In a day or two the mother brought the child to my office, and stated that in addition to what the father had reparted to me, she had noticed that whenever the baby perceived that she was observed in her exercises, she would immediately stop and show every appearance of shame, ie, would cover her face, and sion between Bastian and Tyndall cannot so soon be appear confused and excited On examination of

the external genitals I was unable to discover anything unusual, except that the clitoris seemed a triffe large, and rather a brighter red than normal

The parents are perfectly trustworthy people, and could have no conceivable motive in misrepresenting So it seems to me we must accept this as a case of manifestation of sexual feeling and attempt to satisfy this feeling, in a child of less than one year of age M G SLOAN, M D

BOOK REVIEWS.

INTUBATION OF THE LARYNY By F E WAXHAM, Professor of Otology, Rhinology and Laryngology, College Physicians and Surgeons, Chicago Pages Published by Charles Truax, 75 and 77 Wabash Ave, Chicago 1888 Price, \$1 25

The present small volume is probably the most complete and best description of the subject of intubation that has been placed before the public Dr Waxham is already so well known by his numerous articles upon this subject that we need hardly say that his authorship of the book makes it authoritative

The history of the operation, the anatomy of the larynx as it pertains to the operation, the method of performing the operation, the after treatment and numerous illustrative cases are described The book is well illustrated and the publisher has made a very attractive volume

Intubation has succeeded so well in the hands of Dr Waxham and of others who have given it a fair trial that the profession have justly come to look upon it as a most important operation

MISCELLANEOUS.

NEW HAMPSHIRE MEDICAL SOCIETY -The ninety eighth annual meeting will convene in the Hall of the G A R, 15 Warren St, Concord, Tuesday, June 19, 1888, at 11 o'clock A M President, Dr S W Roberts, Wakefield, Secretary, Dr Granville P Conn, Concord

Association of American Medical Editors -The regular annual meeting of the Association was held at the Burnett House, Cincinnati, Monday evening May 7, 1888, and was attended by a larger number of representatives of the medical press than usual The President, Dr Wm Porter, of St Louis, delivered an interesting address (See The Journal, May 12, 1888) After the discussion of several questions, Dr Mathews, Chairman of a Committee previously appointed, re ported a constitution and By laws which were adopted Dr W C Wile, of the New England Medical Monthly,

Danbury, Conn, was elected President for the ensuing year, and Dr J C Culbertson, of the Cincinnati Lancet Clinic, Secretary and Treasurer The next annual meeting is to be held in Newport, R I, on the first Monday evening in June,

CONGRESS OF AMERICAN PHYSICIANS AND SURGEONS -Preliminary Announcement of the Committee of Arrange ments—This Association will hold its first triennial session in the City of Washington, during the 18th, 19th, and 20th of September next—The meetings of the Congress will be held in the evenings, beginning at 8 PM, and those of the Societies composing the Congress will be held during the daytime, ac cording to the programme each may respectively provide The

sessions will be open to the profession

The Local Committee of Arrangements of the Congress has secured places of meeting for the Congress and each society in close proximity, so that the members of the respective societies can interchange attendance at pleasure, without inconvenience.

It is the purpose of the Executive Committee of the Congress to print the programmes of all of the societies, provided

copies be supplied on or before August 15

The Local Committee requests the secretaries of the societies to forward the names of those of their invited guests who have accepted their invitations, designating them as Foreign and American

The Committee of Arrangements is composed of one member of each society represented in the Congress, as follows Samuel C Busey, Association of American Physicians, Wash-

J Ford Thompson, American Surgical Association, Washington

R T Edes, American Neurological Association, Washington E C Morgan, American Laryngological Association, Wash-

mgton W W Johnston, American Climatological Association, Washington

J E Atkinson, American Dermatological Association, Baltımore

A Sydney Roberts, American Orthopedic Association, Philadelphia

H Newell Martin, American Physiological Society, Balti more

Samuel Theobald, American Ophthalmological Society, Baltimore

S O Richey, American Otological Society, Washington. A T Cabot, American Association of Genito Urinary Sur

gery, Boston Inquiries may be addressed to the Chairman, Dr Buse), at Washington, or to the representative member of each society on the Committee

It may also be stated that the Committee of Arrangements of the American Gynecological Society, which will hold its next annual meeting in Washington at the same time, is composed of Drs Busey, Taber Johnson and King

HEALTH IN MICHIGAN, APRIL, 1888 -For the month of April, 1888, compared with the preceding month, the reports indicate that tonsilitis, influenza, and bronchitis decreased in prevalence

Compared with the preceding month, the temperature in the month of April, 1888, was much higher, the absolute humidity was much more, the relative humidity was much less, the day and the night ozone were about the same

Compared with the average for the month of April in the nine years 1879 1887, measles were more prevalent, and con sumption of lungs, intermittent fever, remittent fever, diphthera, pneumonia, bronchitis and scarlet fever were less prevalent in

April, 1888 For the month of April, 1888, compared with the average of corresponding months in the nine years, 1879 1887, the temper ature was slightly lower, the absolute humidity, the relative hu midity, the day ozone and the night ozone were slightly less

Including reports by regular observers, and others, diphtheria was present in Michigan during the month of April, 1888, at 20 places, scarlet fever at 43 places, typhoid fever at 15 place, and measles at 45 places

THE DIAGNOSIS OF PERICÆCAL ABSCESS, AND ITS RADICAL TREATMENT BY REMOVAL OF THE APPENDIX VERMIFORMIS

Read in the Section on Sirgery at the Thirty Ninth Annual, Meeting of the American Medical Association, Cincinnati, May 8, 1888

> BY THOMAS G MORTON, M D, OF PHILADELPHIA 1A

Abdominal surgery can show many brilliant achievements under modern antiseptic methods, but in scarcely another instance does an operation so completely afford its own justification, or when properly timed present such satisfactory results, as laparotomy when performed for suppurative appendicitis

PATHOLOGY AND CLINICAL HISTORY

It will greatly simplify the subject under discussion if we can first clear up the nomenclature, which, it would seem, has been more or less confused by the refinements of pathologists and others We are accustomed to certain distinct terms to express inflammation of the cæcum, of its peritoneal investment, and of the surrounding structures and cellular tissue

It would seem reasonable that all the niceties of diagnosis between typhlitis, perityphlitis, paratyphlitis and pericæcal abscess can properly be set aside, as without real practical value, since recent pathological researches have demonstrated that, as a rule, in cases presenting the well recognized characters of typhlitis, the symptoms are almost invariably due to appendiresides in the cæcum Fitz records but three cases in which pericacal abscess was caused by ulcerative instance it was due to the presence of a foreign body Pencecal disease may, then, in most cases, be said to mean disease of the appendix vermiformis

It seems hardly worth while to consider the conventional division of appendicitis into the catarrhal and ulcerative, for, clinically speaking, although an uncomplicated catarrhal condition may exist, there

are no signs by which it can ordinarily be recognized Inflammation and perforation of the appendix in most cases, very probably in all cases, is due to irri-

or an aggregation of small objects which from time to time have gained an entrance, or the concretion may be composed of epithelial or other constituents aggregated into a hard mass from the ordinary secretions of the parts

No complete or fully satisfactory classification of the cases of inflammation, perforation and abscess of the appendix can probably at this time be made, but for practical purposes, a division according to the onset and history of the disease, into the acute and chronic varieties, will probably fulfil all necessary

clinical requirements

In the acute disease, the symptoms come on with suddenness and increase in seventy, and often very early present the gravest characters Occasionally the disease progresses from first to last with frightful rapidity, so much so that the patient quickly enters a condition bordering on collapse In one case which recently came under my notice, the child perished with perforation and purulent peritonitis fortyeight hours after the first symptoms were observed

Possibly such extremely acute cases as the one mentioned might afford an opportunity for still further division into the ordinary acute and the supraacute, the latter running their course in a very short time, often in a few hours An explanation of these forms will be given later, when considering the pa-

thology of the subject

Recently I saw in consultation a case which presented marked symptoms of perforative appendicitis After the pus cavity was opened the patient became so profoundly exhausted that death seemed imminent and all further exploration had to be abandoned Surgical interference in many cases is unfortunately citis Exceedingly rare are the cases where the cause so long postponed that a favorable result can hardly be expected

The close proximity to the peritoneum of such perforation of the walls of the cæcum, and in each fetid pus as is found in suppurative appendicitis produces very early unusual depression and exhaustion, so much so that occasionally anæsthesia and simple incision is sufficient quickly to give rise to symptoms indicating heart failure. In such cases any further exploration of the abscess cavity is impossible

In the chronic forms of appendicitis, we have re-curring attacks or relapses Such repeated attacks of inflammation about the appendix region are often followed by a deposit of lymph which forms a barrier more or less complete, sufficient, when perforation tation excited by the presence of a foreign body in takes place, to protect the peritoneal cavity at least the organ It has been shown that the foreign sub- for a time But if operative measures are not understance is commonly a feeal or phosphatic concretion, taken or are unduly delayed, such lymph partitions often yield, and the general peritoneal cavity becomes involved and peritonitis results

In other cases the abscess walls form a distinct pus cavity which surrounds the organ, so that when perforation occurs, the contents of the abscess form a tumor, or more or less defined hardness Such tumors frequently make their way toward the surface, and the superimposed structures become infiltrated and markedly ædematous In such cases the perforation of the appendix may remain open and a fistula form between the bowel, the abscess cavity and strual period, the patient suffered with pain localized the external abdominal surface

In January, 1885, I saw a case of this character in consultation, in a lad ir years of age, who had all the symptoms of perforation and abscess of the appendix A tumor gradually developed and perforated about the same characteristics The last occurred in the abdominal walls incision and evacuated a large amount of pus general condition of the patient at the time did not warrant a search for the appendix The fistula never closed, the boy two years later perished from pulmonary tuberculosis In any abscess of the ileocæcal region, we should always suspect appendix disease, and an effort should always be made to expose this organ In no case should a simple evacu ation of pus be considered sufficient, especially if the history of the case presented any account of former appendix trouble A case of this character came under my care some two years ago, in which I simply evacuated an abscess situated in the ileo cæcal region, and made no investigation of the appendix, as the abscess cavity seemed a closed one Two years later I was obliged to make abdominal section and removed a diseased appendix, which undoubtedly existed at the time of the first operation

L A B, a stout girl of healthy parentage, and with no family history of cæcal or appendicular disease, had a severe fall upon the buttocks in March, She was almost immediately seized with a terrible attack of vomiting and retching, which lasted hours From this time until September, 1885, she suffered with extremely painful menstrual epochs, and from time to time, when tired, had a recurrence of vomiting similar to that immediately succeeding her fall On September 10, during the progress of one of these vomiting spells, she experienced severe pains in the right cæcal region, the whole seizure lasting about Another attack developed on September ten days 29, and still others on November 10 and 23 latter was brought on by taking cold, and in five hours she was compelled to go to bed, and endured the most excruciating drawing pains, which radiated from the right cæcal region to the shoulder blade of Vomiting continued for some hours the same side Emesis then ceased, but the pains continued off and on until January 10, 1886, when I first saw the pa-A hardening was then present in the right cal region Poultices and mercurial inuncıleo-cæcal region tions were ordered, which gave very marked relief She daily seemed to improve, and before March 19 was much overworked in caring for company, and dressing applied She reacted and continued to do about midnight was seized with torturing pains in the well region of the hardening

April 3, when I incised the now greatly enlarged mass, liberated a large quantity of fetid pus, and intro duced a drain tube There was apparently no commu nication with the cacum or its appendix. The tube remained in for a long time, and the wound did not completely close until August Her condition, however, had meanwhile improved amazingly, and she was soon quite herself again, being up and about the house in four weeks

After this, especially when tired out or at a menabout the cæcal region. The attacks resembled Three months after operation she had quite a severe attack of local pain which lasted a number of hours These attacks, at long intervals, presented Subsequently I made a free | January, 1888, which was accompanied by more se-The vere pain than any of the others

During the evening of Friday, March 15, she was taken with violent vomiting and purging These symptoms continued all night, and through Saturday when the pain was most intense. On Sunday her symptoms appeared grave Pain was increased on pressure in the right ileo cæcal region Abdomen soft, fever, rapid pulse and dry tongue On Monday the symptoms continued the same, with a tempera ture of 102° In the afternoon the general symptoms No tumor could be felt, only were more serious increased pain Skin was bathed with sweat There was marked resonance over the part On Tuesday the pulse was feeble, nausea and occasional sick The other symptoms remained stomach prevailed about the same, when diagnosis of perforated appen The same morning she dix with abscess was made was etherized, and the usual lateral incision 5 inches long was made, which came about an inch further laterally than the line of incision of the first opera The deep tissues of the abdominal wall were somewhat ædematous, and just before the peritoneum was reached, a large quantity of most fetid pus was At the base of this cavity was clearly liberated visible the cæcum and appendix The latter was enormously enlarged, thickly covered with lymph and abscess lining membrane A considerable sized opening also communicated with the cavity of the general peritoneum, through which small intestines were forced when she coughed

The appendix was firmly attached to the cæcum, from which it was separated with some difficulty It was then firmly ligated with stout silk at its junction with the cæcum and excised The communication with the general peritoneum was then dilated, and through it the intestines were most thoroughly washed by means of hot water irrigations The abscess car ity proper and surrounding parts were sponged with I 1,000 mercuric solution A glass drain tube was then carried to the bottom of the pelvis and brought out through the lower angle of the wound, while 3 larger rubber tube occupied the line of the same and emerged at its upper extremity

The incision was then closed and an antiseptic These continued until the following day and necessitated the cutting of all

the bottom of the wound, but no prolapse of intestine | tion and who conducted the after-treatment

at any time took place

Great sloughs kept coming away for many days, also much pus, in spite of every effort to keep the wound aseptic The deep glass or pelvic drain became dry on the fourth day and was removed on the From that time the wound was kept lightly packed with antiseptic material and rapidly granulated to the surface, when a few strips of rubber plas ter were applied.

Patient's bowels, from time of operation, were kept in a freely moving condition by means of citrate of magnesia and enemata In less than a month the patient was well, and has since been married appendix was found to be the seat of a very large perforating ulcer, situated near its cæcal attachment,

but no foreign body was discovered

The following case I saw in consultation with and operated upon for Dr Ed R Stone, of Philadelphia

Mrs G, et. 34, mother of one child, had been perfectly healthy up to time of last illness, save for occasional attacks of colic which had readily yielded to anodynes, and it was said that she had had a severe attack of pain and vomiting some months before For two days previous to February 18, 1887, she severely exerted herself and menses were overdue On that day she had severe abdominal pain accompanied by vomiting The pain was described as starting in the right hypochondriac region and darting to the umbilicus No tumor was perceptible, neither was there tenderness upon pressure dynes and counter irritation were ordered February 19, pain less, no emesis nor rise of temperature, some soreness and tenderness to the right of the um-Pain returns as anodyne effects pass off Bowels have not moved for several days Abdomen somewhat tympanitic, tongue coated and hard at tip Evening temperature 100°, pulse 90 Treatment continued

February 20 Restless night Vomits yellow material freely Abdomen tympanitic and tender 101°, pulse 110 Operation advised, but refused

February 21 Symptoms continue She is quieter but weaker Abdomen very large and tender the morning of this day I saw her and, although her condition was very unfavorable, urged abdominal section as her only chance for life, as my diagnosis was perforated appendix and subsequent peritonitis

A free incision was made laterally over the cæcal region, and the appendix found greatly enlarged and perforated in two places, both holes measuring a little more than 1/4 inch in diameter A silk ligature was placed upon the appendix close to the cæcum, and the offending organ then removed There was also purulent peritonitis The abdominal cavity was thoroughly irrigated, the region of abscess cleansed and a drain inserted She died in a few hours

The following case presents the prominent symptoms which are usually observed in cases of chronic suppurative appendicitis, and this patient has been benefited as much by the practical application of the principles of modern wound treatment as any human creature ever can be He was a patient of Dr

the stitches, whereupon the cacum lay in full view at Frank Woodbury, with whom I saw him in consulta-

Charles K, at 26 years, had enjoyed good health until three years ago Since that time he had been subject to frequently recurring attacks of abdominal pain, which would come on without warning whilst he was apparently well, and completely prostrate him. The pain was of a stabbing character and most severe about the lower abdomen and umbilicus, and was attended with great tenesmus of rectum and irritability of bladder These attacks, after lasting a few hours, would usually pass off, leaving him in a weak condition During the periods between attacks The last seizure began about he kept very well April 20 last (1887), when he consulted Dr Woodbury He was then haggard, sallow, and constipated, the tongue was heavily coated Abdominal pain was much complained of Urine contained much albumen and few casts He was placed upon usual medicinal treatment, but steadily grew worse Two days later his temperature rose to over 103°, pain became very severe, there was much nausea and vomiting, and a distinct hardening, but no tumor could be felt in the right iliac region of the abdomen These symptoms continued to augment until I saw him three days later, and determined that operation was his best and only chance. At the time of operation his condition was discouragingly wretched, that of a man in the dying stages of general purulent Nevertheless, operation was begun and peritonitis carried to successful termination The patient was stimulated and antiseptically cleansed The incision was made laterally over the seat of induration latter had now become slightly prominent An abscess cavity was entered at the depth of an inch below the abdominal surface, a free flow of pus took place and the cæcum and its diseased appendix came into view A phosphatic concretion resembling a cherry stone was found alongside that organ, but entirely outside it, and evidently was the cause of the whole trouble The vermiform appendix was greatly swollen and exhibited a perforating ulcer three-fourths around its circumference and very near to the point of its cæcal attachmert A silk ligature was applied close to its root and the remainder excised, together with a large portion of omentum which projected into the abscess cavity The peritoneal cavity was then thoroughly washed out with warm water, for an opening into the general peritoneum was found, and through it the pus had passed into the cavity of the peritoneum. The abscess walls were then thoroughly curetted and, after a final wash, a rubber drain was carned to the botttom of the pelvis and the wound On the following day, drainage was partly closed being imperfect, every stitch was removed, the wound gaped immensely, sloughs came away, healthy suppuration was established and granulations appeared, and the wound promptly closed

Convalescence was uninterrupted from this time, his temperature never again reached 100°, and he has enjoyed perfect health until the present time The drain was removed piecemeal, the last portion not until sixteen days after operation

In the following case the result was less fortunate

often yield, and the general peritoneal cavity becomes | April 3, when I incised the now greatly enlarged mass, involved and peritonitis results

cavity which surrounds the organ, so that when perforation occurs, the contents of the abscess form a tumor, or more or less defined hardness Such tumors frequently make their way toward the surface, and the superimposed structures become infiltrated and markedly ædematous In such cases the perforation of the appendix may remain open and a fistula form between the bowel, the abscess cavity and strual period, the patient suffered with pain localized the external abdominal surface

In January, 1885, I saw a case of this character in consultation, in a lad 11 years of age, who had all the symptoms of perforation and abscess of the appendix A tumor gradually developed and perforated the abdominal walls incision and evacuated a large amount of pus The [general condition of the patient at the time did not warrant a search for the appendix The fistula never closed, the boy two years later perished from pulmonary tuberculosis In any abscess of the ileocæcal region, we should always suspect appendix disease, and an effort should always be made to expose this organ In no case should a simple evacu ation of pus be considered sufficient, especially if the history of the case presented any account of former appendix trouble A case of this character came under my care some two years ago, in which I simply evacuated an abscess situated in the ileo-cæcal region, and made no investigation of the appendix, as the abscess cavity seemed a closed one Two years later I was obliged to make abdominal section and removed a diseased appendix, which undoubtedly existed at the time of the first operation

The incision was then closed and an antiseptic dressing applied She reacted and continued to do Immense swelling of the wound occurred on These continued until the following day and necessitated the cutting of all

TREATMENT

For practical purposes, the treatment of pericrecal inflammation must be divided into two subdivisions, that of the pre purulent and that of the post purulent or suppurative stage, or first, before the formation of pus, or of appendix perforation, and second after that event

The treatment of the pre-purulent, irritative or simply inflammatory disorders of the c ecum and its surroundings, should consist of rest in bed, restriction of diet to nourishing liquids, hot poultices or fomentations frequently replaced upon the parts, perhaps local depletion, and the hypodermic exhibition of morphia to control pain The bowels should be kept open and free from the accumulation of gas or feces by the administration of saline laxatives and enemas, perhaps with the addition of turpentine to the latter

Pain of intense character, would often be as much an indication for operative relief as for morphia

Prompt resolution should take place in cases which are not to go on to the stage of pus formation, and very long continuation of symptoms or relapses or recurrences would be strong indications for surgical interference

The presence of such tedious recovery, relapse or recurrence, would point to the probable presence of conditions exceedingly dangerous to the patient, from hability to general peritonitis or perforation at They would further point, as a rule, to the appendix as the source of irritation and danger, region under consideration

Where the process has reached the suppurative stage, and this condition has been recognized, the course to be pursued is, indeed, very plain Even a small amount of pus lying near the peritoneum is vastly more of a risk than an abdominal section performed for its removal Hence, I should operate whenever the diagnosis of pus has been made occasionally even without positive diagnosis-indeed, without qualification, I repeat, that pus being present in the region of the cæcum, operation is positively ind.cated

Many other risks are to be taken rather than those of purulent peritonitis, for early interference will save most, if not nearly all, cases from this latter dread slight compared to that of rampant abdominal inflammation

Local or general peritonitis supervening in a person who has a history of crecal trouble or starting during a first attack would more than justify op eration

At a later stage of the disorder, all available diag nostic skill must be everted to detect a pericæcal abscess, should it point in an anomalous situation We must ever, however, bear in mind the surgical rule always to attack pus at its source if possible When the crecum is normally placed, this is always feasible if the disease be recognized

THE OPERATION

On account of the nature of the case, there is little time for special preparatory treatment for The surroundings of the patient the operation should correspond with the usual requirement for abdominal operations Asepsis should be rigidly observed in every particular

The aspirating or exploring needle should never be used for diagnostic purposes, for if it does not find pus, we cannot be sure that none is present, while its own dangers are not inconsiderable these cases it is a dangerous and especially unsafe diagnostic resource

Having the patient supine and extended, the field of operation is to be thoroughly cleansed, shaved, and washed with a bi chloride solution I 1000 and finally with ether Towels wrung out of the mercuric solution are placed to protect the field of operation

The line of abdominal incision should be slightly oblique or vertical, not median but lateral.

The advantages of the lateral incision are very obvious and positive If median, the peritoneal cavity would often be opened needlessly, and at a point far remote from the cæcum and appendix, and in a position in which the cæcum and appendix cannot well be reached or dealt with The lateral incision can be made of less size and directly over the appendix and abscess cavity Moreover, in this situation, small circumscribed or secondary abscesses in the abdominal wall, which are sometimes come upon, indeed, in man, that worse than useless appendage can be evacuated before the peritoneum is reached, must be regarded as the root of most evil in the and at its base all necessary manipulations can be made in many cases without opening the general peritoneal cavity at all, while, should the suppuration have extended in this direction, the intestines can just as well be examined and cleansed through a lateral as through a median incision Should there be subsequent sloughing of tissue, as frequently occurs, the sloughs can be far more readily discharged through an opening immediately over the locality of the disease than if it were situated elsewhere, while drainage can be much more thoroughly accomplished by a lateral incision The length of the incision depends upon the conditions found after the abscess cavity is reached an incision three or four inches in length will often be sufficient for the removal of the appendix, but in case there is a large complication, while the danger of operation becomes abscess cavity it can be increased to any desired

> The favored or lateral incision should began at a point about an inch above the middle of Poupari's ligament and to the outer side of the right linea semilunaris, to be continued from this point upwards in a vertical direction, or outward and upward, and carried down until pus, cæcum or peritoneum shall be reached From numerous dissections, made with a view to determine the ordinary position of the appendix vermiformis, I have found that this organ is normally placed immediately under a point two inches distant from the right anterior superior iliac spinous process, on a horizontal line drawn from this process towards the median line of the body

When the abscess cavity is reached, gas is usually The wound can then be enlarged first discharged if necessary, in order to fully expose the cavity Irrigation with boiled water at a temunderneath perature of 105° or 110°, and careful sponging, now permits a clear view to be had of the surroundings of tion of fæces or a foreign body in the cæcum itself, the cæcum, and its appendix The latter is usually found to be the seat of trouble It would be well to excise it in any case, whilst we have the chance, for any cæcal trouble would be likely, in time, to excite disorder in its appendage Without a doubt it should be so treated, if found inflamed, perforated or harboring foreign bodies This can best be ac complished by ligating it as close as possible to its cæcal attachment with a strong silk thread, and then of an artificial anus Recent experience in cases of cutting it off beyond the ligature Cæcal perfora tions if found, should be cleaned and curetted, and that the abdominal wound should never be closed, ' closed by Lembert's suture, even ulcers which except perhaps in the simplest cases, where no pyo not perforated might by the same means be genic membrane exists. Where there is any degree ed into the bowel lumen If the general peri- of suppuration, sloughing or pyogenic tissue, the ab cavity has not been involved the walls of the dominal wound is certainly best treated by the open abscess should be gently curetted, washed with a method mercuric solution 1 1000, and a large drain carried to the bottom of the wound and brought out at its most dependent part The external wound should, with the exception of a suture or two, be left thus to afford free vent to pus and the results of de thoroughly open, and lightly filled with an antiseptic dressing A rope of absorbent cotton should be placed in the glass tube, a large mass of cotton should cover the abdominal and wound surface

four tailed flannel bandage completes the dressing The question of using Lembert's suture after amputating appendix, as has been suggested, is of no practical importance The constricted or tied portion which is very close to the cæcum must close by granulation, indeed, the situation is very similar to that existing when Fallopian tubes are ligatured and removed for suppurative salpingitis No one would think of using a Lembert suture in such a case Moreover, I have found it impossible to employ such sutures after appendix excision, because the tissues being cedematous, infiltrated and friable, will not permit it The attempt to approximate them only causes Cæcal perforations are the threads to tear through As already said, the attempt should be made to close such with Lembert's suture if possible, but even here the gut can be lifted up by tenacula and perforation obliterated by a silk ligature

If the general peritoneum has become involved, the whole abdominal cavity must be thoroughly washed out with hot distilled water, temperature 105° to 110° F, or bichloride of mercury solution 1 10,000 The intestines should be cleansed with sponges and the foreign body, if that has been the source of the perforation, searched for Should peritonitis be far jection of morphia may be required to relieve pain advanced, the intestines must be withdrawn and all adhesions parted with a finger or a knife During the rules of abdominal surgery are observed process of cleansing, and before they are returned to ton rope should be changed in the tube every few the peritoneal cavity, they should be thoroughly protected with towels wrung out of hot water In all gated with a weak carbolic acid or other antiseptic, cases of general peritonitis a glass drainage tube especially where, as is often the case, the secretions must be carried to the bottom of the pelvis and kept are offensive in character in working order by means of ropes of absorbent there will generally be no need of a second or supercotton which act by capillarity In some cases it ficial drainage tube, as the discharges will be at once

may be well to use a second tube of rubber for the more superficial or pericæcal cavity, but if the wound is treated by the open method, this second tube can be dispensed with

Should the cause of the morbid process be impac they must either be excised, or urged by prudent force along the bowel In their operative removal a simple incision, afterwards brought together by Lem bert sutures, would answer every purpose If por tions of the cæcum have sloughed and the breaches of continuity are too large to approximate with Lem bert sutures without producing dangerous constne tion of the gut we must be content with the formation appendix abscess has led me to the above conclusion By this I mean that, with the exception of one or two points of suture, or perhaps no sutures at all, the wound is allowed to remain open, so as to favor granulation from the bottom of the cavity, and structive inflammation Doubtless the cæcum will be exposed, but it will not protrude, and need not lead us to anticipate the slightest difficulty portion of the bowel is in a comparatively fixed post tion and will always afford a barrier to the protrusion After the wound has granu of the small intestines lated to the surface if there is any disposition in it to gape it can be readily approximated and held in posi tion by strips of rubber plaster The same general principles of treatment will hold even for those rare cases of displacement of the cæcum as into scrotal and other hernia, its abdominal transposition, etc important question in these cases will be the diag nosis

It can properly be said that there is no fixed rule for the time of operation in cases of abscess of the ileo cæcal region All I can say in summing up the subject is that when symptoms strongly suggestive of the presence of pus are seen, it is far safer to operate at once than to wait Procrastination in such cases really means even more than surgical uncertainty This uncertainty can be set aside only by an explor Delay is productive of the gravest atory incision consequences to the patient, the prognosis growing worse every hour that the operation is postponed

AFTER TREATMENT

Immediately after the operation a hypodermic in or check vomiting or restlessness Before it is replaced the tube should be im

absorbed into the superimposed dressings. The time for the removal of the glass drain from the pelvis will depend altogether upon the subsidence and character Frequently the tube is gradually of the secretion forced out by the action of the intestines themselves and at the proper time The abscess cavity should be treated exactly as such foul abscess cavities would The closbe treated in any other part of the body ure of such a putrefying tract would only add to the danger of the patient without a single compensating advantage

The bowels should be kept in a soluble condition by salines, threatened peritonitis should be met by active purgation by salines, milk should be given in small doses and at short intervals, and stimulants are generally required Where there has been much exhaustion and considerable suppuration champagne

should be admimistered ad libitum

Typhoid or tubercular crecal, or appendicular inflammation or perforation likewise should receive identical treatment as for the simple inflammatory disorders of that region This whole subject is still in its infancy, so far as the majority of the profession are concerned, but it is of almost boundless promise

REPORT ON INTUBATION

Read in Section on Diseases of Children, at the Thirty ninth Annual Meeting of the American Medical Association, May 10, 1888

BY F E WAXHAM, MD,

PROFESSOR OF OTOLOGY, LARYNGOLOGY AND RHINOLOGY, COLLEGE OF PHYSICIANS AND SUCCEONS OF CHICAGO CLINICAL PROPESSOR RHINOLOGY AND LARYNGOLOGY CHICAGO OPHTHAL LIC COLLEGE

Intubation of the laryn, while not perhaps fulfilling the expectations of some has, nevertheless, within the past year gradually grown in favor and more extended experience has proven the full value of this procedure An occasional physician has met with such signal failure as to disparage the operation and to abandon 1t The same however may be said of tracheotomy, and it is no argument against the oper-

As the full value of an operation can be determined only by a careful investigation of the results in quite a number of cases, I here present a record of my first 150 operations, and although this number is not large it is sufficient to fairly demonstrate that intubation of the larynx possesses nearly, if not quite all the advantages claimed for it In none of the following cases has the operation been performed until severe and increasing dyspnœa has demanded surgical interference In a few instances where I have been called in consultation I have declined to operate beheving that the patients would recover without it Frequently I have delayed operating during my first visit but being subsequently called found it necessary to do so in order to further prolong the life of the In the great majority of cases I was called in consultation with other physicians and the operations performed as a last resort, after all other modes of treatment (excepting tracheotomy) had been found useless and the patients practically given up to die

In the New York Medical Record, of Oct 29, 1887, Dr O'Dwyer reports 50 cases, with 12 recoveries, and in the New York Medical Journal, of Jan 14, 1888, an additional 50, with 15 recoveries, making a total of 100 cases, with 27 recoveries, or 27 per cent

I have within the past year collected, by inquiry and by letter, as well as from published reports, records of 1072 operations performed in various parts of the United States, with 287 recoveries, or 26 77 per cent In 661 cases the ages were given and were as follows

No of Cases	Age	Recoveries	Percentage
31 97 149 140 98 56 27 32 12 10	Under 1 yr 1 year 2 years 3 " 4 " 5 " 6 " 7 " 8 " 10 " 11 "	5 15 29 42 32 19 10 16 5 5	16 12 15 46 19 46 30 00 32 65 33 92 37 03 50 00 41 66 50 00 40 00 00 00
Total,661		181	27 38

The most unpleasant feature of intubation has been the mability of the patient to swallow liquids Solids and semisolids frequently have not been relished or properly digested, and the craving for water has often been so great that parents have sometimes regretted the operation and have blamed the physician for prolonging life and adding an additional cause of suffering It is undoubtedly true that the falling of fluids and solids through the tube and into the bronchi is frequently the cause of broncho-pneu-I have long been at work endeavoring to devise some means of covering the upper opening of the tube during deglutition, and thus overcoming this objectionable feature of intubation The first device for this purpose was the rubber epiglottis exhibited to this Society one year ago While this arrangement was satisfactory in many cases yet in others it would often fail on account of becoming disarranged during the introduction of the tube or later from coughing After much thought and many experiments a metal epiglottis was devised as a substitute This metal epiglottis is controlled by a spring of gold wire inclosed in the hinge at the upper end of the tube the patient swallows, the metal cap is pressed down over the opening of the tube and solids and fluids are prevented from passing into it To prevent sudden suffocation in case any accident should occur to the spring, a slot is made in each side of the head of the I have used this device with tube and near the rim great satisfaction, and the ability to swallow liquids is particularly noticeable in the older children. They

Pa tent ejected the tube with a piece of membrane which did not re-form and recovery quickly followed

SUMMARY OF THE PRECEDING TABLE

Total number of cases, 150

Recoveries, 41

Percentage of recoveries, 27 33

Average age of all cases, 3 years, 11 months and 3 days Average age of those recovering, 4 years, 3 mos and 24 days Average age of fatal cases, 3 years, 8 mos and 7 days

Since the above report the writer has had 9 cases with 3 recoveries, making a total of 159 cases with

44 recoveries, or 27 67 per cent

will take an unlimited amount of fluid without difficulty, which they can not do with the open tube without the most violent coughing. With infants the difference is not noticeable in all cases, many however will swallow without any difficulty whatever

In giving liquids it is better to give them from a

spoon with the head inclined forwards

It would naturally be inferred that this metal epiglottis projecting upwards and lying against the true epiglottis would cause greater irritation and more coughing than the open tube, but I have not observed this to be true. The following cases, only two out of many equally happy in termination, illustrate the

advantages of this device

March 2, 1888, I was called by Dr B D Foster to perform intubation upon a little girl 5½ years old She had been suffering from diphtheria for several days, when the larynx became involved Both tonsils and uvula were covered with diphtheritic membrane, the urine was loaded with albumen, and the dyspnœa from laryngeal obstruction was intense The loud stridor of croup was heard all over the house and the case seemed as hopeless as could have been well selected A tube with the metal epiglottis was introduced giving prompt and entire relief to the difficult breathing The child revived and took liquid It was a nourishment without the least difficulty great comfort to be able to give this patient an abundance of water Milk and brandy were taken freely, without which I am confident recovery would not have resulted, as the child was greatly prostrated The case progressed favorably, although the urine continued to be loaded with albumen Forty eight hours after the operation she ejected the tube, together with a membranous cast The patient improved somewhat and the respiration remained comfortable without the tube for three days, although on the second day she was taken suddenly with a choking spell and the parents thought she was about to After struggling for a few moments she ejected die a large piece of false membrane, which gave her relief The third day after the rejection of the tube the gradual return of the dyspnœa, due to reformation of membrane, necessitated its reintroduction dyspnœa at this time had become almost as intense as when the operation was first performed The child again revived, and continued to improve for three days when the tube was removed The albuminuma gradually disappeared and the patient made a perfect

April 13, 1888, I was again called by Dr Foster, again introduced and worn with the same common to operate upon a boy 3½ years old. The patient one night when it was again expelled with a small

had been sick about one week with diphtheria of a mild type when the larynx became invaded and the usual symptoms of croup followed At the time of the operation the symptoms were urgent The pulse was rapid, the respiration rasping with the stridor heard both on inspiration and expiration There was sinking in of the walls of the chest with every inspir ation, and the patient was bathed in perspiration As my two smallest tubes in the set were in use I was obliged to introduce a tube suitable for a much older child The tube with a metal epiglottis was employed and the urgent symptoms were entirely relieved On account of the large size of the tube fluids could not be taken without some coughing, but solids and semisolids were swallowed without difficulty One thirty second of a grain of bichloride of mercury was given hourly, well diluted, and a steam atomizer constantly employed The child did remarkably well for two days, when there was partial detachment of mem brane below the tube and the respiration suddenly be came greatly embarrassed I was hastily summoned but found the child again breathing comfortably There was, however, a peculiar, loose, hoarse cough, indicating false membrane below the tube Fearing sudden suffocation, from detachment of a large mass of false membrane, the tube was removed, when the child, after coughing and strangling for a moment, expelled a large membranous cast of the trachea As the respiration seemed comfortable without the tube Twelve hours later it was not at once reintroduced however the membrane reformed and returning dysp nœa again rendered it necessary A smaller tube was introduced and the patient instantly relieved With this tube he was able to take liquids without the least difficulty, which rendered it possible to continue The comfort of the child was with the medicine perfect for twelve hours, when the tube was ejected Urgent dyspnæa with a small piece of membrane did not return for several hours, but finally, however, it became necessary to again introduce the tube, and when this was done the respiration ceased, the pa tient became blue and it was necessary to at once The trouble was obvious, mem remove the tube brane had been crowded down below the tube As the tube was removed another membranous cast was The simple introduction and removal of the tube was sufficient to detach the membrane and The patient now to relieve the urgent dyspnœa passed twelve hours without the tube very comfor tably, when it again became necessary to introduce It was retained for twenty four hours, during which time he took an abundance of nourishment Indeed it was and water without any annoyance observed that he took more nourishment and with less difficulty with the tube than without it The tube finally was expelled, together with another piece of membrane that had become detached below it The patient now passed eighteen hours without the tube While the respiration was more or less embarrassed during this time, yet it was hardly sufficient to call for interference until the expiration of this time, The tube was when dangerous dyspnæa returned again introduced and worn with the same comfort for

The cough now became loose patch of membrane and considerable membrane was expectorated in small pieces and in the form of muco pus dyspnœa did not return and the boy made an excellent recovery

I have just received a letter from Dr O'Dwyer, in

which he says

"I received the tubes with artificial epiglottis which I have used in one case at the asylum and the result as far as swallowing was concerned, was most satisfac-In fact I never saw a child with the ordinary, unprotected tube swallow anything like as well The old nurses, who are so thoroughly familiar with this subject, uniformly agreed upon this point There is no doubt but that this artificial epiglottis will be an immense improvement in the operation"

The metal epiglottis which renders it possible for patients to swallow liquids will, I am convinced, increase the popularity of the operation and enable us

to save a larger proportion of patients

70 Monroe Street

THE INFANT-FOOD PROBLEM

Read in the Section on Diseases of Children at the Thirty Ainth Annual Meeting of the American Medical Association, May 10, 1888

BY WM B ATKINSON, A.M, MD,

FROFESSOR OF DISEASES OF CHILDREN AND SANITARY SCIENCE IN THE JEDICO CHIRURGICAL COLLEGE PHILADELPHIA

To the general practitioner everywhere, there constantly comes the question, What means shall be employed to prevent the terrible mortality among infants deprived of their natural food, the mother's breast milk? As it is in very many cases impossible to place the child outside the walls of a large city, this want of proper hygienic surroundings acts as one great factor in the production of disease But perhaps the most active cause of disease is the exhaustion of the vital powers from the want of those articles which, being properly and readily assimilated, aid to maintain the body in its highest and healthiest con-We all know that, other things being equal, that child which has been able to keep its system in the best state, its blood rich and pure, its muscles plump and firm, is sure to pass through an epidemic of children's affections either entirely unscathed or suffering only from a slight attack, readily throwing off the disease and never being troubled with the sequelæ

Defective nutrition, then, is the predominant factor in the causation of the fearful mortality everywhere observed among children We need only point to the statistics of children's hospitals, foundling asylums and similar institutions to show the truth of this

proposition

To us, as physicians and sanitarians, as citizens earnest for the welfare of this great Republic, this comes with powerful import An additional fact also appeals to us when we learn that the vast majority of these are offspring of the native born, while those who survive are largely the children of foreigners This is shown by the valuable statistics of such in-

compelled to admit that other causes, and one a very potent factor, produce the great disproportion between offspring of natives and foreigners, yet it must be admitted that the truth of our original proposition still is evident, that defective vitality causes a vast majority of deaths among infants, and even in children of larger growth

The latter fact is constantly shown by the great mortality which prevails when, by reason of short crops or other causes, the people are unable to procure the food needed to maintain their systems up to

par and thus resist the inroads of disease

It goes without saying that the infant should be raised on its mother's milk whenever possible When, for any cause, this fails, then comes the question, what shall be the substitute? Abroad the milk of asses and goats is in quite common use Cow's milk, being that most easily obtained, is most largely employed in this country This being the fact, we next come to the consideration as to how the two kinds of milk differ, and what is needed in order to cause that of the cow most nearly to approach that of the human

Cow's milk contains more proteid matter, more fat, more mineral matter and less sugar, and as a rule, in health human milk is alkaline, while cow's milk is One special difficulty with cow's often slightly acid milk is that its casein is more or less likely to form an insoluble mass by contact with the gastric juice, while the casein of human milk is in part a peptone, and forms a very delicate coagulum when in contact

with the gastric juice

The effort is always to produce a food for infants closely resembling in its composition the mother's milk, and the nearer this is reached in all its details, the more surely will such food prove wholesome and valuable to the infant

Our idea of a standard infant food, then, would be produced as follows Be sure to obtain the milk of a healthy cow Just here we may premise that we do not believe in the common fallacy, "one cow's The mixture of the milk of several healthy cows is more sure to give an article of real value Undoubtedly, many in this audience can substantiate the claim that it is most usually the pet cow, from which is obtained the milk which is put up for the sick baby, that receives all the banging, hurrying and pelting and, as we all know, is thus likely to yield a milk which may actually be poisonous in its nature The best combination would be pure milk diluted with sufficient pure water to reduce the relative proportion of albuminoids and mineral constituents most nearly to that of human milk, then partially peptonize or digest it, and finally add a soluble carbo-hydrate with sufficient alkali to produce as close a resemblance to breast milk as may be We must not forget that peptonizing milk does not relieve us of the need of being sure that the milk is at the outset pure and fresh.

The milk supply of large cities has now become one of the great problems of the day Churned in the cars to the city, then more thoroughly churned in the wagons over the wretchedly paved streets, dis-Vestigators as Dr Nathan Allen Though we are tributed in many cases from doubtful cans by persons

of much more doubtful appearance as to their own cleanliness, the flavor often aided by the puffing of a cigar or filthy pipe on the part of the distributor, the article is received in many cases in a receptacle of equal doubt as to cleanliness, it is placed, perhaps, in a food chest or so called refrigerator, exposed to the atmospheric contact of other articles of food Is it to be wondered at that the milk becomes of a very doubtful form as to its propriety as an infant aliment?

the new plan of delivering what is called "whole milk " The milk is very carefully placed in glass jars immediately after being drawn from the cow, these, being quite full, are hermetically sealed so that there can be no opportunity of churning or adulteration, or the absorption of odors or disease germs children who have passed the age of infancy, I have fermentation, acidity, diarrhea and the usual train of long been in the habit of urging the employment, particularly during hot weather, of what is called "evaporated milk" Its claims were that it was the Its claims were that it was the milk from healthy, well-fed cows and, being of a density greater than cream, churning and souring were less likely to occur during its transition to the Again, it was very much less ready to absorb or appropriate the odors, etc, to which it might be subjected I have found this more easily borne by the child, and repeatedly I have been compelled to substitute it for the "condensed milk," where a certain proportion of sugar is added in order to preserve be pure and fresh the article

For these reasons, Prof Vaughan urges the use of rise to the suspicion that they are already assuming dried milk solids, that is, they can be transported without injury from any distance and, if properly prepared, may be kept without putrefaction occurring Now, if such pure milk from perfectly healthy cows were partially predigested by the process of peptonization with fresh pancreatine, the temperature sufficiently raised to destroy the ferment, then reduced to a powder by evaporation, and to this dextrine added, thus supplying the carbohydrate, we would then come as near the production of a proper food for infants as might be possible in the absence of the breast-milk

By recent researches, we have been taught that dextrine is the best form of carbohydrate, as it is non-fermentable and does not irritate the stomach of the infant, is easily assimilated and, unlike cane sugar or maltose, is not likely to take on acid fermentation Roasted wheat flour has long been employed and recommended as an article of food for infants, and particularly where diarrhœa is present The reason of this is because this process converts the starch of the flour into dextrine

The malt sugar or so called "Liebig foods" are no doubt often valuable, particularly in infantile constipation, for their laxative effects, but are extremely liable to continue a diarrhœa or increase it these are used for their laxative effect, it is safer to in each instance why this should be done Just here use them alone rather than with milk, lest their fer- it is equally important to see that the water is not mentative tendency be aggravated by the presence of too great a quantity of albuminoid matter

that the "Liebig foods" do not of themselves meet remark by the remembrance of an inspection just the requirements demanded for infantile nutrition, made for the State Board of Health of Pennsylvania.

unless with the addition of cow's milk amination of the analyses of such mixtures, we find that they add no essential to cow's milk, nor do these foods act chemically upon the casein, nor physically by reason of their solubility, and, as I have before remarked, they may give rise to disorders of diges tion in consequence of the readiness with which they take on fermentation

Farinaceous foods are of course out of the question, because of the absence of ptyalin in the secretion of To a certain extent, these objections are met by the salivary glands in the earlier years of infancy The addition of starchy matters to cow's milk with the purpose of rendering the coagulum less dense and more easily broken up in the stomach, as has been recommended by some authorities, is wrong in prin ciple, it really adds an indigestible element, which cannot fail to act as a foreign body sure to produce

> The milk foods, when diluted with water in accord ance with directions, should correspond in nutritive value with human milk Now, that this correspondence should be more nearly perfect, they should also be partially predigested or peptonized, in order that the casein may be rendered more acceptable. It is also necessary that sugar in some form should be added

In peptonizing milk, it is of the greatest importance that the pancreatic extract which is employed should The odor of some digestive fer ments as furnished by the stores is such as to give the putrefactive tendency In fact, it is a very difficult matter to preserve them, as it is well known that the products of the pancreas are much more readily decomposed than any known animal substance Hence the greatest care will be necessary that there shall not be the slightest possibility of the presence of putrefactive germs in any of these articles that may be employed to aid in the preparation of the diet of infants The peptonizing of milk, although apparently a very simple matter as practiced in the laboratory, yet is scarcely feasible in the household

Another point is of great importance is eminently prone to absorb moisture, and hence it should not be combined with dried milk and then put in bottles or other form of package for family use, because, as these packages are only partially used at one time, the balance is extremely liable to absorb moisture, resulting in fermentation, and this is more especially the case in hot weather or when kept in a hot room

We cannot too strongly urge upon all who are compelled to prepare food for infants the great, the imperative necessity of using only water that has To the medical man, the reason is been boiled plain, yet it would not be amiss for him to explain cooled by the addition of ice, as we may thus return too great a quantity of albuminoid matter

I am incited to this remark by the remembrance boiling was intended to expel I am impelled to this

The subject of complaint was the ponds from which ! the ice was obtained to supply the demands of a large stream really nothing but a drain for a full graveyard, one or more slaughter houses, a large number of cesspools which were in constant use, and a large area of swamp land

In diluting any form of infant food we should give positive, definite quantities Undoubtedly all of us have encountered many instances where the child was really starving, while apparently receiving a large quantity of fluid been carried too far

It is unnecessary for me to occupy your time with further points as to times for feeding, nor of necessity for using bottles, etc

Before closing, I may remark that, in my investigation of foods for the preparation of a paper which may be read elsewhere, I received from my friend Chief Medical Purveyor Baxter, of the United States Army, a tabulated analysis of some fifteen forms of foods Of these, only four contained more than 10 per cent of nutritive material, thus showing that even here we are likely to be deceived, and to be employ ing an article as useless for its proposed purpose as the too largely diluted food of the infant already mentioned

In conclusion permit me to say that it has long been my custom, not only in my practice, but also in my teachings, to urge the giving of less medicine, using it only when imperatively demanded, and to insist upon the value of proper hygiene and proper nourishment, believing that these alone, in many cases, will at once place the child on the road to health, and if persevered in will, as a rule, maintain it there

GASTROTOMY FOR REMOVAL OF FORK BY MAX E WITTE, MD, OF JT PLRASANT IOWA

Mrs H W, et 31, married, native of Ohio, was admitted to the Iowa Hospital for the Insane at Mt Pleasant, July 3, 1885, suffering with acute mania The first symptoms of disease were manifested June 20 1885, by wild and irrational language and actions

Since her admission to the Hospital, the maniacal condition has been continuous, and subject to little variation Her habits have been irregular and disorderly, and at periods she has been decidedly excited and violent

During the months of October and Nevember, 1887, she had paroxysms of more than usual mental disturbance, during which it was evident that she suffered much pain, would cry out as if in great distress, walk about cramped, and bent forward and to the left Her mental confusion was so great, however, that no satisfactory information regarding this distress could be obtained from her

In the early part of December a tumor was detected in the abdominal cavity, to the left of the um-

ing torture, which was fast exhausting her strength By the middle of the month, the patient had become These ponds were filled with water from a much emaciated and weakened, and was in a truly marasmic condition The tumor could be plainly felt through abdominal walls, and was apparently the Its exact character could not be size of an orange detected

> December 16, pain was even more severe than usual, and a hard pointed body could be felt connected with the tumor, and involving the abdominal The diagnosis was made of a foreign body The fact is that the dilution had within the alimentary canal, and perforation of the intestinal walls

Operation was at once determined upon, since the The writer op patient's life was in imminent peril erated with the efficient assistance of Dr P F Straub, of the Hospital Staff, making an incision three inches long, parallel to the curve of the costal cartilage, on that side, and directly over the foreign The four prongs of a large table-fork were found projecting through the anterior walls of the stomach near the greater curvature, which had been dragged downward and to the left The stomach was opened and the fork liberated and removed After thorough exploration of the stomach, and cleansing the edges of gastric opening, they were sutured to abdominal wound by means of deep This method was chosen since there were some adhesions of stomach to abdominal walls other set of more superficial sutures was then introduced to approximate the walls still more closely Iron dyed silk and strongly curved needles were employed, and during the operation and subsequent dressings strict antiseptic precautions were observed Patient rallied well from the effects of the operation Her temperature at no time was above 100° F, nor her pulse over 86 She was free from pain, and slept well with chloral hydrate gr xxx given nightly by

A little ice was put in her mouth occasionally, but during a period of twelve days following the operation, food by mouth was entirely withheld fed by nutrient enemata, consisting of beef peptonoids, pancreatic emulsions of milk and defibrinated

After this period concentrated and nutritious food was given by mouth, and without causing any trouble The healing of the operation wound was somewhat retarded by her having during the fourth night, eluded the vigilance of the nurse and turned in bed, thereby partially separating the edges of the wound accident was repaired by the freshening of the wound and the introduction of more sutures

The wound healed throughout the greater extent by first intention, and without resulting fistula. Patient rapidly regained flesh and strength, and is now Digestion is good, and she in usual physical health has no pain or tenderness anywhere about abdomen

The fork is seven and one-half inches long, one inch wide across the prongs, is heavy, four pronged, and spoon handled It is heavily plated with silver, but blackened by action of the gastric juice, where bilicus and in a horizontal plane with it. It became the plating had been chipped off. The fork was daily more painful and caused the patient excruciation missed September 13, 1887, and patient at that time,

and subsequently, stated that she had swallowed it, but the idea seemed so absurd that no credence was given to her story During more than three months, from September 13 to December 16, 1887, the fork had been in her stomach

A CASE OF ACUTE RHEUMATISM IN AN INFANT ELEVEN DAYS OLD

BY ALEX GUTHRIE, MD,

OF CAIRO, ILL

Inasmuch as this case in its etiological bearings is somewhat unique, I will give a moderately full report

of the lying-in period of the mother

Lilha K, æt 18, primapara, was delivered of a healthy male child on March 11, 1888 On the 14th she was attacked with severe pain in the umbilical region, followed by a light chill and high fever Was very restless all night and sent for medical aid the next afternoon When I arrived the pain was moderately severe and paroxysmal, there was marked tenderness over upper two-thirds of abdomen, but very little over lower third Temperature 102 1/2° Tongue furred Breath offensive One stool yester-Lochia normal. day

Hydrarg chlorid mite gr 6 Morph sulph gr 3/3
my Chart No 3
One every two hours, to be followed in four hours by 1 oz

castor oil and gtt x oil of turpentine, also hot fomentations to

This produced free catharsis and great relief

On the evening of the 17th, I was again called, and found her suffering from acute rheumatism, involving both shoulders, left wrist and both knee-Abdominal tenderness had disappeared Lochia normal R Sodii salicylat gr x, every two Also, quin sulphat gr v, every four hours, and puly specae comp prore nata Under this treatment she speedily obtained relief and was soon convalescent.

This much by way of its possible etiological bear-

ings on her infant's attack

During the night of March 21st, and all day on the 22d, her babe was restless, slightly feverish, and cried whenever it was handled I supposed it to be colicky, and ordered a dose of castor oil, to be followed by gtt iv doses of tinct opii camphorat as occasion required Next morning the mother called my attention to its left wrist, which was much swollen, slightly red, and on the lightest handling or flexing of the joint the child would cry as if in pain R Salicylate sodium gr ss every three hours, and inflamed joint to be wrapped up in a woolen cloth wrung out of a warm solution of bicarbonate of soda

March 24 —Swelling has somewhat subsided in left wrist, but right knee and upper part of leg are swol-

To continue treatment len this A M

Sodæ, bicarb .

Э)

Potas acetat Aquæmenth pip S-31 every two hours, and continue camph tinct opium as occasion requires

27th —Swelling has almost disappeared from knee

and leg, but wrist is still puffy

28th —Both wrists and hands are swollen this A v Child seems bright and moderately well nourished, and only suffers on handling the swollen joints To continue treatment

30th—This AM the swelling has almost disap peared from the right wrist, and is much less at the left wrist-joint

April 2d —Has so far recovered that further visits

are deemed unnecessary

The hygienic surroundings were as unfavorable as possible The house in which the mother was con fined was cold and open, and the weather was cold and damp, her arrangements for fire were poor, as were also her food and attention In addition to this, rheumatism was prevalent in the city These facts, when taken together with the sudden appearance of the disease, the swollen, tender and painful joints, its migratory character, its yielding to alkalies, and the absence, so far as I could determine, of a syphilitic taint in the mother, seem to me to stamp the disease as acute rheumatism, notwithstanding the tender age of the infant

Longstreth (On Rheumatism, Gout, and some Allied Disorders, page 22) says "Only one case has been recorded under the age of one month " Henoch (Lectures on the Diseases of Children Wm Wood Page 311) reports a case at the age 1882 of ten months, which was also followed by hardress and contracture of the adductors of the thigh Widerhofer observed the disease in a baby twentythree days old, in the Foundling Hospital at Vienna -the only case of the kind that occurred among 70,000 children in eight years Stager met with it in a baby four weeks old (See Ziemssen's Cyclopedia, Vol XVI, pages 17 and 18)

May 15, 1888

MEDICAL PROGRESS.

EXPERIMENTAL INTESTINAL SURGERY -At the conclusion of his very able paper, "An Experimental Contribution to Intestinal Surgery with Special Reference to the Treatment of Intestinal Obstruction, read at the Ninth International Medical Congress, DR N SENN draws the following conclusions

Traumatic stenosis from partial enterectomy and longitudinal suturing of the wound becomes a source of danger from obstruction or perforation in all cases where the lumen of the bowel is reduced

more than one half in size

2 Longitudinal suturing of wounds on the mesenteric side of the intestine should never be prac ticed, as such a procedure is invariably followed by gangrene and perforation by intercepting the vascular supply to the portion of bowel which corresponds to the mesentenc defect

3 The immediate cause of gangrene in circular

constriction of a loop of intestine is due to obstruction of the venous circulation, and take places first in the majority of cases at a point most remote from the cause of the obstruction

- 4 On the convex surface of the bowel a defect an inch in width, from injury or operation, can be closed by transverse suturing without causing obstruction In such cases the stenosis is subsequently corrected by a compensating bulging, or dilatation of the mesenteric side of the bowel
- 5 Closing a wound of such dimensions on the excluded portion of the intestinal canal mesenteric side of the bowel by transverse suturing may give rise to intestinal obstruction by flexion, and to gangrene and perforation by seriously impairing the arternal supply to, and venous return from, the portion of bowel corresponding with the mesenteric
- 6 Flexion caused by inflammatory and other extrinsic causes gives rise to intestinal obstruction only in case the functional capacity of the flexed portion of the bowel has been impaired or suspended by the causes which have produced the flexion, or, by subse quent pathological conditions which have occurred independently of the flexion
- 7 As in flexion, a volvulus gives rise to symptoms of obstruction when the causes which have given rise to a rotation upon its axis of a loop of bowel, have at the same time produced an impairment or suspension of peristalsis in the portion of bowel which constitutes the volvulus, or when a diminution or suspension of peristalsis follows in consequence of the degree or extent of the rotation
- 8 Accumulation of intestinal contents above the seat of invagination is one of the most important factors which prevents spontaneous reduction, and which determines gangrene of the intussusceptum and perforation of the bowel
- 9 Spontaneous disinvagination is not more frequent in ascending than descending invagination
- 10 The immediate or direct cause of gangrene of the intussusceptum is obstruction to the return of venous blood by constriction at the neck of the in-
- II Ileo cæcal invagination, when recent, can fre quently be reduced by distention of the colon and rectum with water, but this method of reduction must be practiced with the greatest caution and gentleness, as over-distention of the colon and rectum is productive of multiple longitudinal lacerations of the peritoneal coat, an accident which is followed by the gravest consequences
- The competency of the ileo cæcal valve can only be overcome by over distention of the crecum, and is effected by a mechanical separation of the margins of the valve, consequently it is imprudent to attempt the treatment of intestinal obstruction beyond the ileo caecal region by injections per rectum
- 13 Resection of more than six feet of the small intestine in dogs is uniformly fatal, the cause of death in such cases is always attributable to the immediate ileum into the colon or rectum effects of the trauma
- tion, absorption and nutrition, and often results in of irreducible ileo cæcal invagination, where the death from marasmus

- 15 In cases of extensive intestinal resection the remaining portion of the intestinal tract undergoes compensatory hypertrophy which macroscopically is apparent by thickening of the intestinal coats and increased vascularization
- 16 Physiological exclusion of an extensive portion of the intestinal tract does not impair digestion, absorption and nutrition as seriously as the removal of a similar portion by resection
- 17 Fæcal accumulation does not take place in the
- 18 The excluded portion of the bowel undergoes progressive atrophy
- 10 A modification of Jobert's invagination suture by lining the intussusceptum with a thin flexible rubber ring, and the substitution of catgut for silk sutures is preferable to circular enterorrhaphy by the Czerny Lembert suture
- 20 The line of suturing, or neck of intussuscipiens, should be covered by a flap or graft of omentum in all cases of circular resection, as this procedure furnishes an additional protection against perforation
- 21 In circular enterorrhaphy the continuity of the peritoneal surface of the ends of the bowel to be united should be procured where the mesentery is detached by uniting the peritoneum with a fine catgut suture before the bowel is sutured, as this modification of the ordinary method furnishes a better security against perforation on the mesenteric side
- 22 In cases of complete division of an intestine, if it is deemed advisable not to resort to circular enterorrhaphy, one or both ends of the bowel should be closed by invagination to the depth of an inch, and three stitches of the continued suture embracing only the peritoneal and muscular coats
- 23 The formation of a fistulous communication between the bowel above and below the seat of the obstruction should take the place of resection and circular enterorrhaphy in all cases where it is impossible or impracticable to remove the cause of obstruction, or, where after excision it would be impossible to restore the continuity of the intestinal canal by suturing, or where the pathological conditions which gave rise to the obstruction do not constitute an intrinsic source of danger
- 24 The formation of an artificial anus in the treatment of intestinal obstruction should only be practiced in cases where continuity of the intestinal canal cannot be restored by making an intestinal anastomosis
- 25 Gastro-enterostomy, jejuno ileostomy and ileoileostomy should always be made by lateral apposition with partially or completely decalcified perforated bone plates
- 26 In making an intestinal anastomosis for obstruction in the cæcum or colon, the communication above and below the seat of obstruction can be established by lateral apposition with perforated approximation plates, or by lateral implantation of the
- 27 An ileo colostomy, or ileo rectostomy by ap-14 Resection of more than four feet of the small proximation with decalcified, perforated bone plates, intestine in dogs is incompatible with normal diges- or by lateral implantation should be done in all cases

local signs do not indicate the existence of gangrene cooled down, in order to watch the effect on the

28 In all cases of impending gangrene or perforation, the invaginated portion should be excised, both ends of the bowel permanently closed, and the continuity of the intestinal canal restored by making an ileo-colostomy or ileo-rectostomy

29 The restoration of the continuity of the intestinal canal by perforated approximation plates, or by lateral implantation, should be resorted to in all cases where circular enterorrhaphy is impossible on account of the difference in size of the lumina of the two ends of the bowel

30 In cases of multiple gunshot wounds of the intestines involving the lateral or convex side of the bowel, the formation of intestinal anastomosis by perforated decalcified bone plates should be preferred to suturing, as this procedure is equally, if not more, safe, and requires less time

31 Definitive healing of the intestinal wound is only initiated after the formation of a network of new vessels in the product of tissue proliferation years from the approximated arrows surfaces.

from the approximated serous surfaces

32 Under favorable circumstances quite firm adhesions are found within the peritoneal surfaces in six to twelve hours which effectually resist the pressure from within outward

33 Scarification of the peritoneum at the seat of coaptation hastens the formation of adhesions and the definitive healing of the intestinal wound

3.4 Omental grafts, from one to two inches in width, and sufficiently long to completely encircle the bowel, retain their vitality, become firmly adherent in from twelve to eighteen hours, and are freely supplied with blood-vessels in from eighteen to forty-eight hours

Unitary Diseases, June, 1888

METHOD OF ESTIMATING ADDUCTION AND ABDUCTION OF THE LEG IN HIP DISEASE—LOVETT'S method consists in calculating mathematically the angle of deflection The legs of the patient being placed in

35 Omental transplantation, or omental grafting, should be done in every circular resection, or suturing of large wounds of the stomach or intestines, as this procedure favors healing of the visceral wound, and affords an additional protection against perforation—Annals of Surgery, June, 1888

COLD-BATH TREATMENT OF TYPHOID FEVER —M GLENARD declares that whenever the cold-bath treatment has been employed in typhoid fever by the fourth day, the malady has had a favorable course His plan consists in giving, every three hours, night and day, whenever the temperature exceeds 39° C, a bath lasting twenty minutes, at a temperature of Advanced age, epilepsy, and from 18° to 20° C valvular affections of the heart, inter alia, are contra-The cold acts as a stimulant to the indications circulation and lowers the temperature It tends to prevent complications due to hypostasis and hyperpyrexia, and it assists in maintaining the tone and functions of organs not already damaged The cold baths never gave rise to bronchitis, pneumonia, or other complications, but if the application of the method be postponed until after the first week they may, of course, be already present, but in such case the gravity and importance will be less than they would be with any other treatment In complicated cases it is best to begin with baths at 32° C, gradually

cooled down, in order to watch the effect on the brain and heart Baths should not be given oftener than every three hours, and they should be associated with the administration of stimulants If necessary, gentle friction may be employed during and after the bath —London Med Recorder, May 21, 1888

MALIGNANT TUMORS OF THE PROSTATE—Neo plasms are in 90 per cent primitive. In 10 per cent they affect children from the age of 1 to 10

Carcinoma furnishes 86 per cent

Sarcoma is exceptional

The connections of the gland and its abundance of lymphatics explains the almost constant and rapid spread (diffuse prostato-pelvic carcinoma)

Implication of the bladder is exceptional

The predominant symptoms are functional disturb ances of the urinary apparatus

Hæmaturia is often absent

The younger the subject, the more rapid the course The evolution varies from three months to five years

The exploration of the pelvic cavity and the existence of radiating pains form the best basis for di

agnosis

The gravity of prognosis and the severity of some symptoms warrant operative interference, but, on the other hand, removal of the tumor is useless, on account of the rapidity of diffusion —Dr Engelbach, Thèse de Paris, 1888, Jour of Cutan and Gento Uninary Diseases, June, 1888

METHOD OF ESTIMATING ADDUCTION AND ABDUC consists in calculating mathematically the angle of The legs of the patient being placed in deflection a straight line with the body, if one leg be fixed in adduction or abduction there will be lateral tilting of Real shortening can be measured from the pelvis the anterior superior spine to the malleolus, practi cal shortening from the umbilicus to a malleolus of The line between the anterior superior each ankle spines will form two angles with the position it would occupy naturally by crosing the latter line diagon Either one of these two angles represents the angle of deflection of the leg on the diseased side To estimate this angle in degrees Dr Lovett has It will be seen that if the prac constructed a table tical shortening is greater than the real shortening the diseased leg is adducted, if less than the real short ening, it is abducted -London Med Recorder, Maj 21, 1888

Hypodermic Injections in Malarial Attacks—Dr Loysel recommends the following formula for hypodermic injection in malarial attacks—Liq ar senicalis, M, 50, quiniæ sulph, 3ss, and tartaric q >, aqua destillata, M, 160—Injection for leucorrhæ2—Potassium chloratis, 200 grs, vin opii, 5iij, aqua picis (tar water), 3viij—London Med Recorder, Maj 21, 1888

THE

Journal of the American Medical Association Published Weekly

The Editor of this Jourgal would be glad to receive any items of general interest in regard to local events, or matters that it is desirable to call to the attention of the profession. Letters written for publication or containing items of information should be accompanied by the writer's full tame and address, although not necessarily to be published. All communications in regard to editorial work should be addressed to the Editor

SUBSCRIPTION PRICE, INCLUDING POSTAGE.

PER ANNUM, IN ADVANCE SINGLE COPIES \$5 00

Subscriptions may begin at any time. The safest mode of remittance is by bank check or postal money order, drawn to the order of the undersigned. When neither is accessible remittances may be made at the risk of the publishers, by forwarding in registered letters.

SATURDAY, JUNE 16, 1888

VERNONIN, A NEW CARDIAC POISON

MM EDOUARD HECKEL and F SCHLAGDENHAUF-FEN have recently communicated to the Académie des Sciences of Paris some facts in regard to vernonin, a new heart poison obtained from Vernonia nigritiana (known in Africa as Batiatior or Batjentjor), the root of which is used on the west coast of Africa as a febrifuge As yet it has been impossible to obtain an alkaloid from the plant, but the alcoholic extract of the resin contains the glucoside vernonin, a white powder, slightly hygroscopic, the solution of which is pale yellow It is only slightly soluble in ether and chloroform The solutions, when evaporated, leave a colorless deposit of resinous appearance, which strikes a brown color with sulphuric acid, this color passing to a violet purple, and persisting for several hours

According to Heckel and Schlagdenhauffen, when a few centigrams of the aqueous solution of the alcoholic extract are injected under the skin of the frog (in the thigh) paralysis of the limb soon supervenes When the dose is large enough the heart soon ceases to beat, as after an injection of digitalis, convallaria, or strophanthus, and other vegetable cardiac poisons A dose of gram o oz caused some cardiac trouble in the frog, but they soon disappear With a dose of gram o 04 there was at first a slight diminution in the amplitude of the cardiac movements, then, after about five minutes, the beats were twenty four instead of thirty three to the minute In a short time the needle of the cardiograph dragged, and showed only two or three movements a minute At intervals the arrests were interrupted by distension of the point of the in need of a new fad

heart from auricular action In about forty minutes the heart was completely arrested, the needle tracing a straight line With a dose of gram 0 09 the same phenomena were observed, and the animal died in about three hours

749

Experiments on pigeons showed that gram o 15 killed the birds in about fifteen hours The autopsy shows the heart arrested in systole Gram o 25 kills a pigeon in about twelve hours

The experimenters conclude that vernonin is very similar in its action to digitaline, but that its toxicity is twenty five times less marked than that of digital ine Contrary to what has been supposed, the root of the plant does not contain emetine

EXIT-THE FAITH CURE

Under the title "Christian Science Manslaughter" an item from Malden, Mass, of May 26, states that Judge Pettingill found a Mrs Abbie H Corner, a "Christian Scientist," guilty of manslaughter in causing the death of her daughter, Mrs Lottie James, by neglecting to provide proper medical assistance at the time of her confinement on April 18 She was held in \$5,000 bail

The case of Mrs Mary M Reiter, of Chicago, a woman who clung to Christian Science until death, was investigated by a coroner's jury about ten days ago Mrs Reiter had been ill with consumption, under the care of Mrs John C Barker, at 715 Fullerton avenue, for the eight weeks preceding her death, with no other treatment than that of Christian Science, which consists principally in telling the patient that she is not sick at all, she only thinks so The jury recommended that the State's Attorney order an immediate investigation of the case, and not only that, but that all cases treated by Christian scientists, so called, be investigated

In California, a week or two ago, some "Salvation Army" people got into trouble by trying to "faithcure" a sick child, which died

And so it goes It is about three years since this new fad had its birth in the East, and by the assistance of the newspapers spread over this country. For the newspapers, nothing was too good to say of it. Now, that the easily foreseen result has occurred, the papers have discovered that all is not wisdom that cries aloud in the streets, and are as ready to publish derogatory items concerning the "faith cure" as they were at first hasty in flaunting its nonsense in the faces of sensible people. It will not be long before the now votaries of "Christian Science" will be an need of a new fad.

EDITORIAL NOTES

THE INFLUENCE OF TEREBINTHINATE TREATMENT on the richness of the blood in oxyhæmoglobin has been studied by M E BREMONT, Fils This treatment caused increase of weight and profound modifications in the state of the health, all other treatment With the assistance of Henocque, being suspended who made the hemotoscopic examinations, and of Dr Fernet, he has found that the quantity of oxyhæmoglobin was notably increased, while the duration of the reduction was lessened, the weight of the patient being increased The three patients examined were phthisical subjects, in one of these, after forty séances, the bacilli became more and more of a sporule form, and the elastic fibres disappeared, in another the bacilli, which were numerous at first, disappeared This is new evidence of the value of the terebinthinate treatment which, by making the medicine penetrate the skin, transforms the oxygen of the red globules into ozone, it is claimed, and increases its oxidating power without disturbing the digestive functions

THE OPERATIVE TREATMENT OF ECTOCARDIA has been successfully carried out by M LANNELONGUE The patient was a girl, æt 6 years, a congenital About the middle of the sternum was ectocardiac an ulceration about 2 cm in diameter, and closed at the bottom by a yellowish membrane in process of This membrane was raised by the mortification heart, and from its surface cardiac tracings could be In a few days this membrane disappeared, and the ventricular wall engaged at the orifice cardiac apex was in front of and below the opening M Lannelongue made two laterally movable skin flaps, brought them together, and obtained union by The movements of the heart second intention were sufficient to prevent adhesions months cicatrization is solid, and the operation has practically transformed the ectocardia into subcutaneous cardiac ectopia

A NEW NORWEGIAN JOURNAL -We have received Nos I to 10, Vol I, of Tidsskrift for praktisk Medicin, a bi monthly journal published at Christiania under the editorship of DR V UCHER-It is neatly printed, on good paper, and the numbers received contain several interesting articles, among others one by Prof Voss recording a large number of deformities occurring in his private practice

Monthly, of May, DR LEWIS G PEDIGO reports a May 27

case of atropia poisoning, due to the administration of half a grain of the sulphate by mistake Alcohol, strychnia, morphine, galvanism, and inhalation of nitrite of amyl, occasionally, tided the patient over the crisis, after which the reflex excitability was con trolled by bromide of potassium

THE ANATOMICAL BOARD OF GEORGIA, organized last summer, is doing good work, and the indications are that an abundance of anatomical material will be supplied to the colleges in the State The law provides that all bodies required to be buried at the public expense, except those claimed by relatives, shall be turned over to the Board

EPHEDRIN, A NEW MYDRIATIC - KINNOSULE MIURA has found that ephedrin, the active principle of ephedra vulgaris, isolated by Professor W N Nagai, causes mydriasis of from 5 to 20 hours dura tion when used in a 10 per cent solution. Its use is not followed by bad effects

HOSPITAL TAY IN ST PETERSBURG -The municipal authorities of St Petersburg have determined to impose a tax-if the Czar permit-on all citizens more than 17 years old Men will be taxed \$100 and women \$ 75 All persons paying this tax will be treated gratuitously at the hospitals

RETIREMENT OF PROFESSOR DONDERS - PRO-FESSOR FRANCISCUS CORNELIS DONDERS, the well known ophthalmologist of Utrecht, celebrated his seventieth birth day on May 27, and retired from his chair in the University, according to the Netherland law

ONTARIO MEDICAL LIBRARY ASSOCIATION -This Association has been formed to provide a reference medical library for the use of the profession in On The nominal capital is \$10,000, the shares being \$5 each

LIPANINE, a substitute for cod-liver oil, is a sub stance made by Kahlbaum, of Berlin, by partial sapon Kohts claims that he has been ification of olive oil pleased with the results of its use in his children's clinic in Strassburg

EXTRAORDINARY REJECTION OF CANDIDATES -In British Columbia this year all the candidates wno went before the examining board were referred to their studies It should be said that the all included two candidates only

A MARBLE BUST OF CARL SCHRODER was placed ATROPIA POISONING—In the Virginia Medical in the Frauenklinik of the University of Ber in 6"

SPECIAL ARTICLE

THE TRANSPLANTING OF A RABBIT'S COR-NEA INTO THE HUMAN EYE

DR JULIAN J CHISHOLM has recently successfully performed this operation at the Presbyterian Eve. Ear and Throat Charity Hospital, of Baltimore city The patient was a healthy man, 35 years of age, who had lost both eyes from the effects of caustic lime three years since Symblepharon, or the union of the eye hids to the entire surface of the eye balls, was the outgrowth of the accident, with the sloughing surfaces of conjunctiva induced by the lime Operations had been done successfully to liberate the lids from the cornea, but still the fleshy opaque cornea remained with no prospect whatever of clearing up In this hopelessly blind man Dr Chisholm has suc cessfully performed that wonderful operation devised by Prof von Hippel, of Giessen, Germany, viz the insertion of a clear piece of a rabbit's cornea into an opening made for it through the opaque human cor-This section and fitting can be done only by the use of von Hippel's cornea trephine, a circular blade similar to that of the artificial leech, made to run by clock-work.

To perform the operation properly the opaque comea of the human subject must be removed down to Descemet's membrane, which must not be punc-This requires great delicacy in the manipulation of the trephine When nearly the whole thickness of the cornea has been cut through the circular piece must be seized by the forceps and drawn away, leaving the thin lining membrane of the anterior chamber intact With the same trephine a duplicate plug of the rabbit's cornea is taken, going this time quite through into the anterior chamber, and therefore including the membrane of Descemet necessary to have this additional thickness in the graft to make it equal to the piece of cornea removed trom the human eye, so as to keep the superficial surfaces on the same plane The round segment from the rabbit's cornea is then carefully adjusted to the opening made in the centre of the human cornea, Descemet's surface to Descemet's surface, and represents a clear central corneal window corresponding to the pupilary space The closure of the hids with compress and bandage completes the operation a very few days the graft, as in skin grafting, becomes adherent, and the wonderful effects of this delicate operation begin to be enjoyed by the patient

As both the man's and the rabbit's eye were under the effects of cocaine, no pain was experienced by the man nor exhibited by the rabbit

So far as is known only three ophthalmic surgeons have performed this operation Dr von Hippel, in Giessen, Dr Fox, in Philadelphia, and now Dr Chisholm, in Rallimore. The adventure of the trans. The advantages of this transplantation cannot be applied to all lost eyes Unfortunately it is restricted to cases of corneal opacity in which the internal structures of the eye retain their Integrity Ins, pupil, lens and retina must all be good, otherwise no benefit will accrue stored sight to a large class of persons heretofore New York and New Iersey were also elected considered hopelessly blind

SOCIETY PROCEEDINGS

CONNECTICUT STATE MEDICAL SOCIETY

Held in the City Hall, New Haven, May 23 and 24, 1888

WEDNESDAY, MAY 23-FIRST DAY

THE PRESIDENT. DR FRANCIS BACON, of New Haven, called the Society to order at 3 P M

After hearing the report of the committee on credentials, THE PRESIDENT delivered his

ANNUAL ADDRESS

He welcomed those present, and spoke upon the Proposed Changes in the Charter These had caused serious disturbance in the Society for a number of years, and he hoped that it would be settled this year so that more time could be given to scientific work He advised that a standing committee be appointed to watch the interests of the Society in the legislature of the State, so that no injust laws, in regard to the profession, should be passed without a protest from this body. He would be pleased to see the meetings of the Society held in the several cities of the State, and not alternate between New Haven and Hartford, as has always been the custom thought, would create an interest in some parts of the State where at present there was no interest felt

He announced that both the Treasurer and Secretary declined to hold their positions any longer, and that it would be necessary to elect new men to hold the offices that had been so ably filled for so many He thought the President should be chosen on account of his fitness and not because he came from any particular county, and it was a detriment to the Society to follow any rotation in the position of President

THE TREASURER reported that there had been received during the year \$768 21, and there had been expended \$695 20 He had on hand at present \$832 13

DR I C DALTON, of New York, was elected an honorary member of the Society

The committee on honorary members proposed the name of DR EDWARD M MOORE, of Buffalo. According to custom this was laid over until the next annual meeting

The following were elected

OFFICERS FOR THE ENSUING YEAR

President-Dr Geo L Porter, of Bridgeport Vice President-Dr O Brown, of Washington Treasurer-Dr W W Knight, of Hartford Secretary - Dr N E Worden, of Bridgeport Committee on Matters of Professional Interest-

Dissertator-Dr P H Ingalls

Delegates to the American Medical Association-Drs J B Kent, C B Newton, E C Kinney, W H Welch, S J St John, C B Hill, F D Edgarton, W H Bull, B W Mun on and F E Beckwith

restrictions, however, open this great blessing of re-Hampshire, Vermont, Massachusetts, Rhode Island, Delegates to the Medical Societies of Maine, New

In the evening the Society was invited, by the faculty of the Yale Medical School, to attend a

MICROSCOPICAL SOIREE,

after which Dr Francis Bacon tendered a reception to the members at his residence

THURSDAY, MAY 24-SECOND DAY

At 9 P M the Society was called to order, with the President in the Chair The Secretary reported that there had been received during the year

THIRTY FOUR NEW MEMBERS,

that ten of the old members had died, and two had been dropped from membership A large number had left the State during the year The total membership at present is four hundred and ninety-four

The Annual Address of THE PRESIDENT to the So ciety was then given In this the President spoke of

THE RELATION OF THE INSANE TO THE LAWS OF THE STATE

This State compares most unfavorably with the majority of the States Any "reputable physician" can send his neighbor into confinement by certifying that he is insane He thought a competent and permanent commission should be appointed to act in all cases of suspected insanity He also spoke of the plea of "emotional insanity" so often brought before the courts, and said he was glad the courts of Connecticut had never been disgraced by such a He did not think experts could diagnosticate between emotional insanity and uncontrollable an-The expert testimony often given was of no value, the witness generally testifying for the side they were employed He asked the question, What are the "romantic indicia," and what is their diagnostic value? In listening to the expert witnesses we are impressed with the abundance, variety and certainty of these signs, but in studying the best systematic treatises we are struck with the poverty and insignificance of the same phenomena as materials He quoted a number of cases where for diagnosis time proved that the expert testimony was just opposite to the true state of affairs

He thought in all cases of homicidal mania, even if emotional insanity, that society demands as a protection against future attacks, that the person in question should be confined for life and not for any defin-

Delegates from Massachusetts, Vermont and Rhode Island were then introduced and made a few remarks

This was followed by reports of delegates from

this Society to those of neighboring States

DR R M GRISWOLD read a paper, taking his sublect from Genesis, III, 16

"IN SORROW THOU SHALL BRING FORTH CHILDREN"

He said man was perfect until the downfall of Adam, and as a punishment pain and sickness was sent Deformed and diseased women are met everywhere by the obstretician He then spoke at length of the means we have of assisting women in labor For hot tea, and exercise He gave the quinine in doses speaking more particularly upon the prevention than

of from 2 to 5 grains every twenty minutes until four or five doses had been given, and this was usually all that was required Chloroform and emetics he used for rigid os When the pain was so severe a woman could not help herself, a little chloroform at the be ginning of the pain would be of very great assistance Forceps he thought of great utility, and wondered that in this age of building monuments that the women did not build a monument to Chamberlain, their inventor By the use of forceps the number of still-births are greatly lessened and ruptures more infrequent

In the discussion that followed DR Douglas said that he thought quinine, combined with an aromatic, more effective than when given alone

DR KINNEY would never give ergot until the child could be immediately delivered, but would never hesi tate to use forceps when the vagina began to grow dry

DR J McKeniston read a paper on

PARALDEHYDE

As a sleep-producer this drug was what had been sought for for many years There was no disagree able after effect He recommended that it be given after the patient had obtained what natural sleep he He frequently had given it in 3j doses until three doses had been given, and then if the desired effect was not obtained he used something else, but in his hands it had seldom failed. It is a perfectly safe drug and is not likely to injure any important As compared with chloral and bromide, he considered its action quicker than than of chloral and as safe as bromide and more to be depended upon

DR G M SHEPHERD read a paper on

THE FREQUENCY OF ALBUMIN IN THE URINE OF THE HEALTHY

For a long time this has been observed and recog nized to be of only temporary occurrence He quoted the late Dr Flint as saying that albumin in the urine, even with casts, was not always a grave symptom He read a large number of statistics showing the fre quency of this occurrence

ALCOHOL IN THERAPEUTICS

was the title of a paper read by DR E F PARSONS Scripture was quoted by him to show that in the time of Christ, and long before that, alcohol was used He thought no one should hesitate as a medicine to use it when nature demanded it. It is a stimulant to the brain, heart and stomach, increases the size of the capillaries and raises temperature He asserted It can carry on the duties of that alcohol is a food the body, for a time, without the loss of weight It should be used in all diseases that cause death by He said that Dr B W Richardson, of London, and Dr N S Davis, of Chicago, were among the most prominent of those opposed to alco hol in therapeutics, and even these gentlemen used it in some instances

DR C B NEWTON read a paper on

PNEUMONIA,

be kept in the dwelling houses and work shops than 15 usual in most houses and manufactories

DR J K THACHER read a paper on the

RELATION BETWEEN CARDIAC HYPERTROPHY AND NEPHRITIS

He gave the history of a case of nephritis following scarlet fever. From the first appearance of the nephritis there was increased arterial tension, and later cardiac hypertrophy A few weeks after the , nephritis disappeared This case and others similar lead him to believe that the cardiac hypertrophy was secondary to the nephritis

DR G C SEGUR reported a case of

TYPHOID FEVER IN A CHILD AGED 13 YEARS

This had been treated with antipyrin in doses of 15 to 20 grs with the best of results He thought antipyrin particularly suited to the treatment of the high temperature of typhoid fever

The papers that had been read before the several

county societies were read by title

The meeting adjourned at 3 PW, to the New Haven House, where the annual dinner was held

PHILADELPHIA COUNTY MEDICAL SOCIETY

Stated Meeting, May 9, 1888

THE PRESIDENT, J SOLIS-COHEN, MD, IN THE Chair

DR G E DE SCHWEINITZ read a paper on SOME CASES OF HABIT CHOREA, AND THEIR TREATMENT

As is well known, there are certain local choreas for which no definite cause can be assigned, and in which, as Dr Wood puts it, the movements closely simulate purposive acts A child suffering with this malady-for it usually occurs in children, especially girls—is brought for treatment because it has adopted some trick of gesture An eye may be rapidly winked, or the eyeball rolled upward, or the brow wrinkled, or the facial muscles contorted, or, it may be, the shoulder is shrugged, or a forward movement of the head or jaw indulged in At first these movements are under the control of the will, but gradually become more and more obstinate, and more and more aggravated, especially when atten tion is drawn to them, and sometimes the variety of the performances in a single day is truly remarkable This affection has been admirably described by Dr S Weir Mitchell, and from him has received the name Habit Chorea.1

A number of these cases have occurred to me in the past few years, in which the examination and treatment of the eyes have proved of distinct advantage to the patient, and these may prove interesting

Case I -A B, a gurl, at 10, was referred to me by Dr Wharton Sinkler, Feb 2, 1885 This child

treatment He thought a lower temperature should had been brought to Dr Sinkler about a year before, and then the following facts were elicited No history of rheumatism, scarlatina when 6 years old General health good, appetite and digestion normal The movements noted were confined to the orbicularis, the right side of the face and neck, and to the In spite of the most judicious antichoreic treatment these remained unchanged The following results were obtained by an eye examination

Amplitude of accommodation 8 D

OS — Amplitude of accommodation 8 5 D

Conjunctive injected, slight blephantis in each eye, and a history of successive crops of styes

O D Small oval disk, choroid ring all around, absorbing at outer side Retina markedly striated, veiling all edges of disk except the temporal Many lymph reflexes OS Oval disk, less retinal striation, but inner side of disc veiled

Atropine solution to full ciliary paralysis was ordered, and the error of refraction determined. This proved to be as follows

OD + 2 SC + 1 C, axis 90 OS + 2 25 SC

+ o 60 c, axis 90

The full correction was ordered, the constitutional remedies continued and the result was an entire cure of the spasmodic movements

Case 2 - J H B, a lad æt 17, referred to me by Dr S Weir Mitchell, Nov 5, 1886 This boy had consulted Dr Mitchell because he had "got a trick" of twitching his eyes and rolling the balls upward Before he saw Dr Mitchell he had been treated with a long course of arsenic and a number of antichoreic and antispasmodic remedies without avail An eye examination revealed the following points

Amplitude of accommodation 7 D.

Amplitude of accommodation 6 D

Conjunctival watery and posterior conjunctional vessels injected and tortuous

O D Small nerve, a white patch over central ves-Retina much striated and general choroidal disturbance, with a halo-like band at the lower and outer side of the disc OS Small nerve Central lymph sheath full, and nerve surrounded by a broad halo-like band

Sulphate of hyoscyamia to full ciliary paralysis was ordered, and the correction of the refraction error determined as follows

OD + 0 60 c, axis 60 OS + 0 25 s - + 0 60 c, axis 90

This glass was ordered, and after several months of rest the boy allowed to resume his studies Ten month later he returned, and the movements had almost absolutely disappeared His vision then,

through the correcting glass, was with each eye,-

and the amplitude of accommodation was 10 D Through these glasses there was at 30 centimetres

^{1\}errous Diseases 2d edition by S Weir Mitchell M D

an exophoria (insufficiency of the interni) of 4°, no disturbance of equipoise at twenty feet. The abducting power was 7°

Case 3-M E, a girl, set 18, referred to me by Dr Wharton Sinkler, May 20, 1887 The patient's The patient hermother had chorea when a child self was perfectly healthy until she was 10 years of She was then attacked with general chorea, which, however, chiefly affected the face, arms, and the shoulders At 12 years of age menstruation was established, and the chorea ceased, except for the movements of a spasmodic character, which continued in the face, eyelids, and eyebrows time these grew better, but later, for a space of two years, grew worse, and the habit became more fixed In April, of 1887, the patient was in fair general health, with occasional dyspeptic attacks and dysmenorrhæa The movements were now confined to the upper part of the face, and consisted in sudden tight closing of the eyes, rapid raising of the eyebrows and wrinkling of the forehead, with to-and-fro movements of the occipito-frontalis, and an occasional jerk of the head and shrug of the shoulder The movements were not constant, but were increased when attention was drawn to the trouble The eye examination yielded the following results

$$OD \xrightarrow{15} XX$$
 Amplitude of accommodation 8 D

O S
$$\frac{15}{XX}$$
 Amplitude of accommodation 8 D

Conjunctivæ slightly suffused, distinct dread of light, and the retrotarsal folds studded with numerous phlyctenules. In each eye round disk, slight crescents at the outer sides, and marked retinal striation. Refraction doubtful, fundus best studied with concave glass, probably spasm.

Atropine in full strength was used for four days, and complete ciliary paralysis secured The vision

steadily rose, and on the fourth day was easily

and unimproved by any glass, in short, the eyes were absolutely emmetropic. The mydriatic was continued until all traces of the phlyctenular conjunctivitis had disappeared, and the retinal congestion had subsided. During this treatment the movements markedly decreased, although formerly under the best of internal medication these had stubbornly resisted. About a year later, when last seen, the head movements had entirely ceased, there was an occasional shrug of the shoulder, the eyes were comfortable, the vision and accommodation normal, esophoria 2° at 5 metres.

Case 4—D G, a boy, set 10, referred to me by Dr James C Wilson, under whose care the patient was for catarrhal jaundice. For some time the boy had adopted the habit of "making faces." This peculiarity had well-nigh ceased during a period when he was laid up in bed with an injury. One movement, however, persisted, viz, a remarkable spasmodic contraction of the right orbicularis palpebrarum almost as complete and decided as if a pebrarum almost as complete and decided as if a current had been applied to the motor point.

O D $\frac{15}{XV}$ Amplitude of accommodation 9 D

 $OS\frac{15}{XV}$ Amplitude of accommodation 10 D E

ophoria in accommodation 7°

Eyelds heavy, caruncles swollen The con junctiva, especially of the forms, reddened and velvety, and the lymph follicles swollen, slight muco purulent discharge in the mornings Reading was an effort, and sometimes occasioned headache

O D Round nerve, central venous lymph sheath full, retina striated OS Oval disc, slightly hazer retina, and full venous lymph sheaths Cumulative instillations of homatropine were ordered, and the refraction tested and found to be OD + o 65 s OS + o 50 s

This glass was ordered for all near work, and the local condition in the conjunctiva treated with boric acid, insuffiction of calomel, and later painting with a weak solution of nitrate of silver Internally, Dr Wilson ordered Fowler's solution in ascending doses

A month later a letter stated that the eyes were more comfortable, and the twitching was seldom noticed

Case 5—S B, a girl, at 16, referred to me by Dr S Weir Mitchell Jan 9, 1888 This patient was a finely developed girl, perfectly healthy, no history of rheumatism, scarlatina, or fright She had formed the habit of rapidly winking, or spasmodically closing the eyes, especially the right one The movement, at first under the control of the will, gradually became fixed, and was a source of much annoyance and embarrassment She also suffered from severe brow-ache An examination of her eyes

yielded the following results $OD\frac{15}{\lambda V}$ Amplitude

of accommodation to D OS T Amplitude of accommodation to D Evophers in accommodation

accommodation 10 D Evophoria in accommodation 7° The external appearances of the eyes were normal, the conjunctive smooth, the vessels free from congestion Full atropine mydriasis was secured, and the refraction error determined OD + 225 s OS + 225 s

A full correction was ordered, Fowler's solution was given internally, and one month after the treat ment was begun the headaches had disappeared and the spasmodic movements well-nigh subsided

for an eye examination This lad was of fine physical development, with no family or personal nervous taint, except that he had for some time been noticed to squint his eyes inward, as children often do "for fun," and rapidly close and open his eye making at the same time a curious grimace. The boy was very fond of books, and this habit was most marked when he was poring over some work which was especially interesting to him. The eye examination

tion was as follows $OD = \frac{15}{yy}$ Amplitude of 20

commodation 8 D OS $\frac{15}{V}$ Amplitude of accom-

modation 8 D No insufficiency

Conjunctive suffused, and posterior vessels in-

rected

In each eye irregularly oval disks, conus, full central lymph sheaths, and general retino choroidal disturbance H = 15 D V V higher Atropine and correction of the refraction error was advised, but advice was declined. The boy was, however, forbidden to use his eyes for near work as much as possible and given the usual remedies. When last heard from he was reported as better, but the habit spasm still continued.

Case 7—W F C, a young man, æt 18, applied for treatment Jan 17, 1888 His general health was good No history of rheumatism Works hard in a factory A few years ago, when about 12 years of age, had attacks of "chorea," confined to the muscles of the face, chiefly the orbicularis This passed away under general treatment For some months past he had acquired the habit of rapidly closing and shutting his eyes, with a quick, snapping movement No other muscles affected This was partially under control of the will, but was made worse under examination The eyes were examined and found as follows

O D $\frac{15}{V}$ Amplitude of accommodation 8 5 D

L Hyperphona 1°

OS Amplitude of accommodation 85 D

Exophoria 20

Conjunctivæ injected, but not catarrhal, no phlyctænules or swollen lymph follicles Small oval optic disks, nasal edges veiled, and coarse retinal striatum above and below, veins and central sheaths full Distinct dread of light

Atropine was ordered, and continued for several days Under this the refraction was found to be

OD+060s OS+050s

These glasses were ordered for constant wear No constitutional treatment was given Some months later he was reported as comfortable, so far as the eyes were concerned, and that the nervousness had departed.

These seven cases suffice to give an idea of what service the correction of the errors of refraction was in the treatment of this disorder In three of them the habit spasm, as Gowers would say, had existed for a long time, and judicious internal medication and proper hygiene had failed to achieve the desired result, which result, however, was attained after the eyes had been thoroughly treated and corrected In two others the constitutional and the eye treatment were begun simultaneously, and the rapid improvement showed the value of this combination In one instance the eye examination and the correction of the anomalies of refraction were declined, and the habit still continues In another the wearing of the glasses was the only course pursued and the result

refraction existed these were either hypermetropia or hypermetropic astigmatism, in two the errors were 2 D and more, in three less than 1 D, and in one the eyes were emmetropic It is not unworthy to call attention to the fact that so low an error as o 50 D may prove an exciting cause, the removal of which aids in restoring the patient to a normal tone Case 3 is especially interesting, because here a general chorea disappeared, and in its place came a habit chorea-for there is no doubt that the disorder in this patient is correctly so classified-exactly as Dr Mitchell has observed, in a few instances these cases lapse into well-pronounced chorea of the ordinary It is further useful to observe that the eyes in type this case were emmetropic, but that when the existing spasm of accommodation and phlyctænular conjunctivitis had disappeared under the use of the atropine. the patient made rapid strides along the road to recovery This leads me to speak of the value of closely observing the condition of the conjunctiva. especially of the retro tarsal folds, in this malady Years ago, the late Prof Fr Horner called attention to the fact that children, when they first attended school, were sometimes observed to be given to undue winking of the eyes and that without the presence of strong light As an accompaniment, there were often movements of the muscles of the face, arm, or leg these cases the local cause was most often found to be some disorder of the conjunctiva, especially follicular catarrh, blepharitis, or an anomaly of refraction. usually hypermetropia Indeed, in a few instances. the local condition was manifestly the exciting cause of a chorea minor Treatment of the conjunctival catarrh and correction of the hypermetropia, removed the difficulty Not only may the local conjunctival disturbance and the refraction errors exist, but there may be also imperfect equipoise of the eye-muscles It is scarcely necessary to refer to this as a possible important factor In recent times much graver neryous disorders have been attributed to such insufficiencies of the ocular muscles, and for their correction by surgical and other means, most brilliant results have been claimed

It is very far from my intention to give an undue importance to these errors of refraction and inflammation of the conjunctiva as exciting agents in the causation of habit chorea. I am not unmindful of the large number of instances that may be directly traced to nasal disorders, to diseases of the pharyn, nor do I forget that other large class to which no adequate cause can be assigned. I only wish to recall to the memory the value of searching for these among the other causes, and to emphasize the facts that if the habit spasm especially affects the muscles of the face, particularly those around the eye, the following points deserve attention

The condition of the refraction and the muscular balance should be carefully examined and if found abnormal corrected

2 The anomaly of refraction should be determined under complete ciliary paralysis and the full, not a partial, correction ordered

Was most favorable In all the cases where errors of zweite Abheilung Tubingen z 3 Jacobi Amer Jour Med Sciences > S 18 5 xcl 31-3-

3 This correction should be employed in conjunction with proper internal medication and general hygiene and not to the exclusion of these measures

DR S Solis Cohen I have met, more especially in dispensary practice, with a number of cases similar to those reported Prof DaCosta has for many years called the attention of his classes at the Jefferson Hospital Clinics to this group of choreic disorders associated with eye-strain, and during my service as Chief of the Medical Clinic there would be from three to six such cases presented during the term In nearly every instance the defect was hypermetropic astigmatism, in most of the few remaining, simple hypermetropia, in one or two, if my recollection serves, simple astigmatism In order to note the effect of correction of the refractive error the medication was confined to peppermint water Some of the cases were affected with facial spasm only, but a few had spasm of the limbs as well In one or two cases the spasms were unilateral, though I cannot say now whether the error was also unilateral pression is that it was not

In every case that remained under observation cure was effected by the correction without medication Some of the patients disappeared after correction and in these, presumably, recovery was immediate case now under my care in private practice, a girl complained of frequently falling in the street, from sudden failure, as she expressed it, "of the knees" The eyes were prominent, and the heart rapid, so that a suspicion of Graves' disease was entertained About a week ago Dr Jackson corrected the hypermetropia which he discovered, and to-day the girl reported to me that she had been perfectly well since The apparent protrusion of the eyes being due to muscular effort, has disappeared, and the cardiac rapidity has abated

I presume that the reason we find this association of nervous spasm with hypermetropia rather than myopia, is that the former gives greater and more constant strain upon the muscles of accommodation

OBSTETRICAL SOCIETY OF PHILADELPHIA

Stated Meeting, Thursday, May 3, 1888 THE PRESIDENT, T M DRYSDALE, MD, IN THE CHAIR

DR JOSEPH PRICE reported a case of TYPHOID FEVER FOLLOWING OVARIOTOMY

Mrs E N, æt 37, one child sixteen years ago, one miscarriage fourteen years ago, complaining since miscarriage of great pelvic pain, etc, was operated on at the Gynecean Hospital, February 11, 1888, for the removal of the right uterine appendages The tube and ovary were firmly adherent to and under The ovary was enlarged and cysthe fundus uteri The removal was not difficult and the operation was completed in twenty minutes Two years previously the left appendages were removed for a small inflamed and adherent ovarian cyst, the right side at which is often retained until the next depletion that time appearing perfectly healthy The recovery

from this first operation was speedy, and for a year the patient seemed in perfect health. Then the symptoms of pelvic trouble returned and were referred to the right side From the second operation the patient reacted perfectly, and for nine days her temperature constantly remained above normal, varying from 98 6° to 100 1°, the intermissions never amounting to 1° During this time she also com plained of a good deal of headache, weakness and mental depression On the evening of the ninth day her temperature ran up to 102° and she had a slight From that time she presented a typical case of typhoid fever, including the characteristic temperature record, stools and eruption The nervous symptoms were not particularly marked The tem perature varied from 99 8° to 104 8° for four weeks The patient made a good recovery and is now in better health than before the operation

The points of interest in this case are, first, that the patient was probably in the early stage of typhoid fever when she entered the hospital, there having been no cases of typhoid in or near the hospital at that time, second, the operation did not seem to in fluence the course of the fever nor the fever the re sult of the operation, third, the temperature, com bined with the early constipation and meteorism, were naturally attributed to the operation and treated accordingly until the diagnosis of typhoid fever was made, after which the usual expectant treatment for that disease was pursued

DR HOWARD A KELLY exhibited a

KNIFE-BLADE TENACULUM

While he had rarely found, in his experience, that local depletion was alone valuable as an agent for the cure of any form of uterine disease, he frequently found it a powerful adjuvant, similar in its results to the benefits obtained from the cotton tampon

Chronic or recurring pelvic congestions, accompa nied by great pain and discomfort, can often be tapped by a free depletion of the cervit, and the pa tient's condition temporarily much improved Many of the neurotic symptoms associated with a congested, puffy, blue, plethoric cervix, also undergo marked improvement with this plan of treatment, judiciously carried out, combined with applications of glycerole packs or tamponning

He knew of no other method equally serviceable and speedy for the treatment of lacerations of the cervix with eversion and infiltration of the lips Many cases upon which he had heretofore been in the habit of operating now recover perfectly when thus treated, and remain well if the uterus is prevented from sag ging, by giving proper support to a torn or relaxed outlet Except in the latter condition, when associated with lacerations, depletion is not often called for in

spare or anæmic patients To secure any advantage by this method it must I am in the habit of be carried out thoroughly drawing from 6 drachms to 1 oz or 11/2 oz of blood every five days or once a week, following the dep't tion immediately by a glycerole or boracic acid pack,

To deplete the congested pelvic organs he has used

the cervix on both vaginal and uterine surfaces and the vault of the vagina, the latter being used in a senes of experimental studies He is not sure that it has any special advantage over the simple depletion of the Serious difficulties have occasionally arisen in other hands from too deep a penetration of the scanfier, which may wound an artery of large calibre and give rise to alarming ha morrhage Difficulties also anse in the use of the spear-pointed instruments. ing the operator to desist or to make but few punc-A serious practical objection against the straight instruments in use, is that the depletion can only be practiced with safety and satisfaction upon the prominent rounded extremity of the cervix obviate these objections he had invented the "knifeblade tenaculum" here figured, which had been in

extensive use in his office for many months made like an ordinary tenaculum with a blade in place of the hook This blade is placed at an angle slightly obtuse to the handle, and about the same length as the point on the ordinary rectangular uterine ten-In using it the cervix should be fixed by a tenaculum in the uterine canal, when the small, short blade of the instrument can be plunged rapidly in a number of places into the vaginal surface of the cerviv anteriorly and laterally, and even within the cervical canal, being sometimes used to open a very small external os The shortness of the blade, and the fact that it is placed at an angle to the shaft, prevents a deep and dangerous penetration, and if the cutting edge is kept sharp and it is used with rapidity it oc casions, as a rule, but little pain to the patient

This tenaculum is made entirely of metal, 71/2 in in length, tapering gracefully from handle to the blade, which is 130 of an inch long, 110 of an inch broad at its base, 16 of an inch wide on its back satisfactory model has been made by Mr Gemrig, of

this city, who furnishes the wood cut DR J C DA COSTA was glad to hear Dr Kelly speak so highly of the value of depletion in certain diseases of the uterus He was in the habit of exemplifying this by the exhibition, each winter, of one or two suitable cases to his class at the Jefferson Hospital He thought if from 1 to 4 ozs or more blood was removed, instead of 6 drachms, that the effect would be better A woman who, when placed on the table, is suffering with great pain and with an argr, looking cervix, will, after such treatment, leave the table free from pain and with the uterus paled The knife exhibited he thought was very pretty, but an ordinary straight bistoury enabled him to puncture the neck all over and inside as well Even if an artery were cut it was of small matter The trouble usually was that the bleeding stopped too If he removed the speculum the bleeding al most always stopped, but the speculum was always replaced to make sure that this was stopped

DR WM GOODELL remarked that there was one point which Dr Da Costa had overlooked, and that was that, in most cases, simple exposure of the cervix to the air by the speculum will cause it to become pale, although he granted that the effect was doubled by the loss of blood He used to bleed very frequently, and occasionally still did so, but not so often as formerly, because he believed the importance of uterine congestion was overestimated With which often occasion great pain to the patient, oblig- reference to the hæmorrhage, while he in a measure agreed with the last speaker, that it was not usually to be feared, yet he had a patient who bled so furiously after she reached home that she had to send for a physician to check it On one occasion, while plunging a Battles spear, he struck a vessel of such size as to throw a stream of blood directly out of the But ordinarily the difficulty was to secure speculum When the punctures bleed too much enough blood he touched each one with a pointed stick of lunar caustic, which never failed to stop the hæmorrhage

> DR PARISH could endorse all that Dr Kelly had For a number of years he had practiced this method of depletion of the uterus, whether there was laceration or not, when the organ was in a condition of congestion He also emphasized what had been said with reference to the relief and cure of symptoms in cases of laceration of the cervix. He had seen as a result in many of these cases a perfect union of the denuded surfaces, but a continuation of the pain and distress and frequently an increase of In cases where the laceration was dysmenorrhæa not deep he substituted the method of local depletion, conjoined with other treatment, for the operation He added that depletion of the cervix, and particularly of the canal, was one of the best methods of treating many cases of endometritis He had seen sterility of eight and ten years' standing practically cured by this method of depletion

> DR KELLY thought that 1½ ounce of blood removed every few days was quite sufficient forming the depletion the patient lies on the back with either Goodell's or Nelson's speculum in place, which conducts the blood into a wide mouthed bottle with graduated capacity He was glad that the members had expressed themselves so freely and favorably in this matter, as these are the practical conclusions at which he had arrived

FOREIGN CORRESPONDENCE.

LETTER FROM LONDON

Sulfonal, a New Opiate-Bicarbonate of Potash in Iodoform Poisoning—Attempt to blow up a Hospital— Gluten Bread-Dwarfing by Factories and Tenements-Treatment of Spinal Abscesses-Virchow

Professor Kast announces his discovery of a new He calls it "sulfonal" and it belongs to the group of the so called di sulphates, and in an oxydation product of the union of "acthylmerkuptan" with acetone, in crystals without taste or smell, easily dissolvable It has the property of inducing

sleep in invalids, particularly in nervous people and 10,000 being rejected for undersized chests, 2,000 those affected with heart disease, but not in healthy Prof Kast has observed that "sulfonal" produces sleep without altering the pressure of the blood in any degree An accident led to the discovery of the sleep producing property of "sulfonal" It had been administered to some dogs with quite a different intention and the animals first were affected as if with intoxication, and afterwards fell into a deep sleep Experiments made on healthy persons, chiefly medical men, and then on patients in hospitals and lunatic asylums, have proved that the drug is a harmless and certain means of producing sleep in invalids

A 20 per cent solution of bicarbonate of potash has recently been given as an antidote in a case of severe iodoform poisoning As the best results followed, there has been of late to look upon this salt as a direct antidote to iodoform It would be interesting if some of the pharmaceutical chemists would investigate the action of bicarbonate of potash on

10doform

An attempt has been made to blow up a wooden building intended as an isolatory hospital at St George's, an extensive suburb of Bristol There had been, it appears, a strong prejudice against the use of the site for this purpose, it being used as a playground by children The local authorities, however, persisted The building was erected and placed in charge of a caretaker, but no patients had yet been sent there Upon examination immediately after the report it was found that a quantity of gunpowder had been placed under the east corner and fired with a fuse, fortunately the charge being unskilfully laid

very little damage was done A better kind of gluten bread is now being used by invalids suffering from diabetes, it resembles ordinary bread in its general aspect, and is not unlike in taste certain kinds of cakes which are readily eaten by most people Moreover it is easily masticated The formula from which this new gluten bread is made is set down thus Best quality of yeast 20 grams, cold water 120 grams, butter 125 grams, gluten flour 500 The yeast is For one loaf grams, and 4 eggs stirred carefully and quietly into the water, then the eggs and butter are added and the whole melted The gluten flour is mixed in and worked up with these ingredients, and a round loaf is thus made which is about 18 inches wide and 20 inches deep, it is placed before the fire for about an hour, to cause the dough to rise, and is baked in an oven heated from below It is stated on all hands that the above is an improvement on the old kind of gluten bread which gave practitioners so much annoyance, as many patients could not eat it, and complained of its feeling like so much parchment in the mouth

According to the annual report of the Inspector General of Recruiting, it would appear that there is no escape from the conclusion that the influence of factory and tenement is progressively dwarfing a large mass of the population It appears that in the last year 74,991 men offered themselves for examination, 15,280 were rejected on account of bad health, of these the defects are more precisely mentioned, assuming that the paralysis was not to be taken as a

were under weight, and 4,000 under height

Mr Watson Cheyne, in discussing the treatment of spinal abscesses, considers three things have es pecially to be considered—the contents of the abscess, the wall, and the lesson of bone from which they start, although the latter cannot always be made out Mr Cheyne recognizes three types of tubercular abscess, (1) tubercular cavities containing soft, cheesy material, (2) tubercular sequestra, either unseparated or in cavity lined with tubercular granulations, and (3) superficial cases of bone In the first class curvature is commonest, but the last is most extensive, and is chiefly found in adults, accompanied with abscess The contents of these abscesses is not true pus, but broken-down cells and tissues floating in a variable This fluid when inoculated pro amount of fluid duces in guinea pigs tuberculosis. The pyogenic or ganisms take no part in the production of the chronic abscesses, but grow freely in their unexhausted con tents, consequently the entrance of putrefactive fer ments into the cavities causes chronic osteomyelitis Mr Cheyne advocates two methods of of bone treatment, one in which the abscess was cured with out opening it, and by the injection of iodoform and glycerine or iodoform dissolved in ether, and the other method by antiseptic opening Statistics of 56 cases under his treatment, of which 73 2 per cent healed These were mainly psoas abscesses, and 125 died but dorsal, lumbar and cervical were included Cures are most numerous between 28 and 30 years of age The average time of healing is found to be from eight to nine months

DOMESTIC CORRESPONDENCE

LETTER FROM NEW YORK

(FROM OUR OWN CORRESPONDENT)

Diphtheritic Paralysis—Increase of Diphtheria in New York—Commencement of the College of Physi cians and Surgeons

At the last meeting of the Neurological Section of the Academy of Medicine, Dr W H Thomson read an able paper on the Clinical History, Pathology, and Etiology of Diphtheritic Paralysis In it he ex pressed the opinion that all the acute febrile diseases are accompanied by a post latent stage, and that in diphtheria this post latent stage is characterized by the paralytic trouble so frequently met with after an acute attack of this affection Such paralysis he be lieved to be an essential part of the disease, due, in all probability, however, not to the disease itself, but to the presence in the system of certain resulting pto-He thought, also, that some of the cases of diphtheritic paralysis were of peripheral, and some of central, origin

In discussing the paper Dr A Jacobi said that there were undoubted cases of central origin on record, and that even a few instances of ataxia had been ob-He believed that Dr Thomson was right in sequela of diphtheria, but rather as really part and fauces which ran an indefinite course it certainly was diph- ent of the deposit of membranes there thena, this course sometimes being extended over many months other contagious diseases was that, once having had stage of diphtheria attacks In many cases, he believed, the repeated attacks noted simply indicated the continuous pres ence of the disease, which during the intervals remained hidden away in the tonsils or lymph bodies, and was likely at any time to break forth afresh a rule, the paralysis first appeared in the fauces, affecting deglutition, and then successively involved the muscles of ocular accommodation and those of the extremities Finally, there might be respiratory paralysis, which not infrequently proved fatal This order could not, however, be relied upon in any particular instance, and in making a diagnosis in cases where there had been no throat symptoms, one of the main points to be depended upon was the fact that in diphtheritic paralysis only a comparatively small number of muscles are usually affected at the same time Another point was the fact that the sphincter muscles are never, or almost never, involved in the paresis

Paralysis sometimes came on during the acute stage of diphthena In heart failure, which was so common an occurrence in this disease, there was, no doubt, a the pneumogastric occur in any case of diphtheria, and he said he had alcoholic stimulants and cardiac tonics from the very After symptoms of heart trouble had once apof any service Respiratory paralysis was about as fatal as heart failure Hence, the most energetic measures were called for to combat it, and strychnia and electricity should be pushed to the utmost extent possible

Dr Andrew H Smith said it seemed to him very remarkable that we should so frequently have recovery from diphtheritic paralysis when the anatomical lesions were of so marked a character, and that the paralysis had always been somewhat of a stumblingblock to him in trying to accept the view that diphthena is originally a merely local disease He had no doubt that there were cases of diphtheria in which no membrane ever appeared, and the fact that inoccurred without any previous throat symptoms certainly went to sustain the idea that diphtheria is es-In scarlatina and the other exanthemata the avail eruption did not constitute the disease Dr Smith then referred to the case of a child whose mother had

This would seem to indicate that diphtheria

Dr L Putzel said that he did not understand ex-One difference between this and actly what Dr Thomson meant by the post-latent This disease was different from it, the subject was all the more hable to subsequent scarlatina because, in scarlatinal nephritis, the bacterium which was the exciting cause of the acute affection still remained in the system It seemed to him that the acute attack of diphtheria left the nervous system in a weakened condition, in which any slight cause might bring on paralysis As regards the fact that the paralysis usually makes its first appearance in the fauces, the reason for this seemed to be because the throat was so markedly affected in the As to those rare cases in which paacute attack ralysis occurs without any previous local trouble, he said he was not aware that a sufficient number of these had been observed to base any conclusions upon

Dr Malcolm McLean described a very severe and prolonged attack of diphtheritic paralysis which occurred in his own practice a few years ago, and in which he said that more muscles and a greater extent of cutaneous surface were affected than was usual in cases which recover It lasted for four and a half months, and involved the muscles of respiration as well as those of the throat and of both the upper and failure of the heart nerves, either the sympathetic or lower extremities, but did not affect the sphincters This was an accident liable to On the fourth day of the acute attack of diphtheria which preceded the paralysis symptoms of heart failtherefore always insisted on the free administration of ure made their appearance, and the heart continued weak throughout the course of the subsequent pa-On one occasion the pulse, the ordinary peared it was usually too late for such remedies to be rate of which was 52, fell to 32 (afterwards suddenly rising for a time to 160), and this was accompanied by a most violent attack of angina pectoris, which The practical point came very near proving fatal which Dr McLean said he wished to impress was the necessity in such cases of the most absolute rest. In his own case faradization and galvanism were systematically employed for a long time, and in order to receive the treatment he had to be taken in a carriage to the office of the physician who applied it though the electricity was given with the greatest skill, however, he only grew worse, instead of better, except as regards the original paralysis of the fauces, which in time became materially relieved At length, so great was the pain and discomfort which he sufstances were on record in which diphtheritic paralysis fered, that he determined to take absolute rest in bed, and as soon as he adopted this course he began to improve He remained in bed for a month, and sentially a general disease, while the membrane was so satisfactory was the result that he was firmly consimply an indication of it, just as the erythema of vinced that, in these severe cases, unless this absolute scarlating was the outward manifestation of that dis- rest is insisted on, no other treatment will be of any

Dr S Seabury Jones mentioned a case of tabes dorsalis that occurred in a druggist who had received diphtheria in which the diphtheritic membrane ap- a wound in the hand while assisting in a tracheotomy peared, not in the throat, but in the groin, where performed on a diphtheritic patient, the paralysis the skin had become chafed It was also remark-commencing in the injured hand. In such cases, acable, he may be the paralysis sometimes how able, he went on to say, that in cases of diphtheritic cording to Trousseau, the paralysis sometimes, howparalysis not preceded by the appearance of mem-ever, attacked the throat first. He then referred to branes in the throat the paresis usually began in the a case in which the trouble resembled bulbar paral-

ysis, although a good recovery was made under the use of strychnia and iron In this case the patient was a woman who nursed her child through diphtheria, but, as far as could be ascertained, did not have any membranes herself, although she complained of sore throat at the time Trousseau, he said, had long ago described in the most admirable manner all the varieties and characteristics of diphtheritic paralysis, and there was no question in his own mind that the lesion in this affection might be either central or peripheral

The chairman of the Section, Dr W R Birdsall, said that as regards the pathology of diphtheritic paralysis he also believed that, while in many instances there was simply a neuritis, cases of undoubted central origin sometimes occurred latter, however, the central lesion was apt to give rise also to peripheral degeneration In adults diphtheritic paralysis was relatively more common than in children, and it very often occurred in cases in which the original attack of diphtheria was very light As to the matter of heart failure, it was a question, he thought, whether the trouble was of the same plegia-Phthisis-Complications in Bright's Diseasenature as the paralysis noted after the acute attack, or was merely functional in character, and a point against its paralytic origin was the early stage at which it occurred As regards the etiology of diphtheritic paralysis, it seemed to him entirely possible that it might be due to the original poison which caused the acute attack of the disease, the delay in its appearance being perhaps attributable to the comparatively long time which it takes for such touc the medical staff will suffice to show where a large agents to act upon the nervous system

In bringing the discussion to a close Dr Thomson said that he had purposely refrained from taking up tne subject of heart failure in the paper, for the Physicians of Lowdon, 1885, in a very extended reason that it was attended with so many complicating circumstances He doubted very much, however, whether it was due to the same cause as the later pa-In many instances he believed that myocarditis existed, and it seemed altogether probable that this was the fact, from the description given, in He had not touched upon the Dr McLean's case matter of therapeutics in the paper, but he quite agreed with Dr McLean that electricity was of no It was highly desirvalue in diphtheritic paralysis able, he said, to stimulate the peripheral extremities of the nerves, and this could best be accomplished by applying to the throat equal parts of honey and In paralysis of the extremities a soblack pepper lution of pepper (1 drachm to the pint) was also a As to Dr Putzel's criticism useful local application of his so called post-latent period of diphtheria, Dr Thomson said that the paralysis was to him an indication of certain processes going on subsequently to the acute stage, and that he could but again express his conviction that a similar post-latent stage was characteristic of all the acute fevers This postlatent stage varied in its manifestations in the different diseases, and it seemed highly probable that its phenomena were due to the action of ptomaines

is clearly shown in some statistics recently published however, by a reference to the table of distance by the Health Department. From these translations are the statistics recently published however, by a reference to the table of distance to the table of distance to the table of the statistics recently published however, by a reference to the table of distance to the table of the statistics recently published however, by a reference to the table of distance to the table of the statistics recently published however, by a reference to the table of the statistics recently published however, by a reference to the table of the statistics recently published however, by a reference to the table of the statistics recently published however, by a reference to the table of the statistics recently published however, by a reference to the table of the statistics recently published however, by a reference to the table of the statistics recently published however, by a reference to the statistics recently published however, by a reference to the statistics recently published however, by a reference to the statistics recently published however, by a reference to the statistics recently published however, by a reference to the statistics recently published however, by a reference to the statistics recently published however and the statistics recently published however and the statistics recently published however are the statistics recently published however and the statistics recently published however are the statistics recently published however and the statistics recently published however are the statistics recently published how the statistics recently published how the statistics recently published how the statistics recently published how the statistics recently published how the statistics recently published how the statistics recently published how the statistics recently published how the statistics recently published how the statistics recently published how the statistics recently published how the statistics r by the Health Department From these it appears Here we find recorded 34 deaths from typhoid fever,

that during the ten years from 1868 to 1878 there were 1,488 deaths reported from diphtheria and croup, and during the ten years from 1878 to 1888, 2,295, the percentage of the total death-rate of the city being 1 52 in the former decade, and 1 72 in the latter

The first Commencement of the College of Physicians and Surgeons in its new buildings was held May 10, when a class of 120 was graduated On this occasion the first Harsen prize (\$500), for the best examination in all the branches of study, was awarded to a son of Professor Henry B Sands

The New York Medico Legal Society has begun to make preparations for an International Congress of Medical Jurisprudence to be held in this city in June, 1889

CINCINNATI LETTER

Report of the Cincinnati Hospital, Mortality from Typhoid Fever and Sunstroke—Symptoms in Typhoid Cases—Complications in Acute Rheumatism—Hemi Injuries followed by Tetanas—Obstetrical Statistics— Death of Eminent Medical Men—Dr C D Palmer

The twenty-seventh annual report of the Cincin nati Hospital has just been issued, and it is the best report that has ever been issued from that institution It gives evidence of much care in its arrangement and painstaking in the material selected for publica The following quotation from the report of part of the credit for the admirable report belongs "All of these cases have been carefully classified ac cording to the nomenclature of the Royal College of form, by Mr P Alfred Marchand, Registrar to the Staff, and it is hoped it will be regarded as an important contribution to the statistics of the general hospitals of the world"

In a previous letter it was mentioned that the clinical and Pathological School of the Cincinnati Hospital had become a department of the University of Cincinnati, and the report, in speaking of the union, says "The organization authorized by your Board of the Staff Service, under the title of the Clinical and Pathological School of the Cincinnati Hospital, and its union with the Medical Department of the University of Cincinnati, has been most successfully accomplished, and as one result the number of students attending the course of clinical lectures has doubled, and thereby the income for the support of the Library and Pathological Museum has

been increased by \$1000 " The total number of patients treated during the year amounted to 4,027, of whom 352 died, thus making a death-rate of 8 3 per cent The deathmaking a death-rate of 8 3 per cent rate for the previous year, ending Dec 31, 1886, 1 ... 83 per cent From this it appears that the dear rate for the year 1887 is 10 per cent higher than that of the preceding year

The increased mortality may be largely explained,

and 16 from sunstroke The large number of these cases that occurred during the year, and their morslightly higher death rate

The mortality from typhoid fever was 16 25 per Thirty-four out of 209 cases terminated This mortality is not excessive for hospital winter months was mild, and this factor must enter mortality

the year amounted to 1,937, of surgical, 1,509, ophthalmological 206, and obstetrical and gynecological 300 The average number of days of each patient's stay in the hospital was for medical patients 17 58 days, surgical 30 31 days, ophthalmological 51 days, and obstetrical and gynecological 30 19

Some observations of interest as regards the symptoms and complications of particular diseases are also set forth in the report For instance, in typhoid fever cases we learn that 152 out of 200 cases occurred in males Diarrhoea was present in 78 of The youngest primipara was 16, the oldest 37 these cases, 37 had vomiting, 46 had cough, 37 had vomiting, 46 had cough, 35 had delirium (an unusually small proportion), 50 had sweating, 18 had epistaxis, 60 had rose-spots, 72 had gurgling, 52 had tympanitis, the highest pulse was 180, highest temperature 1135 (?) Of the females, 23 had diarrhœa, 24 had vomiting, 18 had cough, 8 were delinous, 13 had sweating, 7 had epistaxis, 22 had rose spots, 25 had gurgling, 17 had tympanitis The highest pulse was 190, temperature 105 4 One had perforation of the intestines, 2 had intestinal hæmorrhage, I had peritonitis, I had phlebitis, and 1 had diphtheria.

In the cases of acute rheumatism treated the following complications were noted Twenty eight had mitral insufficiency, i had chronic alcoholism, mitral stenosis, 1 had mitral insufficiency, aortic stenosis and insufficiency, 2 had aortic stenosis, 1 had mitral stenosis and insufficiency, I had pleuritic weight 7 pounds, 4 oz, and length 18 inches

and one had syphilitic cerebral thrombosis case of chorea was complicated by subacute rheu-

Among the phthisical cases there were found two who also had mitral insufficiency This combination, is uncommon, but that valvular disease of the heart does sometime coexist with phthisis is proven by these statistics

The complications noted as being found with Bright's disease are the following Two had cedema of the brain and mitral insufficiency, I had acute gastritis, 1 had tuberculosis, 2 had valvular disease of the heart, 2 had erysipelas, developed in the hospital, I had phthisis, I had mitral stenosis, I had delirium tremens, and I had mitral insufficiency

A very interesting portion of the report is that de voted to the details of treatment adopted by each

member of the Staft in typhoid cases These reports are well written and carefully prepared, so that one tality will be amply sufficient to account for the can very profitably read them carefully, and perhaps obtain some ideas that may be of future service

A feature of the surgical report that is at very great variance with the reports published abroad is in regard to character of injuries followed by tetanus cases, for a considerable proportion of the fatal Nicolaier and Rossback in some statistics showed cases were moribund when admitted The type of that tetanus usually, in fact almost always, occurred typhoid fever that prevailed here during the early in cases in which the lower extremities were the seat of wounds, and from this fact argued that the bacillus into consideration as helping to explain the low of tetanus was found in the earth, this report shows that the cases in which tetanus developed were con-The total number of medical cases treated during fined exclusively to injuries of the hand and arm thus one had a laceration of the hand, one had a lacerated wound of the index finger, and one had a mashed hand

The appendix to the obstetrical report furnishes some very interesting features, which will probably There were 234 be of interest to many readers women delivered during the year, about 65 per cent of whom were primipare, 20 per cent were duiparæ, r had twelve previous pregnancies The average age of the primiparæ was 21 years and 10 months average age of the multiparæ was 25 years and 10 months The youngest multipara was 17 and the oldest 42

Average duration of labor - Primiparæ 16 hours, 10 minutes, 2d stage 2' 20", 3d stage 14" Multiparæ 1st stage, 10' 15", 2d stage, 2' 18", 3d stage 12"

Presentations,-Primiparæ vertex, 147, breech 6 Multiparæ vertex 75, face 2, breech 3, footling 1

Positions — Primiparæ SOA, 95, ROA,
45, ROP, 3, SDA, 4, RDP, 1, RDA, 2, unknown 3

Sea of children -Primiparæ gave birth to 75 male and 75 female children, multiparæ to 45 male and 37 female In two cases of twins both were females Primiparæ male children weighed 72/3 pounds, and I had aortic insufficiency, I had erysipelas, 4 had were 1814 inches in length, female, weight 7 pounds and length 18 inches Multiparæ male, weight 7 pounds, 4 oz, and length, 16 inches, females,

Seven cases suffering with hemiplegia had syphilis est 3 pounds, female, heaviest 10 pounds, lightest Premature labor occurred in 10 cases 3½ pounds

These extracts from the report will serve to give a fair idea of the work of the past year, as well as to indicate the fact that much credit is due the resident physicians for their careful and painstaking preparation of the clinical histories

During the past year the local profession has been singularly unfortunate in losing the services of four valuable members Drs Dun, Heighway Muscroft and Aub have been called away, and Dr C D Palmer met with an accident, which to say the least. will incapacitate him for a considerable space of As these are all men who were prominent in medical work, men possessed of large experience and liberal views, it will be found a very difficult matter to fill their places

POTASSIUM PERMANGANATE IN ANTHRAX AND FURUNCLE

Dear Sir —Further experiment with this salt on the line indicated in my communication some months since warrants me in announcing it as a veritable spe-

cific against many phlegmonous lesions

The strength of the solution employed is usually about gr x-31 of distilled water, though a much stronger preparation may be used with safety a cotton-tipped probe or hypodermic syringe attempts should be made to reach the fons et origo mali A few drops thus brought into contact with the cone of a recent boil will, in a majority of instances, abort it Or if the furuncle be already opened and suppurating, its tedious progress may be materially abridged by daily saturating the cone and its surroundings with the solution

If, on the other hand, we have a carbuncle to contend with, its focus of inflammation may be reached through one or more of the cribriform avenues, the site of which can be made out even before pus has

appeared on the surface

Within the present month I have cured two large carbuncles, which involved the nuchal regions of two elderly men In one case the induration extended to the spine of the scapula on one side and for several inches on the other Neither of the gentlemen had been free from acute pain nor slept for more than forty-eight hours I described to them the new treatment but, recognizing the importance of prompt action, advised immediate and full incision of the two chose to try the new remedy first, and it was so done The result, as shown on the following day, was all that could be desired, rest had been secured, and the entire aspect of affairs had changed for the better The dressing employed, meanwhile, was a lead and opium, or permanganate, lotion cov-Tonic treatment was advised ered with oil silk rather as a prophylactic, for the treatment of neither case occupied a week

Phlegmonous erysipelas is so rarely seen here that I may never have an opportunity to test the remedy in that direction, but I suggest that the inflamed area be circumscribed or environed by a series of deep injections, with a superficial dressing of the same should certainly expect to arrest the disease us hope that some of your readers will test the pro-C M FENN, M D cess and report

RAILWAY INJURY OF NECK, WITH FRACTURE OF HYOID BONE

Dear Sir -Mr T, on May 4, while at work in the mine was caught between a car and the roof When called to see him I found marks behind the ears which looked very much as if the man had been On examination of the anterior right side of THE DEATH OF DR EDWARD S DUNSTER the neck found a large wound made by an iron on The æsophagus and trachea were exposed from the cricoid to above the lupoid bone piece seemed to have passed behind the anterior tissues nearly through from right to left The thyroid

cartilage was considerably bruised and the hyoid bone was completely severed just to the right of the

It was a question how to hold the ends of bone together, I having no silver wire and could get none in The patient could swallow only with the greatest difficulty, and in the recumbent position breathing was difficult I concluded to try silk I first put a stitch below each piece, which were separated about one-half inch, and thus brought the ends nearly into position, I then passed a large silk thread through the pieces and was then enabled to get good The wound was then closed and the opposition ends of thread brought to the lowest point It healed nicely In a few days the lowest thread came away, and to-day, three weeks after, the one through the bone was removed

For the first two days there was considerable use of temperature but that subsided under treatment and the man made a good recovery

"ELEVATING THE STANDARD," AND HOW EASY'IT IS DONE

Dear Sir —Aside from the plain proposition that the elevation of any standard is the duty of the one bearing it—the method so long discussed—of its ap plication to the proper qualification of students enter ing medicine—is no less simple Exactly as the terse rule "that the proper way to resume specie payment, was to resume specie payment," solved a great finan cial problem So does the above A B C method set tle this old question of an over crowded profession by unqualified members Witness the proof During the past year the writer has received from three young men, applications as office students Although each applicant was bright, ambitious, and in a general sense promising, it was only requisite to state to the candi date the preliminary qualifications required by schools of the highest standard, to convince them that they One is now equipping himself could not enter wherein he was deficient, and the other two have entered vocations the demands of which they are amply qualified to meet, as proven by success and satisfaction already attained

Here, Mr Editor, are two young men rescued from a life struggle with semi-starvation, a profession slightly relieved, and the world at large benefitted The way to resume is to resume, and the way to elevate the standard of medical acquirement is for the H C MARKHAM, M D colleges to elevate it

Independence, Iowa

NECROLOGY.

WHEREAS, It has pleased Almighty God to remove from his earthly sphere our worthy companion and professional brother, Dr Edward S Dunster, of Ara Arbor, Mich, therefore, be it

Resolved, That we as a Society tender to his grow stricken family our heartfelt sympathies

To the profession before whom he has appeared so eloquent in address, logical in his reasoning, honest in his opinions, which he maintained with his utmost power, and above all, his loyalty to his profession he so dearly loved, and for whose best interests he so long and sedulously labored, we can only say that the loss of one so eminent can illy be told in resolutions or words, in this the heart alone can speak

In obedience to the Almighty power that rules the destinies of men, that can build up or cast down, that can give or take away, we bow in humble submission about the bier of our departed friend, fellow member

and professional brother Be it further

Resolved, That our Secretary transmit a copy of these resolutions to the press and to the family

BOOK REVIEWS.

THE SURGICAL DISEASES OF THE GENITO-URINARY ORGANS, INCLUDING SYPHILIS By E L KEYS A.M., M.D., etc. A Revision of Van Buren and Keys' Text book upon the same subjects pp xv, 704 New York D Appleton & Co 1888 Chicago A C McClurg & Co

Since the appearance, in 1874, of the original treatise upon which this revision is founded there have been many changes and much progress in the surgery of the genito urinary organs litholapaxy has had its buth and development, supra-pubic cystotomy has received new study and attention, new methods of exploring and operating upon the bladder have been studied and brought to some degree of perfection, the surgery of the kidney has been reconstructed, as has been, to a great extent, that of the tunica vaginalis and of varicocele, and our therapeutic resources in syphilis have been added to and greatly strength-It is to be expected, therefore, that this revision differs much and in many particulars from the work of 1874—and such is the case The book has been entirely recast The clinical cases of the original work have been omitted in order to make room for new matter

Masterly as is the book there are in it, in our opinion, two serious defects there is not one word in it, so far as we have been able to discover, concerning the treatment of stricture of the urethra by electrolysis, and the subcutaneous use of mercury in syphilis is dismissed in a paragraph as being scarcely worthy of consideration We can but think that the failure to even mention electrolysis was due to inadvertence—surely it could not have been intentional Whatever may be the future estimate of the value of electrolysis in the treatment of certain cases of stricture of the wrether the statistics now at hand show examination of two cases," by Dr A W Wilmarth, of Elwyn, that the method is at least worthy of mention by the

It is the duty of the vidual opinion on the subject author of a scientific work to present facts as they are, not as he wishes they were—and we believe that Dr Keyes, writing to present facts as they are, or as he thinks they are, must have overlooked the subject of electrolysis

As a whole the book is one that will bear the closest study, and is entitled to the same high rank in medical literature that was given the original work

THE PHYSICIAN'S BEDSIDE RECORD The Plimpton Míg Co, Hartford, Conn

This was designed for the purpose of keeping a permanent record of the clinical features of disease, recorded at the patient's bedside It comprises a page for the preliminary history of the case, twentyeight pages for the recording of as many days' observations, ruled one line for each hour of the day, with spaces for pulse, temperature, respiration, medicine, notes of nurse, and directions and notes of physician, following these are three closely ruled pages for the physician's notes or history of the case, and concluding, there is a chart for a tracing of the pulse, temperature and respiration, showing at a glance the variation for each day of the disease

While most physicians probably have a method of their own for case-taking, this pamphlet book will prove exceedingly useful, especially for the preservation of records of cases of protracted illness, as of typhoid fever, etc If by its convenience it encourages more universal case recording, it will accomplish

much good

MEDICAL PUBLICATIONS, HARVARD MEDICAL SCHOOL

This is a neatly bound volume comprising papers upon medical subjects that have been written during the year 1887 by the Faculty and instructors of Harvard Medical College The papers as they appear here are reprints from various periodicals that have been collected and bound together The subjectmatter of each is interesting, and only articles of originality have been admitted to the collection

ADDRESS IN OPHTHALMOLOGY.

THE TENDENCY OF MODERN OPHTHALMOLOGY

Delivered at the Thirty ninth Annual Meeting of the American Medical Association, Cincinnati, May 9, 1888

BY F C HOTZ, MD,

OF CHICAGO, ILL

CHAIRMAN OF THE SECTION OF OPHTHALMOLOGY

There are times in medical science when opinions and doctrines show a remarkable oscillatory motion, swinging like a pendulum forward and backward, sometimes to come back to the point from which they had started out many years ago This unsteady movement makes it very difficult, if not impossible, to determine whether any real progress has been made

within a short period

One of the most remarkable instances of the unstable nature of medical opinions is furnished us by the history of the cataract operations since 1860 that time the corneal flap operation reigned supreme But when von Graese published, in 1865, his "Modified Linear Extraction," and demonstrated its supenonty over the older method by a marked decrease in the percentage of failures, his operation quickly gained favor with the ophthalmic surgeons and en tered on a triumphant march over the world, which is only eclipsed by the phenomenal rapidity with which cocaine in our days conquered the medical profession of all nations In a few years Graefe's operation had superseded the flap operation so completely that the vounger generation of oculists know the latter only from books, and in the course of two decades the superiority of Graefe's method, proven in thousands upon thousands of cases, seemed so firmly established that we all were thoroughly convinced it marked a decided and important progress in ophthalmic surgery And to day—what do we see to day? In all ophthalmological journals and societies voices are loudly urging the return to the corneal flap operation In the Ophthalmological Section of the last International Congress this question excited a very animated discussion, and almost at the same time the same question was brought up before the German oculists in Heidelberg by Prof Schweigger, of Berlin (Graefe's successor!), who expressed himself unreservedly in favor of the corneal flap operation We cannot close our eyes to the fact that this back to where it stood thirty years ago?"

If newness and progress were identical in medical matters we could easily measure the advancement made in each successive year, and it would be an easy task for your chairman to carry out the dictates of the By laws of our Association, which charge him "to prepare an address on the recent advancements in the branches belonging to his Section" But real progress in medical science is of an exceedingly slow growth, slowly old views are modified and new theories evolved, and when they have taken form and flesh they have to stand the crucial tests of long-continued clinical observations before they can be accepted as an improvement or advance

This slow process of cleaning the chaff from the wheat renders it manifestly impracticable to measure the advancement in medicine by the year, and I therefore ask for your kind indulgence if, instead of undertaking the impossible task of determining the progress made in ophthalmology, otology and laryngology during the past year, I have chosen for the subject of this address some considerations regarding

THE TENDENCY OF MODERN OPHTHALMOLOGY IN ITS RELATIONS TO GENERAL MEDICINE

When Graefe began his reformatory work, ophthalmology, like the rest of medical science, was still largely permeated by the doctrine of "dyscrasies" The most affections of the eye were regarded and treated as manifestations of a general dyscrasia or impure state of the blood Constitutional treatment received the principal attention, local remedies were considered of little consequence Physicians had a holy horror of opening by daylight the eyes of children afflicted with the so called "scrofulous ophthalmia," they thought it not only inexpedient but unnecessary to examine such eyes every day

Graefe, in his travels, had been thoroughly convinced of the shortcomings of this therapy, and it was clear to his mind that the only trustworthy foundation for a rational and successful therapy was a thorough knowledge of the pathological changes which take place in the tissues of the eye in disease From the beginning of his practice to his last day he emphasized the paramount importance of daily examination and accuracy in observation. Upon this basis he built up his methods of local treatment and demonstrated by his brilliant success their superiority over the irrational therapy of the past.

reaction has already assumed a formidable size, and laid upon local treatment very soon created in mediback to where it stood thirty years ago?"

But the great stress which in Graefe's clinic was laid upon local treatment very soon created in medical circles the impression that Graefe and his pupils were inclined to rely upon local medication exclu-

sively, and to pay no attention to constitutional or other diseases which possibly might influence the oc-And it came to be generally believed ular affection that modern ophthalmology was so exclusive a specialty that it had no interest in or connection with general medicine

Nothing could be more erroneous than this idea Every leaf of the ophthalmological literature bears witness that modern ophthalmology is striving incessantly to establish the closest connection with general medicine by investigating the relations which exist between the ocular diseases and the maladies of the whole human body

In solving this great problem ophthalmology is endeavoring to answer these two questions

What effect have constitutional and organic diseases upon the eye?

2 What influence have morbid disturbances in the eye upon other parts of the body?

Many are the valuable contributions made by ophthalmologists to our knowledge of the etiological dependence of ocular affections from organic or systemic diseases, especially since the ophthalmoscope has greatly widened the field of these investigations In 1856 already Dr M Heyman, of Dresden, recognized and described the characteristic pathological changes in the retina associated with Bright's disease of the kidneys Diabetes was found not only to disturb the lens, but also to cause iritis and choroiditis, and leukæmia is now known to induce peculiar lesions in the retina Numerous observations have been recorded of the influence of cerebral and spinal affections on the visual organs, and of the effect of tobacco, alcohol, quinine, lead and other poisons Uterine disorders have been found a prolific source of ocular neuroses, and diphtheria a cause of paralytic affections, not to speak of innumerable new facts discovered in regard to the etiological connection of gout, rheumatism, syphilis and malaria with ocular diseases

It would be impossible in this short address to give a full list of all the work which has recently been done in this direction But even these few instances are sufficient to show that modern ophthalmology, far from ignoring the vital connection of the eye with the rest of the body, has been studiously at work to gain a better understanding of this relation on the basis of accurate clinical observations

Nor has it escaped the notice of observant oculists that ocular diseases sometimes exert a grave influence upon the whole organism or its several parts The febrile excitation in panophthalmitis, the violent headache in cyclitis, the terrible paroxysms of neuralgia, nausea and vomiting in acute glaucoma, the giddiness in slight paresis of ocular muscles-these and similar facts prove the diseased eyeball can exert a disturbing influence which may reach far beyond its immediate vicinity

And here is the point where ophthalmology comes into the closest contact with general medicine, since it has directed the latter's attention to the eye as the possible cause of many nervous disorders plaints of asthenopic patients periodic headache, diz- Geo T Stevens, M D New York, 1887 long been known to oculists that among the com-

ziness, nausea or a sensation of weariness are very common, and that all these symptoms are relieved by the glasses which correct the visual difficulty The fact thus proven, that eye strain is capable of seriously affecting the nervous system, logically leads to the inquiry whether the same cause may not be operative in many cases of neurotic affections where the patients do not show any manifest visual disturb Clinical observations on a large scale alone can decide this question And preeminent among those oculists who have undertaken this task, stands Dr Geo T Stevens, of New York, who during a series of years has carefully examined the visual functions of a great number of patients suffering from the various forms of nervous disorders, and also carefully studied the effect the correction of visual difficuities-where any were found-had upon the exciting nervous disturbance The recently published records of his researches1 are highly interesting reading not only for the oculist and neurologist, but for every physician, and it is a task worthy the combined ef forts of physicians and oculists to ascertain whether Dr Stevens is right or wrong in declaring "difficulties attending the functions of accommodating and of adjusting the eyes in the act of vision, or irritations arising from the nerves involved in these processes, are among the most prolific sources of nervous disturbances, and more frequently than other conditions constitute a neuropathic tendency" If these views be confirmed by further clinical observations, oph thalmology would most assuredly have rendered in valuable services to general medicine by disclosing a way of relieving many common and heretofore often intractable nervous affections

From a multitude of evidences con Gentlemen tained in the records of modern ophthalmalogy I have selected but a few which truthfully reflect the spirit of this specialty I wished to show that its attention and interest are not confined to the narrow anatomical limits of the visual organ, that its ten dency is to widen the field of its usefulness and to contribute its share to the advancement of medical science by solving the highly interesting problems of the mutual influence of the body upon the eye and Much has already been done, but much more, undoubtedly, could have been accomplished, had ophthalmology in these efforts been generously assisted by the medical profession But it cannot be denied that general medicine has, for a long time, shown a strange indifference to ophthalmology Do you ask for evidence? Look in your medical text books and see how little notice is taken of the most important discoveries in regard to the influence of general diseases upon the eye Look at your med Not one of them regards the study of ıcal colleges ophthalmology as important enough for medical stu dents to make the attendance of eye clinics obliga Ask your clinical teachers, and they will tell you the interest medical students and physicians take in ophthalmology is exceedingly low if gauged by the number of attendants at the eye clinics

Thus ignored by general medicine and divorced b,

its rapid growth from surgery, ophthalmology has wound and a penetrating wound complicated by inbeen forced into an isolated position never sought by jury of the gastro intestinal canal solve, ophthalmology appreciates too well the importance of the closest intercommunication and the active cooperation with all the other sections of medical science

The great diversity of the scientific work to be done by each branch necessitates the division of this Association into Sections But, while each Section should have its own organization and the privilege to carry out its work in its own way, we do not propose to sever our connection with the Association by establishing a special society, but, realizing the great mutual benefit coming from personal contact of the workers of the different Sections, we shall always bear in mind that one common interest binds all Sections together, they belong together, they can profit from each other, and they shall meet and work together for the advancement of the science and art of medicine

RECTAL INSUFFLATION OF HYDROGEN GAS AN IN-FALLIBLE TEST IN THE DIAGNOSIS OF VISCERAL Injury of the gastro-intestinal canal IN PENETRATING WOUNDS OF THE ABDOMEN

Read in the Section on Surgery, at the Thirty ninth Annual Meeting of the American Medical Association, May, 9, 1888, and illustrated by three experiments on dogs

BY N SENN, M D, PH D,

ATTENDING SURGEON TO THE MILWALLEE HOSPITAL, PROFESSOR OF FRI (CIPLES OF SURGERY AND SURGICAL PATHOLOGY IN THE RUSH MEDICAL COLLEGE, CHICAGO, ILL.

The operative treatment of penetrating wounds of the abdomen complicated by visceral injury of the gastro intestinal canal is now sanctioned by the best surgical authorines, and may be considered as a well established procedure, based as it is upon the results of experimentation and clinical experience ceral wound of the stomach or any portion of the intestinal canal sufficient in size to give rise to extravasation into the peritoneal cavity must be looked upon as a mortal injury unless promptly treated by abdominal section A number of well authenticated cases are on record where a wound in the stomach or the large intestine healed and the patients recovered without the intervention of surgery, but these instances are so few that, practically, the force of the preceding statement remains unimpaired careful study of an namense clinical material Otis came to the important conclusion that gunshot in-Junes of the small intestines under the old expectant treatment without exception resulted in death, and this is a sufficiently cogent argument in favor of their treatment by laparotomy as affording the only chance of recovery

The great difficulty that presents itself to the surgeon in the absence of positive symptoms is the dif-

While the exisit, for, in the great task it has set before itself to tence of serious intra abdominal hæmorrhage can usually be readily recognized by well marked physical signs and a complexus of symptoms which points to sudden diminution of intra-arterial pressure, and thus furnishes one of the positive indications for treatment by laparotomy, the well-known fact remains that a visceral injury of the stomach or intestines seldom gives rise to symptoms upon which the surgeon could

rely in making a positive diagnosis

In the treatment of penetrating wounds of the abdomen laparotomy is resorted to either for the purpose of (1) arresting dangerous hæmorrhage, or (2) the detection and treatment of a wound or wounds of its hollow viscera. The first indication is readily recognized, and the diagnosis not only justifies the operation, but imposes it as a stern duty upon the surgeon from which he should never shrink recognition of the second indication offers greater difficulties, and the uncertainty of diagnosis which surrounds such cases is used as a sufficient argument by many in opposing the adoption of timely and efficient surgical treatment, and is responsible for the loss of many lives which otherwise might have been The uncertainty of diagnosis must remain in the way of a more general adoption of laparotomy in the treatment of penetrating wounds of the abdomen in the case of timid surgeons, and the same cause may lead to most unpleasant medico legal complications in the practice of bolder and more aggressive Clinical experience and statistics have operators demonstrated the importance of making a distinction between punctured and gunshot wounds in the abdomen, both in reference to diagnosis and treatment It is well known that penetrating stab wounds are less likely to be complicated by visceral injury than bullet wounds, consequently this class of injuries offers a more favorable prognosis and does not call so uniformly for treatment by abdominal section penetrating gunshot wounds of the abdomen do not always implicate the gastro-intestinal canal has been well demonstrated by experiment and clinical observation During the last two years three cases of bullet wounds of the abdomen came under my observation where no doubt could be entertained that penetration had taken place, and yet all the patients recovered without operation In all three cases the bullet had taken an antero-posterior direction As in private practice the treatment of penetrating wounds of the abdomen usually involves great medico legal responsibilities, it becomes of the greatest importance to arrive at positive conclusions in reference to the character of the injury before the patient is subjected to the additional risks to life incident to an abdominal

We will suppose a case In a quarrel a man is shot in the abdomen The assailant is placed under The surgeon who is called establishes the fact that the bullet has entered the abdominal cavity, and from the point of entrance and its probable diretion he has reason to believe that it has wounded ferential diagnosis between a simple penetrating cludes to verify his diagnosis by an exploratory laparsome part of the gastro-intestinal canal, and he con-

otomy, the operation is performed, and the most careful examination made, but no visceral wound is found The wound is closed and the patient dies on the third or fourth day of septic peritonitis attorney for the State charges defendant with murder

The defense will very naturally raise the questions "Did the man die of the injury or the operation?" "Shall the defendant be tried for assault and battery or for murder?" During the trial the attending surgeon is made a target for a volley of a medley of scientific and unscientific questions by the cunning attorney for the defense in his attempt to save his client from the gallows or State prison for life, at the expense of the reputation of the surgeon and the respect and good name of the art and science of sur-This picture is not overdrawn Such cases have happened and will happen again It is apparent that if some infallible diagnostic test could be applied in cases of penetrating wounds of the abdomen which would indicate to the surgeon the presence or absence of visceral lesions of the gastro-intestinal canal the indication for aggressive treatment would become clear and the medico-legal responsibility of cases requiring rectal alimentation, and when in a the operator would be reduced to a minimum we can never expect by a study of symptoms or by the ordinary physical examination to fill this gap, I was induced to search for some reliable test which in such cases should prove that the penetrating bullet or instrument had injured the gastro-intestinal canal It occurred to me that a wound in the stomach or intestine should be sought for in some such way as the plumber locates a leak in a gas-pipe The first object to be accomplished was to prove the permeability of the entire gastro-intestinal canal to inflation of air, and the next step was to find some innocuous gas which when inflated would escape from the intestinal wound into the peritoneal cavity, and from there through the external wound, where its presence could be proved by some infallible test

I PERMEABILITY OF THE ILEO-CÆCAL VALVE TO RECTAL INSUFFLATION OF AIR OR GAS

A great deal has been said and written in reference to the permeability of the ileo-cæcal valve to injections of fluids into the rectum or to the insufflation of air or gases The majority of those who have studied this subject clinically or by experiment make the positive assertion that the ileo-cæcal valve is perfectly competent and effectually guards the ileum against the entrance of both fluids and gases forced into the rectum, while others insist that it is permeable only in exceptional cases, and only a few claim that its resistance can be overcome by a moderate degree of pressure Heschl (Zur Mechanik der diastaltischen Darmperforationen Wiener Med Wochenschrift, No 1, 1881) made a number of experiments and satisfied himself that the ileo-cæcal valve serves as a safe and perfect barrier the resisting power of the coats of the intestine he forcible rectal injections of water as a means to refound that the service coat of the color found that the serous coat of the colon gave way first duce an invagination to overdistension, while the remaining tunics yielded subsequently to a somewhat slighter pressure

small intestine of a child on being subjected to overdistension ruptured first on the mesenteric side, the place where acquired diverticular are found Bull (Virchow's Jahresbericht, 1878, B 11 S 205) has found that in the adult one litre of water injected by the rectum will reach the cæcum, but that the entire capacity of the large intestine is from 4 to 5 litres He is of the opinion that in the living body fluid cannot be forced beyond the ileo-cæcal valve, although ancient and modern experimenters claim to have succeeded in the cadaver He affirms that when the rectum is distended by air the ileo cæcal valve is rendered incompetent and the air passes into the small intestines

Cantani (Virchow's Jahresbericht, 1879, B 11 S, 180) is a firm believer in the permeability of the ileo cæcal valve to fluid rectal injections In one instance he treated a case of coprostasis by an injection of a litre and a half of oil per rectum, and an hour later a part of the oil was ejected by vomiting He ad vises that the intestinal tract above the ileo cecal valve should be utilized as an absorbing surface in As diseased condition should be treated by topical apply cations

Behrens (Ueber den Werth der Künstlichen Auftrei bung des Dickdarmes mit Gasen u Fluessigkeiten Goettingen Dissertation 1886) concluded from his experiments that it required the insufflation per rectum of one and one eighth litres of air to reach the ileum through the ileo cæcal valve. In his experi ments he had no difficulty in overcoming the compe tency of the ileo-cæcal valve by rectal insufflation of air

Debierre (La valvule de Bauhin consideree comme barrière des apothicaires Lyon Medicale, No 45, 1885) made numerous experiments on the cadaverto test the permeability of the ileo-cæcal valve to rectal injections of fluids or inflation of air The results which he obtained were not constant In some sub jects the valve proved only permeable to air, in others, to both air and water, while in some no air or fluids could be forced into the ileum by any degree of When the intestine was left in situ the valve force was found less permeable than when the intestine had been removed from the body He attributes the different degrees of competency of the valve to van ations in the anatomical construction of the valve If both lips of the valve are equal in length, or if the lower lip is longer the valve was found impermeable It proved permeable in cases where the lower lip was shorter, contracted and smaller than the upper In the last instance the advancing volume of fluid or air lifted the upper valve, while in the former struc ture of the valve the margins of the lips of valve were pressed against each other, perfectly shutting on all communication between the colon and the ileum,

Mr Lucas ("On Inversion with Inflation in the Cure of Intussusception" The Lancet, January 16, 1886) enumerates the following objections again

r Owing to its weight it everts much too strong The lateral pressure for the intestine safely to bear, and by forcing in water

contact of a large quantity of water with the large bowel is apt to increase the tendency to diarrhola He claims, very properly, that air, on the other hand, is a natural occupant of the intestinal canal, and whilst its pressure is of the gentlest its presence exinflation is attempted

Dawson (Lancet and Clinic, Feb 21, 1885) made a number of experiments on the cadaver and came to the conclusion that when the ileo erecal valve is in a normal condition it effectually guards the small intestine against the ingress of fluids from below

Illoway (American Journal Medical Sciences,) Vol 41, p 168) devised a force pump which he strongly recommends for the purpose of forcing water beyond the ileo caecal valve in case the seat of an intestinal obstruction is located above that point. He the resistance offered by the ileo cæcal valve this method, three of which recovered

Battey (Transactions of the American Medical Association, 1878) asserts the permeability of the entire alimentary canal by enema, and verifies his statement by the recital of his own clinical experience and exinflation of the rectum for diagnostic and therapeutic purposes and proceeds as follows a rectal tube about 6 inches long is carried into the anus and fixed by pressing together the nates, the patient lying on the back A funnel is then connected with the rectal tube by means of rubber tubing For complete inflation of the large intestine 3 drams of bicarbonate of soda and 4½ drams of tartaric acid are separately dissolved in water and portions of either solutions alternately added To prevent sudden overdistension of the bowel it is advised to add the solutions at intervals of several minutes A very important use of this method is to diagnosticate the position of contractions, strictures, or occlusion of the intestine in cases in which it is desirable to operate, and also as showing the pos tion of peritoneal adhesions. The result of his observations has led him to believe that, as a rule, the small intestine is completely closed to the entrance of substances from the colon by the ileo cæcal valve Under the influence of deep chloroform narcosis, however, this resistance is lessened, and fluids can be thrown into the small intestine

In m) paper read at the last International Medical Congress ("An Experimental Contribution to Intestinal Surgery with Special Reference to the Treatment of Intestinal Obstruction") the following experiments appear which illustrate the difficulty in overcoming the resistance of the ileo-cæcal valve by cæcal valve rectal injections of water

Experiment 23 -While completely under the influence of ether an incision was made through the linea alba of a cat, sufficiently long to render the ileo cæcal region readily accessible to light An inclsion was made into the ileum just above the valve

he has found it easy to rupture the bowel after death injected into the rectum and as the execum became well distended it could be readily seen that the valve 2 Should reduction have been accomplished the became tense and appeared like a circular curtain preventing effectually the escape even of a drop of fluid into the ileum. The competency of the valve was only overcome by overdistension of the cæcum which mechanically separated its margins, which allowed a fine stream of water to escape into the ileum cites no unnatural peristaltic action. He administers The insufficiency of the valve was clearly caused by an anysthetic to the point of relaxation before the great distension of the cycum. That such a degree of distension is attained by no inconsiderable danger was proved by this experiment, as the cat was immediately killed, and on examination of the colon and rectum a number of longitudinal rents of the peritoneal coat was found

Experiment 24—In this experiment, a cat was fully narcotised with ether, and while the body was inverted, water was injected per rectum in sufficient quantity, and adequate force by means of an elastic syringe to ascertain the force required to overcome reports four cases of intestinal obstruction treated by disten ion of the cæcum could be clearly mapped out by percussion and palpation before any fluid passed into the ileum As soon as the obstruction at the valve was overcome, the water rushed through the small intestines, and having traversed the entire alimentary canal issued from the mouth periments upon the cadaver Z emssen recommends quart of water was forced through in this manner The animal was killed and the gastro intestinal canal carefully examined for injuries 'Two longitudinal lacerations of the peritoneal surface of the rectum, over an inch in length, were found on opposite sides of the bowel

> Experiment 25—This experiment was conducted in the same manner as the foregoing, only that the cat was not etherized More than a quart of water was forced through the entire alimentary canal from The animal was not killed, and anus to mouth lived for eight days, but suffered during the whole time with symptoms of ileo colitis A post mortem examination was not made in this case, although the symptoms manifested during life leave no doubt that they resulted from injuries inflicted by the injection"

It will thus be seen that in the three cases where fluid was forced beyond the ileo-cæcal valve, in two of them the post mortem revealed multiple lacerations of the peritoneal coat of the large intestines, while the third animal sickened immediately after the experiment was made, and died, from the effects of the injuries inflicted, eight days later These experiments combined with clinical experience leave no further doubt that, practically, the ileo-cæcal valve is not permeable to fluids from below, and that for diagnostic and therapeutic uses it is unsafe and unjustifiable to attempt to force fluids beyond the ileo-We should a priori expect that air and gases on account of their less weight and greater elasticity than water, could be forced along the intestinal canal with less force, and for that reason alone, if for no other, should be preferred to water in cases where it appears desirable to distend the intestine above the ileo cæcal valve The results oband by gently retracting the margins of the wound tained by experimental research in the past speak in the valve could be distinctly seen Water was then favor of rectal inflation by air or gas in all cases

where for diagnostic or therapeutic purposes it becomes necessary to dilate the entire or a portion of the gastro-intestinal canal

I Rectal Insufflation of Air

Experiment 11-Dog, weight 75 pounds animal was profoundly anæsthetized, and by means of an ordinary elastic syringe air was forced through the rectum until the whole abdomen became distended and tympanitic The abdominal cavity was opened in the median line, and the whole intestinal canal was found distended An incision about an inch in length was made about the middle of the small intestines when air escaped, and about one foot of the intestine on either side of the wound col-The remaining portion of the intestines remained unaffected by the incision The animal was killed, and every part of the entire gastro-intestinal canal was carefully examined for injuries cæcal valve remained intact, and no evidences of The ileorupture of any of the coats of the intestines could be detected

Experiment 2 - Dog, weight 12 pounds full anæsthesia the gastro-intestinal canal was inflated in the same manner as in the preceding experiment, and the inflation was carried to the same On opening the abdomen in the median line the distended loops of the intestines protruded from the wound and partial eventration was allowed to take place for the purpose of evamining the intestines for injuries The closest inspection failed to detect evidences of partial or complete rupture of any of the tunics One of the distended coils of the intestine was incised at opposite points on lateral aspect, the incisions being an inch in length Only a limited segment of the bowel on each side of the wounds collapsed, and although the peristalsis was active more remote portions were emptied very The wounds were united transversely for the purpose of making an artificial diverticulum The animal recovered without any untoward symp-

Experiment 3—Dog, weight 13 pounds Animal profoundly etherized, and air inflated as in former The distended colon could be clearly mapped out by percussion before a gurgling sound in jected slowly into the rectum As inflation pro the region of the ileo cæcal valve indicated that the air had entered the ileum After this had occurred the middle of the abdomen became prominent and As soon as the resistance offered by the ileo-cæcal valve had been overcome it required less force in distending the remaining portion of the The inflation was carried to gastro-intestinal canal the extent of distending the stomach, an event which was easily recognized by a considerable prominence in the epigastric region which was tympanitic on percussion At this time an elastic tube was inserted into the stomach, and its free end immersed abdominal distension was materially diminished the inflation was continued the air would escape

through the stomach-tube, showing that a moving current of air existed between the rectal tube and the stomach tube The abdominal distension which remained after the experiment had completely dis appeared after eighteen hours, and the animal never manifested pain or any other symptoms of disease

Experiment 4 - Dog, weight 15 pounds In this experiment inflation was practiced without anæsthesia. The rigidity of the abdominal muscles greatly interfered with the distension of the colon to a requisite degree for overcoming the competency of the ileo cæcal valve The passage of air from the cæcum into the ileum through the ileo-cæcal valve was announced by an audible gurgling sound which was repeated at intervals, as the cæcum, after partial collapse, again was distended by renewing the The insufflation was continued until the inflation stomach became distended by air, which caused vomiting and copious eructations of air remained in perfect health after the inflation

These experiments prove the feasibility of forcing air through the entire alimentary canal from below upwards In not a single experiment could any structural changes be found in the walls of the in testine, and all animals not killed immediately after the experiment recovered The results of these ex periments contrast strongly with those where the same objects were in view by rectal injections with In the latter experiments the force requisite to overcome the ileo cæcal valve invariably produced lacerations of the peritoneal coat of the bowel, which in themselves would constitute a grave source of danger It now became necessary for me to prove that the ileo-cæcal region in man in so far resembled that in the dog that the ileo cæcal valve could be rendered more readily incompetent by inflation of air than by injections of fluids The following two experiments were made for this purpose

Experiment 5 —A young man, 25 years of age, a patient in the Milwaukee Hospital under treatment for a tumor in the epigastric region, was subjected to the experiment He was placed flat on the back On percussion the whole umbilical region was found flat and the abdominal wall retracted No anæsthe With an ordinary elastic syringe air was in gressed the outlines of the entire colon could be clearly seen and accurately mapped out by percussion The cæcal region especially became very prominent The inflation was continued very slowly, and as soon as the air passed through the ileo cæcal valve the hypogastric and umbilical regions began to rise and resonance replaced the former dulness on percussion The arrival of air in the stomach was indicated by distension of the epigastric region, disappearance of the contour of the tumor and resonance on per During the whole process of inflation the patient only complained of a slight pain in the splenic Bubbles of air escaped freely, and the flexure of the colon, and a sensation of fullness in As soon as it became apparent that the abdomen the stomach was distended by air a stomach tube was introduced and its free end was placed under water As the inflation was continued bubbles of air cor tinued to escape On assuming the erect position

¹These experiments were made at the County Hospital, and my thanks are due to Dr M E Connel, Superintendent of the hospital and his assistants, and Dr Wm Mackie of Milwaukee, for valuable assistance

the patient complained of colicky pains in the umbilical region which undoubtedly were caused by an evaggerated peristalsis. The pain, however, soon disappeared, and on the following day he was as well

Experiment 6 - Adult male, suffering from neurasthenia Experiment and result the same as in No 5, only that in this case the pain due to distension of the colon was referred to the ileo-cacal region, and the colicky pain in the umbilical region persisted for a longer time The air was again forced from anus to mouth without causing any in jury whatever and only moderate degree of pain for a short time

The foregoing experiments demonstrate conclusively that in the human subject by a moderate degree of force, short of producing any injury of the tunics of the intestines, air can be forced along the entire alimentary tract, and that this procedure can be resorted to with perfect safety for diagnostic and therapeutic purposes in all cases where the tissues of the intestinal wall have not suffered too much loss of resistance from antecedent pathological changes

2 -Inflation of Alimentary Canal through Stomach Tube

We should naturally expect that the alimentary canal could be inflated with more ease and with a less degree of force by following the normal peris taltic wave That this is not the case will be seen from the following experiment

Experiment 7 - Dog, weight 40 lbs (18 kilo-After complete anæsthesia was effected a flexible rubber tube was introduced into the stomach and the free end of the tube connected with a four gallon rubber balloon, containing hydrogen gas, by means of a rubber tube Between the gas reservoir and the stomach-tube a manometer was interposed, registering accurately the force used in making the grams) inflation. The inflation was made by compressing was isolated as a second compressing was isolated as a second compressing was isolated as a second compressing was included as a second compressing was included as a second compression of the seco the rubber bag A tube was introduced into the rectum to facilitate the escape of gas that might reach this portion of the intestinal tract Under al pressure of one pound and a half the stomach dilated rapidly, and later the entire abdomen became distended and resonant on percussion, but no gas escaped per rectum When the pressure was increased the abdomen took place, as the gas escaped along the side of the stomach tube At this time respiration became greatly embarrassed, but was relieved on allowing gas to escape through the stomach-tube On compressing the abdomen firmly the distension disappeared almost completely, at the same time a large quantity of gas continued to escape through the stomach tube Inflation was renewed, and under a pressure of one pound and a half, the abdomen again became uniformly distended When the pressbelow the umbilicus, occupying almost the entire burned with a steady blue flame abdominal cavity The upper half of the small in- was followed by no unfavorable symptoms

testines was distended, numerous points of sharp flexions were found among the different distended coils The distended stomach had evidently encroached so much upon the abdominal space as to render the greater part of the intestinal canal impermeable by pressure

Experiment 8 -Dog, weight 15 lbs animal was placed fully under the influence of ether the abdomen was opened and the cæcum and lower portion of ileum drawn forward into the wound, and a large needle of an aspirator inserted into the ileum just above the ileo-cæcal valve Through a rubber tube hydrogen gas was forced into the stomach Under one pound (5 hectograms) of pressure the stomach and upper portion of the intestines dilated When the force was increased the gas rereadily turned through the esophagus along the sides of the stomach tube

Experiment 9—Dog, medium size This animal was killed to ascertain the results of an experiment made for another purpose Rubber balloon containing hydrogen gas and manometer were used for making the inflation The tube through which the inflation was made was tied in the œsophagus domen was distended enormously, and on increasing the pressure to three and three fourths pounds (11/2 kilograms), still no gas escaped through the rectal tube The abdomen was then opened, when the stomach was found so enormously distended that it filled almost the entire abdominal cavity one fourth of the length of the small intestines was found distended, and among the distended loops numerous acute flexions could be seen. After the abdomen was opened, under long and continuous distension, the peritoneal covering of the stomach gave way, when the manometer registered only one pound and a half of pressure

Experiment 10 - Dog, weight 18 lbs (8 kilo-Immediately after death the œsophagus was isolated and the tube of the hydrogen gas inflator securely tied in, and a glass tube was inserted into the rectum Under a pressure of two and threefourths pounds (12 kilograms) registered by the manometer the gas first dilated the stomach and then passed along the intestines until it escaped in a steady stream through the rectal tube, where it was ignited On opening the abdomen the stomach was to two pounds (r kilogram) no further distension of found greatly distended, while the distension of the intestines was a great deal less marked the tunics of the stomach or intestines were injured

Experiment 11 -Dog, weight 20 lbs (9 kilograms) Animal etherized and a flexible tube connected with the gas inflator introduced into the stomach and a glass tube into the rectum flation the stomach became gradually distended, and when the pressure had reached one pound and a half (6 kilogram) the dog vomited and a good deal of gas escaped at the same time Inflation was again ure was increased to two pounds (r kilogram) the commenced and was followed by uniform distension dog suddenly died, and all efforts at resuscitation and tympanitis over the entire abdomen, when the On opening the abdomen the stomach was pressure reached two pounds and a half (1 kilogram) found enormously distended, reaching three inches the gas escaped from the rectum, and when ignited The experiment

Experiment 12 -Dog, weight 12 lbs (51/2 kilo Under the influence of ether inflation with hydrogen gas in the same manner as in last experi-As soon as the stomach became well distended, and the manometer registered one pound and a half of pressure, vomiting occurred, attended by a free escape of gas, which was followed by collapse of the distended epigastric region flation was again resumed, it was noted that any increase of pressure over one pound (45 kilogram) was followed by regurgitation of gas, and on this account it was found impossible to inflate the lower portion of the intestinal tract No unfavorable symptoms followed the experiment

Experiment 13—Dog, weight 28 lbs (121/2 kilo-Under the influence of ether inflation of hy drogen gas through stomach tube As soon as the pressure was increased to more than 1 lb (45 kilogram) the gas escaped along the sides of the tube through the esophagus, consequently only the upper portion of the abdomen could be distended, and the inflation evidently did not extend much beyond the The experiment was repeated several times with the same result The animal remained

perfectly well after the experiment

Experiment 14 —Dog, weight 12 lbs (5 kilograms) Inflation of stomach by hydrogen gas under full an-The effect of the inflation was the same as in the last experiment, only the stomach and upper portion of the small intestines could be distended and further inflation was impossible, as the gas escaped from the stomach as soon as the pressure exceeded 1 lb (45 kilogram) A large needle of an aspirator was pushed through the linea alba into the stomach, and the gas which escaped through it on being lighted burned with the characteristic blue After the needle was withdrawn the inflation was continued to ascertain if the puncture in the stomach would allow the escape of gas into the peritoneal cavity The inflation was continued until the entire abdomen was distended by the gas That the distension and tympanites was due to the presence of gas in the peritoneal cavity became evident, as it remained after the stomach had been emptied of its gas, and on percussion it was ascertained that the entire liver dulness had disappeared The dog recovered without symptoms of peritonitis or any other ill-effects from the experiment

These experiments demonstrate conclusively that it is more difficult to inflate the alimentary canal from above downwards than from below upwards, as in the living animal I succeeded only in one instance in forcing hydrogen gas from mouth to anus, while in toneal coat of the stomach only effected distension grams) In this experiment the abdomen was opened of the stomach and upper portion of the stomach and upper portio of the stomach and upper portion of intestinal canal It is evident that great distension of the stomach constitutes an important factor in causing or aggravating intestinal obstruction, as it effects compression which causes impermeability of the intestines, or aggravates conditions arising from an antecedent partial permeability by producing sharp flexions among the dis surgical purposes the stomach can be readily inflated beyond the ileo cæcal valve in dogs under very low

almost to any extent through a stomach tube, and when it becomes necessary to ascertain the presence of a visceral wound or perforation of this organ, this method of inflation may be resorted to with advan

3 Experiments to Determine the Degree of Force which is Necessary to Overcome the Resistance offered by the Ileo cacal Valve

Accurate experiments to determine the force required to render the ileo cæcal valve incompetent by insufflation of air or gas have so far not been made, and as it is exceedingly important to obtain some accurate information on this subject, the following experiments were made In all experiments air or hydrogen gas was used The inflation was made with a rubber balloon The pressure was estimated either with a mercury gauge, or with a manometer used by gas fitters and plumbers The manometer or mercury gauge was connected by means of rubber tubing with the rectal tube on one side and the rubber balloon on the other The rubber balloon in which the hydrogen gas was collected held 4 gallons, and numerous experiments showed that when the gas was forced through the opening of a stopcock, the lumen of which was about the size of a knitting needle, a compression equal to 200 lbs (90 kilograms) would never register more than 3 lbs, (13 kilograms) of pressure

In the living subject the escape of air or gas from the rectum was prevented by an assistant pressing the margins of the anus firmly against the rectal tube

Experiment 15 - Dog, weight 35 lbs (16 kilo-Immediately after death the lower portion of the rectum was isolated and the rectal tube inserted and fixed in its place by tying a string firmly around the rectum The abdomen was opened and the intestines left in situ. The ileum was cut transversely 6 inches above the ileo cæcal valve and a glass tube inserted into the distal end, which was Hydrogen gas was inflated from a rub also tied in ber balloon Under a pressure of 3/4-lb (3 kilogram) the cæcum was dilated, and a moment later the gas escaped from the glass tube and was ignited, the flame remained steady under a pressure of from 1/2to 3/4-lb (2 to 3 kilogram)

Experiment 16 -Dog, weight 20 lbs (9 kilograms) Same as in the preceding experiment, only that the resistance of the ileo cæcal valve was overcome under a pressure of 1/2-lb (2 kilogram) tension of colon and cæcum was moderate, and signs of injury to its tunics could not be found in either

experiment Experiment 17 - Dog, weight 23 lbs (10 kiloimmediately after death, and a large hypodcimic needle inserted into the ileum a short distance above the ileo-cæcal valve before the inflation of hydrogen A pressure of 3/4 lb (3 kilogram) was sufficient to force the gas through the ileo crecal valve and through the needle, the valve remained open under a steady pressure of ½ lb (2 kilogram) Having determined that air and gas can be forced

pressure, varying from 1/2- to 3/4-lb, I proceeded to test the degree of resistance of the ileo crecal valve

in the human subject

Experiment 18 —Strong, healthy young man The subject was placed flat upon his back and hydrogen At first the gas was inflated from a rubber balloon gas was forced in very slowly under a pressure of 11/2 lb (6 kilogram), which distended the colon visibly as far as the crecum As the distension appeared to remain the same the pressure was increased to 2 lbs manometer receded to 1 lb (4 kilogram), and the pressure never exceeded one pound and a half (6 umbilical region became prominent and resonant, showing conclusively that the ileo-crecal valve had been passed and the small intestines were filling rapidly with gas As soon as the whole abdomen had become distended and tympanitic the manometer again registered 11/2 lb (6 kilogram) of pressure, and remained at this figure for some time after further inflation was discontinued by turning the stopcock

Experiment 19 -Young man, in good health Experiment conducted in the same manner as in the foregoing After the colon and cæcum had been well dilated the manometer registered 21/4 lbs (4 kilogram), and the umbilical region became prominent and resonant. As the inflation advanced the average pressure was 1 1/4 lb (8 kilogram), and twice it was increased to 21/2 lbs (1 4 kilogram), when the patient complained of pain in the umbilical region As soon as the stopcock was turned the pressure sank to 3/4-lb (3 kilogram) These two experiments prove that in a normal condition the ileo-cæcal valve in a healthy adult person is overcome by rectal infla tion under a pressure of 11/2 to 21/4 lbs (6 to 12 kilogram) This amount of pressure is not sufficient to mjure the tunics of a healthy intestine, and in both instances the subjects of the experiments complained but little of the immediate or remote effects of the experiment As the result of numerous observations, I can state that when the inflation is made slowly and continuously there is less danger of injuring the intestines than when the inflation is made rapidly, or with interruptions Slow and gradual distension of the cæcum is best adapted to overcome the competency of the ileo cæcal valve, by effecting diastasis of the margins of the valve A rubber balloon holding from 2 to 4 gallons (10 to 20 litres) recommends itself as the most efficient and safest instrument for making rectal insufflation for therapeutic or diagnostic pur-

The following experiments were made to determine

4 The Amount of Pressure Necessary to Force Hy drogen Gas through the Entire Alimentary Canal by Rectal Inflation

Experiment 20 - Dog, weight 35 pounds (16 kilograms) Immediately after death rectal inflation of hydrogen gas was made, and a pressure of one pound (4 kilograms) sufficed to distend the entire abdominal cavity, and when a tube was introduced into the stomach and a burning taper applied to its end a blue flame at once appeared and continued as long as the inflation was kept up under the same pressure

Experiment 21 —Dog, weight 12 pounds (5 kilo-Under ether narcosis rectal inflation of grams) hydrogen gas from rubber balloon The ileo-cæcal valve offered very little resistance, and as soon as the manometer registered one pound and a half (6 kilogram) of pressure the gas escaped through the stomach tube which had been introduced previously, and on applying a lighted taper it burned with a continuous flame as long as the inflation was continued

Experiment 22 -Dog, weight 20 pounds (9 kilo-(9 kilogram), when suddenly the indicator of the grams) Experiment and result same as in last, the

kilogram)

Experiment 23 —Dog, weight 19 pounds (9 kilo-In this experiment no an esthetic was used, and in consequence the pressure had to be increased to three pounds (13 kilograms) before the gas escaped through the stomach tube On account of the violent contractions of the abdominal muscles the escape of gas was intermittent, the flame being frequently extinguished by an absence of the gas

Experiment 24 -Dog, weight 21 pounds (10 kilograms) The animal being completely under the influence of ether the abdomen was opened in the median line, and the ileo cæcal region made accessible to sight Hydrogen gas was inflated per rectum, and under a pressure of three quarters of a pound (3 kilogram) readily passed the ileo-cæcal valve, and under one pound of pressure it ascended the intestinal canal, and in a few seconds reached the A tube was introduced into the stomach, stomach and as the gas escaped it was ignited and burned with a steady flame

Experiment 25 - Dog, weight 18 pounds (8 kilo-Rectal insuffiation of hydrogen gas, the dog being fully under the influence of an anæsthetic The colon and cæcum were only slightly distended when the gas under one quarter of a pound (I kilogram) of pressure passed the ileo-cæcal valve Under one pound (4 kilogram) of pressure the abdomen became uniformly distended and tympanitic, and when a tube was introduced into the stomach the escaping gas was ignited and burned with a steady flame as long as the pressure was continued

Experiment 26 - Dog, weight 20 pounds (9 kilo-Animal etherized, and when completely relaxed hydrogen gas was inflated per rectum, and passed the ileo cæcal valve under a pressure of half a pound (2 kilograms) The stomach became distended under a pressure of one pound and a half (6 kilogram), and on the introduction of a tube the escaping gas was ignited and burned with a continuous flame as long as the manometer registered half a pound (4 kilogram) of pressure In all animals where the insufflation was not complicated by abdominal section no upleasant symptoms followed the All of the animals recovered as experiments rapidly as after an ordinary ether narcosis the experiments the pressure fell rapidly after the ileo cæcal valve had been opened, but the pressure had again to be increased before the gas reached the s omach It usually required one-half to one pound more pressure to force gas through the entire alimentary canal than when it was forced only through 774

the ileo-caecal valve Whenever it becomes desirable to conduct the hydrogen gas a considerable distance along the intestines, or through the entire alimentary canal, it is exceedingly important to proceed slowly with the inflation, as under slow distension on half a pound (2 kilogram) of pressure will accomplish in time a greater degree of distension than four times this amount of pressure if the force is applied quickly, and only for a short time, and is attended by much less risk of injury to the coats of the rectal insufflation of hydrogen gas made under a pressure of one-quarter of a pound, if made very slowly, the abdominal walls being completely relaxed by an anæsthetic, will not only overcome the resistance offered by the ileo cæcal valve, but will prove sufficient to force the gas through the whole length of the alimentary canal I have now sufficiently demonstrated the permeability of the ileocæcal valve and the entire alimentary canal in animals and man to rectal insufflation of air and gas, and I shall now endeavor to establish the safety of. this procedure as a diagnostic and therapeutic measure by showing

II THE RESISTANCE OF DIFFERENT FORTIONS OF THE GASTRO INTESTINAL CANAL TO DIASTALTIC FORCE

a Stomach.

Experiment 27—Large, healthy, adult dog Experiment made immediately after death Stomach in situ. Œsophagus tied and distension made with a force pump from pyloric orifice, the organ being rapidly dilated with air. When the manometer registered eight and one-half pounds (3 8 kilograms) of pressure the stomach was distended at least eight times its normal size, when a rent in the peritoneal covering an inch and a half in length parallel to, and near the omental attachment occurred

Experiment 28—Middle aged man, died of sepsis. The whole gastro-intestinal canal showed marked evidences of septic gastro-entero-colitis, the mucous membrane being softened, very vascular, and dotted with numerous hæmorrhagic infarcts. Organ in situ inflated with air in the same manner as in last experiment. Longitudinal rupture of peritoneal coat along anterior surface under two and one-half pounds of pressure (1 i kilogram), and when it was increased to three pounds (1 3 kilograms) the whole thickness of the wall at the lesser curvature ruptured

b Small Intestines

Experiment 29—Subject same as in experiment 28 Lower portion of ileum under five pounds (2 2 kilograms) of pressure became emphysematous along mesenteric attachment, and ruptured completely as soon as the manometer registered five and three-fourths (2 3 kilograms) pounds of pressure

Experiment 30—Dog, weight 20 fbs (9 kilograms) kilograms) of pressure to force an time of the ileum, with mesenteric attachment intact, was gradually distended and remained intact until a pressure of ten pounds (2 5 kilograms) was reached, when air espounds (2 5 kilograms) was reached, when air espounds (2 5 kilograms) was reached, when air espounds (3 6 to 4 5 kilograms) to force of from eight to ten pounds (3 6 to 4 5 kilograms) to force of from eight to ten pounds (3 6 to 4 5 kilograms)

tery, showing that minute ruptures at numerous points had taken place. When the distension had reached its maximum the segment of bowel inflated was elongated twice its normal length.

Experiment 31—Upper portion of ileum of same animal when distended to its utmost gave way under a pressure of eight pounds (3 6 kilograms), the peritoneal coat on convex side rupturing to the extent of 2 inches (51 mm) parallel to the axis of the bowel

Lam quite convinced that in the dog lation of hydrogen gas made under a one-quarter of a pound, if made very abdominal walls being completely reamesthetic, will not only overcome the

c. Color

Experiment 33—Subject same as experiments 28 and 29 Experiment was made twenty-four hours after death Colon and cæcum apparently very much softened and mucous membrane in a state of inflammation One foot (3 d m) of the transverse colon isolated and gradually distended when the pentoneal coat along the border of one of the longitudinal bands ruptured under a pressure of two pounds and a half (1 kilogram). The peritoneal laceration became very extensive before the remaining tunics ruptured under a pressure of four pounds (18 kilograms)

Experiment 34—Dog, weight 18 lbs (8 kilograms) Immediately after death the ileum was tied just above the cæcum and the inflation made per rectum. Air was pumped in gradually with a force-pump and when the pressure reached ten pounds and a half (47 kilograms) air escaped between the peritoneal layers of the meso colon, at this stage the longitudinal distension of the bowel exceeded twice its normal length

Experiment 35—Dog, weight 23 lbs (10 kilograms)

Experiment the same as the preceding Air was pumped in rapidly until the mercury gauge registered ten and a half pounds (47 kilograms) of pressure, when the sigmoid flexure on its free surface gave way with a loud report, the rent being about one inch and a half (38 mm) in length

Experiment 36—Dog, weight 18 ibs (7 kilograms) Entire colon distended by rectal inflation of air, the ileum being tied just above the ileo cæcal valve Under a pressure of six pounds (2 7 kilograms) the peritoneum ruptured in a longitudinal direction, opposite the meso-colon, and the remaining tunics gave way a little later under the same pressure

These experiments are of the greatest importance in showing that the pressure which was found necessary to apply in rupturing a healthy intestine was greatly in excess of that which is required to force air through the ileo-cæcal valve, or even the whole length of the alimentary canal. It only requires from one-quarter of a pound to a pound and a half (i to 7 kilograms) of pressure to force air through the ileo-cæcal valve, and from half a pound to two pounds and a half (2 to 7 kilograms) to force it from anus to mouth, while even the weakest portion of the 32stro-intestinal canal effectually resisted a distending force of from eight to ten pounds (3 6 to 4 5 kilograms) force of from eight to ten pounds (3 6 to 4 5 kilograms)

grams) The experiments on the human cadaver, where the resisting power of the gastro-intestinal circumstances it would have been safe to resort to inflation, as the pressure required to rupture the colon or small intestines exceeded that which has been found adequate to force air or gas beyond the ileo-excal valve, or even the entire length of the ali-When an intestine is distended to mentary canal its utmost capacity slowly by inflation of air or gas, and the pressure is maintained uninterruptedly, rupture occurs at one of two points, either a longitudinal convex surface of the bowel opposite the mesentence attachment, or minute ruptures on the mesentence side give rise to extravasation of air or gas between the two serous layers of the mesentery, in either case, if the pressure is increased, complete rupture takes place at the point where the laceration first com-

III DISTENSION OF GASTRO-INTESTINAL CANAL BY RECTAL INSUFFLATION OF HYDROGEN GAS

This part of the paper contains an account of the experiments which were made preliminary to the practical application of the hydrogen gas test as a diagnostic measure in penetrating wounds of the abdomen, and furnish only so many more demonstrations of the permeability of the ileo-cæcal valve and the entire alimentary canal to rectal inflation of hydrogen

Experiment 37 -Dog, weight 15 lbs (6 kilograms) Under ether anæsthesia hydrogen gas from rubber balloon was slowly forced into the rectum until the entire anterior abdominal wall had become uniformly distended and tympanitic, when the distended stomach was punctured with a large needle of an aspirator and gas escaped in a steady stream, and when ignited burned with a continuous flame After a considerable portion of gas had been evacuated in this manner the upper abdominal region receded and the flame was extinguished The animal recovered without any untoward symptoms

Experiment 38 -Dog, weight 17 lbs (7 kilograms) Without anæsthesia hydrogen gas was inflated per rectum until it escaped through a tube which had been introduced into the stomach As it escaped from the stomach tube it was ignited and burned with a large blue flame The abdominal muscles were so rigid that distension was never well marked, and the inflation required a good deal more force than in animals where muscular rigidity has been overcome by an an esthetic The dog remained perfectly well after the experiment and in a few hours the remaining tympanites had disappeared

Experiment 39 - Dog, (weight 35. lbs (15 kilograms) No an esthetics used On account of rigidity of abdominal muscles it required persistent efforts to force hydrogen gas from rubber balloon per rectum through the whole alimentary canal As soon as the stomach had become distended by the gas the animal vomited, at the same time gas escaped by repeated emctations The animal manifested no signs of suffering after the experiment

Experiment 40 -Dog, weight 27 lbs (12 kilograms) Under anæsthesia hydrogen gas was inflated canal to diastalic force was greatly reduced by ante-per rectum until it escaped through tube which had mortem pathological changes, show that under such been introduced into the stomach, a lighted taper was applied to the free end of the tube and the gas ignited and burned with the characteristic blue flame

> Experiment 41 - Large Newfoundland dog Under an esthesia a duodenostomy was made, and hydrogen gas injected per rectum and ignited as it escaped from a rubber tube which had been inserted into the distal portion of the bowel through the

Experiment 42 —Adult male, abdominal organs laceration of the peritoneal coat takes place on the healthy, no anæsthesia. Inflation of hydrogen gas per rectum The gas was stored in a four-gallon (9 litres) rubber balloon and was forced into the rectum by compression As the distension progressed the colon could be distinctly mapped out from sigmoid flexure to execum by inspection and percussion soon as the cæcum had become visibly prominent a stethoscope was applied over the ileo-cæcal region, and as the valve became incompetent by overdistension of cæcum a distinct gurgling sound could be heard as the gas entered the ileum Whenever inflation was arrested the gurgling sound disappeared and was heard again whenever the ileo-cæcal valve was opened by renewed inflation

Distension of the small intestines was attended by resonance and prominence of umbilical and hypogastric regions The incompetency of the ileo-cæcal valve was invariably announced by a reduction in the pressure The patient complained of a sensation of distension in the umbilical region and intermittent colicky pains which, however, disappeared completely after a few hours The pain appeared to be less severe than after similar experiments with inflation of air

Experiment 43—Young man in comparatively good health Inflation same as in preceding experiment Ausculation over ileo-cæcal valve revealed the same sounds as the gas escaped from the colon into The sound seemed to vary somewhat according to the size of the opening in the valve and the force used in making the inflation, and always disappeared as the valve closed after suspension of The colicky pains subsided as the small intestines emptied themselves of their new contents The assistant who compressed the rubber balloon was always able to announce the beginning of the incompetency of the ileo-cæcal valve by experiencing a sudden diminution in the pressure

Experiment 44 —Adult male, suffering from gastric catarrh Hydrogen gas inflation per rectum to extent of causing great distension of abdomen which caused the hepatic dulness to ascend at least two inches Auscultatory signs the same Sharp colicky pains in the umbilical region were relieved by a free escape of gas through rectum

Experiment 45—Hysterical female Abdomen flat and dull on percussion from umbilicus to pubis, no resonance over sigmoid flexure Rectal inflation with hydrogen gas Compression of rubber balloon corresponding to only one fourth pound (1 kilogram) of pressure readily dilated the whole colon, its course

being indicated by a distinct prominence and tympan-tended by a well-marked blowing, gurgling sound tic resonance from sigmoid flexure to cæcum Under The patient felt the entrance of gas into the ileum the same pressure the gas escaped with little or no resistance through the ileo-caecal valve from the colon into the ileum, the occurrence being attended by the characteristic auscultatory sounds and followed by distension and resonance of space from umbilious to nent and tympanitic Only 2 litres of gas were used pubis Amount of gas inflated about four litres The in this experiment patient complained of some pain in the region of the splenic flexure of the colon during the distension of health the colon, and later of slight intermittent pain in the region of the umbilious

Experiment 46—Middle-aged woman, suffering from retroversion of the uterus Abdomen flaccid and dull on percussion in the median line from umbilicus to pubis Rectum distended with hardened Hydrogen gas inflated in the usual manner The mercury gauge registered two and a half pounds (1 kilogram) of pressure before the gas reached the sigmoid flexure, after this it fell to one pound (4 kilogram) and the inflation progressed without any further resistance As soon as the gas passed through the ileo cæcal valve the pressure fell to three-quarters of a pound (3 kilogram) and remained so during the inflation of the small intestines, slight variations marking the opening and closing of the ileo cæcal valve As the umbilical and hypogastric regions became prominent and tympanitic the patient complained of a griping pain About eight litres of gas were injected A few hours after the experiment all symptoms had disappeared

Experiment 47 — Female recently operated on for laceration of perineum Rectum empty Abdomen flaccid, umbilical, hypogastric, and right iliac regions dull on percussion The inflation was made very slowly and the pressure never exceeded 1 lb (4 kilo-As the large intestine became distended the transverse colon came plainly into view On auscultation over the ileo cæcal valve the escape of gas into the ileum was marked by a blowing sound, which in pitch was increased or diminished by the degree of pressure As the lower portion of the small intestines became distended the lower part of the abdomen became prominent and tympanitic, and the patient complained of colicky pains About 3 litres of gas were inflated In half an hour the patient appeared as well as before inflation

Experiment 48 — Middle aged physician suffering This was the second attack, and the acute symptoms had subsided Over the cæcum a circumscribed area of dulness and tenderness palpation it appeared as though the swelling were adherent to the anterior abdominal wall The area of dulness was outlined externally by pencil marks before inflation was commenced As the colon became distended under a pressure of 1/4-lb (1 kilogram), the circumscribed, indurated region became more prominent, imparting to the palpating fingers the feeling of hardness, but on percussion it was resindurated wall of the cæcum had been lifted forwards of ½ lb (4 kilogram) Nearly 6 litres of gas were by the pressure of the gas Under the same pressure inflated per rectum. The distension of the colon inflated per rectum. the gas escaped in a continuous stream into the ileum, caused simply a feeling of distension along its course, its passage through the ileo cæcal valve being at- but as soon as the gas escaped into the ileum colicky

distinctly and complained soon after of a slight colicky pain in the umbilical region The space between umbilicus and pubis, which before inflation was com pletely dull on percussion, now became more promi-

Experiment 49 — Young physician in perfect Region between umbilicus and pubis perfectly dull on percussion, also left iliac fossa. Inflation of 4 litres of hydrogen gas under 1/3 lb (15 kilogram) pressure The outlines of the distended colon could be clearly seen and marked out by percussion before the gas escaped into the small intes-The passage of gas through the ileo cæcal valve was again attended by a well marked gurgling sound, after which the entire abdomen became promment and tympanitic The patient felt a sensation of distension during the inflation of the colon, and as the small intestines became distended complained of griping pains, gas escaped freely by eructations and per rectum, which soon relieved the colicky pains in the umbilical regian

Experiment 50 — Medical student in robust health Region from umbilious to pubis flat on percussion, while the course of the entire colon was tympanitic Rectal inflation with hydrogen gas As the resistance of the ileo-cæcal valve was overcome the mercury gauge registered 1/2-lb (4 kilogram) of pressure The passage of gas through the ileo-cæcal valve was attended by a gurgling sound which was heard at some distance by a number of persons present in the Later a continuous blowing (almost amphorroom 1c) sound could be heard over the ileo cæcal valve The subject of the experiment was conscious of the passage of gas from colon into ileum, and soon after complained of a colicky pain which he referred to The whole abdomen became the umbilical region uniformly distended and tympanitic on percussion, and the distress caused by the great distension was only relieved by a free escape of gas by eructations and through the rectum Four litres of gas were used in this experiment

Experiment 51—Young physician in good health Rectal inflation of 4 litres of hydrogen gas under a pressure of only 1/3 lb (15 kilogram) Distension of colon well-marked previous to escape of gas through the ileo cæcal valve As soon as the gas entered the ileum the middle and lower portion of the abdomen became distended and tympanitic The inflation was continued until the stomach became distended amd gas escaped by eructation The subject of the experiment complained of quite severe colicky pains as long as the small intestines remained distended by gas

Experiment 52 - The writer of this paper, being desirous of experiencing himself the sensations which would be caused by inflation of hydrogen gas, sub mitted himself to experimentation under a pressure pains were experienced, which increased as insuffiation advanced, and only ceased after all the gas had escaped, which was the case only after an hour and a half When the intestines and the stomach had become fully distended the feeling of distension was distressing, and was attended by a sensation of faintness which caused a profuse clammy perspiration A great deal of the gas escaped by eructation, which was followed by great relief The colicky pains attending inflation of the small intestines by air or gas are evidently caused by increased peristaltic action of the bowels in their attempt to expel their contents, as it always assumed an intermittent type and subsided promptly after the escape of the gas

In none of these experiments did the pressure exceed 1 lb (4 kilogram) in overcoming the resistance offered by the ileo-cæcal valve, and often a steady, long-continued pressure of 1/4- or 1/3 lb (1 to 15 kilogram) sufficed Every time the ileo caecal valve was rendered incompetent by distension of the cæcum the pressure was promptly diminished owing to the escape of gas from the colon into the ileum the experiment where the inflation was made in a walls of the cæcum, when distended during the inflation, were better adapted in effecting incompetency of the valve These experiments also furnish strong proof of the fact that inflation, to be safe and effective, should be done very slowly under a low, steady pressure, continued only for a short time, and is at tended by no risks whatever of rupturing a healthy intestine and, when cautiously practiced, can be resorted to even in cases where the resisting power of pathological processes

As I was searching for an innocuous, non-irritating canal, would escape into the peritoneal cavity in inch on trying hydrogen gas, it became necessary to study experimentally the effect of this gas on the different tissues of the living body The numerous inflation experiments on man and dogs have demonstrated the safety of pure hydrogen gas when employed in this manner, as not in a single instance were any immediate or remote toxic symptoms observed which could be referred to absorption of the gas, hence we have the assurance that the inflation of a large quantity of hydrogen gas is unattended by any risk whatever as far as intoxication is concerned The following experiments also show the innocuity and non irritating qualities of hydrogen gas when brought in contact with the most susceptible tissues to inflammatory reaction in the living body, at the same time they also show that hydrogen gas is removed by absorption in a comparatively short time when injected into serous cavities or into the subcutaneous connective tissue

(To be concluded)

THE APPENDIX VERMIFORMIS, ITS FUNCTIONS, PATHOLOGICAL CHANGES AND TREATMENT

Read in the Section on Sirgery at the Thirty ninth Annual Meeting of the American Medical Association, May 1888

BY J McFADDEN GASTON, M D,

PROFESSOR OF SURGERY SOUTHERN MEDICAL COLLEGE, ATLANTA GA

Preliminary to a consideration of the function pertaining to any organism, it is requisite to understand its structure, or in other words, the physiology

of a part depends upon its anatomy

The presence of the appendix vermiformis in man and in some of the higher order of apes, while absent in most quadrupeds and other inferior animals, may perhaps lead the followers of Darwin to the conclusion that the missing link is to be sought in this development, but I have no inclination to enter into the abstruse question of evolution, and only regret that we are precluded from receiving any information by a study of comparative anatomy in respect In to this unique appendage If the dog and cat were supplied with this structure, the facility for making case of typhlius the ileo cæcal valve offered no re-experiments upon them might enhance very much sistance, and the gas escaped freely into the ileum, our knowledge of its normal and abnormal condithe valve in all probability had been rendered par- tions, whether idiopathic or traumatic, but the door tially or completely incompetent during the course is shut to all such investigation, and a human subof the local inflammation or the indurated, thickened ject does not fully avail for satisfactory data in regard to the structure of the appendix vermiformis and its office

In its general outline it is subject to great variation of size and position, being found in different subjects from three to six inches in length, and lying diversely in its relations to the cæcum Its diameter admits of considerable changes owing to the various contents of the canal, whether gaseous, mu-This tube is of the same size from cus or serous the intestinal wall has been diminished by antecedent its attachment to the lower walls of the cæcum to its termination in a blind pouch at its free extremity When empty or only occupied with mucus, its gas which, when inflated into the gastro-intestinal diameter is ordinarily about one-fourth of an There is usually a mesenteric attachment to case a wound or perforation existed, and had decided the wall of the cæcum and this duplicature of the peritoneum invests its entire length, while a muscular layer is found between this and the mucous membrane which lines it The opening into the cæcal cavity has a valvular arrangement of the mucous membrane which is capable of closing the orifice, and doubtless prevents the entrance of foreign bodies ordinarily into this blind pouch. It becomes, however, dilated under certain circumstances so as to admit of the passage of small solid masses through this orifice, and they became arrested in the tube proving a source of disturbance In view of that fact, this structure has been regarded by some writers as a trap, which is very prone to cause the obstructions of its canal by foreign bodies, as when once introduced there is perhaps a kind of constriction of the onfice which interferes with their escape That there exists in the middle coat of the appendix, longitudinal and circular, muscular fibres, which by their contraction and relaxation, alternately, provide for a serous or mucus exudation, and after certain modifications in it, promote its expulsion, is very

evident from observation of the histological ele- to recognize this hypothesis on the same basis that ments of its organization Whether any considerable proportion of the fæcal matter enters the cavity of the appendix has not been determined, and it seems most probable that the quantity may be small in view of the relative size of this diminutive tubular sac and the capacious cæcal pouch which receives the contents of the ileum through the ileo-cæcal The capacity for distension being limited in extent precludes the view, that the cavity of the appendix, may serve as a diverticulum in cases of undue accumulation of fæcal matter in the colon

An opportunity has been afforded to me recently of noting that obstruction of the descending colon from an organic stricture, inducing such distension of its walls by the retained contents as to result in perforation and death, did not materially affect the size of the appendix vermiformis It cannot, therefore, be regarded as a safety valve for the cæcum, but rather as a loop-hole for the entrance of matters prejudicial to it, and the adjacent structure, and may be appropriately regarded as a danger signal to warn the organism of approaching trouble

The location of the orifice of the vermiform appendix at the most dependent part of the caput coli while the entrance of the ileum through the ileocæcal valve is above and at the inner side, affording ing the absence of any signs of degeneration to the a direct passage to the contents of the alimentary canal into the cæcum as a receptacle, would seem to favor the conclusion that some change is there brought about by the contact of fæcal matter with the emanations from the appendix

Its mucous lining, according to Gray, is furnished with a large number of solitary glands, and Satterthwaite states in his "Manual of Histology" that "in the vermiform appendix we find the collection of solitary lymph follicles so closely placed that the space left between adjoining glands does not equal in diameter that of these structures themselves

On the other hand we learn from Quain, that, "in man the chief function of the cæcum is absorption, as is shown by the great number of lymphatics in its walls," while Laudois tells us that, "the contents assume the character of fæces and become formed in the lower part of the great intestine"

The high authority, Littre, warrants the assertion that, "it is in the cæcum, the residue of the alimentary substances assumes all the characteristics of fæcal matter" In the absence of other explanation of the peculiar odor imparted to the contents of the colon from this point forward, it is fair to infer that this modification comes from the influence of the appendix vermiformis, either by some chemical or vital process

ing without material for vivisections in the absence light upon the function of this development which of wombats and apes, while the opportunities for characterizes a higher order of animal creation. The are few, upon the principle of exclusion, it is expected that this theory of the function of the appenince in the animal economy has not heretofore been ing us to a satisfactory conclusion. If it can be pointed out by physiologists, I would appeal to them made to appear that the native population of our

the owner of a certain historic dog in the backwoods of North Carolina claimed that he was a good possum dog-that he had tried him thoroughly for every other species of game without discovering any hunting qualities, and hence he concluded that he ought to be good to catch the opossum So of the appendix for getting up a stink

Reasoning upon the general principle that all the organs of the human body are fitted for the discharge of useful purposes in the animal organism, we are not warranted in concluding that the appendix vermiformis is an exception to this rule of the fitness of things, and it behooves us to investigate seriously its function We should satisfy ourselves as to its relations to the digestive and excrementitious processes, with its position as a sentinel at the gate-way, without participating, so far as known thus far, in the work of alimentation or defecation The antiseptic property of sulphurous gases is well known, and the presence of sulphuretted hydrogen in the colon cannot be accounted for by any process of decomposition developed in its contents, as the cases of arrest of fæcal matter with or without impaction, are not attended with such results as would ensue from such a process We are therefore warranted in attributpresence of an antiseptic element, which is developed in the vermiform appendage and intermingled with the fæcal mass in the cæcum which serves as a reservoir, where this process may be undergone as the residue of the alimentary substances is poured The effectual security out of the small intestine against regurgitation by the structure of the ileocæcal valve and the barrier afforded by the valvular opening of the appendix to the entrance of fæcal matter into its cavity, while gaseous emanations or its natural secretion of mucus may pass out into the caput coli, favor the view that an important office belongs to the appendix vermiformis It doubtless preserves the contents of the alimentary canal from decomposition during their progress through the colon, beyond that effect claimed for the admixture of bile elements with the excrement It is evident that ordinarily the fæces do not enter the canal of the appendix owing to the duplicature at its orifice, and when by failure of this impediment, solid mat ters, fæcal or otherwise, enter its cavity, there is no capacity in its walls for their expulsion. It hence follows that in case of such accidents we find that an inflammatory process is developed in the appendix

The number of cases in which the appendix has been removed by operative procedures or has been obliterated by disease are thus far comparatively I have not such data to record in support of this few, and the observations upon the effects of such view as will stand the test of scientific criticism Be- lesions have not been reported, so as to throw any vague conception of its rudimentary nature seems to show of reason or any foundation in fact, so far as the study of comparative anatomy can aid in direct-

primeval forests who subsisted largely upon herbs and roots, with an admixture of animal food, pre respect it may go towards sustaining this claim. But tioner far fetched hypothesis, nor are there any data available from history of the human race since the creation of mankind, which tend toward the confirmation of this view, and it is only an acknowledgment of ignorance on the part of those who would attempt to bolster up this theory without facts

The increased number of disorders of the appen div vermiformis which have been recognized in these latter years might lead to an inference that it is destined to entire obliteration in the course of time, were it not evident that many affections of the appendix have been formerly ignored from the lack of proper observation in diagnosticating the troubles of appendix vermiformis may be removed with impunity, then it will only prove what has been demonstrated in the case of other important members of the body, that they were not essential to the human seat of the inflammation in the appendix organism But no one would undertake to set aside the important office of the ovaries in the role of crea tion, because, forsooth, they had been removed without detriment to the health and comfort of the individual subsequently It strikes me forcibly that the practice of cophorectomy resorted to so frequently of late for slight causes, and in some instances without indications of disease in the organ, may at no distant day be held as an excuse for cutting down upon the vermiform appendage upon the slightest provocation, for the purpose of ligating and excising it, and thus ridding the individual of further trouble from its disorders How far this might be justified from a consideration of the great risk to life attend ing inflammation and perforation of its walls, in the absence of trustworthy data for an early diagnosis, depends upon the importance which may be attached to the function of this peculiar structure, and surgeons must await with interest the effects of its removal

Whether inflammation is developed in this structure independent of mechanical irritation from the entrance of foreign bodies and the formation of fæcal concretions, has not been clearly demonstrated Clinical observations in cases that yield to treatment leave doubts as to the real seat of disease referred to this region, and so far as noted in post mortem examinations, the lesions have for the most part been traced to the presence of a mechanical irritant While some have claimed that inflammation is set up in the vermiform appendage as a result of derangement of the digestive apparatus, and others have tion supposed that the entrance of germs into its cavity has developed morbio processes in its structure, the facts go to prove that such causes of diseases are rare in comparison with the troubles growing out of local irrita'ion having a mechanical origin It is re

and inflammation is not well defined either by the sensations of the patient or by objective symptoms sented any marked increase of development in this recognized in a physical examination by the practi-There is an absence of preliminary indica-I am not aware of any such facts to corroborate this tions, pointing to the nature of the inflammatory process at the incipiency of disorders of the appendix vermisormis, which presents a problem of difficult solution for the surgeon At this early stage there may, however, exist a certain degree of sensitiveness upon pressure immediately over the site of the appendix, and this tenderness revealed by cautious palpation may serve for the recognition of an incipient inflammation when there is no perceptible thickening or induration in the tissues of the appen-It is clear that the causative influence, of whatever character it may be, must up to a certain point, be of gradual operation in the development of inflam-During this stage it is of the greatest immation Should it appear in the future that the portance to be able to recognize its presence and Not only the external examination should progress be carefully made, but a digital exploration by the rectum should be directed to the discovery of the

> There are in most instances some concomitants of the local trouble manifested in derangement of the alimentary canal, perhaps of a reflex order, prior to the extension of the inflammatory process to the adjoining structures. In the early history of appendicitis it has been noted that there may occur either a disposition to frequent evacuations or a state of intestinal torpor, in which it is difficult to arouse the peristaltic action of the bowels either by purgative medicines or enemata. During this period the constitutional disturbance is not very marked, and yet there exist usually a febrile state with slight rise of temperature, so that nice discrimination will detect a departure from a normal condition of the system

While the presence of fæcal concretions or other foreign bodies in the canal of the appendix may be tolerated for a greater or less period without any manifestation of trouble in the ordinary performance of the functions of the intestines, there are good and sufficient grounds for the conclusion that intestinal derangement from other sources may become an exciting cause of the inflammatory process from a local The history of cases in which death has ırrıtant occurred from other diseases presents quite a number of instances in which there are unmistakable indications of disease in the appendix which has terminated by resolution But it is found generally that inflammation set up in the wall of the canal by a mechanical irritant leads to perforation and extravasation of the contents, accompanied by characteristic shock and followed by diffused inflamma-This is the dividing line between two distinct phases of symptoms, and whatever may have obscured the case previously, it is for the most part well defined after this grave result

There may be only a circumscribed involvement of the surrounding structures, exciting adhesive inflammarkable that the presence of such foreign bodies mation in the serous tissues which shut in the exudararely produces any serious inconvenience until per- tion from the cavity of the appendix and thus formforation of the wall of the appendix vermiformis ing a local abscess. But usually the septic matter ensues, and even then the localization of the pain permeates in different directions and sets up general

peritonitis, with a train of constitutional troubles, attended with marked cerebral disturbance and vital depression

An observation of a peculiar pain in the penis from perforation of the vermiform appendage has been reported by Tiffany, and the same marked feature occurred in my two cases of perforation which were verified by post mortem examinations In the elaborate paper of Fitz on "Perforative Inflammation of the Vermisorm Appendix," some stress is laid upon the disturbance of the urinary and genital organs During the first three days following the onset of the pain connected with perforation micturition is occasionally disturbed Perhaps unusually frequent on the first day it is likely to be difficult on or after the In certain instances the use of the cathethird day The right testicle may be retracted ter is required and swollen, in which case the course of the pain is apt to be toward this gland

We can understand how the escape of irritating matter from the appendix should cause trouble by transmitting inflammation to the contents of the abdomen, including the pelvic viscera, but it is not apparent that such disturbance of the urinary and genital organs results from general peritonitis induced by other causes, and the pain in the penis cannot be attributed to the peritonitis If it should be found that this painful development in the penis is present in the early period of the appendicular inflammation, and is not the result of perforation, it would aid very much in making the diagnosis at this stage

We have the authority of a standard work on Pathological Anatomy and Histology for stating that the most frequent form of inflammation of the appendix The appendix is swollen and is a suppurative one congested, its walls are infiltrated with pus, at some points there may be necrosis and sloughing of portions of its wall Within the cavity of the appendix we find fæcal concretions or foreign bodies or nothing (but mucus) Such an inflammation may terminate in resolution, but more frequently it sets up an inflammation of the surrounding tissues flammation may be either a local or general peritonitis or a suppurative inflammation of the parts about the appendix Less frequently there is a chronic inflammation of the mucous membrane of the appendix, followed by constriction of its upper portion while the lower part is dilated into a cyst filled with (Delafield and Prudden) mucus and serum

Another elaborate treatise on Pathological Anatomy and Pathogenesis states that typhlitis and perityphlitis imply inflammation of the vermiform appendage and parts around it

The vermiform appendage is peculiarly adapted to catch and retain substances passing through the Matters which have been swallowed—such as grape seed, apple pips, cherry stones and the like -and fæces may accumulate in the appendix and Sometimes these become set up inflammation crusted over with phosphates and carbonates and so form fæcal concretions or calculi The inflammaappendage, and then attack the contiguous structure pressions, I would urge a prompt recourse to cura tures, and in this way necrosis and gangrene with tive measures

perforation may be caused The issue differs in different cases It is comparatively favorable if the inflammation continues to be circumscribed, while the exudation is moderate in amount, protective adhesions and false membranes may thus be formed about the affected spot It is very unfavorable when perforation takes place before adequate ad hesions are formed, fatal peritonitis is nearly always When perforation takes place into a part of the peritoneum shut off by adhesions a burrowing fæcal abscess is produced which may burst internally or externally Sometimes the appendage is entirely obliterated by adhesive inflammation, but if the inner or intestinal end becomes closed while the re mainder continues to be patent, the natural mucus secretion may collect in the latter and distend it into It is likewise specially noted that tubercu lous and typhoid ulceration, localized in the vermiform appendage, may give rise to dangerous lesions (Ziegler)

It is not out of place to repeat what has been stated in a recent publication by me, that I cannot acquiesce in that view of pathologists which attributes the degeneration of the cæcum and ap pendix to a low state of vitality in their tissues, but on the contrary I hold that they are highly vitalized, and that it is from being overtaxed in the perform ance of functions connected with the excrementi tious process that they are so subject to disease

I agree with Agnew in considering inflammation as hypernutrition, and consider that it is an effort of nature to restore the equilibrium of the circulation, which has been interrupted by a local morbific im The inflammapression from the causative agent tory process is an attempt at recuperation of the in jured part, and within certain limits it is salutary, but when it transcends the powers and capacities of the organism I infer that from the undue excitation and over action of this extraordinary impulse, there is a breaking down of the forces of the organization, which leads to disintegration and death of the struc-By the development of inflammation tures involved in the tissues of the cæcal region nature resents an insult to the components of this organism, and when it triumphs over the difficulties encountered resolution ensues, but if it fails, ulceration and perforation occur, leading to abscesses and peritonitis

To illustrate the important vital connection of the ileo cæcal structure with the general organism, I may refer to the fatal results of the resection of this division of the intestinal canal of dogs reported in my paper on obscure impediments of the intestinal canal in Gaillard's Journal, while resection of a por tion of the ileum was followed by complete restora tion of the intestine These deaths occurred in less than twenty four hours, indicating that they were the effect of shock, which can only be explained upon the basis of a most intimate link of association of this structure with the organic nervous system

Being therefore convinced of the traumatic reaction on the part of the caecal division of the in testines as a consequence of injuries or morbific im

the diseased appendix, all writers are pretty well agreed upon using anodynes and keeping the patient at rest in the early stage with soothing fomentations mild purgative or to an enema to secure evacuations, when the bowels are bound at the outset, and afterwards used opiates in full doses continuously of every kind is hurtful, and that masterly inactivity should be observed with a view to promote resolution of the inflammatory process, if this be possible, thus averting suppuration and perforation

With the uncertainty that hangs over the diagnosis in the early stage of appendicular disorder, the expectant treatment is generally recognized as the most prudent course, but there is a growing tendency among surgeons to cut the Gordean knot by a decisive step, and use an exploratory operation by in cision for determining the exact seat and character of the disturbance Aggressive practitioners such as Bull and Weir, with others, have inculcated surgical interference at the earliest practicable period, and with the lights before us in the cases of this kind the surgeon is warranted so soon as he has good and sufficient reason to believe that there exist progressive inflammation of the appendix, in verifying this diagnosis by cutting down upon it This course is indicated when the symptoms of a local and constitutional or general nature are such as to raise a presumption in favor of appendicular inflammation, in advance of those phenomena which usually accompany perforation In other words, an exploratory operation is advisable with a view to learn the event there is no evidence of inflammatory action in the tissues of the appendix or cæcum, and no indurated mass can be discovered by palpation in either, after careful exploration, the incision may be closed without any probability of serious consequences

If, however, on the contrary, appendicitis is verified, with or without the recognition of a solid body within its canal, it would be proper to ligate or suture the cæcal attachment, and excise the appendix vermiformis, as a security against further inflammatory developments in its structure Thus all liability to the graver results of perforation would be most effectually obviated, and thus surgery of a destruc tive order would eventually prove to be conservative in preventing other grave consequences The diagnosis of appendicular disorders cannot be guaranteed without an exploratory operation, as the statements of those most familiar with this class of cases, show most conclusively, and it cannot augment matenally the risk to life, while it ensures a radical cure when disease exists

An incision may be made outside of the right rec-The extension of the opening upward noted in my case of perforation of the appendix re-

In regard to the proceedure for the treatment of toneal cavity by adhesions, so that it left the iliac fossa and reached the diaphragm on the right side, burrowing behind the liver in the form of a cloaca, which could not have been explored properly by an over the iliac region, but some have resorted to a incision in the linea alba owing to the adhesions existing then between the intestines and the abdominal wall

In a recent laparotomy for volvulus of the ileum It may be put down as a dogma in the management near its excal connection such difficulty was encounof incipient cases of appendicitis, that perturbation tered in the exploration of the seat of disease through an incision in the median line from the umbilicus to the pubes, that it was found necessary to extend my incision upwards to a point midway between the umbilious and ensiform cartilage to effect my object The walls of the intestine involved in the twist were agglutinated and the canal entirely occluded, with disintegration on either side of the obstruction The cecal segment was ligated and the other was cut beyond the gangrenous line and stitched into the median incision, after the process for artificial anus, upon closing the abdomen

> If the site of the trouble could have been known in advance, as is presumed to be ascertained in appendicitis, it would certainly have required a shorter incision in the linea semilunaris than was found necessary in the linea alba in that case I avail myself therefore of the opportunity to modify my criticism in the paper read at Chicago, upon the opening of the abdomen at the outer border of the rectus muscle, and fully realize its advantages in operating for appendicular extravasation

The great advantage of the several steps consists in adapting the extent of the operative procedure to the nature of the case If there be a doubt in the diagnosis of appendicitis it is solved by a transverse exact condition of the parts involved, and in the incision in the iliac region, and if nothing be revealed requiring further surgical interference the opening may be closed by suturing the peritoneum with catgut in continuous form, while the fascia, muscles and skin are brought together by interrupted suture of iron dyed silk There will not occur much strain upon the suture in this line of union and the operation should not be carried further except when the evidence of disease in the adjacent structures demands a larger field of observation Incisions along the linea semilunaris upward or downward with the turning aside of the corresponding flaps will afford ample scope for proceeding in cases of circumscribed abscesses or general peritonitis resulting from perforation of the appendix vermiformis

> It has been my object in this paper to direct attention to the early development of inflammation in the structure of the appendix, as its progress and termination in perforation have proved serious in most cases, and the intractability of the consequences of the extravasation of its contents, as manifested by suppuration and peritonitis, is generally recognized by surgeons

I am not prepared to assert that a differential diagalong the linea semilunaris would be indicated in case nosis of appendicitis can be assured prior to perfora suppurating track should be discovered, as was ation, but a reasonable presumption in favor of the seat of the disorder being in the structure of the apported April 20, 1887, in the Medical and Surgical pendix, may be reached by a careful examination of Reporter This was shut off from the general pen- the local signs and the general symptoms In view

of the strong probability of the existence of the appendicular trouble it is claimed that an exploratory operation is justifiable in advance of any indications of perforation We should choose the lesser evil of rubber bandage an unnecessary incision, rather than risk the greater, in the calamitous results of extravasation of the contents of the appendix into the peritoneal cavity accompanied by shock and followed by septicæmia The difficulties which the surgeon must encounter from delay in resorting to an operation until perfora tion assures him of its necessity, should warrant him in forestalling the danger by an exploratory incision says so soon as he becomes impressed with the probability of appendicular inflammation, and if realized, to be plicity and efficiency, tend to the advancement of followed by radical operation

MEDICAL PROGRESS.

SEPARATION OF THE VERTEBRÆ WITH PROTRUSION of Hernia -Dr W F Wilkins, of Ottawa, Kansas, reports the following unique case

Some time since we had a wind storm that did a great deal of damage, and among other houses that were demolished was one occupied by Mr G and The husband was not at home at his young wife the time of the storm, but returned shortly after his house had been scattered over the vacant lots ad-The young wife, who was in her eighth month of gestation, while being tumbled about with the furniture and fragments of the house, was rendered insensible by the corner of a table, as she supposed, coming violently in contact with her abdomen Pains came on the day after, and she was delivered of a male child with a peculiar "hunch on its back," as the attending physician called a hernia situated at the juncture of the dorsal with the lumbar vertebræ

I was called to see the child on the sixth day after delivery, and found the "hunch" of a purple color and about the size of a goose-egg After careful examination I diagnosticated the case a hernia of some description, and the parents decided to have the lit tle fellow operated on as soon as possible The next day, with an assistant, I anæsthetized the patient and proceeded to operate by cutting down upon the her-We made a longitudinal incision about 4 nial sac inches long, and found the vertebræ separated to the Through the opening protruded extent of ½ inch the hernia with its contents The spinal cord had been pushed to one side I returned the hernia with out opening the sac, carefully replaced the cord and brought the vertebræ into exact apposition Then the question arose how to keep the bones in position? After considerable deliberation, I carbolized a silver suture and passed it through the superior intervertebral notch of the dorsal vertebra, into the superior intervertebral notch of the lumbar vertebra, through the inferior intervertebral notch of the lumbar, back to say nothing of the small amount of relief production the concepts side through the concepts and through the concepts and through the concepts and through the concepts and through the concepts and through the concepts and through the concepts and through the concepts and through the concepts are through the concepts and through the concepts are through the concepts and through the concepts are through the concepts and the concepts are through the concepts are t bral notch of the lumbar into the superior interver-tebral notch of the dorsal vertebra, repeating this dispel an ordinary case, but what about the, to most three times, and making a figure of 8 knot binding people, disgusting smell? The treatment verily is

the bones firmly in position The external wound was closed with six catgut sutures, the whole dusted with iodoform, and the dressing finished with a broad

Antiseptic precautions were observed throughout the operation, which lasted about half an hour wound healed by first intention and the little fellow was practically well in six days -St Louis Med and Surg Journal, June, 1888

TREATMENT OF ECZEMA —MR J A WETHERELL

Communications which in any way, by their sim the domain of practical treatment, are deserving of the consideration of all professing dermatology, and especially of those who make this branch their sole Having myself been a sufferer from recurrent chronic eczema for a period of five years, and consequently taken a great interest in all pertaining to it, I believe that I have discovered a new method of treating the disease What is to follow has particular reference to the eczema simplex affecting the fingers and hands The best procedure, possibly, will be to divide the subject into sections

Medical Treatment — (a) External pieces of lint, sufficient to surround the fingers separately, in pure liquor carbonis detergens, and apply them, surrounded by gutta-percha tissue, at bedtime They are allowed to remain on all night Considerable smarting is at first caused, but it soon disappears On removing the lint in the morning the skin looks sodden, the former vesicles are often raised into small bullæ, which, however, ere long get absorbed and During the day the hand is left exposed to dry up the open air or, better still, kept gloved in thin kid They are washed every third day with lanoline coal-To render the skin more pliable and soft tar soap a little lanoline is rubbed in every morning In the course of three or four days the upper hardened cuticle comes off, in some cases as a whole, in others in large flakes, leaving a clean smooth surface, healthier, with more tonicity in it, and not so subject to undergo the catarrhal multiplication so characteristic of eczema When much redness or heat exists, or there is an acrid discharge, or the implicated surface is evtensive, we may moderate the strength of the alco holic solution of coal tar by mixing it with (1 to 10 or 20) cold water, or the alkaline bathing, to be presently mentioned, may be tried If there are only a few vesicles, I have often touched them over with a little pure carbolic acid, so as to bring away a mere shell of epidermis of limited area Let us now briefly review a few of the other local methods adopted As to ointments—e g, of bismuth, zinc, etc—all I have to remark is that they are, like the tar method of Hebra, simply disgusting Even the lowest menial does not care to parade the streets with his fingers or hand bandaged up with so many white linen rage, Huile de Cade or oleum rusci pyroligneum

worse than the disease Bathing with saline or alka line waters, such as are found at Harrogate, Bath, etc. alternating or combined with the application of spirituous alkaline lotions, I have great faith in, especially where the disease is extensive or there is much evudation, e g, in eczema rubrum, or the case Watering-places and is intractable to other means the seaside, however, are not always near, nor could the patient always afford to go to them The various gelatine, collodion, or other impermeable coatings, I consider worthless (b) Internal Drugs, as such, are not required To speak of treating the gouty or rheumatic diathesis by colchicum, etc., is simply ridiculous Such terms as these should, in my opinion, be abolished, or applied only where actual a tacks of gout or rheumatism exist or threaten Should we not rather speak of such as "a constitution with a tendency to excessive formation of uric acid," or even as "uratic" To give large doses of arsenic is sheer waste of material Very small doses often dispel scaliness, but it should only be administered in the form of some mineral water, as La this occurring Bourboule, Woodhall, etc

- 2 Dietetic Medication -Avoid stimulating and in digestible substances, as pickles, tea, etc In other words, the chief materials of diet should be lean meat, milk, or cocoa to breakfast, old bread, fresh vegetables (except starchy bodies, as potatoes), no pastry Avoid all that disagrees, especially beer and malt
- 3 General Indications Cleanliness in everything is very essential, clothe and diet the patient according to the changing season, avoid all local irritants, take plenty of fresh air and exercise, and by these means alone regulate the bowels and other emunc-

In spite of all rules, cases now and then occur which withstand all treatment, baffle every effort, and cling to the sufferer for a lifetime Such must be attacked on general principles The plan cannot be a stereotyped one — Lancet, June 2, 1883

URETHAN AND ANYL HYDRATE IN INSOMNIA -DRS J P CROZIER GRIFFITH and ELWOOD R KIRBY, in an article on this subject, give the records of 19 cases of insomnia treated by urethan records show that out of 19 cases there have been but 2 where the hypnotic action was really satisfac-In a few others the effect was slight, or it was doubtful whether the sleep could be attributed to the action of the medicine, and would not probably have been obtained without it In 3 cases there were unpleasant secondary effects, though in the last case the stomach was irritable to other drugs usually well It may be objected that the amount generally employed (15 grains) was too small This may possibly be true, though it is that usually recomfore adopted repeated in two hours or less, and in one case as which I shall hereafter mention much as 60 grains were given during the night with

however, conclude that, as far as our experience goes, urethan is an uncertain and unreliable hypnotic, though in large doses it will at times prove useful, and has advantages which at least recommend it for trial in some cases

Amyl hydrate was used in 18 cases The results were exceedingly favorable In only 2 cases were there any unpleasant effects, in one a temporary delinum occurred with the first dose in a rather hysterical woman, and in the other vomiting was produced, though the stomach of this patient was unusually ir-The taste is often complained of, but we have succeeded in disguising it to some extent with liquorice, as v Mering suggests We have also found it very satisfactory when given in gelatine capsules, each containing 20 minims The ordinary capsule in two parts will answer nicely for this purpose, and will retain the drug without leaking A full glass of water should be immediately swallowed after the capsule, in order to avoid offending a possibly irrita-In most cases there is no danger of ble stomach

Our results show that amyl hydrate does not always succeed in producing sleep Particularly is this the case when pain is present, or when there is very troublesome cough We believe it, nevertheless, to be a valuable hypnotic, more powerful than urethan or paraldehyde, and to be preferred to them, and always to be chosen in place of chloral to produce sleep, though it is not so strong as the latter drug -Med News, May 19, 1888

ELECTRICAL TREATMENT OF SALPINGITIS -DR Apostoli records a case of hydrosalpingitis treated by his method of galvano puncture, with excellent results, and draws the following conclusions

In gynecology fever and inflammation are not to be regarded as absolutely contraindicating the methodical and proper application of the galvanic current

2 Inflammation of the uterus and its appendages, when not in the stage of suppuration, may be advantageously treated by the galvanic current This current, though admissible in the first stages of congestion and inflammation, I consider ought not to be used when suppuration exists, unless it be brought into action in the form of an electrical cauterization, for the purpose of making a safe and certain outlet for the matter through the vaginal wall

3 A galvano-caustic puncture is a valuable means by which we may gain two ends first, to check the outbreak of inflammatory action or to stop its progress, secondly, to give an easy exit to a collection of fluid, by the falling of an eschar, in any case where the cavity containing such fluid is accessible through the upper part of the vaginal wall

4 Every inflammatory exudation presenting itself mended by the earlier writers, and which we there- in the vaginal cul-de-sac may be treated by means of Moreover, the dose was frequently the galvano puncture, except under the condition

5 This method may be easily and harmlessly emout hypnotic effect It is also true that a few cases ployed for the treatment of certain cases of salpinging constituted too severe a test for a simple hypnotic, tis and hydrosalpinx, on account of the close relation as pain or persistent cough was present We must, between the tumors and the vaginal wall.

6 In making every galvano-puncture, all the rules which I have hitherto laid down concerning the seat of the puncture, its depth, the size of the trocar, the antiseptic precautions, the repose of the patient, etc., must be scrupulously observed

7 Two negative galvano-punctures, vaginal only, were sufficient in one case of hydrosalpinx to bring about very quickly an important anatomical change, and complete symptomatic cure -Brit Med Jour, May 12, 1888

Peppermint Water in Pruritus Pudendi —Dr AMAND ROUTH calls attention to the value of peppermint water in pruritus pudendi In pruritus due to pediculi, ascarides, an irritable urethral caruncle, an endocervical polypus, early cancer of the cerviv, distension of Bartholini's ducts or glands, the leucorrhœa of vaginitis, endocervicitis, and metritis, or the irritating discharges of advanced carcinoma uteri, or to a gouty or diabetic diathesis, peppermint water excels all others, cocaine inclusive, in affording relief, whilst endeavors are being made to remove the tain a good supply of lymph If necessary, a second The agent here alluded to is peppermint water used as a lotion The B P preparation answers well, but is bulky for carrying about, and is incapable of concentration unless rendered alkaline This is best done by borax, as being in itself soothing and antiseptic Patients can easily make their own lotion, as required for use, by putting a teaspoonful of borax into a pint bottle of hot water and adding to it 5 drops of oleum menthæ piperitæ and shaking well, the parts affected to be freely bathed with a soft If no cracks or sores are present, this lotion will remove the itching, but if there be eczema or a rawness from scratching, it is inapplicable oil, with 5 grs of iodoform to the ounce, is then The greatest and most permanent remore useful lief is afforded in the neurosal form, especially in the pruritus which often accompanies pregnancy also very useful in the pruritus which occurs at the climacteric, or in elderly women, in whom it may be only part of a general pruritus, and also in those cases of women of all ages where the urine simultaneously becomes of very low specific gravity without any evidence of having a gouty or granular kidney as a remote cause — Brit Med Jour, April 14, 1888

Kephir and its Use as an Infant Food —Dr LONGSTREET TAYLOR has found kephir useful in feed-He considers ing marasmic and hand-reared infants that it is superior to peptonized preparations and kou-The former is theoretically perfect, but practically not always satisfactory, either because the process is carried on too far or because injurious ptomaines are introduced during the process of prepar-The latter is too expensive and too difficult a maximal effect is pi to obtain ever to be of much general service phir is a product of the fermentation of cow's milk by which the thick coagulum which would otherwise form is broken up into fine flocculent flakes, which are much more amenable to the influence of the gas-It must not be used after it has become mel in the dose of 3 g too old and sour, as in this state it is neither palatable - Vratch, No 8, 188 nor digestible For young infants only the weak or

young kephir in the first stage of fermentation should be used It should be given lukewarm, i e, about 75° F If the infant is less than a month old it may be diluted with one third of water, the proportion of water being gradually diminished so that when the infant is six weeks old it may take the kephir undiluted -Arch of Pediatrics, May, 1888

Mode of Obtaining Vaccine Lymph without PUNCTURING THE VESICLES -In the Brit Med Jour, April, 1888, DR GRIGG describes a method of ob taining lymph without puncturing the vesicle, which does away with the chance of contamination with blood, and lessens the risk of subsequent inflamma It is as follows A small bead of pure glycerme is dropped upon the centre of each pock, then the top of each pock is rubbed with a smooth blunt instrument (the round glass head of a shawl-pin does excellently) After the lapse of two or three min utes the bead of glycerine will have increased to nearly double its size, especially if the vesicle condrop of glycerine may be applied after the first has been used, and even a third Another advantage in this plan is that it is not necessary to hold the infant's arm, and consequently it does not become trouble some and difficult to convey the lymph from one arm to another

CONDURANGO —PROFESSOR OSER, of Vienna, who has been making trials of condurango bark in carcinoma and other diseases of the stomach, finds that it has an excellent effect on the appetite and that it relieves over-sensitiveness Some patients can take it for months without any unpleasant symptoms, while in others it soon sets up nausea, which cannot be prevented either by the simultaneous administra tion of correctives or by the ent preparations of the bar the liquor Conduiango to deserve a place in our ' tomatic remedy, but as action on malignant dise dictum that the only ho stomach by means of di a mistaken diagnosis —

Hypodermic Injecti DR NIKOLAI N Rus ing employed Scarenz number of cases of sy ing conclusions not only in the hos " patients 2 The bea veterated neglected fo tion, the method may an auxiliary means fc doubtful cases non syphilitic person 17 injurious effects

A NOVELTY IN HEPATIC SURGERY

In the American Journal of the Medical Sciences, for June, DR L McLane TIFFANY, of Baltimore, records two cases, of abscess of the liver and stone in the gall bladder, in which the important part of each operation was the shutting off of a portion of the liver by suture from the general cavity of the belly, so that treatment could be applied irrespective of the neighboring but not entirely investing peri-

In the case of the abscess an incision 3 inches long was made just below, and parallel to, the right costal cartilages, and carried down to the peritoneum When hæmorrhage was arrested the peritoneum was opened for a distance of 2 inches, and the liver, which was not adherent, was exposed Slight traction on each lip of the wound caused the edges of the peritoneum to open widely, showing an oval area of liver surface, 1 by 2 inches The peritoneum edge and liver surface were then sewed together by close continuous sutures with a fine needle and silk, by which the general cavity of the peritoneum was shut off from the wound, and the operator had a buttonhole of extraperitoneal liver at disposal for the operation, which was then completed

The second case is particularly interesting from the fact that the gall bladder was opened through the liver, since digital exploration failed to detect the gall bladder, and the intestines were adherent to the under surface of the liver and to the gall-bladder, which was felt through the intestines after the incision was sufficiently enlarged In view of the success of

was done as follows. A slender hollow needle was passed directly through the liver from above downward into the gall bladder, and on aspirating a perfectly clear fluid entered the syringe. It was thought that if adhesions prevented the gall bladder from projecting beyond the liver edge the same would prevent extravasations into the peritoneal cavity, so the parietal peritoneum was sewed to the upper surface of the liver, making a "buttonhole" 1 5x2 inches, the rest of the peritoneal incision being also closed, and with the needle, which remained in situ, as a guide, the gall bladder was reached by cutting through the thickness of the liver, the incision being of such a size that the operator's fingers would fill it The gush of blood that followed the use of the knife was arrested by the forefinger thrust into the wound The finger was not removed for three minutes, and no hæmorrhage followed its removal Several stones were detected by the end of the finger, and were removed with the forceps A rubber drainage tube was left in the gall-bladder, and in one month from the time of operation there was perfect union of the wound.

785

Dr Tiffany's cases show two things that hæmorrhage from a wound of the liver is not the surgical bête noir it has been supposed to be, and that it is amenable to pressure applied directly to the bleeding surface, as is shown by the case of stab-wound of the liver treated successfully by Burckhardt, described in THE JOURNAL, Vol viii, p 323, and Vol ix, p 62, in which the furious hæmorrhage was arrested by a tampon of 10doform gauze The cases show, in the second place, that by shutting off an area of the liver from the peritoneal cavity there is a distinct gain for purposes of drainage, and lessened risk of septic in-One of the chief advantages of the method, as can be readily seen, is the rapidity with which it can be performed, so that it is readily applicable in cases of stab or gunshot wound of the liver, in which a more tedious method would be out of the question

DR TURNBULL'S TREATMENT OF ACUTE AND CHRONIC OTORRHŒ4

In THE JOURNAL of June 9, 1888, DR LAWRENCE TURNBULL assigns a high value to inflation of the Eustachian tube as a means of treatment in suitable cases, but principally of catarrh with perforation often proves very dangerous in unskilled hands in "otorrhœa" on account of its effects on the circulation, local effects of an excessive pressure, and also the blowing back of purulent secretions from the nose and pharynx into the ear Before practicing the operation in the case of abscess, the operation inflation, the nostrils should be cleansed thoroughly

The patients, especially children, should be taught to keep the nostrils clean Many children do not know how to blow the nose The discharge of purulent matters from the ear into the pharynx, setting up secondary troubles, is not a matter of theory with Dr Turnbull, but is proved by observation distressing case of bilateral perforation came under Dr Turnbull's notice in which hæmoptysis and gastric hæmorrhage had been diagnosticated from the vomiting of bloody discharges which he describes as having been swallowed from the ear, via Eustachian tubes At the post-mortem examination, the stomach contained a pint of putrid and bloody matter

Dr Turnbull does not approve of syringing, as a rule, and says it should never be done except by the physician. In the first place, a good syringe is a rarity, and an expensive rarity. Even if the instrument is good, in improper hands it may tear the membrane. He claims to have seen such accidents occur, to the entire destruction of the membrana tympani.

THE MALADY OF THE EMPEROR FREDERICK III

According to the cabled reports of last Monday, the disease of which Frederick III died was cancer The autopsy proved that the larynx of the larynx was completely destroyed by cancer, and that purulent bronchitis existed There was also inflammation of the finer ramifications of the bronchial tubes into which purulent particles had entered The whole larynx was in a state of suppuration, and presented a soft lumpy mass, with scarcely any trace of cartilaginous structure remaining There was nothing to show the existence of perforation of the walls separating the trachea and esophagus The choking sensation from which the Emperor suffered during the last of his life, which was attributed to such a perforation, appears to have been really due to collapse of the larynx, owing to the destruction of the cartilage The direct cause of death is given as paralysis of the lungs, according to the cable reports

Dr Mackenzie, in his report on Emperor Frederick's case, says "In my opinion the disease from which the Emperor died was cancer The morbid process probably commenced in the deepest tissues of the cartilaginous structures of the larynx and they became affected at a very early date. The small growth which was present when I first made an examination was removed by me by several operations, and all the portions removed were submitted to Professor Virchow. He was unable to detect any evi-

dences of the existence of cancer The examinations made in the beginning of March by Professor Wal deyer led to the belief that cancer was then present Whether the disease was originally cancerous, or as sumed a malignant character some months after its first appearance, it is impossible to state. The fact that perichondritis and carysis of the cartilages played an active and important part in the development of the disease doubtless largely contributed to make it impossible to form a decided opinion as to its nature till quite a recent date."

To Dr Mackenzie's report Dr Hovell adds the following "In so far as my observations since last August permit me to form an opinion, I concur en tirely in Dr Mackenzie's view"

MICHIGAN STATE MEDICAL SOCIETY

The programme of the twenty-third annual meet ing of this Society was not only elegant in its appear ance, but admirable in the arrangement of the work of the Society The general meetings for transacting the business of the Society were to be held in the morning, and the reading and discussion of papers occupied the afternoons in three Sections-Practice of Medicine, Surgery, and Obstetrics and Gynecology Each Section was provided with a full complement of papers on important subjects, and by this plan more than three times as much work would be ac complished as could be done if all were attempted in general sessions, as is done by nearly all our State The annual meeting was recently Medical Societies held in Detroit and proved highly satisfactory to the If all our larger city and members in attendance County Medical Societies would provide for having their scientific and practical work done in Sections, each holding meetings as often as the amount of work might require, while the general meetings for business and social purposes might be only annual or semi annual, and if all the State Societies were made up of delegates from the local societies and would follow the example of the Michigan Society, the whole sys tem of medical organizations would be in harmony with that of the American Medical Association, and afford the devotees of every legitimate specialty am ple opportunity to cultivate their own field in har mony and affiliation with every other, and thereby preserve the unity and social integrity of the whole profession

TRANSACTIONS OF THE NINTH INTERNATIONAL MEDICAL CONGRESS

To answer several inquiries it is proper to state

that three large volumes of the Transactions are through the press and the fourth is well advanced But a fifth will be required to complete the publication The work is progressing as rapidly as is consistent with good quality of work, and with a fair prospect of completion within the next two months All inquiries regarding the volumes already published should be addressed to John B Hamilton, M D, late Secretary General, and Chairman of the Publication Committee, Washington, D C

EDITORIAL NOTES

An Association of Sanitary Inspectors is one of the new organizations of Great Britain a national association, with sub-associations of the provincial associations, says the Sanitary News, at a meeting held in Liverpool lately, passed resolutions to the following effect "That the interests of the public health demand that all candidates for the position of sanitary inspector shall be duly qualified and certified by examination held under and directed by authority of the Government, that fixity of tenure be assured during good tary inspectors be fixed by the Local Government Board, that one simplified Public Health Act, applicable to the whole kingdom, embodying these amongst other changes is necessary for the efficient discharge of the duties affecting the public health which devolve upon the sanitary inspectors"

THE SALE OF UNWHOLESOME FRUIT -It is at this season of the year that the health of city dwellers, and especially of the young, is endangered by untipe or over-ripe fruit Those most endangered are the children of the poor, and the wandering waifs of the streets, since over ripe and even partly decayed fruit is exposed for sale at "cut prices" by the dealers This is being done now in Chicago, and probably in other cities, and city health authorities would do well to put a stop to the practice at the beginning of the hot weather In Chicago the fruitstands and street venders do no small business in over-ripe and partly decayed bananas, which, when purchased by a small boy is a double engine of destruction, since the peel is usually deposited on the side walks before the boy begins to jeopardize his oun health by eating the fruit

THE CHICAGO GARBAGE CREMATORY IS doing satisfactors work, and a careful record is kept of the proportion of fuel consumed to the amount of material burned

GLASS DRAINS AND PIPES for the plumbing of houses have been recommended by a Chicago architect, chiefly from the fact that the material is not acted upon by the agents that usually corrode pipes of other material, and is safe from the attacks of rats

THE "CANADA MEDICAL AND SURGICAL JOURNAL" will soon appear as the Montreal Medical Journal

A TRAINING SCHOOL FOR COLORED NURSES IS CONnected with the Spellnan Seminary, Ga

SOCIETY PROCEEDINGS.

GERMAN MEDICAL SOCIETY OF PHILADEL-PHIA

Meeting of May 14, 1888

VICE-PRESIDENT LAWRENCE WOLFF IN THE CHAIR

DR CARL SEILER read a paper on

HYPERTROPHY OF THE TONSILS

He said that as yet we did not know whether the tonsils performed any physiological function or not, but that the view was prevalent that these organs were residuary and of no use in the economy He behavior, that the minimum scale of salary for sani-stated further that in the normal condition they were invisible and became visible only by a hypertrophy of their tissue This view had lately been forcibly expressed by Dr Daly, of Pittsburgh, and found a proof in the fact that even when slightly hypertrophied in youth they usually disappeared at the age of 25 or 30 years They had no connection whatsoever with the genito-urinary apparatus, as had recently been asserted

After briefly describing the minute anatomy of the tonsil, he entered upon the subject proper, and said that we could recognize three distinct varieties of hypertrophied tonsils first, the ordinary soft hypertrophied tonsil most commonly met with in childhood and early youth, and rarely found in adult age This variety is characterized by simple enlargement of the tonsillar tissue, with a corresponding increase in the size of the crypts, which latter mostly contain plugs of white, cheesy secretion This secretion in some cases becomes putrid and emits an extremely disagreeable odor This simple hypertrophied tonsil is frequently the seat of periodical acute inflammation, which may or may not produce parenchymatous suppuration Coexisting with this chronic tonsillar hypertrophy we usually find a chronic nasopharyngeal catarrh and more or less hypertrophy of the pharyngeal tonsil These conditions give rise to a variety of symptoms, the most prominent of which are interference with proper vocalization and articulation, insufficient eration of the blood, gastric disturbances and frequently catarrh of the middle

The second variety is the so-called scirrhous ton sil first mentioned by Dr Jarvis, of New York, which is characterized by a smooth exterior surface and a hard, cartilaginous feel to the touch of the finger or so, rarely contain the cheesy secretion of hypertrophied tonsil is met with usually in young does not become impacted in the tissue of the tonadults, and is rarely, if ever, the seat of acute period-sil ical inflammation The hardness is imparted to it by a deposit of connective tissue between the cellular week or ten days, and from four to six applications elements, and particularly around the blood-vessels, canaliculizing them, and thus depriving them of their contractility They interfere by their presence with contractility vocalization and articulation, and naso-pharyngeal catarrh as well as chronic laryngeal inflammation, frequently coexist with them

The third variety may be called the ragged hypertrophied tonsil, and is nothing but the result of the first variety having been the seat of frequent tonsillar abscesses which have caused parts of the tissue to slough away, leaving a ragged mass of tonsillar tissue between the faucial pillars young strumous adults and is perhaps the most dangerous to the general health, masmuch as it gives lodgment to septic material and thus in many cases

produces chronic septicæmia

Dr Seiler then entered into the consideration of the treatment of hypertrophied tonsils, and said that in all cases the offending masses should be removed, but that the method by which this was to be accomplished should be carefully considered and adapted to the requirements of each individual case chemical caustics applied to the surface of the tonsil were worse than useless, as their application gave rise to a great deal of pain and had to be kept up for a considerable length of time to produce any re-In the ordinary soft variety the tonsil sults at all was best removed by ablation with the tonsillotome Care should, however, be taken not to wound the edge of the anterior pillar, because a small branch of tonsil, in which the canaliculization of the vessels the tonsillar artery runs close to this edge and when cut gives rise to hæmorrhage difficult to control the anterior pillar is adherent to the tonsil, it should be loosened, and if this is not possible owing to the bands of fibrous tissue connecting the pillar with the tonsil being too strong to be torn, the tonsillotome cannot be used with any degree of safety and the galvano-cautery knife should be used After the projecting portion of the tonsil had been ablated, the cut surface should be brushed over with a 60 grain solution of nitrate of silver to cause contraction of the capillaries and to cover the wound, and any secondary hæmorrhage, which, however, rarely occurred, should be controlled with a strong solution of tannic and gallic acid used as a gargle The old method of and gallic acid used as a gargle removing the tonsils with the volcellum and bistoury the lecturer said was unsafe, as the edge of the anterior pillar, even when not adherent, was too easily Total extirpation wounded by the heel of the knife or enucleation was also dangerous, besides being unnecessary except in the extremely rare cases of cancerous growth in the tonsil

ragged tonsil was the galvano-caustic method of removing hypertrophied tonsils. In applying this moving hypertrophied tonsils. In applying this method the galvano cautery knife should be heated method the galvano cautery knife should be heated to a bright red heat, and should then be pressed into to a bright red heat, and should then be pressed into twenty-four hours

the tissue of the tonsil by entering one of the crypts The crypts are usually not enlarged, and if and cutting with it from within outward, so that the This variety eschar resulting from the burn can easily fall off and This procedure Dr Seiler said did not give rise to any pain, and should be repeated at intervals of a usually sufficed to reduce the tonsils to a size com patible with health and comfort of the patient Under no circumstances should any preparation for the removal or reduction of hypertrophied tonsils be undertaken while the organ was in a state of acute in In the case of the ragged tonsil, scrapflammation ing the tonsillar tissue from the capsule with a sharp curette had been recommended, but this method was not only very bloody, but also painful, and on that account the galvano cautery was to be preferred

For the removal of the scirrhous tonsil, Dr Seiler It is usually found in recommended the Jarvis snare as the best and safest The steel wire loop should be laid instrument around the enlarged tonsil and by turning the screw should be gradually decreased in size until the portion encurcled by the wire was cut off If done slowly the operation occasioned very little pain and time was given for the edges of the rigid vessels to become agglutinated so that little or no hæmorrhage resulted The best way, he said, was to start the snaring process and then let the patient turn the screw himself, trusting to him that it was not done too quickly, for the patient would tighten the loop until he felt the pain and would then stop, to begin again when the pain had ceased The time occupied in thus removing a scirrhous tonsil was from two to three hours

DR MUERLECK suggested that many of the supposed cases of hæmophilia were cases of scirrhous caused profuse and persistent hæmorrhage after ab-For this reason he asked the lecturer to definitely state the diagnostic differentiation between the soft and fibrous forms

DR VANSANT desired the judgment of Dr Seiler upon the use of alkalies in acute tonsillitis-especi-He inquired ally of sodium bicarbonate and borax furthermore, whether, after repeated attacks of in flammation, the resulting hypertrophy ever spontane-In the matter of diagnosis, it ously disappears should be borne in mind that other tissue changes than simple inflammation and hypertrophy may have their seat in the tonsils It is a question whether the initial lesion of syphilis would be likely to lead to The cases he had observed presented a mere superficial ulceration without induration. In none of the cases reported by Tchisbriakoff, Peter son, Tomasheosky and Seveki within the past year, was the fact of induration mentioned. He would like to know whether this peculiarity is constant in 2

DR WOLF had had considerable success in abort lesion in this location The safest and only applicable one in cases of ing acute tonsilitis by Dr Seiler's method, viz by

cation was generally successful in preventing suppuration—besides giving great comfort to the patient by reducing the tension and pain

DR FRIEBIS noted the frequent association of tonsillar hypertrophy and otitis media, but was not clear in his mind whether the same is to be attributed to impeded nasal respiration (mouth breathing), or to the septic influences from the crypts, or to mechanical obstruction of the mouth of the Eustachian tube by the swollen gland Dr Miller, in using the cautery knife, had frequently had it stick in the tonsilar tissue and had caused pain and hamorrhage by its violent This difficulty was due to a too early shutting off of the current and could easily be avoided The knife should be hot when applied and removed He had used the galvano cautery more often than the guillotine-even in the soft variety-owing to an unconquerable prejudice on the part of the patients against any cutting operation For the same reason the blade must be heated after it is in the mouth, so that the patient may not see it If both tonsils were treated at one sitting, deglutition would be rendered unnecessary painful He treats them. therefore, in alternation, with two sittings per week He reduces them so that they do not project beyond the pillars and leaves the rest to cicatricial contrac-A most useful battery for the purpose is that of Dr Seiler The method of gouging out the growth with the finger is not only barbarous but dangerous He would not agree with the lecturer ing and night that the tonsils are necessarily in a pathological state when they fill the space between the anterior and posterior pillars, and do not extend beyond them

DR WEED quoted the two cases reported by Croly of primary sarcoma of the tonsil, in both of which incisions were made to evacuate the supposed abscess Such an affection might be mistaken for a hypertrophy even more easily than for quinsy, and the guillotine might evoke a dangerous hemorrhage difficult by the fact that a variety of affections have here their local manifestations Le Gendre considers the tonsil the site of the initial lesions of scarlatina and diphtheria, and Fraenkel calls attention to other varieties of septic infection from this gland Le Brun looks upon all tonsilitis as infectious and regulates his therapeusis accordingly hand, Froelich reports a group of cases in some of following amendments were adopted which the tonsil seems to have been the seat of local lesion, although not the point of original inoculation The first case was one of so called follicular tonsilitis followed by a fatal suppurative peritonitis autopsy Froelich and his assistant sustained slight be more convenient for him to attend wounds with a resulting follicular tonsilitis In addition to the cases quoted by Dr Van by Dr Delavan in the Annual of the Universal Med ical Sciences, just published fore so many varieties of acute tonsilar inflammation, Pharmaceutical Association it is idle to vaunt any one remedy as being suited to nually the result of their joint labors " The strong solution of nitrate of silver

the process, but had failed in other forms of inflammation He was unable to state whether the virtue of the silver salt was in its astringency or in its germicide power In tonsilotomy for hypertrophy it is, according to the experiments of Zuckerhandl, impossible to wound the internal carotid without cutting the wall of the pharynx

DR SEILLR, in closing the discussion, said that the differentiation between the soft and scirrhous varieties of hypertrophy was easily made by the sense of touch, the former being soft and doughy, while the latter was hard and cartilaginous, and never occurs before the age of puberty. He believed that an initial lesion of syphilis upon the tonsil was never in-This was owing to a poverty of submudurated cous connective tissue An early diagnostic sign is glandular involvement at the angle of the jaws. The much vaunted alkaline treatment of acute tonsillitis with bicarbonate of soda or borax had in his experience given no results greater than a temporary al-The only abortive treatment leviation of the pain with which he had had success was that mentioned by Dr Wolff There is no doubt that hypertrophy of the tonsil does sometimes disappear with the advancing age of the patient This is due to a physiological atrophy of the glands The periodical attacks of acute inflammation may be prevented by a proper tonic treatment, attention to hygiene, and particularly by ablutions of the neck and chest morn-

MEDICAL SOCIETY OF THE STATE OF PENNSYLVANIA

Held at Philadelphia, June 5, 6, 7 and 8, 1888

TUESDAY, JUNE 5-FIRST DAY

The thirty-ninth annual meeting of the Medical Society of the State of Pennsylvania was called to In cases of acute tonsilitis the diagnosis is rendered order by The President, Dr R J Levis, of Philadelphia, on June 5

Prayer was offered by the Rt Rev O W Whitaker, DD, Bishop of Eastern Pennsylvania

The Address of Welcome was delivered by Dr John H Packard

After reports of officers and committees had been On the other received and other routine business transacted, the

"That the censors of the appropriate district or districts shall have power to determine whether a resident of one county shall be entitled to become a At the member of an adjacent County Society, which may

"The Committee on Pharmacy shall consist of five number of the household developed similar symp. members, to be appointed annually by the President, whose duty it shall be to consider all matters pertainsant of syphilitic moculation, are a number collected ing to pharmacy, and who shall be empowered to represent this Society in conference with a similar There being there-|committee to be appointed by the Pennsylvania They shall report an-

had in the speaker's hands seemed to abort the attacks of speaker's hands seemed to abort the attacks of speaker's hands seemed to abort the attacks of recurrent quinsy, or had at least modified tion on which was postponed until Wednesday

Resolved, That a committee of five be appointed by the President to secure the cooperation of County Medical Societies and individuals interested in the subject, to urge upon the State Legislature the enactment of a law essentially identical with that proposed by this Society and favorably reported to the House of Representatives at the last session of the Legislature

AFTERNOON SESSION

The first business was the

ADDRESS IN HYGIENE,

by Dr Traill Green, of Easton

He referred to the great importance of pure air and the necessity of providing adequate ventilation in public and private buildings The importance of bathing was also alluded to, and the necessity of keeping cellars perfectly clean was insisted upon The fear of suffering in the hour of death was then considered, the speaker holding that this fear was rarely realized Even in true croup death is accompanied by stupor which prevents suffering In regard to the fear of the possibility of being interred before life has become extinct, the author stated that a careful investigation had shown that there was not a well authenticated case in which this had occurred.

The dread of being eaten up by worms after burial was referred to An inquiry made among those whose business is connected with cemeteries, etc, shows that worms are never seen in bodies buried in the ground Worms are never seen more than one foot below the surface

DR EDWARD R MAYER, of Wilkesbarre, then delivered the

ADDRESS IN MEDICINE

The main portion of the address was devoted to a consideration of intra corporeal antisepsis, to which the author attached considerable value He had for a quarter of a century employed the sulphites had employed these apparently with success as prophylactics in scarlet fever, measles, diphthena and Gastric and intestinal antisepsis have proved of service in gastro-intestinal affections value of antipyretics and analgesics was then briefly referred to

Dr Hugh Hamilton, of Harrisburg, read a paper entitled The Chemical Factor in Disease

DR WILLIAM PEPPER then read

A CONTRIBUTION TO THE CLINICAL STUDY OF ALBUMINURIA

The paper was based on the records of the chemical study of the urine in the cases occurring in his private practice during the past eight months The examinations had been made by Dr J P Crozier Griffith The total number of cases was 239 Of this number albumen was not found in 96 cases The number in which albumen was found, continuously or at some period, was 143 there must be some forms of albuminuria not signifi- of foreign authorship are recommended, only 157 cant of organic disease of the kidneys In 80 of the American works are advised Reference was made

cases in which albumen was found, its presence was capable of explanation from the presence of pus or In many cases, however, it was difficult to blood decide that the quantity of blood, pus, or other accidental addition to the urine was sufficient to explain the amount of albumen found In 41 cases the pres ence of albumen could not be explained in this way, but yet in none of these could casts be found, al though looked for with great care In only 22 cases of the 143 were casts found

DR FRANK WOODBURY, of Philadelphia, read a paper on

THE EFFERVESCENT FORM FOR THE ADMINISTRATION OF CERTAIN REMEDIES

Attention was called to the fact that the last Pharmacopœia contained only two preparations intended to be administered in effervescent form liquor magnesii citratis and magnesii citratis granula Sparkling wines and malt liquors owe most of their palatability to the excess of acid which they Modern works on therapeutics say very little with reference to the action of carbonic acid gas as a medicinal agent It plays as important a part in the animal as in the vegetable economy Effervescing preparations were much employed by practitioners of a generation ago The effervescing form of medication affords a valuable means of ad ministering nauseous and disagreeable medicines Small quantities of alcohol are much more stimulat ing when given in the effervescent form than in the shape of spirits Malt liquor is, when properly given, a better hypnotic than bromide of potassium. It is useful in gastralgia or nausea, and in renal colic It has been found useful as a food and stimulant in children suffering with diphtheria Effervescing draughts are useful in fevers, being grateful to the patient and tending to reduce the temperature and favor the action of the skin In local affections of the digestive tract these agents are commonly resorted to In true migraine they may be given with the addition of a small quantity of deodorized tincture of opium

The author concluded the paper with the hope that the next committee of revision of the Pharma copœia might be induced to extend the list of gran ular effervescent salts and, if possible, establish uni form and standard formulæ for the carbonated and other mineral waters, both natural and artificial, that are now so largely used by the profession and the public

WEDNESDAY, JUNE 6-SECOND DAY

THE PRESIDENT, DR R J LEVIS, then delivered the President's Address

THE TRADITIONAL ERRORS OF SURGERY

Prejudice has done more to perpetuate error than any other cause American text books have now reached such a high position that it is necessary to rely to but a slight extent on foreign authorship, yet As a rule, the test employed was an examination of the announcements of seventy two It is therefore evident, he said, that regular medical colleges shows that, while 186 books

anatomy, largely the result of tradition

Very few great advances have been made in medicine without being subjected to the opposition of prejudice No sadder instance of traditional prejudice can be found than that shown by the opposition and long probationary trial of ovariotomy The tardy recognition of the importance of antiseptic surgery is a since its introduction by Lister The tendency to the complication of surgical instruments and appara tus was next considered An instrument is rarely delphia made straight if it is possible to make it crooked

Other traditional errors referred to were delay in delphia the operative treatment of depressed fractures of the skull until symptoms appear, delay in the operative phia. treatment of strangulated hernia until inflammation has appeared, the failure to recognize the distinctly local origin of certain malignant growths and the possibility of their eradication by thorough operation, ignorance of the fact that the tourniquet may well be discarded in favor of the use of the elastic bandage, the reliance on styptics to the disregard of more efficient means of checking hæmorrhage

Dr A Lowry Sibbet, of Carlisle, Pa, then read A Brief Review of the Decisions of the Courts concerning the Registration Act of 1881

Dr. John H Packard made some remarks on

THE PROPOSED STATE BOARD OF MEDICAL EXAMINERS

The speaker stated that there existed a committee of this Society charged with perfecting a plan and urging the establishment of a State Board of Medical Examiners He had grave doubts of the expediency of this, and criticised the provisions of the proposed Objection was made to the provision for a mixed board of regular and irregular practitioners The proposed bill says that no one shall be excluded or rejected because of his or her adhesion to special This was clearly in opposition to the Code of Ethics of the American Medical Association

DR L F FLICK, of Philadelphia, then read a

THE CONTAGIOUSNESS OF PHTHISIS

It was held that phthisis was contagious, and the evidence bearing upon this view was offered in detail, and the objections urged to this idea were considered

Dr. Given stated that he had had fifteen years' experience as physician to various Indian agencies in the Southwest Very little rehance was to be placed upon published statistics He had found that among the most degraded tribes of Indians phthisis was quite common, but as they became more civilized the disease decreased, and among those who had some white blood it was at its minimum

DR EARLY, of Fayette Co, in a practice of fortythree years, had never seen any evidence of the contagiousness of phthisis

Dr. Thomas J Mars, of Philadelphia, held that the evidence advanced by Dr Flick was not sufficient to prove the contagiousness of the disease

investigations on this subject showed that there was tube inserted into the esophagus

to want of thoroughness in the teaching of practical increasing evidence of the strict inoculability of

AFTERNOON SESSION

REPORT OF NOMINATING COMMITTEE

President—J B Murdock, Allegheny

Vice Presidents-L H Taylor, Luzerne, Benj discredit of the time, nearly 30 years having elapsed Lee, Philadelphia, W W Dale, Cumberland Co, W S Rowland, York Co

Permanent Secretary-Wm B Atkinson, Phila-

Recording Secretary—Charles W Dulles, Phila-

Corresponding Secretary—J H Musser, Philadel-

Treasurer—O H Allis, Philadelphia

Committee on Publication—Drs Edward Jackson. G W Guthrie, S H Gamp

DR THEOPHILUS PARVIN, of Philadelphia, then delivered the

ADDRESS IN OBSTETRICS

The first portion of the address was devoted to consideration of the recent advances made in the use of electricity in obstetrics and diseases of women Electricity in the induction of premature labor has been recommended, but has only a limited value and usually must be supplemented by other means to secure full dilation Electricity has been used with success for the destruction of the living fœtus in extra-So far no unfavorable result has uterine pregnancy followed the use of the faradic current Such favorable results have not followed the use of the galvanic The day is, however, coming when extrauterine pregnancy will be treated by abdominal section as soon as recognized

The faradic and galvanic currents have also been found of great service in the treatment of pelvic cel-

lulitis and fibroid tumors

The suggestions made with reference to the treatment of placenta prævia were spoken of The author concluded that the proper plan was to pursue expect ant measures when there is no severe hæmorrhage If there is serious bleeding premature labor should be at once induced If hæmorrhage occurs after the viability of the child, labor should at once be brought Probably the best method is to use Barnes' hydrostatic dilators with detachment of the placenta as recommended by Barnes

The use of antiseptics in midwifery was insisted Reference was also made to the results obtained by the improved Cæsarean operation paper closed with an earnest protest against the indiscriminate performance of operations for the removal of the ovaries

Dr. Joseph Price and Dr C F Penrose repeated the experiments of Dr N Senn showing the

RECTAL INJECTION OF HYDROGEN GAS AS AN INDICA-TION OF INTESTINAL WOUNDS

Experiment 1 -A dog was etherized, and the gas DR E T BRUEN, of Philadelphia, thought that injected in the rectum was ignited at the end of a

Experiment 2—A stab wound was made in the upper portion of the small bowel The gas appeared at the abdominal wound and was ignited at the end stools, amelioration or disappearance of diarrhea, of a tube inserted into the opening

Experiment 3 - A gunshot wound was made and its existence demonstrated in the same way

DR M PRICE, of Philadelphia, reported a successful case of

REMOVAL OF THE RIGHT KIDNEY FOR PISTOL-SHOT WOUND,

in a girl of 14 years The ball also passed through the right lobe of the liver, and the convalescence was complicated by numerous abscesses in the track of this wound

DR JOHN B DEAVER, of Philadelphia, read a paper on

NEPHRECTOMY FOR MORBID GROWTHS

After referring to the forms of morbid growths which involve the kidney, and to the history of the operation, he described a case in which nephrectomy was performed for a tumor of the kidney which proved to be a carcinoma of the medullary type The kidney was 8 inches in length and 5 inches transversely The patient died twenty-four hours after operation from shock The following conclusions were presented

- I Sarcoma in children should not be subjected to operation
 - 2 Sarcoma in adults should be operated on
- 3 Carcinoma in adults, unless seen early by the surgeon, contraindicates operation
- 4 Malignant growths, in the majority of cases, should be removed by abdominal section
- 5 Benign growths of the kidney are cases for lumbar operation If too large to be removed entire, they should be removed by sections, the pedicle being first ligated

Dr J H Musser, of Philadelphia, read a memorandum of the Life and Character of Benjamin Rush DR WM F WAUGH, of Philadelphia, then read a paper on

THE SPECIFIC TREATMENT OF TYPHOID FEVER

The speaker had used, since 1881, in the treatment of typhoid fever, the benzoate of ammonium and of sodium as first recommended by Klebs had continued these remedies until nine months ago, and he thought that they had been of benefit ing 1887 he had used the sulpho carbolate of zinc in the treatment of summer complaint in children The different forms of disease classed under this head are almost certainly due to a specific microbe grain doses were readily given to children in their The use of this remedy was followed second year This experience led him to Journal by marked success employ the sulpho carbolate of zinc in the treatment of typhoid fever Twelve cases only had been treated Three cases were diagnosed by two or more physi-In these the symptoms cians as incipient typhoid promptly disappeared under treatment, so that there The diagnosis in the is doubt as to the diagnosis remaining nine cases was undoubted One of the cases, admitted in the third week after repeated hæmorrhage, died The others recovered The ad-

ministration of the drug was followed by relief of gastric disturbance, disappearance of fetor from the cessation of hæmorrhage, lessening of tympany and reduction of temperature two or three degrees

DR T D DUNN, of West Chester, read a paper on

THE HYPODERMIC USE OF HYDROCHLORATE OF CO CAINE IN MIGRAINE AND SPASMODIC ASTHMA

The speaker had used this drug in his own person and in the case of others in the treatment of sick headache with satisfactory results He had used it in doses of one half to three-fourths of a grain. In spasmodic asthma, combined with one-twelfth to oneeighth grain of morphia the results had been immediate and satisfactory, and unattended with the nau sea usually produced by morphia

In the discussion which followed attention was called to the dangers attending the hypodermic use

of cocame

DR E A WOOD, of Pittsburgh, read a paper on ARTIFICIAL DIGESTION AND ARTIFICIAL PEPSIN,

protesting against the routine employment of artificial pepsin in all cases of dyspepsia without reference to the cause of the indigestion or to the seat of the process Pepsin was useful in only certain definite forms of dyspepsia

(To be concluded)

DOMESTIC CORRESPONDENCE

THE RELATIONS OF THE JOURNAL TO ILLI-NOIS AND CHICAGO

A Letter to the Editor of the Philadelphia Medical and Surgical Reporter

Dear Sir —In a recent issue of the Medical and

Surgical Reporter you say

"I hear a great deal of complaint that THE Jour-NAL is not what it was intended to be, namely a substitute for the volume of Transactions complain that the proceedings of the Association are not properly reported in The Journal, and that the papers are not published in regular order or according They say here that it is to any well arranged plan too much filled with the proceedings of the Chicago and Illinois societies, and that papers read at the meeting are pushed aside to make room for papers which have not been presented to the Association at all, and which were written long after the ones which they have displaced "

As a member of the American Medical Association you have an unquestionable right to criticize THE Courtesy to THE JOURNAL and to the members of the Association demand, however, that such criticisms should be made first directly to the members of the Association through the pages of THE JOURNAL, and not in another paper unless your communication is refused space by the Editor of THE JOURNAL Something more than courtesy demands that your criticisms, wherever they may be published, be founded on fact, and that, even it they

¹ In Cincinnati

be unfriendly, they be just and not misleading While acknowledging your right to criticize, I claim the same right to investigate the grounds of your criticism, and in the proper place—the pages of THE JOURNAL

I was in Cincinnati at the meeting of the Association, but heard no such complaints as those you mention. Possibly my facilities for hearing are inferior to those of some others, but I heard the opinions of a large number of members in regard to The Journal I certainly did not hear any complaint "that The Journal is not what it was intended to be, namely, a substitute for the volume of transactions." As I understand it, The Journal was intended to more than substitute the volume of Transactions. Nor did I hear any complaint that The Journal is too much filled with the proceedings of Chicago and Illinois societies.

Now let us see by an examination of the departments of Volume IX, July-December, 1887, of The Journal, whether your criticisms are fair and just I take several departments so as to show that your criticisms not only do not apply to the proceedings of Chicago and Illinois societies, but do not apply to any one of four departments of The Journal

ORIGINAL ARTICLES-VOLUNTARY

From this it is seen that Illinois furnished only four more voluntary original articles than the District of Columbia

In taking account of the Association papers published in Vol IX it must be remembered that these papers were read at the meeting in Chicago, and it would be only natural that Chicago and Illinois would turnish a larger proportion of these papers, than they would at more distant meetings

From this table it is seen that while Illinois fur-

(Colorado kansas, kentucky Massachusetts, Missouri New Jertey, tew York Texas Wisconsin) (California Georgia Arkansas Yew Jersey Louisiana, Ohio Rhode Island Wisconsin)

nished more papers than any other State, it furnished fewer pages than New York, and while the Illinois papers averaged 2 45 pages each article, the averages for New York, New Jersey, Rhode Island, Maryland and Massachusetts were above this

Now let us compare local society reports correspondence, and miscellaneous items in Vol IX

LOCAL SOCIETY PROCEEDINGS

Pennsylvania	31 52 pe	r cent	of total
Illinois	26	44	**
District of Columbia	18 91	**	**

Other States less than 2 per ct each			
Eastern States	24	.7	66
Western "	23		"

In Vol 1X were published a total of 256 items of original articles, society reports, and correspondence, as follows

Domestic	214
Foreign	42

The distribution by large cities (American) was as follows

Eastern

1 New York 23 = 8 98 2 Philadelphia 23 = 8 98 3 Washington 21 = 8 2 4 Boston 9 = 3 51 5 Pittsburgh 4 = 1 56 6 Baltimore 2 = 0 78	
S2 = 32 01	"

An average of 13 66 each

Western

r Chicago 2 St Louis 3 Indianapo		47 = 1835 8 = 312 5 = 195	**
	_	60 = 23.42	

Average 20 each.

TOTAL ITEMS-BY STATES

Eastern3

	U/ 18		
	Pennsylvania	30 == 11 71 per cer	ıt
	New York.	28 == 10 93 "	
	Massachusetts	9= 351 "	
4.	Virginia	5 == 195 "	
		72 = 2S.12	

(3 Excluding D C. and 4 States giving less than I per cent.

Western	
I Illinois 2 Indiana 3 Michigan 4 Missouri 5 Iowa 6 Wisconsin	$57 = 22\ 26\ per\ cent$ $11 = 421$ " $11 = 421$ " $9 = 351$ " $7 = 273$ " $6 = 234$ "
FC	101 = 3945

If to the four Eastern States we add the District of Columbia, as should be done, the total is 93, and the Eastern percentage increased to 36 32 table shows that 4 Eastern States have an average percentage of 7 03, as compared with the Western average of 6 57

On summing up, then, we get the following page percentages

Eastern States

Original articles—voluntary "—Association (7 Society proceedings—(local) Correspondence News and Miscellany	States)	33 po 42 64 59 54 25 27 5	er cent
Western States	Average,	37 53	**

Western States

Original articles—voluntary "—Association Society proceedings (local) Correspondence. News and Miscellany	40 per cent 44 22 " 39 " 14 11 " 23 08 "

Average, 32 22

Europe, 35 items, 13 67 per cent of total Therefore, when we see the District of Columbia contributing almost as many voluntary original papers as Illinois, New York sending almost as many Association papers to the Chicago meeting, and giving 14 per cent more correspondence than Illinois, Pennsylvania furnishing 6 per cent. more society reports, and Massachusetts as much news and miscellany, it appears-and is a fact-that your criticism was both unfair and unjust. Such is likely to be the case when one neglects to investigate the foundation for his notions before he publishes them

In Vol X, up to the No for June 2, 1888, I find 72 voluntary original articles (not Association articles) These arrange themselves as follows

-		
Pennsylvania	No 17	Pages 55 7
Illinois	15	33 / 41 15
District of Columbia	12	
Massachusetts	• • • • • • • • • • • • • • • • • • •	34 7

. Columbia Society	215 "

Thus it will be seen that the pages of THE JOURNAL. are not so full of Chicago and Illinois as of Pennsylvania and Philadelphia society reports, and that the Chicago and Illinois societies stand third on the pageaverage list

After all, is it not most natural that Chicago and Illinois should furnish a larger proportion of material to THE JOURNAL than any other city and State? Every journal, whether private property or owned by an Association, must depend upon its own city and State for a large proportion of its material Is it to be supposed that THE JOURNAL would draw as much material from Boston or New York as from Chicago? There are great weekly papers published in those cities, much older than THE JOURNAL Can THE JOURNAL hope to compete with your Reporter for Philadelphia and Pennsylvania material? If Illinois and Chicago writers send as good material as those of other States, should they be told that they must move into some other State so as to equalize matters?

You complain, practically, that the papers read before the Association are not published in a lump, and to the exclusion of voluntary papers Suppose this was done, would not voluntary contributors cease sending material to THE JOURNAL, so that in a short time THE JOURNAL would exist for a few months in the year, and then become torpid until the next meeting of the Association? One of the impossibilities of this life is eating one's cake and having it

You will probably admit that voluntary papers may be, and in many cases are, as valuable from a scientific standpoint as the papers contributed through the Sections of the Association From 2 business point of view, then, would it be wise to reject good voluntary papers, which would go to other journals, and displease the authors to the extent that they would first cease contributing to THE JOURNAL, and then cease subscribing to it? Further more, THE JOURNAL would thus get the name of a "close corporation paper," run solely in the interest of the men that read papers at the meetings of the Association each year Had The Journal been

Or,

begun on this principle it would have died in its kill it I have no doubt that many who pretend to be friends of The Journal would rejoice to have it contingency that need not be considered, as shown by the success of THE JOURNAL If it had not found favor with the profession, and such as no other American journal has ever had, it would not have been necessary to enlarge it by 4 pages an issue last July, nor would it be necessary to add 4 more pages an issue after June, 1888

Finally, do you not think that in case you make best I To be sure of your ground, and not make ² To publish your critistatements at random cisms in the proper place—The Journal—so that you may not unjustly prejudice those that do not read The Journal against it, and so that members of the Association may see your criticisms without stumbling upon them accidentally?

I remain, Very truly yours,

Wi G Eggleston

Chicago, June 11, 1888

STATE MEDICINE.

NATIONAL MARINE PATROL

The Secretary of the Treasury has issued the following circular, under the date of June 4, 1888

In order to assist local authorities in the maintenance of quarantine against the introduction of infectious diseases, as provided in section 4792, Revised Statutes, the act of April 29, 1878, and appropriation acts authorizing the President to maintain quarantine at points of danger, the President has determined to establish, by means of the vessels of the Revenue Marine, a national patrol of the coast of the United States, so far as it may be DISEASES OF MAN practicable under existing law and consistent with the performance of the other duties confided to that

You are accordingly directed to cruise, actively, with the revenue steamer ----, under your command, upon the outer lines of your cruising grounds, and to exercise special vigilance in speaking all vessels arriving from foreign ports, or from infected ports of the United States, directing your inquiries, first, as to the port from which the vessel sailed, and, crew, or that the vessel has left a port at which contagious or infectious diseases were prevailing, her master will be directed to proceed for examination of destination

tive to the inspection of vessels

If a vessel be found with sickness on board, or in

a foul condition, she will be directed to proceed to early infancy To begin on this principle now would the quarantine station hereinbefore indicated, and the Revenue Marine officer will immediately notify the proper quarantine officer In such case no person pursue this policy, and would attend its funeral with will be permitted to board the vessel until the med-But on the present policy a funeral is a ical officers in charge of the quarantine shall have given the usual permit

Should the pilot or master of a vessel, when hailed, report cases of recent or present sickness on board, the revenue officer will not board, but will send her immediately to quarantine,

Quarantine officers will be recognized as follows,

Medical officers or acting assistant surgeons of the any future criticisms of The Journal it would be Manne Hospital Service in charge of Gulf, South Alantic, Cape Charles, or Delaware Breakwater Quarantines, or any officer of said Service on duty at any port on the interior rivers, the Great Lakes or Pacific coast, and all quarantine officers acting under proper State or local authority

Special regulations to aid local quarantine authorities will be promulgated hereafter should occasion require

Dr Jerome Cochran, of the State Board of Health of Alabama, in a recent report has stated that the late epidemic of yellow fever in Florida was not introduced into the State by the usual trade chan-This confirms unofficial nels, but by smugglers statements received at this Bureau some weeks since Dr Cochran states that the last case was discharged May 11, and the last death occurred May 8, and that there have been active precautions taken to prevent the reappearance of the disease

JOHN B HAMILTON, Supervising Surgeon-General Mar Hosp Service

BOOK REVIEWS.

Data of their Nomenclature, Classification and Genesis By John W S Gouley, M D, Surgeon to Bellevue Hospital 8vo, pp 412 New York J H Vail & Co 1888 Chicago W T Keener

The objects of this book, as explained in the preface, are first, to urge the official adoption of a suitable basis for the nomenclature and classification of the diseases of man, second, to place before the medical profession certain propositions directed to an improved classification of diseases, and, third, to secondly, as to health of those on board at the time awaken the attention of teachers to the necessity of of departure, during passage, and at the time of ameliorating the nomenclature of medicine, pointing hailing, and should the information gained indicate out some of the many misused and improperly formed a condition of contagion or infection in the vessel or words that are now current, and proposing new terms for their consideration

In the opinion of the author a nomenclature and classification to be useful and staple should not only to the outer quarantine station provided for her port rest upon a proper foundation, but should be duly authorized by the whole profession of medicine, and The following regulations will be observed rela- he submits certain questions for discussion in and settlement by the International Medical Congress

The work is divided into five sections. The first

of the human body, a statement of the objects and can have his rational, sciencific treatment his ease scope of medicine, a classification of medicine, the mutual relations of medicine and surgery, an arrange
Arodyne. In the orner he asserted that several year and analysis are along the protocological propagation. ment of medicine into departments in accordance sive professional experience among a large and enlarge with the apparatuses of the human body, the definition and genesis of disease, a synopsis of the morbid that the prevalent opinion—anchantable and untractive popular are larger as a mistaken one. He get that the prevalent opinion—anchantable and untractive opinion—anchantable a suggestion of a groundwork for the classification of was a leading factor in is leave to sheld himself from team, diseases, and an analysis of some of the anatomical The second section reterms used in classification lates to the history, development, scope and significance of human nosography, and contains synopses of a considerable number of systematic arrangements of diseases, illustrative of the principles of nomenclature and classification, and also rules for the guidance of nosographers by Cullen, Parr, Young, and

The third section consists of a nosographical bibliography, chronologically arranged from the time of Felix Platerus

The fourth section is devoted to the elucidation of what is conceived to be a proper basis, character, and method of the nomenclature and classification of the diseases of man, and to the definitions of the terms of classification

The fifth and last section is intended as further explanations of the morbid states and morbid processes, and as an analysis of some of the terms used in general pathology, besides which it embodies a summary of the present state of knowledge of the bacteria, ptomaines, leucomaines, and "extractives," and indicates the relations borne to medicine and surgery by these microorganisms and toxic alkaloids of putridity, and, finally, remarks on the neoplasms and on their classification

Such is the scope of this work, a work that is a monument of patient, painstaking labor, and for which we fear the author will not be rewarded by an early recognition on the part of the profession, unless some effort be made to simplify matters at the Tenth International Medical Congress

MISCELLANEOUS.

THE AMERICAN ASSOCIATION FOR THE CURE OF INEBRI ates held its semi annual session in Brooklyn recently Several papers were presented. One, by Dr. T. L. Wright, of Belle fontaine, Ohio, on "Points Touching the Medical Jurispru dence of Alcoholic Inebriety," referred in large detail to the physical, mental and moral disabilities caused by alcoholic indulgence, and asserted that these were only the advance guard of permicious results

Dr C C Fite, of Knoxville, Tenn, offered a paper on "The Prohibition Question from a Medico Legal Standpoint," in which he redicted that long before prohibition becomes general, the vital issue—the prevention and cure of drunkenness will be reached by society regarding habitual indulgence in al-cohol as a disease and, denying the right of any individual to further a tendency, hereditary or acquired, toward the inevitable physical and mental damage which excess in drinking involves, insisting that he shall be protected—and with him those who, otherwise, might inherit the baneful effects of his excess-by treating and caring for him as are the insane, or the victims of e ner disease The paper was a logical, forceful plen for the

and claimed that a more misonal and right appreciation of i. situation—regard ng such matient, with certain exception, a creatures of conditions beyond control—would be most hely a against the protective confliction to untruth. Besides, a more liberal and correct opinion on this score would have an imporant bearing on their med co- early and treatment. In his second paper, Dr Mattison werred to the recent triumphs of analytical chemistry in giving the procession such valuable hypnotics as amylen hydrate and sulpholal, and, noting the far reaching value of any drug that will take the place of opiumwhich, while so great a blessing is so of en a bane-expressed his belief that the new anodyne, antifebria, was the richest ad dition of modern times to the therapeuties or pain

PORTRAITS OF DR C R AGNEW — It the last meeting of the Ophthalmological and Otological Section of the New York Academy of Medicine, the following motion was made and

"That a committee be appointed, of which the chairman of the Section, Dr David Webster, be a member, whose duty it shall be to obtain a good photograph of the late Dr Cornelius R Agnew, for the purpose of having engravings suitable for framing made from this. The right of issue and sale of such engravings shall be given to some first class publisher, if practi cable, if not, the committee shall offer them to the profession

In accordance with the above, a committee has been appoint Members of the profession who desire such an engraving, accompanied by an autograph signature, should send their names and addresses to the Secretary of the committee, Dr Charle H May, 640 Madison Ave, New York City, at once all such names shall have been recor who have quested a copy of the engraving will the cc the same, either by the publisher the matter in charge

ADDRESS IN SURGERY.

SOME RETROSPECTIVE AND PROSPECTIVE THOUGHTS ON SURGERY

Delivered at the Thirty ninth Annual Meeting of the American Medical Association Cincinnati, May 8, 1888

BY DONALD MACLEAN, MD,

OF DETROIT

CHAIR IAN OF THE SECTION ON ANATOMY AND SURGERY

Our generation has witnessed one of the most active and progressive eras in the history of that department of medical science to which the attention of this Section is especially devoted. It has occurred to me that a concise and candid statement of some of the impressions made upon my own mind and some of the conclusions at which I have arrived as the result of active experience, extending over a period of at least a quarter of a century, might not be altogether uninteresting to this Section, which has conferred on me the great honor of electing me its chairman, an honor which carries with it the responsible duty of delivering an address on the present occasion

The vastness of the subject and the shortness of the time at my disposal necessitate a brevity and conciseness of style which might easily be construed as implying a spirit of dogmatism, which is now, once well defined opinions and still be tolerant of those who differ from us, and no one could approve or admire the spirit of scientific skepticism more than So that it goes without saying that I freely and fully concede to every one the right to judge for himself how much or how little of what is here said he shall accept as true Any one who will reflect for a moment how often he has had occasion to modify his opinions on important surgical matters will surely hesitate a good while before venturing to be censorious toward those who fail to accept his views or his methods of practice Not only so, but as we look around us and observe the almost diametrically opposite views which authorities of equal eminence hold on the same subject, we cannot but feel that it is absurd and presumptuous for any one to attempt to dictate to his brethren in the profession what they shall accept as final truth in surgery

One thing is certain, that the progress of surgery during the last quarter of a century has been unpre-

the results of this wonderful period of activity, winnowing out whatever has proved to be false, misleading or unreliable, and giving proper significance and credit to the genuine and the permanent, is a profitable employment and a true labor of love for the scientific student and practitioner of surgery

Without claiming for myself any special fitness for this work, the mere fact of my election to this honorable office encourages me in the hope which I have expressed, that a frank statement of some of the opinions which my observation and experience have led me to form may be listened to with interest by my present audience Perhaps, too, the fact that I have been actively employed during almost the entire period of my professional life in the work of teaching surgery to large classes of medical students may add somewhat to the interest of such a summary of my views on a few of the great surgical problems of our day as I here propose to make

The marvelous progress of modern surgery in our time is commonly attributed to two great agents, namely, anæsthetics and antiseptics But with all due deserence to these, it should not be forgotten that they themselves are only part of the fruits of a great general movent all along the line of the natural sciences, and that advances in anatomy, chemistry, physiology, histology, etc., have contributed in innumerable ways to the progress of surgery, and it is no more than just that the great army of able and for all, emphatically disavowed It is possible to hold enthusiastic laborers in these collateral departments should receive adequate recognition for the services which they have rendered, directly or indirectly, to surgery Nor should the fact be overlooked that even before the beginning of the present surgical era, that is, before the introduction of anæsthetics, and long before antiseptics were dreamed of, surgery was a great scientific art, and many of the principles and the methods promulgated and taught by our fathers stand unchallenged and unchanged to this day those great minds who cultivated and practiced surgery without the aid of our "modern conveniences," it is impossible to concede too high a meed of praise The least we can do is to acknowledge with grateful candor the extent of our indebtedness to them

That the introduction of anæsthetics constitutes one of the most important events in the history of surgery is a fact generally conceded, and still it seems to me that, in trying to explain the rapid progress of our art in recent times, a mistake is often made in cedented To correctly analyze the methods and due to this For example, it is a common thing nowattributing to other causes a good deal that is really

a days to hear much, if not all the credit of the wonderful advances in the surgery of the abdomen, the surgery of the articulations, the surgery of the bloodvessels, etc, given to Listerism, or antiseptic devices Now, the fact is that antiseptics without anæsthetics could have had but a comparatively limited and insignificant field af usefulness, and before attempting to decide or define the true value of antiseptic processes, let us try to do justice to some of the other factors in this interesting problem

The introduction of anæsthetics at once enlarged the field of operative surgery, in the first place by enabling patients to undergo operative procedures which otherwise could not be endured, in the next place, by enabling many persons to cultivate and acquire operative skill and experience who, without the aid of anæsthetics, would have shrunk from the dread ordeal of performing a surgical operation troduction of anæsthetics inaugurated an era of unprecedented enthusiasm in the cultivation of every department of surgery And out of this, as a necessary and natural consequence, has come the splitting up of surgery into subdivisions which are now dignified by the name of specialties, as, for instance, ophthalmology, otology, gynecology, etc, all of which must still be included under the head of surgery The oculist or the gynecologist who is not a surgeon, in the largest and best sense of the term, is in great danger of becoming a charlatan

To the introduction of anæsthetics, more than to any other agency, is due the credit of this wonderful extension of the boundaries of modern surgery should not be forgotten that this great movement had not only started, but had made considerable progress, before the theories of Pasteur and their practical application to surgery by Joseph Lister were thought Perhaps the best illustration of this assertion is derived from the history of abdominal surgery Spencer Wells, Clay, Atlee, Peaslee, Dunlap and Keith, as well as others, had achieved world-wide fame as ovariotomists long prior to the advent of an-In his address on surgery to the tiseptic surgery British Medical Association in 1865, Prof James Syme spoke as follows in reference to the operation of ovariotomy

"The objections originally entertained with regard to both prognosis and diagnosis have been in a great measure removed through the careful discrimination of cases, while the operative procedure has acquired a corresponding degree of perfection, and the results are so satisfactory that the proportion of deaths does not exceed from 30 to 35 per cent. The most successful operator in Scotland is my friend and former house surgeon, Dr. Thomas Keith, who has operated in thirty-five cases and lost only nine of his patients."

In the United States and other countries to-day there are many ovariotomists who are honestly of the belief that by the use of strict antiseptics they possess an immense advantage over those ovariotomists of preantiseptic times. They certainly have the unspeakable advantage of the vast accumulations of the recorded experience of operators who, like those whom I have named, have been so careful and thorough in the publication of their cases, their obserough in the publication of their cases, their obserous mately appear that the sum and substance of the lite.

vations and their methods, and still, I ask, can it be truly said that the mortality of ovariotomy has, on the whole, materially lessened since Professor Syme uttered the words which I have just quoted? When full and fair credit is given to the other aids which have come to the profession as a whole, through increase of knowledge and enlargement of experience during the period of wonderful surgical activity from 1865 to 1888, how much room is left for credit on behalf of antiseptics? In our reflections and calcu lations on this point it is only just to note the remarkable fact that among the most emmently successful of the abdominal surgeons of to day we find men like Tait, Bantock and others who claim that, so far as their experience in abdominal surgery goes, antiseptics have been weighed in the balances and found wanting, and by whom they have been de nounced as a delusion and a snare It has been customary of late years, when a successful operation of a new or exceptional nature, such as resection of intestine, cholecystotomy, splenectomy, etc, is recorded, to claim the result as another argument or fact in support of antiseptic surgery And it may be that the belief in the marvelous advantages of such safeguards as it is supposed to furnish has inspired confidence beyond that which our increased knowledge of pathology, our improved dexterity in manip ulation and our faith in the generally recognized and approved principles of surgery independently of antiseptics can afford us But is it not just possible that too much value has been attached to the influence of antiseptics and too little to the numerous other factors which enter into this complex and manysided problem? Is it not just possible that even if Listerism had never been heard of, surgeons would by this time or, at all events, sooner or later, have come to appreciate the immense value of perfect surgical cleanliness and conceded to it its true position in relation to all the other essential requisites of successful operating, such as tenderness of manipu lation, efficient drainage, healthy surroundings, judi cious dieting, conservation of blood, prevention of shock, wise and skilful nursing, etc? All honor to Lister as the great apostle of surgical cleanliness, no matter what the ultimate fate of his theoretical views The germ theory of disease as applied to may be surgery may be materially modified, or even proved to be in certain important respects erroneous, the use of carbolic acid, bichloride of mercury and the other germicides may ultimately come to be regarded as worse than useless, and all the complicated paraphernalıa which constitutes antiseptic surgery declared un necessary and absurd, and still the fact must remain that, whether right or wrong as a matter of abstract scientific truth, the theories and the methods of Lister have done much to encourage the progressive mod ern surgeon in his righteous ambition to carry his beneficent labors to the furthest limit of possible The simplest and most obvious truthare often the most difficult of apprehension and application by those most interested in their effect. It will be a most striking and wonderful exemplifi cation of this old and true saying if it should ultiis comprehended in the ancient scriptural admoni ultimate fate of the germ theory in surgery may be, carbolic acid, bichloride of mercury, etc, may be, one thing is certain that anything like a return to the old, loose and careless methods, as regards cleanliness, of conducting surgical operations and of dressing surgical patients is absolutely impossible, and for this the world will always feel grateful to Joseph Lister

AN ESTHETICS

There are few subjects of surgical interest that have been so freely written about and discussed in our day as an esthetics

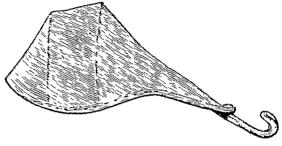

Even the briefest review of this vast field of surgical literature would lead me far beyond the scope of this address I merely refer to it for the purpose of declaring that, after very careful and respectful consideration of the views of those who have written and spoken on the subject, and after impartially testing the different substances recommended, I find myself irresistibly forced to the conclusion that, upon the whole, for all general purposes, chloroform possesses superior advantages My own experience with it induces me to believe that, when carefully administered in suitable cases, it is little if at all more dangerous than other anæsthetics, and its advantages in other respects are too well known to require further illustration on the present occasion Death under anæsthetics is in every case a great and shocking catastrophe, but when it occurs during some comparatively trivial procedure the circumstance is appalling Fortunately, in the progress of surgery of late years, local anæsthesia by ether spray, cocaine, etc., has been found to constitute an efficient and altogether safe substitute in a large field of minor though painful operations That in the near future other and better general anæsthetics than any yet known may be discovered, is surely not an

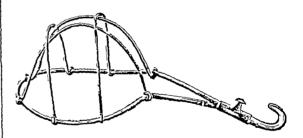

No z -Chloroform Dropper

unreasonable expectation, when we consider the

work of this great surgical prophet and his disciples medical science. As a justification for my own faith in the safety and general efficacy of chloroform, pertion, "Wash you, make you clean" Whatever the haps I may be allowed to state that it is very nearly thirty years since I commenced using it, and so far whatever the fate of the so called germicides like no accident that could ir any way be attributed to its use has occurred to disturb the early impressions as to its trustworthiness made upon my mind by the eloquent teachings of James Young Simpson and the no less powerful utterances and example of James Syme To the use of the simple little apparatus which I here present I have come of late years to attach great value in the administration of chloroform

THE MICROSCOPE IN SURGERY

Who of us is unable to recall the time when great things were hoped for by surgeons from this truly wonderful instrument, which has done so much in other departments of science? Who does not recall the confident predictions indulged in as to what would be accomplished by its means in the diagnosis and classification of tumors, in the diagnosis of the different morbid fluids, and so on? Can it be claimed to-day that these hopes have been realized, these predictions fulfilled? I fear not How much has it done to enlarge our knowledge of the essential characteristics of different kinds of pus? Can we by its means distinguish with perfect certainty between the pus of gonorrhea and the pus from a chancre or any other source? In short, has the microscope added anything to our powers as practical surgeons so far as this and other common surgical fluids are concerned?

In the diagnosis and classification of tumors great things were expected of it, and it was also expected that by its means the prognosis of morbid growths would become a matter of actual and unmistakable demonstration That much information interesting ceaseless energy of earnest and brilliant students and to the scientific surgeon has been obtained as the experimenters in this as in all other departments of result of vast efforts in the investigation of the ori-

gin and the essential nature of morbid growths no held out the least shadow of hope in such a case one can deny, but for the practical purpose of deciding whether or not a given tumor should be the efficacy of this agent in favorably affecting the removed by operation, or for the purpose of determining the prognosis in relation to the question of confirmed by further experience, is certain to be re return or the danger of general infection of the system, I have not been able to persuade myself that of this department of surgery the microscope has added much if anything to our We must still depend upon the ordinary clinical signs and symptoms, the anatomical relations, and the facts of its history in determining our views as to the true nature and the best treatment of a morbid growth

In certain departments of practical medicine nearly related to surgery, such as the examination of urine, etc, the microscope is invaluable, but to the ordinary practical surgeon its usefulness has not equalled the expectations of its early enthusiastic advocates

ELECTRICITY IN SURGERY

Electricity is another modern addition to the armamentarium of the practical surgeon, and although it has in some directions proved disappointing, still it can, I think, with truth be claimed that when used for suitable purposes, it has demonstrated its right to much during the winter and she suffered from shootthe respect and gratitude of the profession harm has been done and much unfair prejudice periods excited against this useful agent by the absurd and found to occupy nearly the whole of the gland extravagant claims which have from time to time been made in its behalf as the result of inaccurate observations or unscientific deductions, and there is reason to fear that this kind of obstruction to the proper recognition of electricity as a surgical agent That certain forms and has not yet entirely ceased degrees of urethral and other strictures are capable breast of being remedied by electrolysis skillfully and carefully applied I am prepared to believe, but when we are told that all other methods of treatment of this large and important class of surgical cases are to be completely superseded, or nearly so, by this one, my belief is that our duty as rational practitioners is to suspend judgment

Cases of far-advanced, long-neglected stricture, with fistulæ in perineo and large deposits of dense, inflammatory tissue, will, in my opinion, still furnish a useful field for the operation of external perineal urethrotomy, an operation which I have performed with the most satisfactory results in a large number of cases which I do not believe would have yielded I performed the old operation of urethrotomy with- and a half inches in diameter, covered with fine out a guide in a case of complete occlusion of the sponge, the negative electrode a copper plate two urethra, the result of laceration from fracture of the inches square, covered with sponge The patient had passed all his urine through a permeal fistula for five years, not a drop having passed by the natural channel in all that time occluded portion of the urethra extended to a length The operation, in which of more than two inches I was assisted by my colleague, Prof Frothingham, and my brother, Dr A C Maclean, was a long and difficult one, but was crowned with absolute success tricity or any other method of treatment could have same application was made for the same length of

The testimony of Apostoli, Keith and others as to growth and tendencies of uterine fibroid tumors, if garded as marking a most important era in the history

In this connection the following very recent case appears to me sufficiently important and suggestive to give here in detail Mrs S G, at 18, residing at Matamora, Ohio, was admitted to the University of Michigan Hospital April 18, 1888 She is of German extraction Her father died in 1875 of acute consumption During his early life in Germany he appeared to have been in hospitals for treatment of tumors on arm and shoulder During latter years he suffered very much from rheumatism occasionally Seven brothers and sisters died in childhood in Ger many, cause of death unknown to the patient The children born in America are healthy Mrs G commenced to menstruate at 12 and has been regu lar since, was married in June, 1887 During the fall of 1886 she first felt a lump in the left breast, which was painful The swelling was about the size of a walnut and was movable. It increased very Much | 1ng pains, which were more acute at her menstrual On examination by me the tumor was was hard, nodulated, the nipple retracted, and, in short, presented every appearance of scirrhus Moreover a dense mass of considerable size existed Had this patient been a woman over in the axilla thirty years of age I should undoubtedly have recommended and performed amputation of the

The resemblance between this breast and many which I have amputated for cancerous disease, and which have been proved by ulterior investigation to The age of be malignant, was very striking indeed the patient was the only consideration which led me to entertain a hope that the prognosis might not after all be so grave, and that the tumor might be amenable to treatment by milder means, and I deter mined before doing anything else to make a fair trial of electrolysis with it For that purpose I requested my assistant, Dr George A Hendricks, to take charge of the treatment, which he did on April 19 The applications were made with positive electrode over the growths and negative over the sternum, the positive electrode being a circular copper plate one the sponges were wet with a strong solution of salt and before application the parts were well washed with On April 19 nine cells, seven miliampéres, alcohol were applied for ten minutes, on the 20th, 38 cells, 30 miliampéres, for twelve minutes, applied over the tumor Chloroform was given during these applications, as the patient could not tolerate them without anæsthesia On April 21, 12 cells, 10 mili On the same day the ampéres, for ten minutes

time over the axillary tumor making the skin of the chest sore, a larger one was made, of an oval shape, five by eight, covered with as hemostatic agents fine sponge On April 22, 38 cells, 30 miliampéres were applied for ten minutes over the breast and for the same length of time over the axillary tumor By this time the breast tumor was found to be reduced to a spherical nodule about the size of a walnut Contraction of the nipple had to a great extent disappeared On April 24, beginning with 9, increas ing gradually to 24 cells, for twelve minutes on breast and axilla On April 25, 26 and 27 the same application, on April 28, 30 cells, on April 29, 38 cells After this the skin over the breast ap smaller On April 30, 38 cells were applied over the breast and to the axilla On May 3 the patient was menstruating, and the treatment stopped for the present, but the growth by this time in the breast and in the axilla had almost entirely disappeared and the patient, considering herself cured, was most anxious to return to her home in Ohio, which she was permitted to do

In chronic enlargement of the prostrate in old men I think I see in this direction a gleam of reasonable hope for a class of cases hitherto regarded as

almost if not quite beyond remedy The value of electrolysis in the treatment of that common and important surgical condition knows an nævus or aneurism by anastomosis is a triumph of surgery which belongs to our own generation Previous methods of treatment, namely, excision, caustics, ligature, injection of astringents into the structure, are all inferior in every respect to the method by electrolysis I have used and have seen used every one of these different methods, and have no hesitation in giving the preference to electrolysis on the score of safety, efficiency and ease of applica-I here present for inspection a few photo graphs illustrative of a large number of cases of nævus, treated successfully by electrolysis at my public clinic

SURGICAL HÆMORRHAGE

Our generation has witnessed substantial advances in regard to the management of surgical hæmorrhage Its prevention during long and extensive operations by means of Esmarch's bandage is one of the most striking and important of these advances No surgeon would now like to dispense with this simple but truly valuable appliance

The aortic compressor, invented simultaneously by Pancoast and Lister, by which, with the utmost safety and ce tainty, the circulation through the lower half of the body may be absolutely controlled during pleasure, is another device in which, from actual experience in many urgent cases, I have come to have perfect confidence I am fully persuaded that no danger of injury to the abdominal organs is involved in its use

Catgut, and other animal ligatures, properly prepared, constitute another substantial improvement

The negative pole peculiar cases, is another step in the right direction They are dirty, irritating, and above all unreliable By 'means of acupressure Simpson and others claimed nearly if not quite as brilliant results in the healing of surgical wounds as the advocates of antiseptic surgery have since claimed for their methods Now a days, however, acupressure, notwithstanding the strong theoretical arguments in its favor may almost be said to be a deadi ssue

In regard to that interesting affection, aneurism, the revival of the old operation of Antyllus in certain suitable cases, and the restricting of the Hunterian operation to a somewhat more limited field of peared somewhat irritated, but the tumor decidedly usefulness, is a most striking and interesting improvement, for which the credit is mainly due to Prof Syme The achievements of this truly great surgeon in this department of surgery were sufficient to shed peculiar brilliancy over the closing years of his peculiarly brilliant career I hope I may be pardoned for suggesting in this connection that when the enthusiastic devotee of "all antiseptic precautions" heralds forth to day as an additional proof of the value of his method a successful case of ligature of an artery for aneurism, the remarkable fact should be remembered that Prof Syme, whose career was practically closed before antiseptics were discovered, ligatured the femoral artery for aneurism fifty-eight times without a single failure If there has been any corresponding record made since the introduction of those methods, I have not heard of it

The recently promulgated view that an artery may be securely ligatured by a broad animal ligature, without rupture of any of its coats and without the formation and organization of the classical coagulum between the point of ligature and the first branch, if true, is undoubtedly the greatest discovery relative to the surgery of the arteries that has been made in Such a revolutionary doctrine ought to be accepted cautiously and after careful observations on the human subject I am able to contribute one or two facts in its favor from my own experience. Two years ago I was compelled to ligature the common femoral artery immediately below Poupart's ligament, for urgent hæmorrage, the result of ulceration of the artery in connection with an obscure abscess which originated in the interior of the pelvis I used carefully prepared catgut ligature and with perfect success so far as the hæmorrhage was concerned patient, an old, worn out man, died some weeks afterward from a complication of diseases, but no trouble came from the ligature of this most dangerous of all the arteries Unfortunately, no post mortem examination could be obtained in this interesting case

Some months ago I was compeled to ligature the superficial femoral under circumstances of urgent emergency for secondary humorrhage from the popliteal artery, the result of a pistol shot injury inflicted some weeks before the case came into my Extensive burrowing of pus all through the tissues of the thigh had occurred, and the patient was nearly exhausted from septicæmia, from which death The abandonment of all the so called styptics, as the ultimately resulted nine days after the operation of per salts of iron, tannin, etc, except in very rare and ligature of the femoral On post mortem examination

No 1-Before operation

No 2-Before operation

No 3 -After operation

No 4 -Before operation

No 5 -After operat 52

by the microscope the artery was found securely ment there was no trace of a clot

These are not the only, though they are perhaps the most striking, cases in which I have been able to note the same state of affairs

I venture to relate here the following recent case of a bloodless operation for traumatic aneurism, which seems to illustrate more than one of the points mentioned in connection with this subject

F S, at 10 years, son of a farmer, residing at Calkinsville, Isabella county, Michigan, was admitted Arbor on the morning of October 19, 1887 two and one half months previously he was boring a hole with a pocket knife through a strip of pine wood, when the wood, proving softer than he exand his clothes and penetrated the thigh, making an artery was injured and dangerous hemorrhage ensued, which was controlled by pressure Upon admission to the hospital a considerable tumor was visible, occupying Scarpa's triangle, and over-lapping the lateral boundaries of that space The aneurismal brut could be heard with great distinctness all over the tumor, which, in short, presented all the charactenstic symptoms of aneurism The patient's father stated that the size of the tumor was rapidly increasing, but that the general health of the patient was good Pulse, 116, temperature 99° On October 20, in the presence of the medical class, Dr T J Sullivan assisting me, he was placed under the influence of chloroform, the aortic compressor applied, an incision made about two inches in length over the surface of the tumor, the aneurismal sac exposed, and freely opened, and the coagulated contents evacuated The compressor was then slightly relaxed, and the bleeding point by that means accurately determined The artery was cautiously freed from its connections, and strong catgut ligatures applied above and below the point of wound and cut In the primary incision two or three small vessels were divided, which were also ligated No special antiseptic measures were used, other than perfect cleanliness Suppuration was not altogether prevented The highest temperature was reached on the second day after the operation, when the thermometer under the tongue reached 103° this the temperature fell below 100°, and at no time afterward exceeded that point The case progressed favorably, and the patient was discharged cured on the 1st day of November, that 1s to say, just eleven days after the operation, and he has continued well to the present time The ligatures which were applied to the femoral artery were never heard from in any way

In contrast with the case just related, I desire to refer briefly to a case of traumatic aneurism of the common femoral artery, reported by myself in the New York Medical Record, for Jan 4, 1882 that case the wound was produced by a pistol shot, and was situated immediately below Poupart's liga- had the following history

The patient was a boy, æt 14 The acciclosed, the inner coats had not been divided and dent happened on April 28, and on October 10, of the same year I performed the Hunterian operation, placing a carefully prepared catgut ligature upon the Had there been a reasonable external iliac artery hope of the wound being in the superficial femoral as in the previous case, I should have performed the old operation, or had the external wound been unhealed or in any danger of opening up again, I should have felt compelled to treat the case as a wounded artery, and applied a ligature on the affected vessel above and below the wound As it was, the situato the University of Michigan Hospital at Ann tion of the scar excluded all hope of the superficial About femoral being the wounded vessel In the next place, the external parts were as perfectly healed as if they had never been injured, and the aneurism being comparatively small and well defined, although pected, the knife suddenly slipped through the wood in reality, a false aneurism caused by an external wound had come to correspond very closely to a incision about three quarters of an inch long ob-true aneurism, at least in so far as the question of liquely outwards and downwards The underlying treatment was concerned, so that the Hunterian operation seemed the best, and indeed, at that time, the October 31, that is twenty-one only alternative days from the date of the operation, this patient was dismissed cured In a similar case to-day, it would be at least justifiable to take into consideration the propriety of substituting the old operation for the Hunterian, as in the case of aneurism affecting the superficial femoral which has been described in a preceding paragraph of this paper

DISEASES OF THE JOINTS

The treatment of diseased joints has made solid and satisfactory progress in recent times Those intractable cases, to the pathology of which Sir Astley Cooper, Sir Benjamin Brodie, and others, devoted so much attention, and which they so unsuccessfully endeavored to cure by different forms of counter-irritation and constitutional treatment, are now successfully managed by physiological rest, pressure, extension, and counter extension, and especially by the operation of resection or partial resection own observation and experience have convinced me that this last method of treatment, that is, resection or partial resection, has a much larger field of usefulness, especially as regards the hip and knee, than has hitherto been generally believed A mistake is in my judgment, often made in postponing the performance of this operation until the disease has extended far beyond the limits of the articulation, and the case has become hopeless by any means other than am-So soon as a case of articular disease refuses to yield to a fair trial by the milder methods, the duty of the surgeon, in my opinion, is to open the roint and remove all of the diseased tissue By this course the danger to the life and the limb of the patient is reduced to a minimum, and the duration of the treatment materially abbreviated

In certain cases of congenital or acquired deformity of joints, beautiful results are possible by resection, as well as by subcutaneous osteotomy example, on March 15 last, a young man, F McM, æt 16 years, came to my public clinic on account of a very peculiar deformity on his left knee joint, which

The patient had malarial fever five years ago, which lasted for four or five months During convalescence, when attempting to walk, he noticed a weakness in his left knee, which appeared to bend beneath his weight This weakness increased steadily, and seven months before admission it became much aggravated No medical advice until six month's ago, when a doctor advised him to wear a splint for support, which he has since done tendency to luxation, however, continued to increase up to the time of admission when it was found to constitute a very unsightly deformity, and to almost entirely deprive the patient of the use of his limb In walking there was a plainly apparent subluxation of the head of the tibia outwards, so that the leg formed an angle of about 120 degrees at the knee-On March 22, he was presented at the clinic, placed under the influence of chloroform, and the ordinary operation of resection of the knee joint performed, a slice being removed from the articular surfaces of the femur and tibia, with the saw The bones were extremely vascular, but the hæmorrhage was speedily arrested by the application of hot The osseous surfaces and the edges of the wound were coaptated and secured with four silver wire sutures through the soft textures, down to but not including the bones The wound was covered with iodoform gauze, and supported with splints composed of folded newspapers well covered with cotton batting maintained by bandages Nine drachms of chloroform were used

On April 23, he was presented to the clinic The wound at that time had not been dressed for four resections of the joints, and have every reason to days, but very little suppuration had taken place The union between the bones was solid so that the limb could be lifted bodily by taking hold of the On April 24, a light plaster cast was applied by Dr Hendricks, and the patient walked into the clinical amphitheatre on his crutches, and was able to lean considerable weight on the affected limb He was then dismissed from the hospital, five weeks from the day of operation

In the treatment of the early stages of articular disease affecting the joints named, and especially the elbow and the knee, the plaster of Paris cast is, in my opinion, a useful appliance, but it requires much cautious judgment and careful observation in its

management

Iu any case of articular disease when the degeneration of tissue has extended, as it sooner or later does unless arrested by efficient treatment, beyond the limits of the articulation, inducing destruction of the medullary canal and other parts of the bones in volved, the only efficacious treatment is amputation, and under these circumstances I have in several instances successfully performed amputation One case in point, I had the even at the hip-joint honor to report to this Section, illustrated by a very striking specimen, at the annual meeting two years ago at St Louis

TREATMENT OF FRACTURES

had, for obvious reasons, a peculiar interest for the a comparatively new and very important principle of

practical surgeon, and in our generation, as in previous ones, much activity has been displayed, and much ingenuity exercised in efforts to improve methods and appliances for the management of these common and important surgical cases take a long time, and be a tedious and unprofitable task to describe, discuss or even enumerate the many suggestions and inventions which have engaged the attention of surgeons during the memory of those listening to me I will only take time to notice a very few of those which appear to me to be the most worthy of consideration here

The first of these is the improved and simplified methods of securing efficient, continuous extension, and counter-extension in the treatment of fractures, especially of the thigh, the most difficult and hazardous of all fractures so far as the surgeon's reputation is concerned The method known by the name of its inventor, Gurdon Buck, has attained to such universal acceptance that now it may be said to have

no competitor for professional favor

The abandonment of all complicated and mysterious machinery, and the substitution of the simplest forms of material, such as pasteboard, leather, and so forth, as coaptation splints, is another striking fact in the history of this department of surgery in our day My own favorite splint for these purposes consists of folded newspapers surrounded by one or more sheets of cotton wadding This constitutes a simple, cheap, light, safe, efficient and easily applied I use it not only in the treatment of apparatus fractures of the long bones, but in the treatment of feel entirely satisfied with it, and many of my former pupils have testified to its merits as a practical appliance

The use of plaster of Paris as a dressing in fractures, notwithstanding the eloquent claims made for it some years ago, in certain high quarters, has now, I think, reached its proper position in the estimation of the profession It is a suitable method of treatment for a few fractures, under certain exceptional circumstances, but its field of usefulness is, in my

opinion extremely limited

The treatment of Colles' fracture without any splints at all, and regarding the concomitant sprain of the wrist-joint, and the danger of adhesions and contraction of tendons as the chief indication after the fracture is once reduced, carefully eschewing immobilization (which is improper in sprains everywhere), according to the teachings of Bouchet, E M Moore, Le Comte, Gordon, Pilcher and others, I have had numerous opportunities of testing, and have had the pleasure of placing on record some of the results of my experience, which have been eminently satisfactory in every case in which I have Instead of regarding Colles' fracture with fear and trembling, as used to be the common feeling toward it on the part of surgeons, it may now, with our better understanding of its pathology and our improved methods of treatment be regarded as among the safest and most satisfactory of all frac And in this connection I may refer briefly to

practice as regards all fractures in the neighborhood of joints, namely, the cautious, efficient measures now adopted by the aid of an esthetics, when necessary, to prevent anchylosis, and contraction of fibrous structures by the use of passive movements, cautiously applied to the articulation during the course of treat ment of the fracture The treatment of fractures of the humerus, when non union seems to threaten, by placing the forearm in the straight instead of the rectangular position, on the principle laid down by the late Dr Frank Hamilton, I feel bound to approve after some very satisfactory experience therewith The main argument in favor of the rectangular position namely, the danger of anchylosis in the worst position, no longer holds good, since by the maintenance of judicious passive movements, this contingency is fully provided for

In regard to the treatment of non union of fractures, there are only three observations which it less formidable procedures seems necessary for me to mention here The first of these relates to the cause of non union, about which great uncertainty has always existed in the minds of the profession For some years past it has been my fortune to receive, at my public clinic in the University of Michigan, many cases of ununited tracture, mostly from the lumber camps and mining rendered possible by the aid of anæsthesia districts of the northern part of the State, and I have been struck with the fact that, in every instance, the fracture has been produced by direct and very great violence, so that it has seemed to me a reasonable explanation of this unfortunate accident that the violence of the injury, affecting injuriously the vital powers of the tissues involved, is responsible for the disastrous failure of the reparative efforts of nature

examination whether or not there is any reasonable tion chance for union to be induced in any given case of If, on examination, the medullary canal is found enlarged, the cortical substance proportion ately thin, the bone and neighboring tissues generally having undergone fatty degeneration, no operation and no method of treatment will, in my opinion, succeed in inducing union

In the third place, experience has led me to discard entirely the expedient of wiring the ends of bone after the operation of resection for non-union convinced that it does not improve the chances for union, and I have in cases of my own and of other surgeons frequently had occasion, months or years afterward, to operate for the removal of silver ligatures which had become a serious source of annoyance and danger to the patient Within a few months I have performed resection of the femur for non-union in two extremely bad cases, and in an equally bad case in the lower jaw where the fracture was compound and comminuted, and in all three the result was complete success although no silver ligatures nor appliances of newspaper coaptation splints, a modification of Lis- same proceeding

of these cases were any germicides or antiseptics used, although a strong effort in the direction of perfect surgical cleanliness was made, and in all the wounds healed rapidly and with very little irritation

STONE IN THE BLADDER

In regard to operations for the removal of unnary calculi great activity has prevailed and decided progress has been made in very recent times generations were moved with admiration by the brilliant operations performed and the large ratio of successful results obtained by Cheselden, Liston, Dudley and others, our own generation has noted with at least equal gratification the practical results which have flowed from the persistent efforts and the wonderful scientific ingenuity of men like Thompson, Bigelow, Otis, Gouley and others, whereby it has been attempted to substitute for lithotomy safer and

The operation of lithotrity and the instruments by which it is effected, have been most completely revolutionized, and I think we may almost say perfected, under our own eyes, while litholopaxy, or the operation of Bigelow, constitutes one of the many valuable additions to the long catalogue of surgical procedures So successful have these methods been in the hands of their inventors and others, and so ingenious and plausible the arguments urged in their favor, that there has seemed to me to be some danger of their being too universally resorted to, to the exclusion of the timehonored operation of lithotomy Recent utterances, however, such as those of Mr Reginald Harrison, of England, encourage the hope that moderate and In the second place, I have come to believe that it reasonable views will ultimately prevail, and that full is possible for the surgeon to determine by actual justice will be done to all of the procedures in ques-For my own part I have always believed and taught that, while lithotrity and litholopaxy are valuable methods of getting rid of stone in the bladder, still there are substantial advantages in lithotomy which will always make it the best operation in a large and important class of cases Mr Harrison, in the article referred to (The London Lancet, February 4, 1888) says

"Mr Cadge, in his recent Hunterian lectures, pointed out that the recurrences of stone after lithotrity are lamentably frequent, and if there were added to the list those numerous cases of phosphatic deposit or concretions so often noticed after this operation, the relapses, he believed, would reach nearly 20 per cent The state of the interior of the bladder, relative to its shape, its power of contraction and the presence or absence of inflammation, has a determining influence in the reproduction of stone, and we have, I think, been rather too much disposed to allow the physical properties of the stone to determine for us, as it were, the selection of the operation, irrespective of these relative conditions Though a that kind were used The fractures of the femur were hard stone is, as a rule, best treated by lithotomy, treated simply as any ordinary case of compound this by no means implies that some small and soft fracture of that bone would be treated, namely by ones are the less advantageously removed by the Let me take, for instance, the ton's long splint, and Buck's extension and counter- case of a stone in the bladder occurring in an adult, extension apparatus by weight and pulley In none with some chronic cystitis and enlargement of the

The patient had malarial fever five years ago, which lasted for four or five months During convalescence, when attempting to walk, he noticed a weakness in his left knee, which appeared to bend beneath his weight This weakness increased steadily, and seven months before admission it became much aggravated No medical advice until six month's ago, when a doctor advised him to wear a splint for support, which he has since done tendency to luxation, however, continued to increase up to the time of admission when it was found to constitute a very unsightly deformity, and to almost entirely deprive the patient of the use of his limb In walking there was a plainly apparent subluxation of the head of the tibia outwards, so that the leg formed an angle of about 120 degrees at the knee-On March 22, he was presented at the clinic, placed under the influence of chloroform, and the ordinary operation of resection of the knee joint performed, a slice being removed from the articular surfaces of the femur and tibia, with the saw bones were extremely vascular, but the hæmorrhage was speedily arrested by the application of hot The osseous surfaces and the edges of the wound were coaptated and secured with four silver wire sutures through the soft textures, down to but not including the bones The wound was covered with iodoform gauze, and supported with splints composed of folded newspapers well covered with cotton batting maintained by bandages Nine drachms of chloroform were used

obtained, and in which there is strong promise of before the inflation still greater progress in the near future

Nor are these by any means the only subjects which the rapid flight of time warns me to omit the consideration of here, notwithstanding their great practical importance and their tendency to show forth the progressive nature of the surgery of our day But here my discourse, fragmentary and incomplete as it unquestionably is, must stop. If the effect of anything that I have said should be to convey a favorable impression of the present condition and pros pects of our beloved art, and to inspire even in the slightest degree hope and courage in the minds of those who, like myself, are struggling to promote and elevate its beneficent powers, I will be more than sat In any event, I must always feel deeply sensible of the honorable trust reposed in me by my brethren of this section, and my highest ambition will ever be to prove myself in some degree at least worthy of the great honor conferred upon me Certainly I know not any higher privilege or purer pleasure than that of contributing even in the least degree to the assistance, the gratification or the encouragement of the noble army of those who have enlisted for life in the arduous and beneficent service of surgery

"Men my brothers, men the workers, ever reaping something That which they have done, but earnest of the things that they shall do "

RECTAL INSUFFLATION OF HYDROGEN GAS AN IN-FALLIBLE TEST IN THE DIAGNOSIS OF VISCERAL INJURY OF THE GASTRO-INTESTINAL CANAL IN PENETRATING WOUNDS OF THE ABDOMEN

Read in the Section on Surgery, at the Thirty minth Annual Meeting of the An erican Medical Association, May, 9, 1888, and illustrated by three experiments on dogs

BY N SENN, M D, PH D,

ATTENDING SURGEON TO THE MILWAULEE HOSPITAL PROFESSOR OF PRINCIPLES OF SURGERY AND SURGICAL PATHOLOGY IN THE RUSH MEDICAL COLLEGE, CHICAGO ILL.

(Concluded from page 777)

IV—HYDROGEN GAS IS INNOCUOUS AND NON IRRI TATING WHEN BROUGHT IN CONTACT WITH LIV-ING TISSUES AND IS PROMPTLY REMOVED

B1 ABSORPTION

a -Peritoneal Cavity

Experiment 53 - Dog, weight 45 lbs A circumscribed spot to the right of the linea alba was shaved and thoroughly disinfected and through this space a well disinfected medium sized trocar was plunged into the pentoneal cavity To the cannula of the trocar the rubber tube of the inflation balloon charged with hydrogen gas was attached and the whole peritoneal cavity filled with gas by compressing the balloon About four litres of gas were injected No gas escaped upon the withdrawal of the cannula and the puncture was sealed with cotton and

important fields of brain and thoracic surgery, in but little pain, and the next day the tympanitis had which, of late years, such brilliant results have been disappeared and the dog was as frisky and lively as Two days after the experiment was made the dog was killed and the peritoneal cavity carefully examined Not a trace of the gas remained and the peritoneum throughout presented a normal appearance

b - Pleural Cavity

Experiment 54—Dog, weight 25 lbs thorough disinfection an aseptic hollow needle was inserted between the seventh and eighth ribs in the axillary line into the left pleural cavity and hydrogen gas from rubber balloon forced through it until the pleural cavity was thoroughly distended On making a physical examination of the chest at this time the apex of the heart was found to the right of the sternum, vesicular breathing on left side absent, and on percussion of this side abnormal resonance The respirations became superficial and greatly increased in frequency On withdrawing the needle no gas escaped externally, but a circumscribed subcutaneous emphysema which appeared showed that some of the gas escaped through the puncture in the pleura into the subcutaneous connective tissue Twenty-four hours after the inflation the dog appeared to be in perfect health. The normal relations in the chest had become restored and the subcutaneous emphysema was less extensive animal was kept under observation for a considerable length of time, but at no time could symptoms of pleuritis be detected

c — Subcutaneous Cellular Tissue

Experiment 55—Old dog, weight 43 lbs small perfectly aseptic trocar was inserted through the skin into the loose cellular tissue in the right inguinal region and through the cannula two litres of gas were injected, the gas distributing itself through the loose connective tissue over a large surface of Upon the withdrawal of the cannula the the body puncture was hermetically sealed with iodoform The subcutaneous emphycollodium and cotton sema disappeared completely in forty eight hours, and no traces of inflammation could be found at the point of punture, or at any place where the gas had come in contact with the tissues

Experiment 56 - Dog, weight 25 lbs Subcutaneous inflation of two litres of hydrogen gas through the cannula of a small trocar into the left side of the The subcutaneous emphysema reached from the clavicle and axilla on that side to the crest of the ilium, the gas at some points elevating the skin at least four inches from the subjacent tissues gas was absorbed somewhat more slowly than in the preceding experiment, but three days after the inflation no trace of emphysema could be detected and the subcutaneous connective tissue was as pliable and movable as before the inflation

-RECTAL INSUFFLATION OF HYDROGEN GAS IN THE DIAGNOSIS OF PENETRATING GUNSHOT WOUNDS OF THE ABDOMEN

In these experiments the animals were strapped on one of Pasteur's operating tables Abdomen 10doform collodium The animal appeared to suffer shaved, and after complete etherization the shooting

prostate The probabilities are that for many months, if we look at a section of such a stone after its removal, the bladder has been engaged in encasing it in a mould of phosphates just as completely as if it were done by plaster of Paris I have examined a very large number of bladders with prostatic hypertrophy and, having regard to the pouched condition of the viscus as well as the condition of the mucous membrane, relative to the presence or absence of phosphatic deposit upon it, it has often struck me not that lithotrity has its failures, but that, under these circumstances, its successes are so numerous

"Reflections such as these induced me, some years ago, to greatly alter my mode of procedure in cases of this kind, where either it was clear that the stone was the effect rather than the cause of disease, or where this fact was demonstrated by the failure of The bladder, under these circumstances, lithotrity resembles a chronic abscess with a stone in it, and it is just as necessary to open and drain the one as the have accomplished so great and beneficent a result phosphatic stone had been removed by three lithotrities, and who was never free from vesical irritation, I performed, two years after the first crushing, lateral lithotomy, and removed more phosphatic calculus of recent formation His bladder was then drained and washed for eight weeks, until he voided normal acid urine, when the tube was removed and the wound This and similar instances are healed in a month examples not merely of successful lithotomy, but of successful drainage In the performance of lithotomy in cases of this description my aim is to make a wound into the bladder which will permit of very ready and efficient drainage, and which is not likely to close up before the interior of the viscus is ready for the reception and continence of the urine Hence I am an advocate for lateral lithotomy, which best fulfils the conditions that are required As a rule, cases of this kind require drainage to be continued from four to eight weeks, and I have drained them as long as ten weeks before the state of the bladder, as evidenced by the urine, was such as to allow the wound From a gentleman of 70, who to heal up for four years had passed his urine by catheter, I removed by lateral lithotomy three uric acid calculi of moderate size, coated with phosphates I made a very free opening into the neck of the bladder, put in one of my largest-sized tubes and drained continuously for eight weeks, when the wound was allowed He can now expel his urine without assistance and has entirely discarded the catheter remarkable that the bladder should have entirely recovered its power after so long a period of inaction

as four years " I have made this lengthy quotation from Mr Harrison's lectures because it expresses very distinctly the views that have guided my own practice, and which I have been accustomed to teach for many years, and the following remarkable case from my own experience seems to me to furnish a strong argument in their support In November, 1883, I was asked by Dr Bennett to see a patient in the Wayne bladder among other things The history of the case extended compels me to omit all consideration of the

was briefly as follows Five years previously, the patient had fallen from a building and injured his spine, causing complete paraplegia, with incontinence of urine I found him confined to bed, suffering great pain from the presence of two very large stones in his bladder, and from all the disagreeable effects of complete incontinence of urine in a paral yzed man, including bedsores I administered chloroform, removed the stones from his bladder by the left lateral operation, made provisions for thorough drainage and washing out of the bladder, and not only did the wound heal when permitted to do so but, when this took place, it was found, to the surprise of all, that the patient had recovered complete control over his urine, which he retains to the present time The calculi were phosphatic and comparatively soft, so that they might easily enough have been removed by lithotrity or litholopaxy But will anyone say that either of these procedures could possibly In a man of 60, from whom large masses of for him as the operation which I performed did?

A good deal has been said in recent times in favor of the supra pubic or high operation of lithotomy, and no doubt there is an important field of usefulness for this method of opening the bladder Still, I can not believe that the advantages are sufficiently great to justify us in preferring it to the old operation of lateral lithotomy On this subject also I think Mr Harrison, in the lecture from which I have already quoted, has expressed himself in wise and conservative terms Among other things he says

"We must not be unmindful that experience has already shown us that supra-pubic cystotomy, like other procedures having the same object, has its own difficulties and dangers Instances have been recorded where a weakened bladder under the press ure of distension has given way and death has then followed, and similarly the rectum has suffered in a corresponding manner, but without producing any To most of us the simplicity serious consequences and ease with which lateral lithotomy can usually be performed is such as to strongly prejudice us in its favor in its absence of any special reason to the contrary such as I have indicated Still, on the other hand, there are places for both the high and low operations in the practice of surgery which they can fill with relative advantage, and without fear of clash-

The operation of cystotomy by the left lateral method, for chronic cystitis and chronic irritable bladder is one which I have practiced with most grat ifying results in numerous cases, some of which are so striking in character that I would like to detail them here, but time does not permit

One point of great practical importance in this connection must, however, be noted, namely the fact, long since pointed out by Sir Benjamin Brodie, that certain cases of chronic cystitis and chronic irri table bladder are associated with and dependent upon suppurating kidneys, and of course these cases should be carefully diagonized and excluded from the class amenable to operation

The undue length to which this paper has already

the right kidney which showed a perforation through the centre An examination of the gastro intestinal canal revealed two perforations of the crecum, and five of the small intestines After passing through the kidney the bullet perforated the diaphragm, traversed the pleural cavity and escaped through the chest wall two inches (5 cm) to the right of the

Experiment 63—Old dog, weight 35 pounds Thoroughly etherized and shot in the abdomen, the bullet entering three inches (7 4 cm) to the right of, and an inch and a half (3 cm) below, the umbilicus passing almost transversely through the abdominal cavity it escaped at a corresponding point on left side Inflation of hydrogen gas was attempted, but failed on account of the apparatus being out of order The abdomen was opened and no gas was found even in the colon Twelve perforations of the small intestines were found, and a number of perforations of the mesentery which had caused profuse hæmor-

Experiment 64-Large, black dog Etherized and shot in the abdomen, wound of entrance three inches (7 4 cm) to the right of, and an inch and a half below, the umbilious, wound of exit near a corresponding point on opposite side, the bullet taking nearly a transverse course Rectal inflation of hydrogen gas gave a prompt positive result abdomen was opened and five perforations of small intestine were found, besides laceration of thoracic duct, and a number of perforations in mesentery perforation contained gas, while above the lowest

perforation the bowel contained no gas

Experiment 65 - Dog, weight 25 pounds Under full anæsthesia the animal was shot in the abdomen, the bullet passing nearly in a transverse direction through the abdominal cavity an inch and a half below the umbilicus from points of entrance and exit midway between linea alba and spine Rectal insufflation of hydrogen gas made under very low pressure led to rapid distension of the abdomen, an occurrence which furnished strong evidence that the gas had escaped through a perforation in the colon into the peritoneal cavity. The gas escaped in bubbles through the wound of entrance, and when a lighted taper was held near the wound it burned with a jet varying in size On opening the abdomen gas escaped from the peritoneal cavity, small intestines empty, and only a small amount of gas in the colon The following intra peritoneal injuries were found Four perforations of the duodenum, two of the jejunum, and one of the cecum also a perforation nearly through the centre of the left kidney, laceration of the receptaculum chyli, and a number of per-forations in the mesentery The bullet was found between the left kidney and the abdominal wall

In all of these experiments the bullet was fired through the abdomen from side to side transversely, or somewhat obliquely, directions which invariably brought into the track of the bullet a number of in- geon to the wound testinal coils, and often the colon likewise. In the

blood The source of this profuse hemorrhage was little higher up the intestines escaped, but the stomach showed two perforations, one near the pylone, and the other near the cardiac extremity Rectal insufflation of hydrogen gas proved an infallible test in every instance, except in the case where it failed on account of the inflation apparatus being out of order Contrary to the experience of other experimenters, I found that fæcal extravasation does not uniformly take place soon after gunshot wounds of the intestines, and in the cases where I observed it some part of the colon nad been wounded testinal inflation does, therefore, not tend to increase the frequency of this occurrence, and must therefore be looked upon as a harmless measure in this

Inflation, as a preliminary measure, greatly expediates the first step in the operation of abdominal section in cases where the intestine has been perforated or injured, as the gas which escapes into the peritoneal cavity separates the intestines from the anterior abdominal wall, and the incision can be made safely and rapidly without fear of wounding the intestines Penetrating wounds of the abdomen, where the course of the bullet is in an opposite direction to that which has been described in the preceding experiments, that is in an antero-posterior direction, may not implicate the intestines at all, or if visceral injury is inflicted, it is more likely that only a single perforation exists, and never does the surgeon meet with such a multiplicity of lesions as have been cited above Unless the surgeon can ascertain before hand that in a case of penetrating wound of Colon and small intestine below the lowest point of the abdomen an injury to some portion of the gastrointestinal canal exists, the very means which he resorts to in making an anatomical diagnosis is often an imminent source of danger, as only too often he may have to examine every inch of the gastrointestinal canal for this purpose, a procedure which is always attended by great risk to life If by such a simple and harmless procedure as insufflation of hydrogen gas he can satisfy himself that the gastro-intestinal canal is perforated, the course to pursue becomes clear-to open the abdomen, seek for the perforation until he finds it, and to adopt proper treatment for the visceral injury

Cases have also happened in which the operator opened the abdomen, sought for, found and treated one or more perforations, and on making the autopsy a day or two later found, to his great chagrin and sorrow, a perforation which he had overlooked at the time of operation It seems to me that in cases in which any doubt exists as to the integrity of the remaining portion of the intestinal canal, after closing one or more perforations, it would be advisable to search for additional perforations by resorting again to slow and careful inflation before the abdominal wound is closed If no other perforations exist the gas will be confined to the interior of the gastrointestinal canal, and if the stomach or intestines at some point difficult of access are injured, the leakage of gas through the perforations will lead the sur-

In the practical application of rectal insufflation two experiments where the track of the bullet was a of hydrogen gas, as a means of diagnosis in pene-

was done at short range with a thirty-two calibre re-Inflation of hydrogen gas was practiced im mediately after the shot was fired, and after its diagnostic value was carefully studied the abdomen was opened and its contents examined for visceral injur-In all cases where the colon was perforated in flation could be done under very slight pressure, as the gas readily escaped into the peritoneal cavity, and from there through the bullet wound in the abdominal wall, where it was ignited as it escaped As it is not the object of this paper to give the result of the operative treatment, the experiments will only be described in reference to diagnosis as verified by abdominal section, but in every case an attempt was made to save the life of the animal by operative treatment, and in a few instances the efforts were rewarded by success

Experiment 57—Dog, weight 30 lbs The abdomen was opened by an incision through the linea alba and a coil of the small intestine was drawn forward into the wound, and an incision one half an domen examination revealed the following visceral inch (12 mm) in length was made on the convex injuries side and the intestine returned was inserted into lower angle of wound, and the rest | the ileo-cæcal valve, eight in the upper part of the of the wound closed by sutures About two litres leum within the space of one foot (30 cm) of the of hydrogen gas were inflated per rectum when the intestine The mesentery was perforated at three gas escaped through the glass-tube, and when ignited burned with a continuous steady blue flame as long siderable size were severed, which gave rise to proas the inflation was continued The wound was opened and a small quantity of gas was found in the peritoneal cavity The whole intestinal tract below the visceral wound was found moderately distended by gas, while above the wound the intestine was normal in size

Experiment 58 —Dog, weight 15 lbs When the dog was completely under the influence of ether hydrogen gas was forced from anus to mouth, and while the abdomen was still moderately distended the animal was shot in the abdomen, the bullet being directed transversely from the point of entrance on the side of the abdomen two inches (5 cm) to the right of the median line and on a level with the um-On applying a lighted taper to wound of entrance, and compressing the abdomen, hydrogen gas escaped and was ignited When the inflation was resumed the gas burned with a continuous flame at the wound of entrance The abdomen was then opened and two perforations in the stomach were found, one on the anterior surface near the pylorus, and the other on posterior surface at the cardiac extremity, about an inch above the omental The distension of the stomach by hyattachment drogen gas had brought this organ within range of the track of the bullet

Experiment 59 - Dog, weight 20 pounds Under complete anæsthesia the animal was shot in the abdomen, the bullet taking the same direction as in the previous experiment, only that the track was about an inch (26 cm) above the umbilicus ately after the shooting hydrogen gas was inflated that the colon in some part of its course had been per rectum, and its presence in the abdominal cavity injured became evident by a marked tympanitis, absence of entrance where it was lighted and burned with the liver dulness, and later by a localized emphysema characteristic blue flame around the wound of entrance As the pressure was opened was found almost completely filled with

continued bubbles of gas escaped, and on applying a lighted taper, ignited with a feeble explosive re The abdomen was opened, and the stomach showed two perforations, one just above the omental attachment near the pylorus, and the other on the same level at the cardiac extremity Little hæmorrhage, and no extravasation of contents of stomach

Experiment 60 - - Dog , weight 30 pounds Animal anæsthetized and shot in abdomen at a range of two feet, wound of entrance two inches to the right of, and on a level with, the umbilious Wound of exit one inch above the middle of left crest of ilium Inflation of hydrogen gas per rectum soon caused extensive tympanitis, and as but little force had been used the conclusion was drawn that some part of the descending colon had been injured As the gas did not readily escape through the bullet wounds a small cannula was inserted into the abdominal cavity through the wound of entrance, when the gas escaped freely and was ignited On opening the ab-Two perforations in the descending colon, A small glass tube four in the ileum, within a distance of ten inches of points, and a number of mesentenc vessels of confuse hæmorrhage

Experiment 61—Large coach dog The animal was completely etherized and shot in the abdomen Wound of entrance midway beat close range tween linea alba and vertebral column on left side, a little below the level of the umbilicus, wound of exit close to last lumbar vertebra over crest of ilium on opposite side Rectal inflation of hydrogen gas under slight pressure at once produced diffuse tympanitis, and the gas escaped freely through wound of entrance where it was ignited and burned with a large steady blue flame as long as the inflation was continued On opening the abdomen gas escaped, but inspection showed that the small intestines contained no gas, a condition which pointed to the colon as the seat of perforation One per foration was found in the anterior wall of the sigmoid flexure and two perforations in the cæcum the small intestines two perforations were found in the ileum near the cæcum, and three in the upper portion of the jejunum Among the other organs injured were the spleen, the receptaculum chyli, and a number of perforations in the mesentery

Experiment 62 - Large dog, profound ether Shot in the abdomen, the bullet entering narcosis on a level with the umbilious and about one inch to the left of the median line Point of exit two inches from spinal column, and a little above the lower border of the chest On inflating the rectum with hydrogen gas hardly any force was required to dis tend the abdomen, and for this reason it was believed

out resorting to an exploratory laparotomy In conclusion I beg leave to submit for your discussion the following propositions

r The entire alimentary canal is permeable to rectal insufflation of air or gas

2 Inflation of the entire alimentary canal from above downwards through a stomach tube seldom succeeds, and should therefore only be resorted to in demonstrating the presence of a perforation or wound of the stomach, and for locating other lesions in the organ or its immediate vicinity

3 The ileo cæcal valve is rendered incompetent, and permeable by rectal insufflation of air or gas under a pressure varying from one fourth of a pound

to two pounds

- 4 Air or gas can be forced through the whole alimentary canal from anus to mouth under a pressure varying from one third of a pound to two pounds and a half
- 5 Rectal insufflation of air or gas to be both safe and effective must be done very slowly and without interruptions
- 6 The safest and most effective rectal insufflator is a rubber balloon large enough to hold 16 litres of air or gas

7 Hydrogen gas should be preferred to atmos pheric air or other gases for purposes of inflation in all cases where this procedure is indicated

- 8 The resisting power of the intestinal wall is nearly the same throughout the entire length of the canal, and in a normal condition yields to diastaltic force of from eight to twelve pounds of pressure When rupture takes place it either occurs as a longitudinal laceration of the peritoneum on the convex surface of the bowel, or as multiple ruptures from within outwards at the mesenteric attachment. The former result follows rapid, and the latter slow, inflation
- 9 Hydrogen gas is devoid of toxic properties, non-irritating when brought in contact with living tissues, and is rapidly absorbed from the connective tissue spaces and all of the large serous cavities
- To The escape of air or gas through the ileo cæcal valve from below upwards is always attended by a blowing or gurgling sound, heard most distinctly over the ileo cæcal region and by a sudden diminution of pressure
- II The incompetency of the ileo cæcal valve is caused by a lateral and longitudinal distension of the cæcum which mechanically separates the margins of the valve
- 12 In gunshot or punctured wounds of the gastrointestinal canal insuffiation of hydrogen gas enables the surgeon to demonstrate positively the existence of the visceral injury without incurring the risks and medico-legal responsibilities incident to an exploratory laparotomy

THE CONSUL GENERAL at Honolulu reports that many lepers leave the Sandwich Islands as soon as the disease appears, the greater number coming to the United States, in order to prevent being banished to the Island of Molokai

JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, No 65 RANDOLPH STREET

CHICAGO ILLINOIS

LONDON OFFICE, 57 AND 59 LUDGATE HILL

SATURDAY, JUNE 30, 1888

COMPLETION OF VOLUME X

The present number completes the tenth volume of The Journal of the American Medical Association and the fifth year of its publication. As usual, it is accompanied by a full index and title-page, convenient for binding and future reference

At the beginning of the fourth year, volume ix, it was found necessary and convenient to enlarge THE JOURNAL by the addition of four pages to the department for papers and original contributions, by which volumes in and a were made to contain 832 doublecolumn pages each, or a total of 1,664 pages for the Such has been the progress and material development of interest in The Journal that we shall commence the sixth year, volume xi, July 7, with the further addition of four more pages to the readingmatter, and present the whole in a new typographical dress-improvements that, we trust, will be gratifying to all its readers This will make each of the future volumes contain 936 pages, or a total of 1,872 for the year, which is more than four times as much important reading matter as members of the Association received in the single annual volume of Transactions before THE JOURNAL was established and yet without any increase in the amount of the annual membership dues from each member Under the former arrangement all the papers and proceedings were distributed in one volume not until from six to nine months after each annual meeting, while in THE JOURNAL at present every member gets, each week, as large an installment of papers and reports as he can find time to read, and before the time he formerly received his single volume he has already had not only all the papers

trating wounds of the abdomen, the field of possible operation should be carefully prepared by shaving and disinfection before inflation After thorough disinfection of the external wound or wounds, and the field of operation, the patient should be placed thoroughly under the influence of an anæsthetic for the purpose of relaxing the abdominal muscles, which greatly facilitates the inflation. In the absence of a Wolf's bottle hydrogen gas can be readily generated in a large wide-mouthed bottle into which a small handful of chips of pure zinc is placed The mouth of the bottle is closed with a cork with two perforations, through which two glass tubes are inserted, one for the purpose of pouring in water and sulphuric acid, and the other, which should be bent nearly at right angles, for leading away the gas tube and the rubber balloon with a capacity of 16 htres of gas are connected by means of a rubber In from five to ten minutes the requisite amount of gas can be generated and everything is The rubber tube connecting ready for the inflation the balloon with the rectal tip of an ordinary syringe should be interrupted by a stop-cock, so that the escape of gas can be prevented whenever inflation is The return of gas along the temporarily suspended sides of the rectal tip can be readily prevented by an assistant pressing the anal margins firmly against it The inflation must always be made slowly, as long continued, uninterrupted pressure accomplishes most effectually lateral and longitudinal dilatation of the cæcum, conditions which render the ileo-cæcal valve incompetent, and which must be secured before inflation of the small intestines is possible entrance of gas from colon into the ileum is always least slightly dilated by gas If this perforation is attended by a diminution of pressure, and its occurrence can invariably be recognized by a gurgling or blowing sound over the ileo cæcal valve, and sometimes the sounds are sufficiently loud to be heard at some distance

If, after inflation, abdominal distension and tympanitis be from the very first diffuse, and liver dulness has disappeared, it is a certain indication that it is due to the presence of gas in the peritoneal cavity, and not to distension of the gastro intestinal canal If, on the other hand, the distension and tympanitis follow the course of the colon, and after the entrance of the gas through the ileo cæcal valve is circumscribed and limited to the umbilical and hypogastro regions, and gradually extends to the upper portion of the abdomen, and the liver dulness is displaced up wards, it is in all probability caused by a gradual and successive inflation of the intact bowel in an upward In some penetrating wounds of the abdirection domen it is difficult, if not impossible, to follow the course of the bullet through the abdominal wall with a probe or finger on account of a relative change of position of the different layers of tissues in the track of the bullet obliterating the canal, but even in these cases a moderate distension of the peritoneal cavity by an accumulation of gas outside of the intestines will force bubbles of gas through the tortuous canal, that some portion of the gastro intestinal canal has gastro-intestinal canal in penetrating wounds of the and by this sign the surgeon may know positively been perforated, and in order to prove that the bub- abdomen or perforations from any other cause, with-

bles which escape are part of the hydrogen gas which has been inflated he applies a lighted match or taper, and if it is hydrogen gas it will ignite with a slight explosive report, and burn with a characteris tic blue flame The burning of the escaping hydrogen gas on the surface of the external wound is a most effective means in securing for the wound an aseptic condition, and on that account the escaping gas should be lighted both for diagnostic and therapeutic purposes in all cases in which rectal insufflation of hydrogen gas reveals the presence of visceral injuries of the gastro-intestinal canal

As the hydrogen gas from its low specific gravity will always occupy the highest space in a cavity partially filled with fluids, it is necessary to place the This glass external abdominal wound in such a position that blood or any other fluid that may be present in the abdominal cavity will not interfere with its ready es-If the wound is anterior the patient must be placed in dorsal position, if lateral, on the opposite side during the inflation If during inflation early and diffuse tympanitis takes place, it speaks in favor

of perforation of the colon

Should the external wound prevent the escape of gas from the peritoneal cavity by sliding of the different layers of tissue of the wound in the abdominal wall, or by the presence of a coagulum in the track made by the bullet, it becomes necessary to secure a sufficient degree of patency of the wound for the escape of gas by careful probing or the removal of The finding of perforations is coagulated blood also greatly facilitated by inflation, as the bowel be-The low the lowest perforation will always be found at now closed and additional perforations are suspected to exist the inflation can be repeated, and the bowel will again become distended as far as the next perforation, and this process can be repeated until the entire intestinal canal has been examined by this By searching for leaking points in this method manner but little manipulation of the intestines be comes necessary, and thus one of the great sources of danger in the operative treatment of wounds or perforations of the gastro-intestinal canal is avoided The moderate distension of the intestines lest after treating the visceral wounds never interfered with the return of the intestines into the abdominal cavity or the closure of the external wound in any of the experiments, and the numerous observations made in reference to the disappearance of the gas by absorption, or escape through the natural outlets, are conclusive in showing that the distension due to the presence of the gas disappears in a remarkably short time, and it can therefore be safely stated that rectal insufflation of hydrogen gas in the diagnosis and treatment of penetrating wounds of the abdomen does not interfere with an ideal healing of the visceral After a careful study of and laparotomy wounds the subject of rectal insufflation of hydrogen gas in its various aspects, I do not hesitate to recommend its adoption in practice as an infallible diagnostic test in demonstrating the existence of a wound of the

AFTERNOON SESSION

DR B ALEX RANDALL, of Philadelphia, delivered the

ADDRESS IN OTOLOGY

Attention was mainly directed to the treatment of ear disease by the general practitioner

read a paper on

PREVENTION OF EAR DISEASE

The paper referred to the prevention of ear affections by proper care in childhood

DR HARRISON ALLEN, of Philadelphia, read a paper on

GOUTY SORE THROAT,

giving the diagnostic points, and the methods of treatment which he had found of service

Dr. J William White exhibited two patients on whom the

RADICAL OPERATION FOR THE CURE OF HERNIA

had been performed Case one, was one of com plete oblique inguinal hernia. The bowels became strangulated in the sack by bands of lymph The upper portion of the constriction was divided sack was drawn downward and tred It was then re-The stump was then next secured in the The tissues on either side were brought to gether, the skin being not included The upper twothirds of the wound were closed in this way lower third was packed with iodoform gauze tient recovered without a bad symptom, and at present, ten weeks after operation, there is no signs of return of the hernia In a second case, a similar operation was performed with the exception that an undeveloped testicle lying in the inguinal canal, and giving rise to pain, was removed

DR H F HANSELL, of Philadelphia, read a paper on

INSUFFICIENCY OF THE INTERNAL RECTI MUSCLES

The following conclusions were presented

I In all cases of continual functional headache the extrinsic muscles of the eye should be examined

2 Insufficiency is found in cases of emmetropia,

hypermetropia, myopia and astigmatism

3 The condition can be relieved by prisms and by tenotomy, when less than 10° by prisms, when greater, by the latter method

both eyes had not been necessary

DR HEYL, of Philadelphia, read a paper on

CERTAIN EYE SIMPTOMS IN BRAIN DISEASE

The object was to describe two abnormalities which he had met with. The first abnormality is the injection of a fine series of vessels coming off at had followed an attack of scarlet fever and diphtheria right angles from the main retinal trunks This he had found in cases of melancholia and also in meningeal congestion

The second observation inal artery divides is equal to that of the central ar- Tuesday of May, 1889

The abnormality consists in a diminished calibre of these two branches This had been found in cases in which there was reason to suspect disturbance of the intra-ventricular fluid

DR CHAS W DULLES, of Philadelphia, made a

REPORT ON HYDROPHOBIA.

DR L J LANTENBACH, of Philadelphia, then in which he maintained that in the human being socalled hydrophobia was not a true infectious disease

DR E O SHAKSPEARE thought that experimental research showed that hydrophobia was an infectious disease The crucial test is the inoculation of rabbits with the medulla of individuals dying with hydrophobia and the transmission of the disease to the animal This test had been satisfactorily applied in this way in many cases

On motion Dr Dulles was requested to continue his studies and report at the next meeting of the Society

The President announced the following appoint-

ments for next year

Address in Medicine, Dr J C Wilson, Philadel-

Address in Surgery, Dr J B Roberts, Philadelphia Address in Obstetrics, Dr F N Baker, Delaware

Address in Hygiene, Dr Thos J Mays, Philadel-

Address in Mental Disorders, Dr Alice Bennett. Montgomery Co

Address in Laryngology, Dr W H Daly, Alle-

Committee to consider the Medical Examiners Bill, Drs L F Flick, Edward Jackson, E A Wood. L H Taylor and Wm F Waugh

Dr Goodwillie, of New York, then read a paper describing New Methods of Treatment of Hare-Lib and Cleft Palate in Infants

Dr E A Wood offered a resolution as follows

WHEREAS, The four Hospitals for the Insane under the care of the State of Pennsylvania are at present organized on either of two radically different plans, each claiming better results,

Resolved, That the President of this Society acpoint a committee of thirteen, which shall include the superintendents and chief physicians of such State hospitals, to investigate into the relative merits of the two systems and report at the meeting of this

Adopted Society in 1889

The afternoon session closed with a paper by Dr In the experience of the speaker operation on Laurence Turnbull, Philadelphia, describing a case of ear disease in which a portion of the mastoid cells on one side were discharged, and on the other the semicircular canals and cochlea There was facial paralysis, the portion of the bone through which the facial nerve passes also coming away There was still a certain amount of hearing The ear trouble

FRIDAY, JUNE 8-FOURTH DAY

After the transaction of some routine business and Normally the combined the presentation of the newly elected officers, the calibre of the two vessels into which the central ret- Society adjourned to meet in Pittsburgh, the third

of the Association, but along with them a great variety of additional matter of equal value with that derived directly from the Association Our chief embarrassment now is that so large a proportion of writers desire to have their papers published at once, apparently forgetting that they cannot have a journal regularly each week and at the same time have all the contents designed for six months put into the first six weekly However, during the brief time we may continue to edit The Journal we shall continue, as heretofore, to give in each number of The Journal the greater part of the original department to such variety of the papers of the Association as will afford something of interest for the greatest number of readers, and a little space to voluntary contributions, remembering that a large proportion of these are also from members of the Association, and equally entitled to a hearing

EDITORIAL NOTES

Association —Dr John B Hamilton, who was Secretary of the Nominating Committee, writes that by an inadvertence he failed to put Dr W Thornton Parker, of Newport, R I, on the list of nominees as reported by the Committee, for Assistant Secretary of the Association

A Man Without a Larynx —The Paris correspondent of the Lancet writes that he has recently seen a man, aged 37 years, upon whom Dr Péan performed ablation of the larynx on February 27, 1886 He still wears the cannula introduced at that time, and when he speaks he closes the orifice of the cannula with his finger His voice is not very audible, but is distinct

Northwestern University—On Commencement Day, June 21, 1888, the corner-stone of the astronomical observatory building was laid with appropriate ceremonies, on the University grounds, at Evanston The \$25,000 required for the building was generously donated by Mr J B Hobbs, of Chicago

THE AMERICAN RHINOLOGICAL ASSOCIATION will hold its sixth annual meeting at Cincinnati, Ohio, September 12, 13 and 14, 1888 Secretary, Dr John North, Keokuk, Iowa

DR E MILLER REID, of Baltimore, has recently been elected Professor of Physiology, Hygiene and Clinical Medicine in the Baltimore University School of Medicine

SOCIETY PROCEEDINGS.

MEDICAL SOCIETY OF THE STATE OF PENNSYLVANIA

Held at Philadelphia, June 5, 6, 7 and 8, 1888 (Concluded from page 792) THURSDAY, JUNE 7—THIRD DAY

DR H C WOOD, of Philadelphia, delivered the ADDRESS IN MENTAL DISORDERS

The paper was devoted to considerations of the medico-legal relations of insanity Reference was made to certain defects in the Pennsylvania lunacy It was thought that trials in which this question arose might be rendered more just if an alienist should be on the bench as associate judge, or by reference to a commission whose finding might pos sibly be subject to review by the judges Another recommendation was that the jury of six provided for by the law should be substituted by a commission of three, one to be a member of the legal profession, one of the medical profession, and one a man of In conclusion, the following resolution business was offered

Resolved, That the President be directed to appoint a committee of — members, who shall confer with the State Committee of Lunacy, and if, in the concurrent opinion of these committees, any changes are advisable in our laws relating to lunacy, shall have the power to represent this body in obtaining such legislation

Action was deferred until later in the session

Dr J Chris Lange, of Pittsburgh, read a paper on Some Influences of Disease upon the Mind

The Address in Surgery was delivered by Dr Jas McCann, of Pittsburgh, the subject being Brain Surgery

The resolution presented by Dr Jackson, on Tues day, in regard to the

BOARD OF MEDICAL EXAMINERS

was taken up

DR J H PACKARD moved that the whole matter be referred to the Judicial Council for a decision whether or not the bill is in conformity with the Code of Ethics of American Medical Association

This was decided out of order, on the ground that the Society had already on two occasions approved of this bill, and that the American Medical Association had approved a similar bill

The resolutions were then adopted

DR JOHN V SHOEMAKER, of Philadelphia, read a paper on

THE CAUSE AND TREATMENT OF PSORIASIS

A patient was exhibited who had been the subject of repeated attacks of psoriasis for the past nine teen years. The interesting point was that each at tack was associated with an attack of rheumatism Various methods of treatment had been tried with out avail. The author intended to try the effect of suppositories of 1/4 to 1/2 grain of arsenious acid, the object being to make some impression upon the rheumatic state of the system.

cians who are now annually sent out, materially aids symptoms, and their treatment, locally or generally, a trade, and they merely exchange the carpenters correct, but there is a mean between them saw and the grocers scales for the scalpel and quitemperament, and prevention, hygiene, and medica tion, etc., are the methods. Some run after new certain nervous affections fashions, and thus we have experimental therapeutics, dence of what he may believe " However medication

was in vogue then It is not now so
In discussion Dr F H Williams, of Boston said that the term "experimental therapeutics" had had torn various interpretations, and the most modern of to the difficulties there has ansen a new way of studying the action of gree to have value, it is quite likely that it will be of some Recipes should become simpler A mixture with a dozen or so ingredients is a mistake, and better

there is a tendency among the junior practitioners to have almost unbounded faith in drugs, especially till they are taught by experience what is of the greatest advantage Meddlesome treatment is bad Much is to be expected from the germ theory

3 Dr Francis H Davenport, of Boston, then read an exhaustive paper on "Uterine Displacements and their influence on the General Nervous System" been recognized from the very earliest time They give rise to both local and general symptoms tactus eruditus is now seeking new worlds to con- repaired quer, and trained men can now find by palpation the Fallopian tubes and the ovaries, and even the round ligaments Next will follow the palpation of the ureters and some of the muscular tissues the treatment pessaries of all forms are recom | tion of operative measures which are now daily perbinding down a retroflexed uterus, and Byford's sician with the surgeon is impossible operation for shortening the round ligaments through the vagina

according to the conditions of distension of the blad- meningeal cavities

in this They look upon the practice of medicine as varies accordingly. Neither extreme is probably

The relationship between the genital organs and The treatment of the sick is a matter of the nervous system is so rigid that it was on this account the ancients applied the term hysteria to This is not absolutely correct, for hysteria may occur in men as well as in vicanous therapeutics, routine therapeutics, and women Hysteria in women and neurasthesia due rational therapeutics Dr Jacob Bigelow said fifty to the genitals generally occurs between the ages of years ago "The rational American requires evi-puberty and the menopause Ovarian disease is probably the most active in causing these nervous Also neglected lacerations of the disturbances cervix will do it, especially if the perineum is also Chronic metritis, etc., and displacements add Backward displacements are them deserves attention. Within the last few years more severe, occur oftener, and are of greater de-Hence from them the disturbance is greater drugs, chemically and physiologically, in large labor- Anteversion, pure and simple, occurs rarely, but atones erected for the purpose This is the case when complicated with descent it is not rare Reespecially in Germany When a drug is found here troversion is the most common form of displacement, and if the angle of displacement is not over 90° service to the practitioner. This study has just been there may be no symptoms. If greater than this, there occurs pressure on the rectum, etc, and the greater it is the more the weight of the intestines only one drug used for a definite purpose would be comes upon the uterus and we have prolapse also The minor grades are not detected in the ordinary Dr E P Hurd, of Newburyport, remarked that method of examination, for the uterus falls back To detect such minor degrees the standing position is the best Displacements are not always primary. When they are primary the treatment should be local, unless the general tone is too bad ito allow it until this is improved. If there are no adhesions the replacement, even in the unmarried patient, can be made at one sitting under ether If there are adhesions the slow method of packing the vagina will be The reader said these uterine displacements have necessary If there are tears of the perineum of and importance, which may occur even if they do The not appear so from the outside, these should be first

4 A paper on "The Modern Practice of Surgery" was next read by Dr Otis K Newell, of Boston, who said, that men live so much in their own day In that they are apt to think no further improvement possible In the old day the peritoneum was con-Progress, however, is now in the direc-sidered fatal even to the touch, now the danger of exploration of the peritoneum is chiefly nil formed, much bolder than was dreamed of twenty communication so aids in the dissemination of years ago eg, laparotomy and suturing of the knowledge that it is hard to keep properly informed uterus to the abdominal walls for the cure of retro- Particularly have the studies regarding antiseptic flexion, Alexander's operations on the round liga- treatment been so great that it is almost impossible ments, Sanger's method of tearing the adhesion to keep pace. A successful combination of the phy-The surgeon should have special training A man should not now be allowed to die of apendicitis since it has Curiously enough the normal position of the uterus been worked up by some Antisepsis and asepsis has been settled only very recently It is absurd to are now as important as anæsthesia, and the surapply the same rules to the uterus as to a fixed body geon should be held accountable for aseptic healing like the kidney It is now considered that the nor- We can now successfully operate, I Upon organs mal position of the uterus varies within certain limits in the cavities, as in the pleural, peritoneal and the 2 Resection of organs in conder and rectum The variations outside of these timuity 3 Resection of individual organs 4 Evnormal limits are considered by some to be the causes tirpation of organs 5 Replacement of defects by and by others the effects of the other troubles and transplantation in plastic operations from the same

DOMESTIC CORRESPONDENCE

LETTER FROM BOSTON

(FROM OUR OWN CORRESPONDENT)

The Massachusetts Medical Society One Hundred and Seventh Anniversary

Private Mental Sanitaria and Inebriates-Therapeutic Nihilism-Uterine Displacements and their Influence on the General Nervous System-The Modern Practice of Surgery-Statistics and Climatology of Phthisis and Pneumonia in Massachusetts-Officers

The one hundred and seventh anniversary of the Massachusetts Medical Society was held in Boston, June 12 and 13, and was attended by a number somewhat larger than usual of its members from various parts of the State

First day, June 12 - The forenoon was devoted to an acceptance of the invitation to visit the Massachusetts General Hospital, the Boston City Hospital. the Children's Hospital, and the Carney Hospital In the afternoon several interesting papers were read and discussed The President of the Society, meeting, and after a few words of welcome, called happier in a small "home," but this is no better upon (1) Dr A W Thompson, of Northampton, fitted to cure them, and only certain national and the patients can be kept happier in a small "home," but this is no better fitted to cure them, and only certain national and the patients can be kept happier in a small "home," but this is no better fitted to cure them, and only certain national and the patients can be kept happier in a small "home," but this is no better them. who read a paper on "Private Mental Sanitaria and the Inebriates" The reader referred to the late Dr S B Woodward, the first Superintendent of the State Asylum at Worcester, who, in 1835, held that inebriety is a disease, and that there should be a separate State hospital for its treatment Whatever poison has produced the inebriety, the disease has reached the mind, and is a psychosis, and like other psychoses it should be treated as such The inebriates should never be sent to an asylum, although many cases of inebriety have been cured in these They have an injurious effect on the other classes There should be one or two special places for inebriates, and these should be divided into wards and so forth, since these patients may be offensive to The cottage and private hospital system, each other some say, are not suited to any psychosis, but the reader thinks that the whole system lay in a public need, and it has done much good work, although it is hardly more than fifteen years since it began now has firm root in New England and has stood the test of experience In one particular, the large asylum has the advantage in the treatment of How often, after all details for the comfort and care pyschoses, viz, the fact that the public Superintendent is a salaried officer, and is in a judicial relation Secrecy as to his method is not posto his patients sible, his reputation is not local, and there has to be no consideration of a private account at the bank In many cases, discipline should be prescribed in doses, the same as we prescribe quinine or apply splints

The ideal hospital, however, is the private hospital over which presides an ideal Superintendent esty is the best policy in dealing with the insane is best he should be told that he is insane, and he should know the manner and the mode of restraint The discussion was opened by Dr Edward Cowler, concerning other drugs The vast number of physical concerning other drugs.

Superintendent of the McLean Asylum at Somerville, who said that this is a very important subject. The treatment of inebriety is a burning question of the It is a pyschosis There have been occasional cases at the McLean Asylum, which is private but of larger dimensions than is usual for a private institu tion, and some of them have been cured, but the rule is not to receive them Experience shows that patients partly well, are unable to accommodate themselves to their surroundings They make more demands, and they are of no assistance to the Superintendent in the care of others There are also difficulties in the treatment of these cases in sanıtarıa, especially since a very small proportion of the patients who go there will remain long enough for a complete cure Therefore there should be a special hospital for inebriates, when the inebriety has become a disease, and it should be under special law as to commitment, detention, etc

Dr Walter Channing, of Boston, endorsed Dr Cowler in his statement that the treatment of inebriety is a failure in large hospitals The compulsory law as to commitment now in force is a little aid to the friends, but it affords no relief to the mebriates satisfactorily treated in small places violent should go to the large institutions Dr Channing also advocated a special institution for ine briates, with a special law as to commitment and de tention for a definite period

Dr Charles P Bancroft, Superintendent of the N H State Insane Asylum at Concord, thought that the proper care of the mebriates is difficult in public institutions, and probably it is so, too, in the private Some special legislation is necessary, and in addition to the views of the other speakers, he advocated a certain amount of enforced labor, for the mebriate is generally lazy, and enforced idleness is de moralizing

2 A paper entitled "Therapeutic Nihilism" was read by Maurice D Clarke, M D, of Haverhill, who began with the remark, that it has been said that there is a tendency toward therapeutic nihilism in If by this, is meant that we sit at the bed Boston side with folded hands, and are waiters, and not The lasty, howworkers, it may be somewhat true ever, necessarily, expect that we shall "do something" of the patient have been carefully attended to, and accurate instructions for the continuation of the "But arn't you going to same, have we been asked do something, doctor?" And this feeling is some what shared by the doctors themselves said somewhere recently, that whereas rheumatic fever formerly meant Dover's powder and six weeks, it now means salicylic acid and six days lancet has now disappeared, and new drugs are coming on, which are advocated as specifics Note how It antipyrin and cocaine are said to be "good in" so many different diseases Note also the old editions of the dispensatories and their similar statements

or other individuals or from animals 6 Restoration and retention of displaced organs Also Bigelow's lithoplaxy and endoscopic examination of the bladder. Orthopædic surgery is now taking the place of mechanical treatment. The surgeon should not be deterred from operation by a possibility of bad result Then the reader referred to the relation of legitimate medical practice to quackery, saying that "In medicine, unlike any other science, the quack is only readily detected by him who is well versed in the art itself, and it, therefore, devolves upon the physician more than any one else to aid in his exposure and If the united efforts of this Society extermination cannot soon succeed in establishing the most effective laws for the quick suppression of such vice, there is one way, I believe, in which it can be done I refer to the education of the public in general medi-In other commucal, hygienic and sanitary affairs nities this is already being done with great effect, and here in spite of the insulting lack of legal support, the medical profession is doing much in the same direction. The great value in educating the public in regard to the prevention and cure of disease is already recognized, and quite universally, to a greater or less degree, especially in hygienic and sanitary matters, being put into practice

5 The next paper, "A Study of Phthisis and Pneumonia in Massachusetts, Statistical and Chmatological," read by W Everett Smith, M D, of Boston, showed an exhaustive research into the statistics which were available to the writer, but no idea of the value of it nor the amount of labor involved in its preparation can be given without a reproduction of the admirable tables which so graphically stated the

facts obtained by the writer

The paper was inspired by a statement of Dr H I Bowditch, who said in 1862 that consumption was not equally distributed in accordance with the amount It is impossible, however, to estabof soil moisture lish this at present, since there are no data, and the Society passed a vote appointing Dr Smith a committee to confer with Prof Shaler and Gen Greely on this subject, who within the next three years will publish a series of fifty-two maps in relation to this subject, showing the soil structure and other geologi-

In connection with the meeting there is an exhibit of drugs and preparations, foods, surgical instruments aud apparatus, books, etc , by the leading manufacturers and dealers of Boston and New York are also some very interesting, curious old instru ments loaned by the Harvard Medical School, and some excellent models of very large size, of bones, muscles, etc, designed by Dr Thomas Dwight for purposes of instruction in anatomy

OFFICERS FOR ENSUING YEAR

The following officers were elected by the Coun-

cillors for the ensuing year

President, Dr David W Cheever, of Boston, Vice President, Dr George Jewett, of Fitchburg, Treasurer, Dr Frank W Draper, of Boston, Corresponding Secretary, Dr Chas W Swan, of Boston, Recording Secretary, Dr Francis W Goss, of Rox-

bury, Librarian, Dr Edwin H Brigham, of Boston, Orator, Dr Henry P Walcott, of Cambridge, Anniversary Chairman, Dr James R Chadwick, of Boston (To be concluded)

MISCELLANEOUS

DR S WEIR MITCHELL -The University of Bologna, on the occasion of the eight hundredth anniversary of its founda tion, conferred its honorary degree upon several representatives of literature, science and art, and included in the list was Dr S Weir Mitchell, of Philadelphia, who represented the National Academy of Science on the occasion

INPURE WATER -In Canton, Mass, the employes of the rolling department have been prostrated by drinking impure water to such an extent that it is feared it will be necessary to close the works of the Kinsley iron and machine company

A MONUMENT to COHNHEIM was unveiled at Leipzig, with appropriate ceremonies, on June 3
